SHEET 8 OF 8

NOTES:

1. APPLICABLE STANDARD/SPECIFICATION: IEEE 315–1975
   GRAPHIC SYMBOLS FOR ELECTRICAL AND ELECTRONIC DIAGRAMS.
2. CUSTOMER DRAWING NUMBERS CONSIST OF:
   (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE
   REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE
   X = ORDER NUMBER.
3. REPRESENTS NODE IN DISTRIBUTIVE I/O NETWORK

   NX.X.XX
   - NODE
   - NETWORK
   - CHASSIS

4. ALL COMPONENTS SHOWN DE–ENERGIZED (SHELF STATE).
5. PORTS 1–8 ARE PDH (PLANT DATA HIGHWAY) OR CUSTOMER DCS.
   PORTS 9–20 ARE THE UDH (UNIT DATA HIGHWAY).
   PORT 21 IS THE ADH (ATLANTA DATA HIGHWAY–REMOTE MONITORING &
   DIAGNOSTIC PORT). PORTS 22–26 ARE TRUNK WITH 25 & 26 BEING THE
   SC FIBER PORTS.
6. SYSTEM SUPPLIED BY GEPPLP, INSTALLATION AND LOCATION IS
   UNDER CUSTOMER SCOPE AND MUST COMPLY WITH THE INSTALLATION
   INSTRUCTIONS STATED IN THE OEM SUPPLIED WITH THE SYSTEM.
   THE MAXIMUM LENGTH OF THE CABLE FROM ANTENNA TO HMI IS
   300FT [91.44 M] PER GEPPLP DESIGN.
7. SYSTEM SUPPLIED BY CUSTOMER, GEPPLP RECOMMEND TO USE
   GE PART #398A4893P0001 (SUPPLIED BY MEINBERG).
8. INSTALLATION AND LOCATION IS UNDER CUSTOMER SCOPE AND MUST
   COMPLY WITH THE INSTALLATION INSTRUCTIONS STATED IN THE OEM
   SUPPLIED WITH THE SYSTEM. THE MAXIMUM LENGTH OF THE CABLE
   FROM ANTENNA TO HMI IS 300 FT [91.44 M] PER GEPPLP DESIGN.
9. ENET8 IS SUPPLIED BY GE WHEN THE REMOTE HMI OPTION IS PURCHASED.
   THE ETHERNET SWITCH IS AN ALLIED TELESYN INTERNATIONAL AT–8026FC MODEL.
10. THE WOBBE METER CAN SUPPORT UP TO 3 GAS TURBINE GENERATOR SETS, FOR CAT5e ETHERNET CABLE
    INSTALLATION THE WOBBE METER CAN DIRECT CONNECT TO EACH UNIT FEATURING ONBOARD ETHERNET
    SWITCH (ENET7), PORT 3 IS FOR UNIT 1, PORT 4 IS FOR UNIT 2, AND PORT 5 IS FOR UNIT 3.
11. THE WOBBE METER CAN SUPPORT UP TO 3 GAS TURBINE GENERATOR SETS, FOR FIBER OPTIC CABLE INSTALLATION THE
    WOBBE METER CAN DIRECT CONNECT TO ONE UNIT FEATURING ONBOARD ETHERNET SWITCH WITH FIBER OPTIC PORT.
    THE FIBER PORT SHALL INTERFACE WITH ENET1 FIBER OPTIC PORT, IF MULTIPLE UNIT INSTALLATION IS REQUIRED ENET1
    AND ENET2 AS APPLICABLE SHALL BE LINKED TO ENET1 AND ENET2 AS APPLICABLE OF ADDITIONAL UNITS UP TO 3.

1. BOLT HOLE TOLERANCE: ± 1/8" [3], TRUE POSITION.
2. LEVELING AND GROUTING TO BE PERFORMED PER GUIDELINES OF INSTALLATION MANUAL.
3. ALL ANCHORING HARDWARE AND EMBEDDED STEEL TO BE SUPPLIED BY CUSTOMER AND SHALL BE ASTM F1554 Gr. 105 ANCHOR BOLT WITH A MIN. YIELD STRENGTH OF 105,000 PSI.
4. W14 X 61# BEAMS ILLUSTRATED AT ANCHOR POINT 10 DO NOT EXTEND TO BOTTOM OF SKID. ALL OTHER BEAMS SHOWN ARE W30 X 132#.
5. W30 X 132# BEAMS ILLUSTRATED AT ANCHOR POINTS 5 AND 6 ARE JOINED BY PLATE AT BOTTOM FLANGES. GROUTING BENEATH PLATE AND BEAMS IS REQUIRED. SEE SHEET 2.
6. FLAT PLATES ILLUSTRATED AT ANCHOR POINTS 2, 3 AND 4 EXTEND TO THE BOTTOM OF SKID. GROUTING OF THESE PLATES IS REQUIRED. SEE SHEET 2.
7. SHEAR LUGS ARE SHIPPED LOOSE FOR FIELD INSTALLATION. HOLES FOR SHEAR LUGS NOT SHOWN FOR CLARITY.
8. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
9. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
10. TOLERANCES: LINEAR DIMENSION: ± 1/8" [3 mm] ANGULAR: ±0.5°
11. LIFTING PINS ARE NOT SHOWN ON PLAN VIEW FOR CLARITY.
12. FOR GROUT INFORMATION AND SHIM LOCATIONS, REFER TO GEPPLP LM6000 60HZ INSTALLATION MANUAL.
13. BOLT TORQUE CAN BE VERIFIED BY ENSURING THAT THE PROTRUSIONS ON THE LOAD INDICATING WASHERS HAVE BEEN COMPRESSED. SUFFICIENT TORQUE WILL COMPRESS THE PROTRUSIONS TO THE EXTENT THAT A MAXIMUM GAP OF 0.005" [0.127 mm] EXISTS BETWEEN THE PROTRUSIONS. NOTE THAT THE MAXIMUM GAP MAY BE INCREASED TO 0.015" [0.381 mm] IF THE LOAD INDICATING WASHER IS USED UNDER THE UNTURNED ELEMENT.
14. DATUM DIMENSIONS ARE FROM GENERATOR END OF SKID.
15. CUSTOMER SUPPLIED GENERATOR AND GEARBOX ANCHOR BOLTS TO BE EMBEDDED INTO FOUNDATION. SEE SHEETS 7 & 8.

SHEET 9 OF 12

NOTES:

1. FOR P LOADS '+' IS A COMPRESSION AND '–' IS A UPLIFT. VT IS TRANSVERSE SHEAR AND VL IS LONGITUDINAL SHEAR.
2. EACH VALUE IN THE LOAD TABLE REPRESENT A LOAD AT EACH ANCHOR LOCATION.
3. ROOF LIVE LOAD IS APPLIED AS PER IBC 2009 TABLE 1607.1, REPRESENTS A UNIFORM LOAD OF 60 PSF ON PACKAGE AND AIR FILTER AND 100 PSF ON WALKWAYS APPLIED AT EXPOSED SECTION OF THE MAIN UNIT AND ON THE AIR FILTER ROOF.
4. SEISMIC LOADS ARE DUE TO 0.6g STATIC ACCELERATION APPLIED IN THE LONGITUDINAL AND TRANSVERSE DIRECTION AS PER EQUIVALENT LATERAL FORCE PROCEDURE FOR SEISMIC DESIGN OF BUILDINGS. THESE LOADS ARE AS PER IBC 2009 CODE SECTION 1613 THAT REFERENCES ASCE 7–05.

SITE CLASS	D
OCCUPANCY CATEGORY, TABLE 1604.5	III
SEISMIC DESIGN CATEGORY – SECTION 1613.5.6	E
I_E – OCCUPANCY IMPORTANCE FACTOR, CATEGORY III, ASCE 7–05, TABLE 11.5.1	1.25
R – RESPONSE MODIFICATION FACTOR, ASCE 7–05, TABLE 15.4–1	2.50
SDS – SPECTRAL RESPONSE ACCEL.AT 0.2 SEC – G	1.20
SD1 – SPECTRAL RESPONSE ACCEL.AT 1 SEC – G	0.70
G–LEVELS FOR BASE ACCELERATIONS FOR DESIGN PER IBC 2009	0.60

SEISMIC LOAD MAY BE POSITIVE OR NEGATIVE
CUSTOMER SHOULD INCLUDE THE VERTICAL SEISMIC LOAD EFFECT Ev = +/–0.2SDS D = 0.24 D IN THE FOUNDATION LOADS AS PER ASCE 7–05 SECTION 12.4.

5. WIND LOAD ARE PER ASCE 7–05 CODE, 150 MPH FOR LOW RISE BUILDING, H <60 FT

WIND PRESSURE (PSF), EQ 6–18	p = qh (GCpf – GCpi)	75.533(GCpf–GCpi)
EXTERNAL PRESSURE COEF., FIGURE 6–10	GCpf	
INTERNAL PRESSURE COEF., FIGURE 6–5	GCpi	+/–0.18
VELOCITY PRESSURE (psf) , Eq 6–15	qh = 0.00256 Kz Kzt Kd V2 I	75.53
VELOCITY PRESSURE EXPOSURE COEF. – TABLE 6–3	Kz	0.98
TOPOGRAPHIC FACTOR, Eq. 6–3	Kzt = (1 + K1 K2 K3)2	1.369
FIGURE 6–4	K1	0.17
FIGURE 6–4	K2	1
FIGURE 6–4	K3	1
WIND DIRECTIONALLITY FACTOR, TABLE 6–4	Kd	0.85
WIND VELOCITY (MPH)	V	150
IMPORTANCE FACTOR, TABLE 6–1	I	1.15
EXPOSURE CATEGORY	C	C

6. OPERATING LOADS REPRESENT THE FOLLOWING:
   A. AXIAL THRUST – DUE TO THE MOMENTUM CHANGE THROUGH THE TURBINE.
   B. PRESSURE DIFFERENCE – DUE TO THE PRESSURE DIFFERENCE BETWEEN THE INLET AND THE EXHAUST.
   C. NORMAL OPERATION TORQUE – DUE TO THE OVERTURNING TORQUE PRODUCED BY THE FLUID COUPLING.
   D. THERMAL EXPANSION – DUE TO THE MECHANICAL RESISTANCE TO THE THERMAL GROWTH OF THE TURBINE.
7. GENERATOR FAULT TORQUE IS DECOUPLED INTO UPWARD AND DOWNWARD COMPONENTS. GENERATOR FAULT CAN BE CONSIDERED AS EMERGENCY LOAD CASE.
8. GENERATOR FAULT AND ENGINE SEIZURE CAN BE CONSIDERED AS EMERGENCY LOAD CASE.
9. THE PEAK VIBRATION VELOCITY AT ANY POINT OF THE FOUNDATION SHOULD BE LESS THAN 0.06 IN/SEC AT THE RATED TURBINE SPEED OF 3600 RPM.
10. FOUNDATION SHALL NOT EXCEED +/– 1/8" FLATNESS AND +/– 1/4" SLOPE. FOUNDATION SHALL NOT BOW MORE THAN 1/8" AT ANY LOCATION ON THE SKID.
11. ONE END OF THE FOUNDATION MUST NOT BE 1/4" HIGHER OR LOWER THAN THE OTHER END OF THE SKID.

SCALE NONE SHEET 11 OF 12

NOTES:

1. P IS VERTICAL LOAD (TENSION/COMPRESSION), VT IS TRANSVERSE SHEAR AND VL IS LONGITUDINAL SHEAR.
2. SHORT TERM LOAD CASES ARE THE RESULT OF THE FOLLOWING BLADE-OUT CONDITIONS AT THE INDICATED ROTOR POSITION.
   A. TWO STAGE 0 LOW PRESSURE COMPRESSOR AIRFOILS: 27840 gm-in (982.03 OZ.-in), SPEED RANGE 0-4300 RPM FOR 50 Hz UNIT AND 60 Hz UNIT.
   B. TWO STAGE 1 HIGH PRESSURE COMPRESSOR AIRFOILS: 2752 gm-in (97.07 OZ-in), SPEED RANGE 0-10800 RPM.
   C. THREE STAGE 2 HIGH PRESSURE TURBINE AIRFOILS: 4911 gm-in (173.23 OZ-in), SPEED RANGE 0-10800 RPM.
   D. TWO STAGE 5 LOW PRESSURE TURBINE AIRFOILS: 41158 gm-in (1451.81 OZ-in), SPEED RANGE 0-4300 RPM FOR 50 Hz UNIT AND 60 Hz UNIT.
3. SHORT TERM IS DEFINED AS FIVE SECONDS FOR TURBINE LOAD DECAY DURING COASTDOWN.
4. THE CONTINUOUS UNBALANCE LOAD CASES ARE THE RESULT OF THE ALLOWABLE ROTOR UNBALANCE AT THE INDICATED ROTOR POSITION.
   A. TWO STAGE 0 LOW PRESSURE COMPRESSOR AIRFOILS: 300 gm-in (10.58 OZ-in), DESIGN SPEED 3911 RPM FOR 50 Hz UNIT AND 3905 RPM FOR 60 Hz UNIT.
   B. TWO STAGE 1 HIGH PRESSURE COMPRESSOR AIRFOILS: 100 gm-in (3.53 OZ-in), DESIGN SPEED 10600 RPM.
   C. THREE STAGE 2 HIGH PRESSURE TURBINE AIRFOILS: 150 gm-in (5.29 OZ-in), DESIGN SPEED 10600 RPM.
   D. TWO STAGE 5 LOW PRESSURE TURBINE AIRFOILS: 200 gm-in (7.05 OZ-in), DESIGN SPEED 3911 RPM FOR 50 Hz UNIT AND 3905 RPM FOR 60 Hz UNIT.
   E. GENERATOR, BRUSH 7-290ER, CONTINUOUS UNBALANCE LOAD OF 987 gm-in (34.82 OZ-in) AT MIDDLE OF ROTOR PER BRUSH SPECIFICATION.
   F. GEAR BOX, LUFKIN, CONTINUOUS UNBALANCE LOAD OF 152 gm-in (5.36 OZ-in) AT MIDDLE OF SHAFT AS PER LUFKIN SPECIFICATION.
5. THE LOADS IN THE DYNAMIC FOUNDATION LOAD TABLE ARE THE MAXIMUM (0 TO PEAK) LOADS OF EACH ANCHOR BOLT IN THE OPERATING RANGE THESE LOADS MAY OCCUR AT DIFFERENT FREQUENCIES OR PHASES, AND THEREFORE, IT MAY BE TOO CONSERVATIVE TO TREAT LOADS AS STATIC LOAD CASES.
6. DYNAMIC LOADS SHORT TERM: FROM MAX TO ZERO IN 5 SEC. THESE LOAD CASES ARE ASSUMED NOT TO ACT SIMULTANEOUSLY.

7. THE PEAK TO PEAK VIBRATION VELOCITY AT ANY POINT OF THE FOUNDATION SHOULD BE LESS THAN 0.06 in/SEC AT THE RATED TURBINE SPEED OF 3605 RPM FOR 60 Hz UNIT AND 3911 RPM FOR 50 Hz UNIT.

ELECTRICAL DATA SHEET - CONTINUATION

BDAX 7-290ERHJT, 59.100 MW, 0.850 pf, 13.800 kV, 60.0 Hz

4. REACTANCE AND SEQUENCE RESISTANCES

A) Direct Axis Reactances:

4.1	Saturated synchronous reactance, $X_{d(v)}$	206%
4.2	Unsaturated synchronous reactance, $X_{d(i)}$	230%
4.3	Saturated transient reactance, $X'_{d(v)}$	19.4 %
4.4	Unsaturated transient reactance, $X'_{d(i)}$	23.8 %
4.5	Saturated subtransient reactance, $X''_{d(v)}$	14.1 %
4.6	Unsaturated subtransient reactance, $X''_{d(i)}$	17.7 %
4.7	Saturated negative sequence reactance, $X_{2(v)}$	13.7 %
4.8	Unsaturated negative sequence reactance, $X_{2(i)}$	17.2 %
4.9	Zero sequence reactance, X_0	9.3 %
4.10	Potier reactance, X_P	20.3 %
4.11	Saturated stator leakage, $X_{sl(v)}$	8.1 %
4.12	Unsaturated stator leakage, $X_{sl(i)}$	12.7 %
4.13	Short circuit ratio	0.48

B) Quadrature Axis Reactances:

4.14	Saturated synchronous reactance, $X_{q(v)}$	165 %
4.15	Unsaturated synchronous reactance, $X_{q(i)}$	210 %
4.16	Saturated transient reactance, $X'_{q(v)}$	23 %
4.17	Unsaturated transient reactance, $X'_{q(i)}$	34 %
4.18	Saturated subtransient reactance, $X''_{q(v)}$	17 %
4.19	Unsaturated subtransient reactance, $X''_{q(i)}$	21 %

C) Sequence resistances:

4.20	Positive sequence resistance, R_1	0.0052 p.u at 75 °C
4.21	Negative sequence resistance, R_2	0.0266 p.u at 75 °C
4.22	Zero sequence resistance, R_O	0.0077 p.u at 75 °C

Notes:

1. The electrical details provided are calculated values. Unless otherwise stated, all values are subject to tolerances as given in the relevant national standards.

BRUSH ELECTRICAL MACHINES LTD

ELECTRICAL DATA SHEET - CONTINUATION

BDAX 7-290ERHJT, 59.100 MW, 0.850pf, 13.800 kV, 60.0 Hz

5. TIME CONSTANTS AT 20°C

A) Direct Axis:

5.1	Transient O.C. time constant, T'_{do}	9.5 seconds
5.2	Transient S.C. time constant, 3 ph, T'_{d3}	0.64 seconds
5.3	Transient S.C. time constant, L-L, T'_{d2}	1.30 seconds
5.4	Transient S.C. time constant, L-N, T'_{d1}	1.60 seconds
5.5	Subtransient O.C. time constant, T''_{do}	0.05 seconds
5.6	Subtransient S.C. time constant, 3 ph, T''_{d3}	0.04 seconds
5.7	Subtransient S.C. time constant, L-L, T''_{d2}	0.04 seconds
5.8	Subtransient S.C. time constant, L-N, T''_{d1}	0.04 seconds

B) Quadrature Axis:

5.9	Transient O.C. time constant, T'_{qo}	2.9 seconds
5.10	Transient S.C. time constant, 3 ph, T'_{q3}	0.32 seconds
5.11	Transient S.C. time constant, L-L, T'_{q2}	0.48 seconds
5.12	Transient S.C. time constant, L-N, T'_{q1}	0.58 seconds
5.13	Subtransient O.C. time constant, T''_{qo}	0.05 seconds
5.14	Subtransient S.C. time constant, 3 ph, T''_{q3}	0.04 seconds
5.15	Subtransient S.C. time constant, L-L, T''_{q2}	0.04 seconds
5.16	Subtransient S.C. time constant, L-N, T''_{q1}	0.04 seconds

C) Miscellaneous:

5.17	D.C. Armature time constant, 3 ph, T_{a3}	0.30 seconds
5.18	D.C. Armature time constant, L-L, T_{a2}	0.30 seconds
5.19	D.C. Armature time constant, L-N, T_{a1}	0.27 seconds

Notes:

1. The electrical details provided are calculated values. Unless otherwise stated, all values are subject to tolerances as given in the relevant national standards.

BRUSH ELECTRICAL MACHINES LTD

ELECTRICAL DATA SHEET - CONTINUATION

BDAX 7-290ERHJT, 59.100 MW, 0.850 pf, 13.800 kV, 60.0 Hz

6. GENERATOR SATURATION FACTOR

6.1	Saturation factor 1.0	0.11
6.2	Saturation factor 1.2	0.49

7. INERTIA

7.1	Moment of inertia, WR^2	970 $kg.m^2$
7.2	Inertia constant, H	0.99 kWsecs/kVA

8. EXCITATION

A) No load (cold):

8.1	Excitation current at no load, rated voltage	325 amps
8.2	Excitation voltage at no load, rated voltage	46 volts
8.3	Exciter field current at no load	1.9 amps
8.4	Exciter field voltage at no load	10 volts

B) Rated load (hot):

8.5	Excitation current at rated load and P.F	934 amps
8.6	Excitation voltage at rated load and P.F	178 volts
8.7	Exciter field current at rated load and P.F	6.1 amps
8.8	Exciter field voltage at rated load and P.F	46 volts

C) Short circuit clearance of 2.7 p.u rated line amps (hot):

8.9	Excitation current on clearance	1810 amps
8.10	Excitation voltage on clearance	345 volts
8.11	Exciter field current on clearance	13.7 amps
8.12	Exciter field voltage on clearance	103 volts

Notes:

1. The electrical details provided are calculated values. Unless otherwise stated, all values are subject to tolerances as given in the relevant national standards.
2. The rotor inertia value may vary slightly with generator / turbine Interface. In the event of conflict, the figure quoted on the rotor Geometry drawing takes precedence.

BRUSH ELECTRICAL MACHINES LTD

ELECTRICAL DATA SHEET - CONTINUATION

BDAX 7-290ERHJT, 59.100 MW, 0.850 pf, 13.800 kV, 60.0 Hz

9. INHERENT VOLTAGE REGULATION

9.1	F.L. to N.L. rated pf, constant excitation	35 %
9.2	F.L. to N.L. unity pf, constant excitation	27 %
9.3	F.L. to N.L. steady state under full AVR control	± 0.5 %

10. EFFICIENCY AND LOSSES

These losses below are calculated values. The total loss and the resulting efficiencies are guaranteed, subject to the tolerance specified in EN 60034-1.

MW output	59.100	59.100
Power factor	0.850	Unity
Friction & windage loss(kW)	320	320
Stator core iron loss(kW)	140	140
Stator copper loss at 95°C(kW)	110	79
Stray load loss at 95°C(kW)	245	177
Rotor copper loss at 95°C(kW)	158	80
Exciter loss(kW)	12	6
Total loss(kW)	985	802

Efficiencies:

% load	100	75	50	25
0.85 power factor	98.36 %	98.29 %	97.95 %	96.59 %
Unity power factor	98.66 %	98.53 %	98.14 %	96.72 %

11. CAPACITANCE AND SURGE IMPEDANCE

11.1	Capacitance per phase of stator winding to earth	0.19 microfarad
11.2	Surge impedance per phase	96 Ohms

Notes:

1. The electrical details provided are calculated values. Unless otherwise stated, all values are subject to tolerances as given in the relevant national standards.

ELECTRICAL DATA SHEET - CONTINUATION

BDAX 7-290ERHJT, 59.100 MW, 0.850 pf, 13.800 kV, 60.0 Hz

12. RESISTANCES AT 20°C

12.1	Stator resistance per phase	0.0033 ohms
12.2	Rotor resistance	0.140 ohms
12.3	Exciter armature resistance per phase	0.00130 ohms
12.4	Exciter field resistance	5.39 ohms
12.5	Pilot exciter resistance	0.084 ohms

13. EXCITER

13.1	Exciter frame size	BXF 10.20-3S
13.2	Voltage rating	196 Volts D.C
13.3	Current rating	1028 Amps D.C
13.4	Output	201 kW
13.5	Frequency	180 Hz
13.6	A.C. voltage at full load	177 Volts RMS
13.7	A.C. current at full load	707 Amps RMS
13.8	Power factor	0.74
13.9	Number of phases	3
13.10	Response ratio	3.5 $Secs^{-1}$

14. ROTATING RECTIFIER

14.1	Number of diodes	12
14.2	Arrangement	3 ph full wave bridge; 6 arms; 2 fused diodes in parallel per arm.
14.3	Diode repetitive peak reverse voltage	2000 Volts
14.4	Diode rated mean forward current	330 Amps
14.5	Diode mean forward current at rated load	156 Amps
14.6	Diode reverse voltage at rated load	178 Volts
14.7	Fuse rating	450 Amps

Notes:

1. The electrical details provided are calculated values. Unless otherwise stated, all values are subject to tolerances as given in the relevant national standards.

NOTES:

1. TOLERANCE ON FLANGE CONNECTIONS ±1/8" [3]
   TOLERANCE ON ELECTRICAL CONNECTIONS ±1/8" [3]
   TOLERANCE ON BOLT HOLES ±1/16" [2] TRUE POSITION
2. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
3. ADDITIONAL EXTERIOR LIGHTING TO BE SUPPLIED BY CUSTOMER.
4. MAXIMUM LOAD ON EACH ENGINE REMOVAL FOOT PAD IS 10,000 LBS [4536 kg], (20,000 LBS [9072 kg] TOTAL ENGINE REMOVAL LOAD). MAXIMUM LOAD ON EACH GEARBOX REMOVAL PAD IS 28,000 LBS [12700 kg].
5. AUXILIARY SKID, SPRINT SKID & FIRE PROTECTION SKID FOUNDATIONS MUST BE AT THE SAME ELEVATION AS THE MAIN SKID FOUNDATION. MLO SKID FOUNDATION MUST BE 1'-6 1/2" [471] LOWER.
6. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)-(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X-(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
7. TOLERANCES:
   LINEAR DIMENSION: ±1/8" [3]
   ANGULAR: ±0.5°

SAFETY NOTE: CAUTION

1. GEPPLP SHALL NOT BE LIABLE FOR DAMAGE CAUSED BY EXCESSIVE FLANGE LOADS OR INADEQUATE EXPANSION JOINT DESIGN. FAILURE TO PROVIDE FOR ADEQUATE THERMAL EXPANSION OR EXCEEDING ALLOWABLE FLANGE LOADS MAY RESULT IN DAMAGE TO OR DESTRUCTION OF FASTENERS AND ENGINE/EXHAUST SYSTEM RELATED HARDWARE RESULTING IN EXHAUST LEAKS AND ACCELERATED WEAR ON THE EXHAUST DIFFUSER ASSEMBLY. IT IS THE CUSTOMER'S RESPONSIBILITY TO ALLOW A CONSERVATIVE AMOUNT OF EXPANSION CAPABILITY TO ACCOMMODATE INSTALLATION ERRORS AND TOLERANCE STACK-UPS FOR THE COMPLETE EXHAUST SYSTEM.
2. IN THE REMOTE CHANCE OF A HP ROTOR FAILURE THE ENGINE CASING MAY NOT CONTAIN THE ENTIRE FAILURE. IT IS HIGHLY RECOMMENDED THAT NO PERMANENTLY MANNED SPACES BE LOCATED IN THE PLANE OF THE HP TURBINE. IT IS ALSO HIGHLY RECOMMENDED THAT ALL POTENTIALLY HAZARDOUS LINES (i.e. FUEL) OR EQUIPMENT (i.e. SHUTOFF VALVES, CONTROL VALVES) ALSO BE LOCATED OUTSIDE THE PLANE OF THE HP TURBINE.

INDICATES CUSTOMER CONNECTION.

NOTES:

1. MAXIMUM LOAD ON EXHAUST FLANGE TO BE 500 LBS [227 kg] VERTICAL AND 50 LBS [23 kg] AXIAL. TRANSITION FROM EXHAUST COLLECTOR TO OUTLET FLANGE IS SOLID. FOR EXPECTED THERMAL GROWTH, SEE EXHAUST OUTLET LOCATION DIMENSIONS.
2. ALL MAIN UNIT FLANGED CUSTOMER CONNECTIONS ARE LOCATED 6'-8 1/2" [2045] FROM CENTERLINE OF UNIT, EXCEPT:
   14: ALIGNED WITH CENTERLINE. THE OTHER TWO ARE LOCATED ON SAME SIDE AS CONNECTION 6.
   149: 7'-0 1/4" [2140] FROM CENTERLINE
   228: 6'-10 1/2" [2092] FROM CENTERLINE
   229: 6'-10 1/2" [2092] FROM CENTERLINE
3. ALL MAIN UNIT NPT COUPLINGS EXTEND 6'-5 1/8" [1959] FROM CENTERLINE OF UNIT, EXCEPT CONNECTION 14, 161, 183 AND 184. FOR CONNECTION 161, PUT NPT COUPLING FLUSH WITH PANEL.
4. FOR CONNECTION DESCRIPTIONS, SEE SHEET 7.
5. REFERENCE OTHER APPLICABLE GENERAL ARRANGEMENTS FOR LOCATIONS AND DESCRIPTIONS OF ADDITIONAL CONNECTIONS. THOSE CONNECTIONS NOT LISTED ARE NOT USED ON THIS PROJECT.
6. AN ASTERISK (*) INDICATES CONNECTION HARDWARE BY GEPPLP.
7. "HOT" INTERFACE MATING FLANGE SHOULD BE EXTERNALLY INSULATED AND 321 SS.
8. CONNECTIONS 10, 11, 24 AND 297 ARE SCHEDULE 40 304 SS PIPE RECESSED 1/2" [13] FROM EDGE OF SKID. CUSTOMER TO WELD PIPING AT INSTALLATION.
9. HARDWARE CONNECTION 13 IS SUPPLIED BY EXHAUST STACK / EXPANSION JOINT SUPPLIER.

INSTALLATION FOOTPRINT

LEGEND:

- ● ANCHOR BOLT

NOTES:

1. FOR VERTICAL P LOADS '+' IS A COMPRESSION AND '–' IS A UPLIFT. VT IS TRANSVERSE SHEAR AND VL IS LONGITUDINAL SHEAR.
2. EACH VALUE IN THE LOAD TABLE REPRESENTS A LOAD AT EACH ANCHOR LOCATION.
3. LIVE LOAD REPRESENTS A UNIFORM LOAD OF 60 PSF APPLIED AT EXPOSED SECTION ON THE ROOF OF GLO TANK.
4. SEISMIC LOADS ARE DUE TO 0.6g STATIC ACCELERATION APPLIED IN THE TRANSVERSE OR LONGITUDINAL DIRECTION AS PER EQUIVALENT LATERAL PROCEDURE FOR SEISMIC DESIGN OF BUILDINGS. THESE LOADS ARE AS PER IBC 2009/CBC 2010 CODE SECTION 1613 THAT REFERENCES ASCE 7-05.

SITE CLASS	D
OCCUPANCY CATEGORY	III
SEISMIC DESIGN CATEGORY – TABLE 1613.5.6	E
I_E – OCCUPANCY IMPORTANCE FACTOR, CATEGORY III, ASCE 7-05, TABLE 11.5.1	1.25
R – RESPONSE MODIFICATION FACTOR, ASCE 7-05, TABLE 15.4-2	3.00
S_{DS} – SPECTRAL RESPONSE ACCEL. AT 0.2 SEC – G	1.44
S_{D1} – SPECTRAL RESPONSE ACCEL. AT 1 SEC – G	0.75
G – LEVELS FOR BASE ACCELERATIONS FOR DESIGN	0.60

SEISMIC LOAD MAY BE POSITIVE OR NEGATIVE.

CUSTOMER SHOULD INCLUDE THE VERTICAL SEISMIC LOAD EFFECT $Ev=+/-\ 0.2S_{DS}D$ IN THE FOUNDATION LOADS AS PER ASCE 7-05 SECTION 12.4.

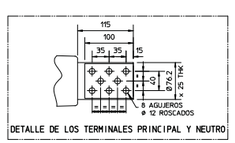
GENERAL NOTES :

PHASE SEQUENCE = T1-T3-T2
TERMINAL MARKINGS - AS SHOWN ON PLAN VIEW



ASSOCIATED DRAWINGS :

321642500 - ROTOR GEOMETRY
321642400 - CONNECTION DIAGRAM

AUXILLIARY TERMINAL BOX DESIGNATIONS :

TB1 - CONTROL
TB2 - POWER
TB3 - INSTRUMENTATION
TB4 - STATOR WINDING RTD's

ALL BOXES ARE FITTED WITH EARTH LEAD TO STATOR FRAME (M10 STUD).

DETALLE DE LOS TERMINALES PRINCIPAL Y NEUTRO

MACHINE WEIGHTS :

WOUND STATOR = 53865 KG
ROTOR (INCLUDING EXC ARM) = 14342 KG

GENERATOR COMPLETE = 72900 KG

HEAT EXCHANGER = TBA KG (DRY) / TBA KG (WET) (B)

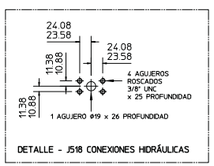
FOUNDATION LOADING

FAULTY SYNCHRONISING LOAD (120° OUT OF PHASE) = +/- 145230 KG

THIS ASSUMES INFINITE BUS-BAR (ZERO SYSTEM REACTANCE).

AIR CIRCUIT AND HEAT EXCHANGER DETAILS

THERMAL DETAILS	MACHINE AIR CIRCUIT	COOLANT CIRCUIT TREATED WATER (50% GLYCOL)
DISSIPATION AT RATING POINT	933 KW	933 KW
NORMAL INLET TEMPERATURE	TBA C	32.2 C
THERMAL OUTLET TEMPERATURE	38.5 C	TBA C
FLOW RATE (TOTAL)	21 m3/Sec	38.9 L/Sec
VELOCITY	-	TBA m/Sec
PRESSURE LOSS	730 Pa	<TBA KPa
WORKING PRESSURE	-	NOT KNOWN
DESIGN PRESSURE	-	10.34 bar g
TEST PRESSURE	-	13.44 bar g



BEARING DETAILS

NON-EXCITER (DRIVE) END BEARING DETAILS									
OIL FLOW		POWER LOSS	SUPPLY PRESSURE (NOMINAL)	ORIFICE BORE	JOURNAL JACKING		THRUST JACKING		
					PRESSURE	FLOW	PRESSURE	FLOW	
2.1 L/S	33.3 US GPM	40.5 KW	2 BAR	Ø17	49 BAR	0.08 L/S 1.3 US GPM	185 BAR	0.19 L/S 3.0 US GPM	

EXCITER END BEARING DETAILS						
OIL FLOW		POWER LOSS	SUPPLY PRESSURE (NOMINAL)	ORIFICE BORE	JOURNAL JACKING	
					PRESSURE	FLOW
1.1 L/S	17.4 US GPM	25.2 KW	2 BAR	Ø12	49 BAR	0.08 L/S 1.3 US GPM

ABOVE DETAILS ASSUME OIL TO ISO VG 32 AT 55°C.
STATED PRESSURES ARE AT BEARING OIL INLETS

BOTH BEARINGS ARE INSULATED.
LOCATION BEARING FITTED AT NON-EXCITER END ONLY - MAXIMUM ALLOWABLE AXIAL THRUST = 33400N.
MAXIMUM OPERATING OIL LEVEL IS WITH THE OUTLET PIPES HALF FULL (ie 600mm FROM ROTOR C/LINE) - THIS ALLOWS FOR A BEARING AIR DRAIN OF 0.05m³/SEC (TOTAL).

DETALLE - J518 CONEXIONES HIDRÁULICAS

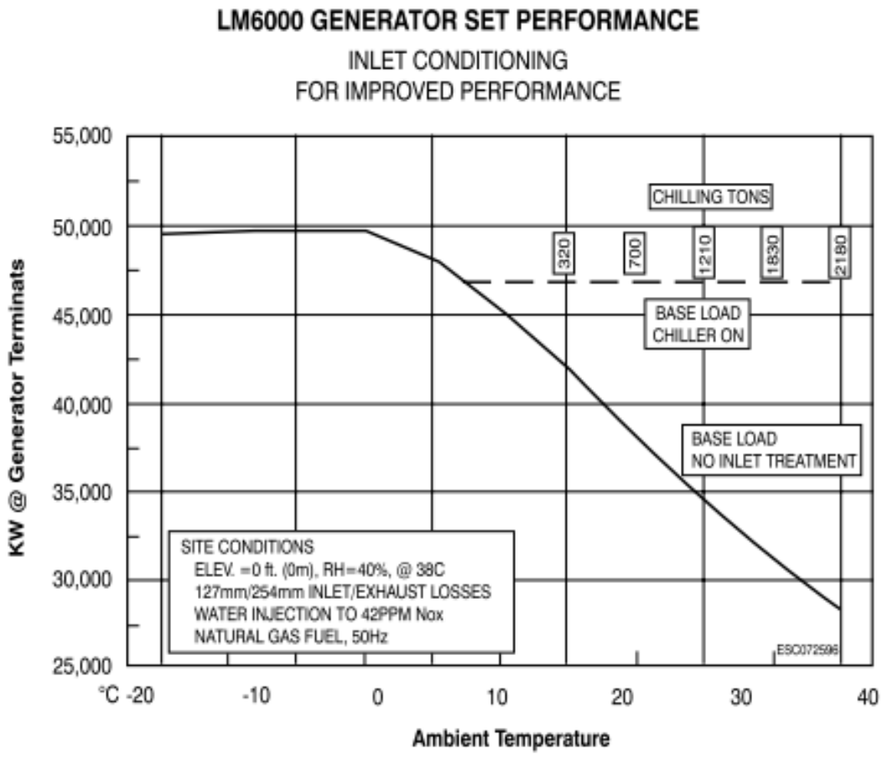
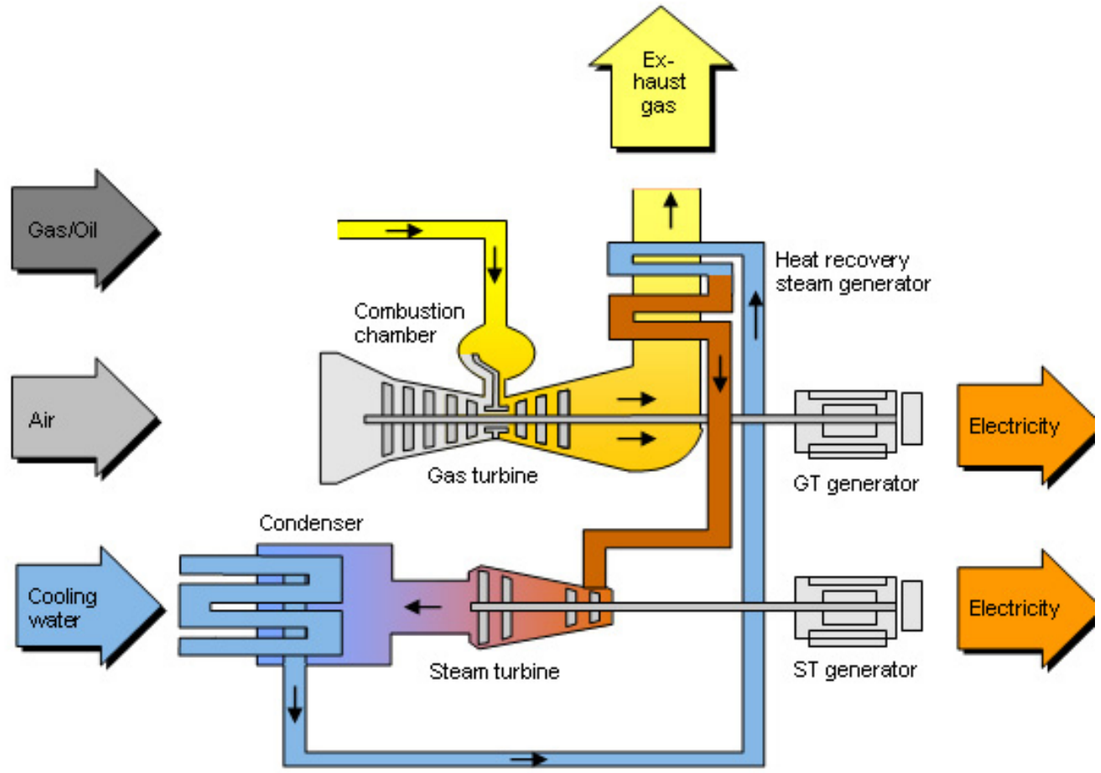
TURBINE INLET AIR TEMPERATURE CONDITIONING SYSTEM



Project #20441
Part#BOP-177-20441

imagination at work

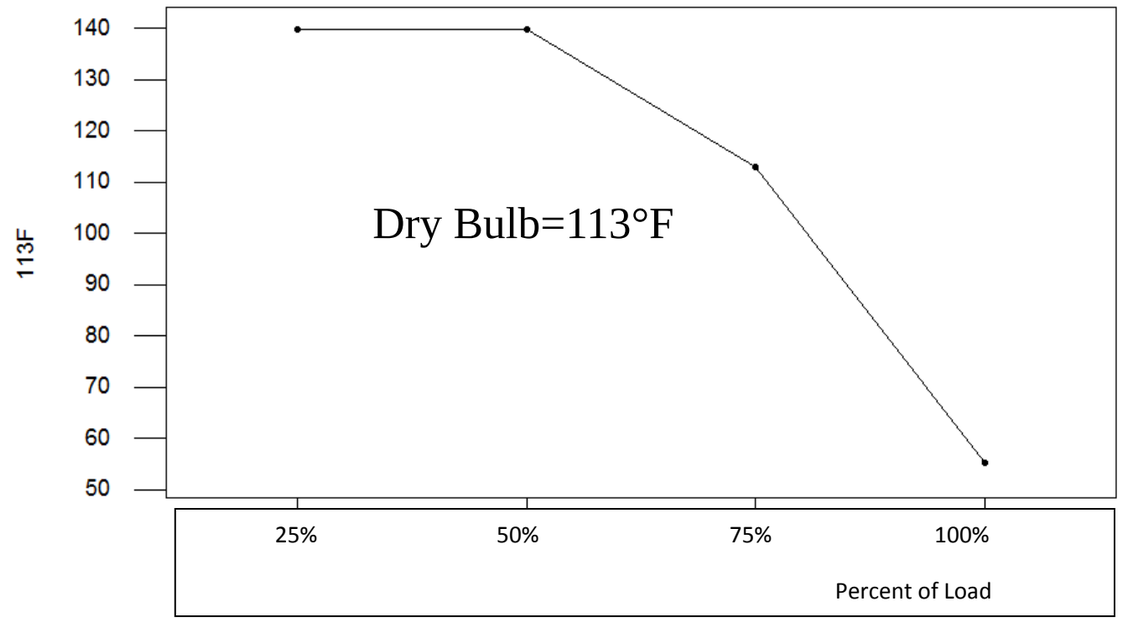


Inlet Air Chilling

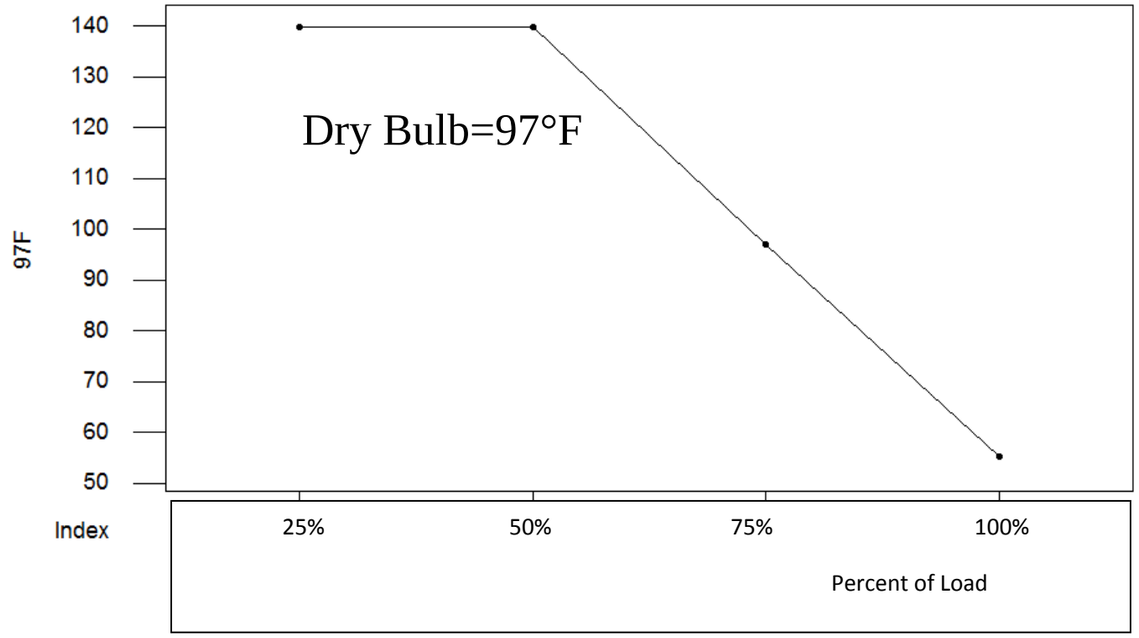
The Gas turbine output power is directly related to the inlet air condition and especially air temperature.
This typical chart shows that increasing the inlet air temperature from 5.5 °C (42°F) to 38°C (100°F) will result to decrease the load about 50%, i.e. from 50 to 25 MW and vice versa.
Nowadays it is a common practice to use different kind of chilling system to chill the gas turbine inlet air and archive more power.

imagination at work

In combined cycle power plant, where the exhaust gas is used to produce steam, the condition will be different because the “cycle performance” is related to exhaust gas temperature and its mass flow rate as well. In combined cycle mode, the gas turbine best efficiency does not mean the best combined cycle efficiency necessarily. The following graphs show some optimum gas turbine inlet air temperature in different load and ambient conditions and we can see that especially in lower output, higher inlet air temperature results in higher efficiency.



imagination at work



Optimum Air inlet Temperature (T2) for different Combined cycle load

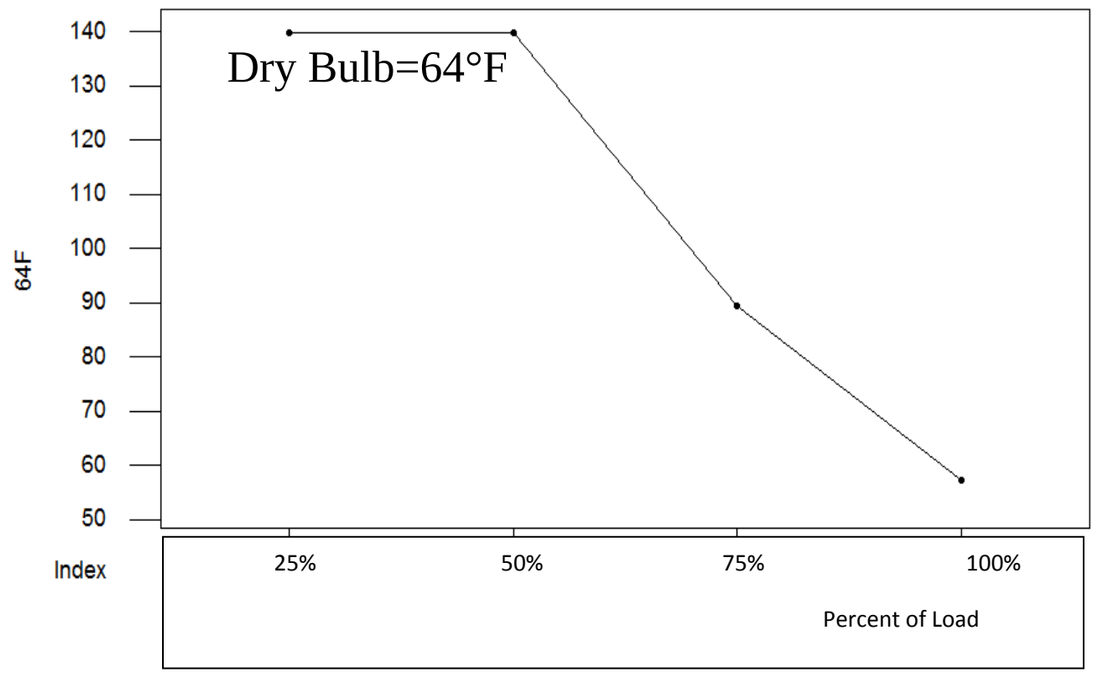
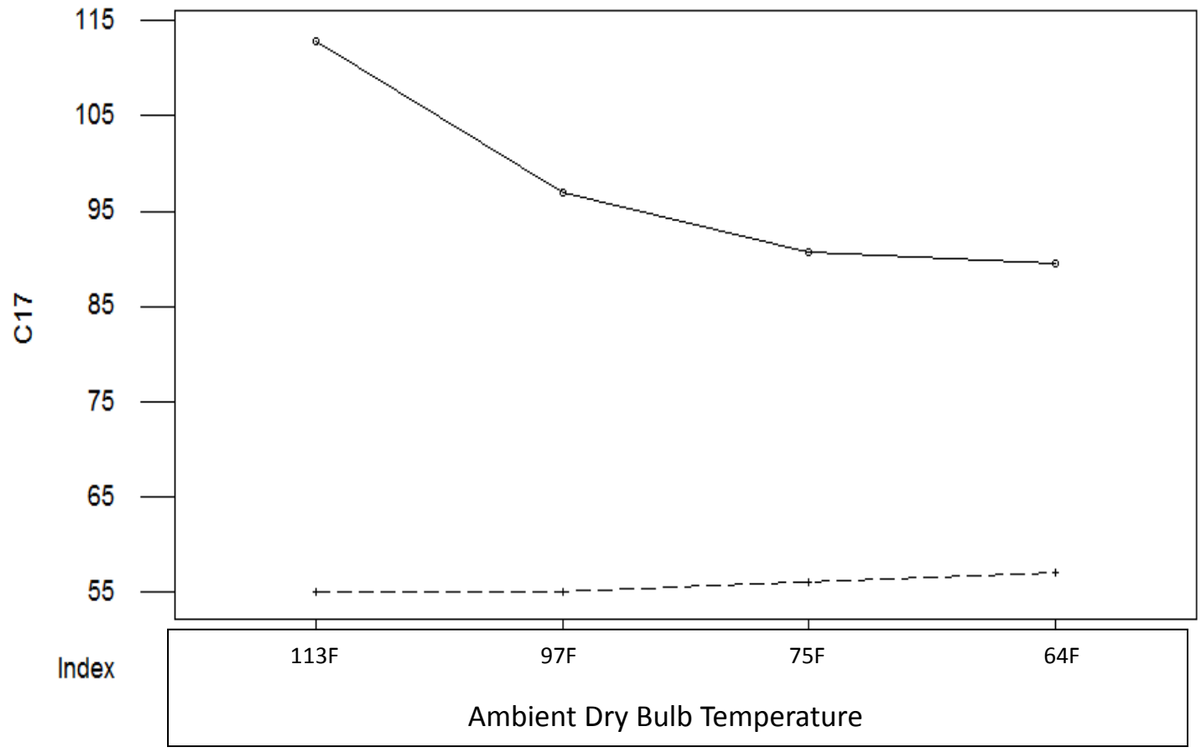
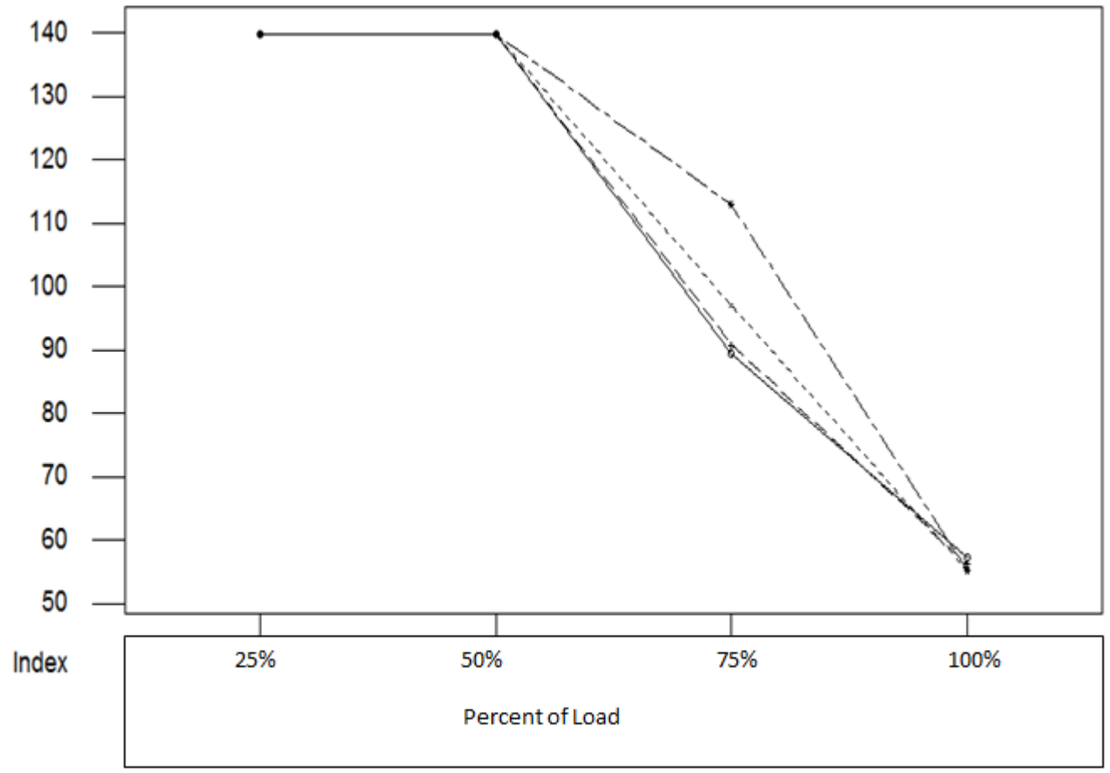
Optimum Inlet Air Temperature Vs. Combined Cycle Output



imagination at work



Optimum Inlet Air Temperature Vs. Combined Cycle Output



imagination at work

Optimum Inlet Air Temperature Vs. Ambient Temperature

It is possible to conclude from the graphs that for having the best efficiency at 100% of cycle load, the inlet air to be chilled but if less output is necessary, then the optimum efficiency will be achieved by heating the inlet air .

What we mentioned previously is the result of having "**Air conditioning**" instead of "Air chilling" package for Pasadena combined cycle power plant.

imagination at work

Scope of supply

To provide the optimum inlet air temperature, GE will provide a packaged modularized inlet air conditioning system that will allow for conditioning of the GT inlet air. The system is designed to operate in the following air conditioning modes:

GT Inlet Air Chilling
GT Inlet Air Heating

The chilling system will consist of:

- Two (2) 860 TR Nominal Water cooled Centrifugal Chillers (4160 V, 60 Hz Motors) on the structural steel skid with packaged piping, and valves,
- 3 x 50% Primary fixed speed Chilled Water Pumps
- Allen Bradley PLC Control System
- Factory Packaged Enclosure painted Ameron PSX700 GE Pearl Grey
- HVAC Unit for module climate control
- Exhaust Fans and Louvers
- Refrigerant Monitoring and ventilation per ASHRAE 15
- Lifting Lugs
- Low Voltage (LV) MCC
- Medium Voltage (MV) MCC
- Service Monorail for pumps
- Temperature Control Valves

Note: Cooling water(Condenser water) will be provided by plant Cooling Tower.

The heating system will consist of:

- One (1) Carbon Steel Shell & Tube Heat Exchanger designed and constructed to ASME Sec. 8 Div. 1. The heat exchanger will utilize extraction steam from the Once through Steam Generator (OTSG) to heat the fluid contained within the chilled water closed loop.
- One (1) Temperature Control Valve.
- One (1) Plate & Frame Heat Exchanger (Pre cooler)
- Expansion Tank
- Condensate Recovery system including tank, level control, with 2 x 100% condensate forwarding pumps.
- Miscellaneous valves and fittings
- Painted Carbon steel base frame.

Site and Design Parameters

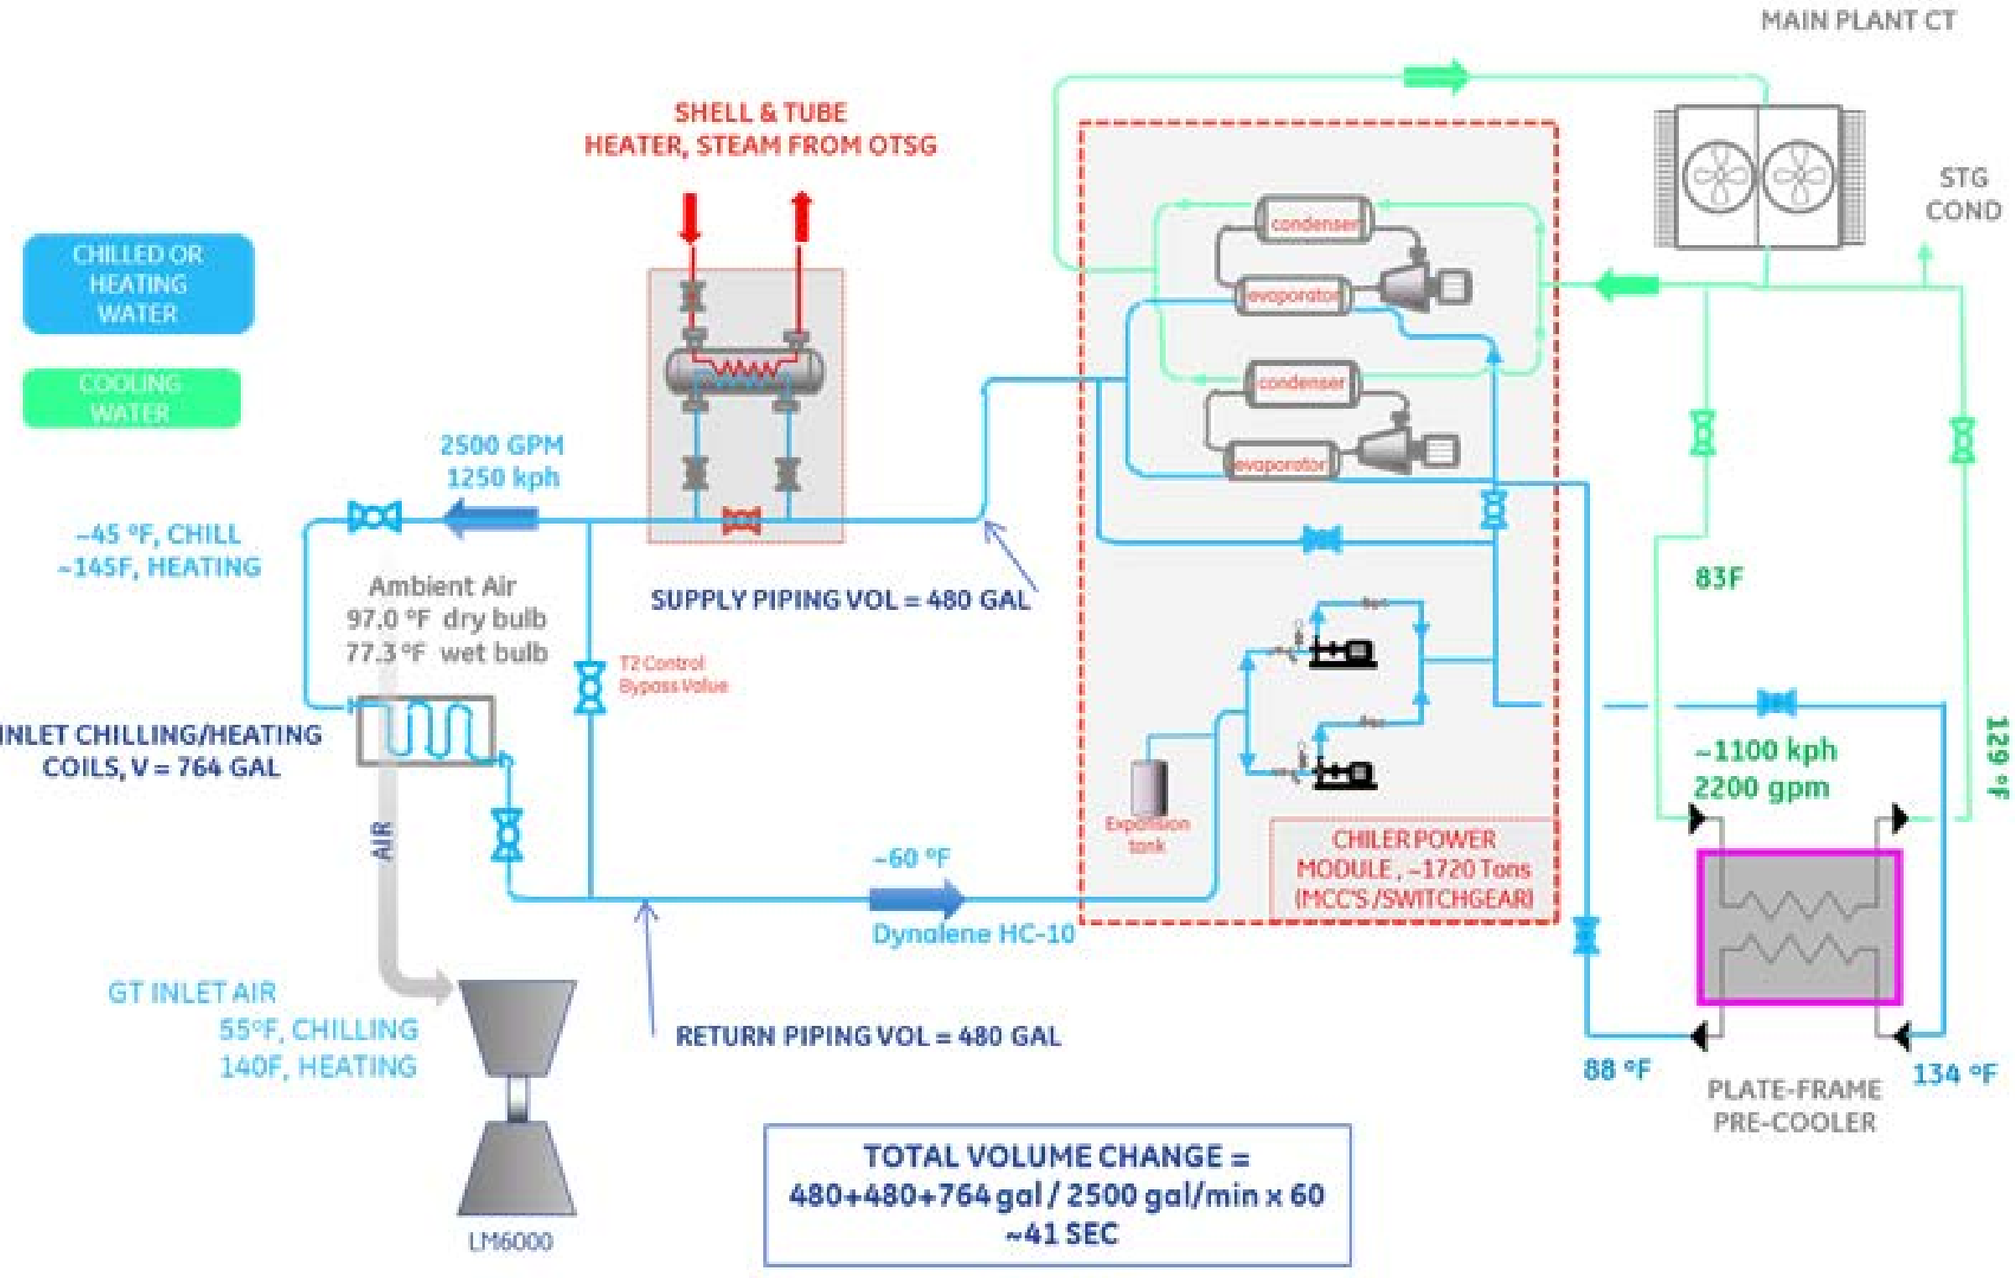
Design Parameters:

1-Chilling Mode:



- Target T2 — 54 °F
- Coil Inlet temperature (HC-10) — 45 °F
- Coil Inlet temperature (25% PG) — 43 °F
- Circulating Water — 2500GPM
- Max. Power Consumption (HC-10/25% PG) — 1212/1264 KW
- Condenser Water Flow/ Supply Temperature — 2717GPM/85F

2-Heating Mode:

- Target T2 — 140 °F
- Coil Inlet temperature — 145 °F
- Coil Outlet Temperature(HC-10/25%PG) — 128.3/128.7
- Supply steam to Heat Exchanger
  - pressure — 167.7Psia
  - Temperature — 570 °F
  - Mass Flow Rate — 17.37 KPPH

Pasadena Glenarm CC
Inlet Air Chilling/Heating Conceptual Design

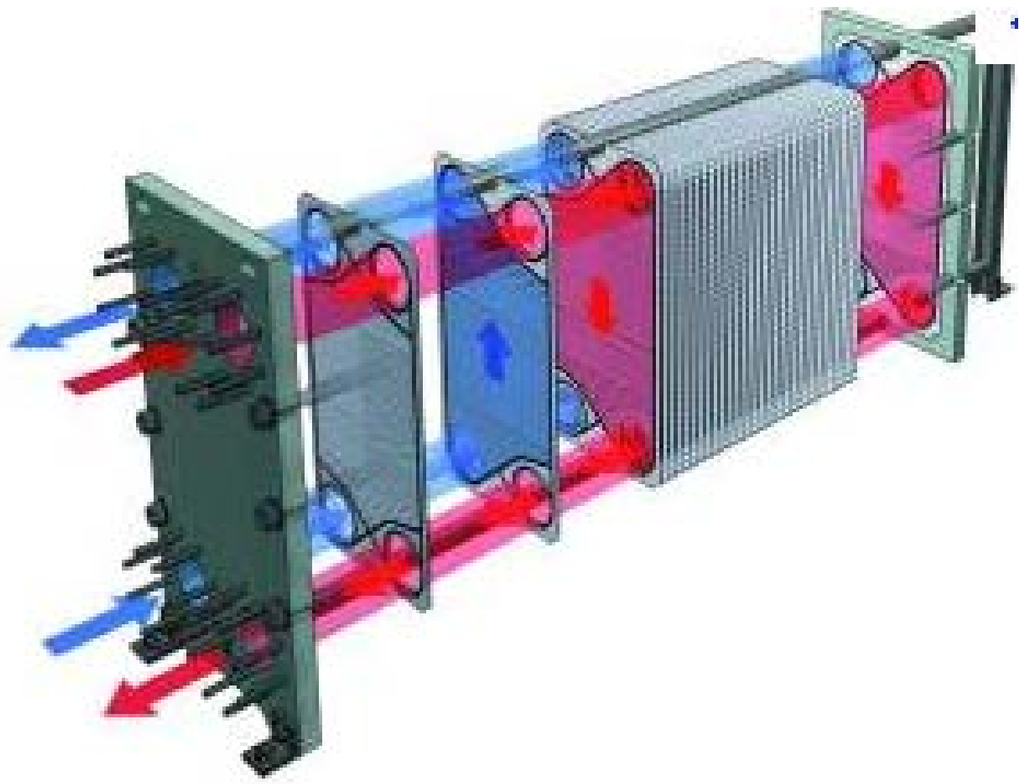
Simplified Conceptual System

System Description

The role of air conditioning system control is regulating the T2 and therefore the plant output by inlet air chilling or heating whatever whenever necessary.
Plant control system, DCS(not in GE scope) will continually send a measured net plant MW signal, measured at the high side of the GSUs, to the chiller system PLC. To change plant output, DCS will send to chiller PLC a desired net plant MW value.
The chiller system PLC will compare current net plant MW to target and reduce or increase GT inlet air temperature until target MW is reached.
The plant needs to swing over a wide power range; numerous times a day. Therefore frequent change over from Chilling to Heating mode and vice versa will be necessary as well for adjusting the T2.

System Description

Regulating T2 will take sometimes based on the amount of water in the circuit and the required temperature difference. According the rough calculation, this time will be less than 5 minutes even in worst case. (circulating water temp=ambient=32°F to 140 °F).
In the other word, the rate for temperature change will be about 0.4 °F/sec



Or 23 °F/min.)

Assumed pipe length(ft)	300
assumed pipe size ,in	12
volume of system (ft^3)	235.5
Mass of water(lb)	14,702
Max Temp. diff from 145 °F to 32 °F	112
Q(cooling Load) BTU	1,646,600
Chiller capacity(TR)	1720
Chiller Capacity(BTU/hr.)	20,640,000
required time(t=Q/P),min	4.79(4' 48")

imagination at work

Role of Pre Cooler

When system is changed from heating to cooling, the closed loop water temperature should be reduced from 145 to 45 but there is a max water temperature for chiller start up. The mentioned heat exchanger will act as a pre cooler, using plant cooling water to cool down the circulating water. After loop is cooled enough, then chiller will be started and cooling water will be used for its main purpose of chiller condenser cooling.

imagination at work

Out Of Scope

The followings are excluded from GE scope of work/supply:

- Installation, pre commissioning and commissioning activities.
- MV and LV electrical feeds to the module electrical room.
- Cooling Water interconnect piping for chiller condenser heat rejection from plant cooling tower.
- Chilled water Interconnect piping between Chiller Package, Shell & Tube Heat exchanger, and GTG inlet Air Coils.
- Extraction Steam interconnect piping between Inlet heating Shell & Tube heat exchanger skid and OTSG extraction steam header (or designated tie-in point)
- Extraction Steam pressure control valve to condition supply steam from OTSG to the heat exchanger design conditions.
- Condensate return piping from Condensate recovery package to plant condensate line
- External electrical and controls wiring
- First fill of Chilled Water Fluid

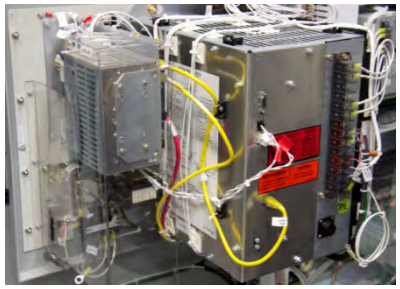
LM6000 Control System Overview



GTG Controller

- Package sequencing and GT controlled by the MicroNet™ Plus Controller
  - Chassis contains power supply, CPUs, and I/O cards
    - Includes CAN/LON/Serial interface
  - Dual-Redundant CPU Architecture
  - 24 VDC Redundant Power Supply
  - Communicates with HMIs and other devices via OPC/EGD/Modbus

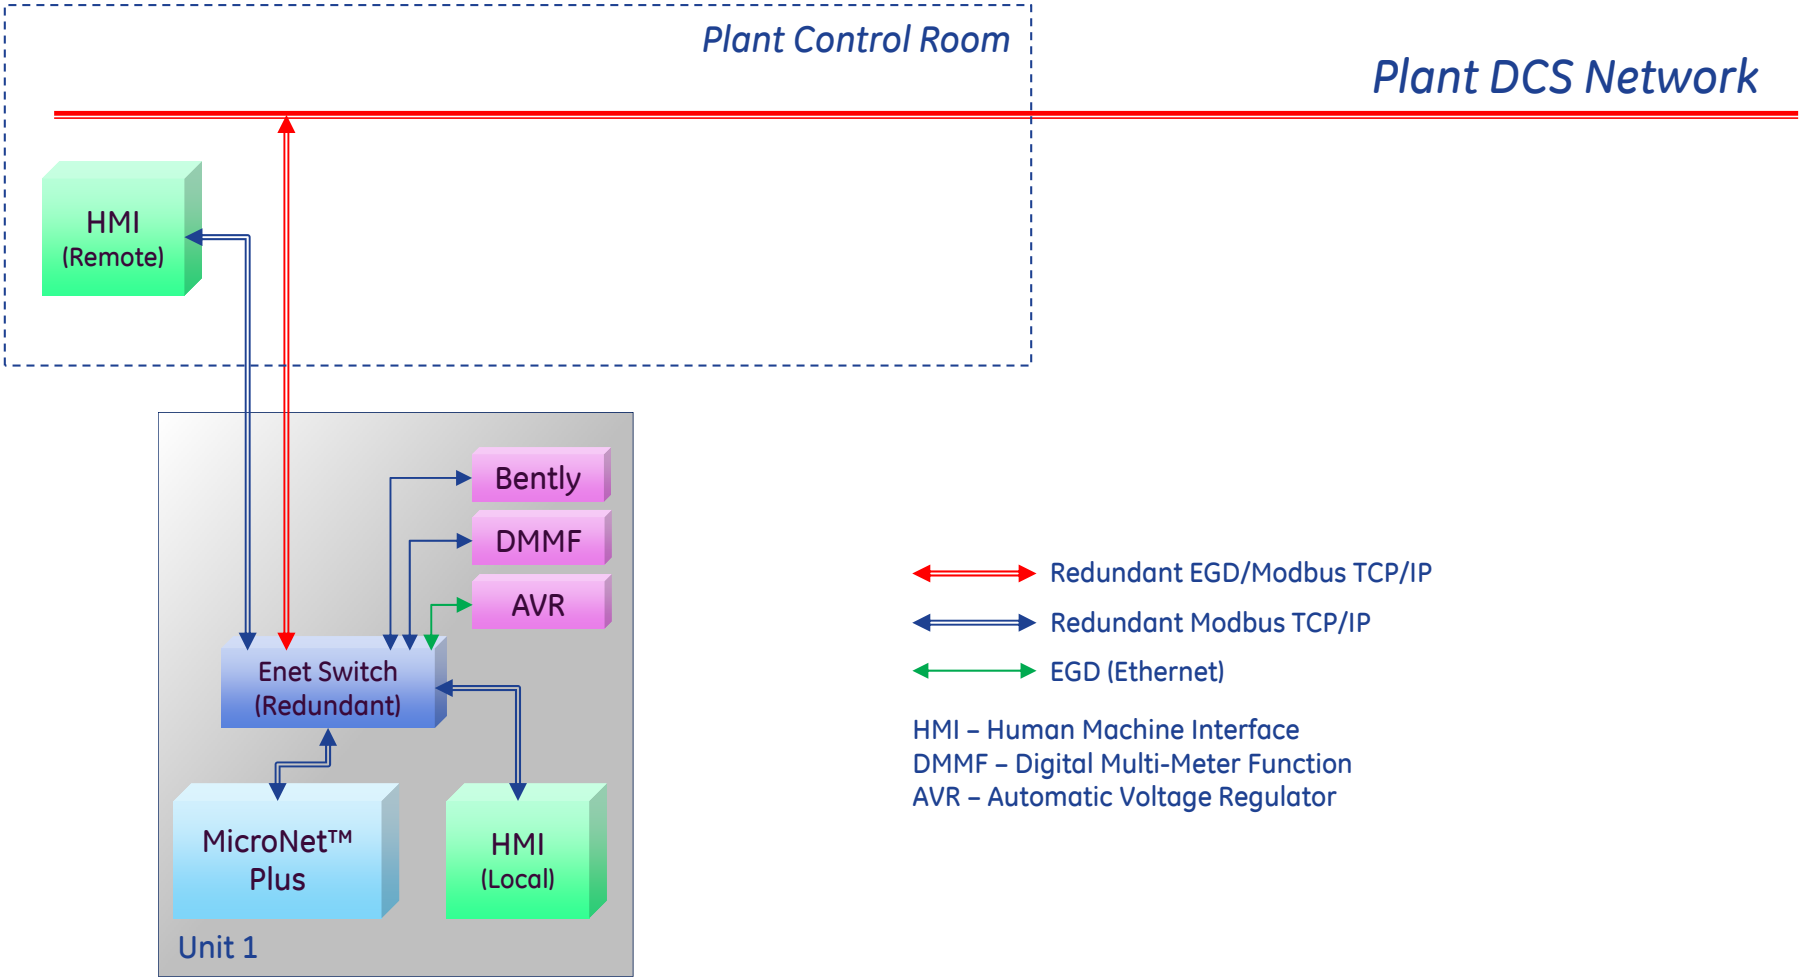
Other Control System Devices

- **Automatic Voltage Regulator (AVR)**
  - Model: GE EX2100e
  - Purpose: Provides excitation and voltage monitoring
  - Communication w/ Micronet: EGD

- **Bently Nevada Vibration System**
  - Model: 3500 series
  - Purpose: Monitors generator/gearbox/turbine vibration
  - Communication w/ Micronet: Hard-wired and Serial Modbus

- **Integrated Generator Protection System (iGPS)**
  - Model: Beckwith M-3425A
  - Purpose: Provides generator protection against short-circuits, excitation problems, etc.
  - Communication w/ Micronet : Hard-wired

Other Control System Devices (cont'd)

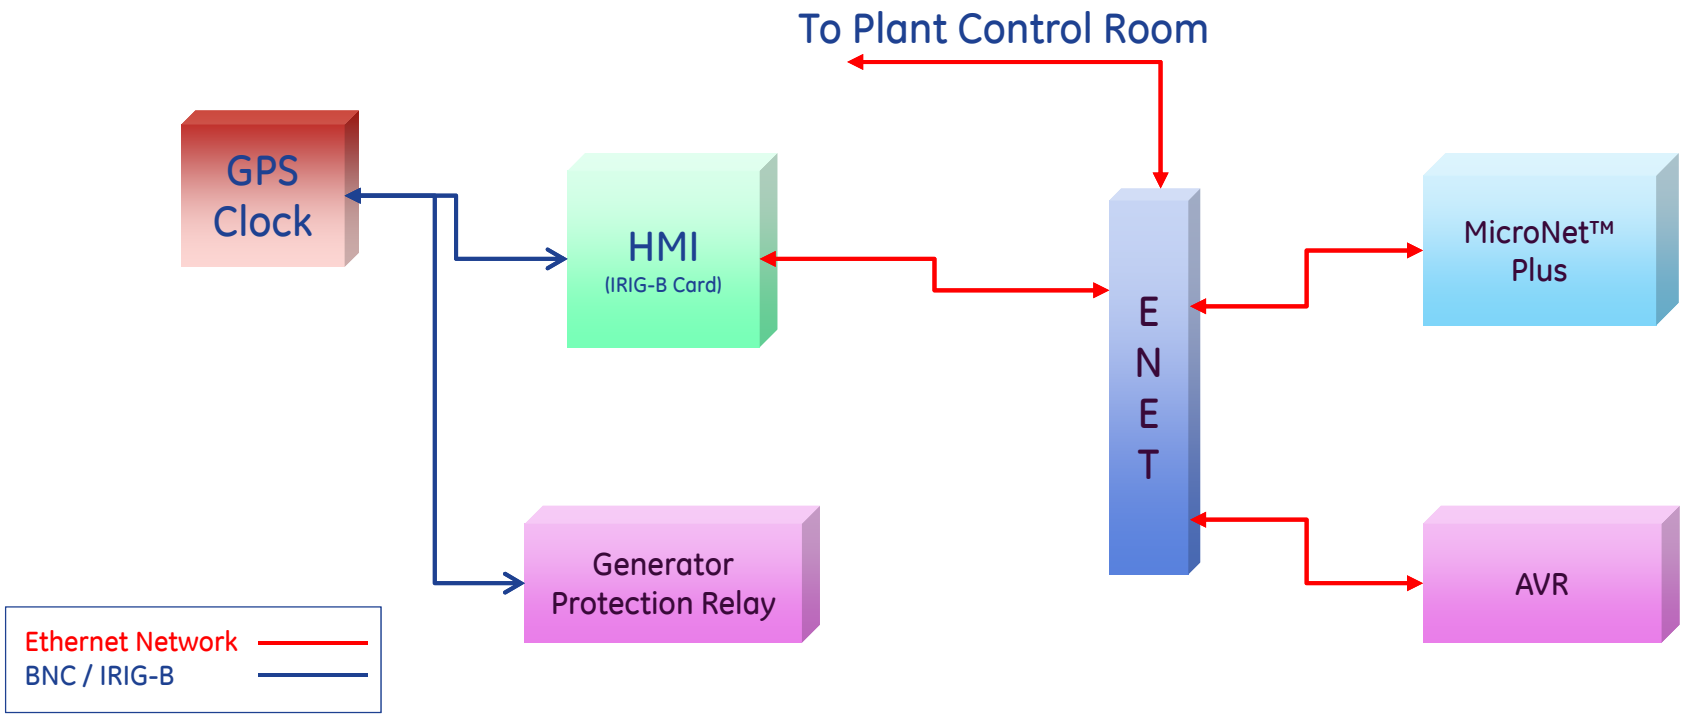


- **Digital Meter Multifunction (DMMF)**
  - Model: SATEC PM174
  - Purpose: Displays generator parameters
  - Communication w/ Micronet : Modbus

- **Fire and Gas Protection Panel (FPP)**
  - Model: Allestec 800 series
  - Purpose: Provides GTG protection based on detection of smoke, fire, and unburned fuel
  - Communication w/ Micronet : Hard-wired

Network Architecture

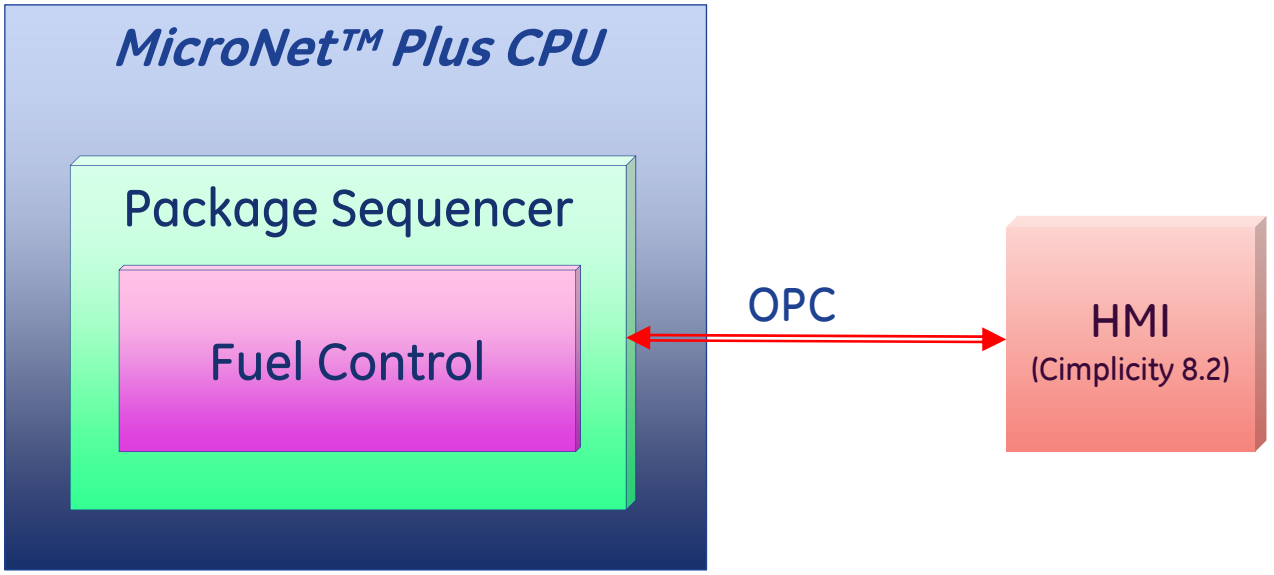
Redundant EGD/Modbus TCP/IP



Redundant Modbus TCP/IP

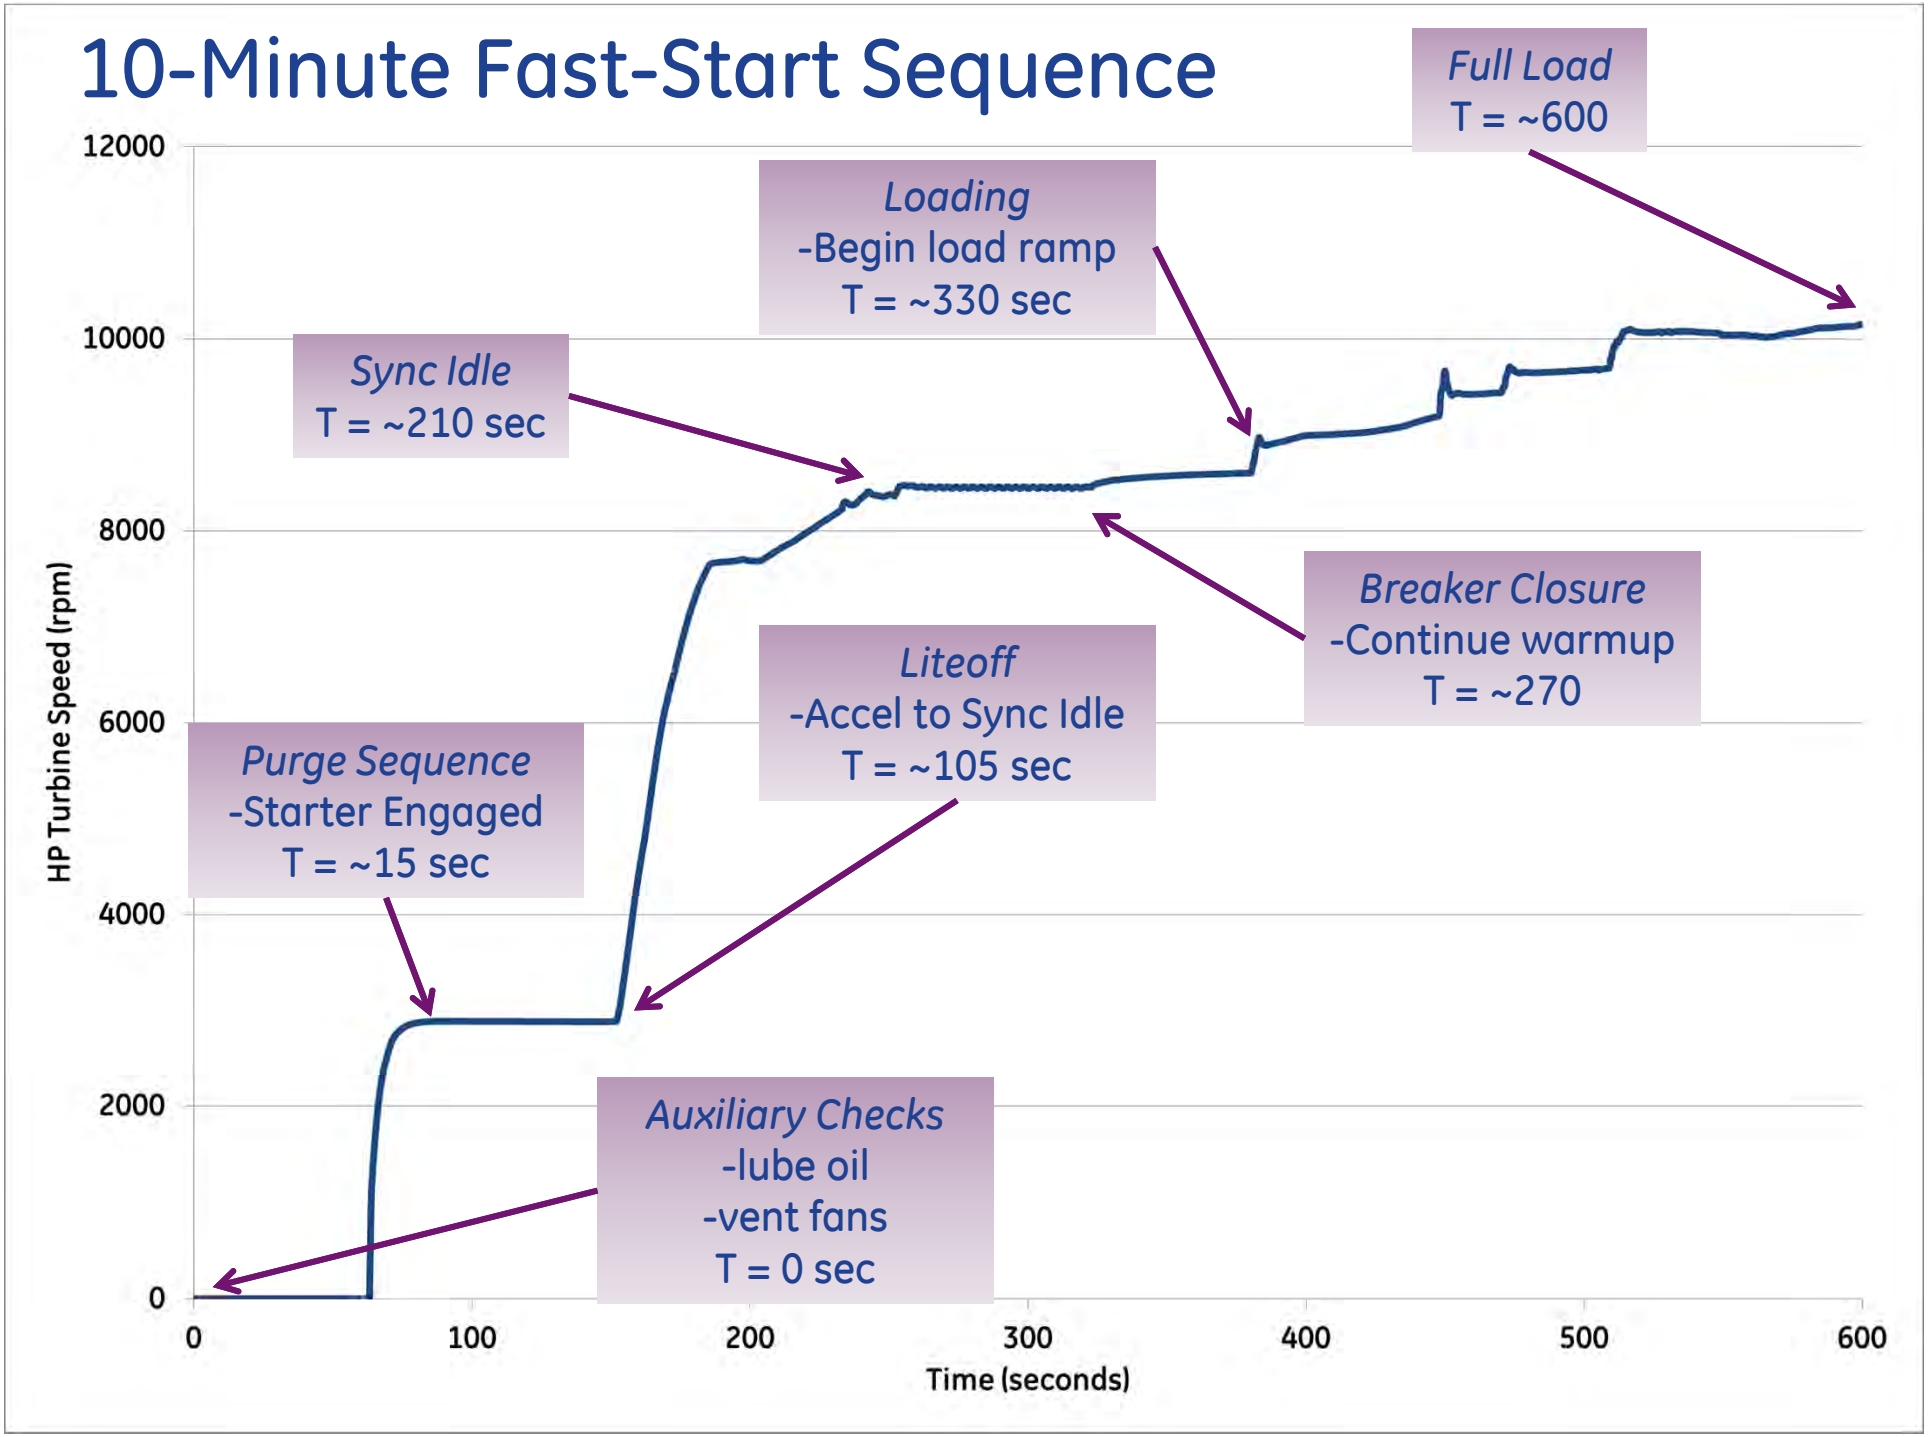
EGD (Ethernet)

HMI – Human Machine Interface
DMMF – Digital Multi-Meter Function
AVR – Automatic Voltage Regulator



Time Synchronization

Time synchronization via GPS clock or DCS time signal through NTP over the Ethernet network



Control Software Architecture

- All control software is written using GAP (Graphical Application Programmer)
  - Core qualified with GE Aviation by Woodward
  - Sequencer code for package written by GE Aero
- Final CPU software and device communication is validated through computer simulation and static testing in Houston

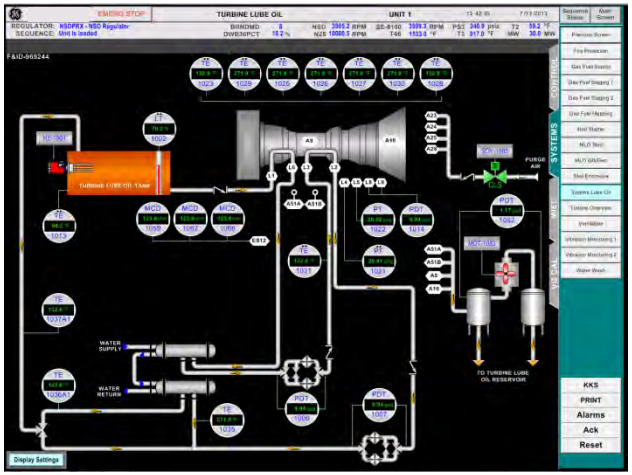
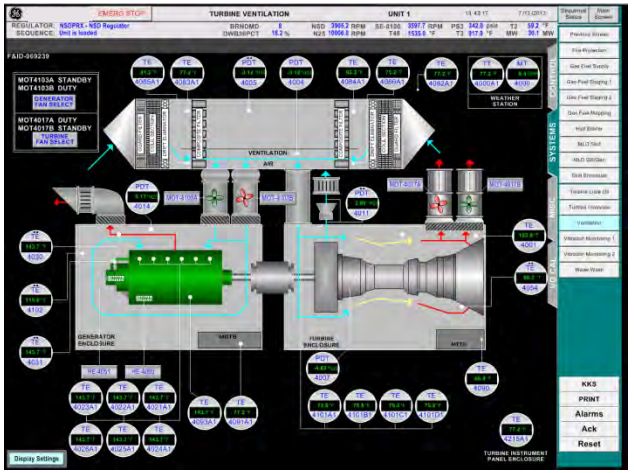
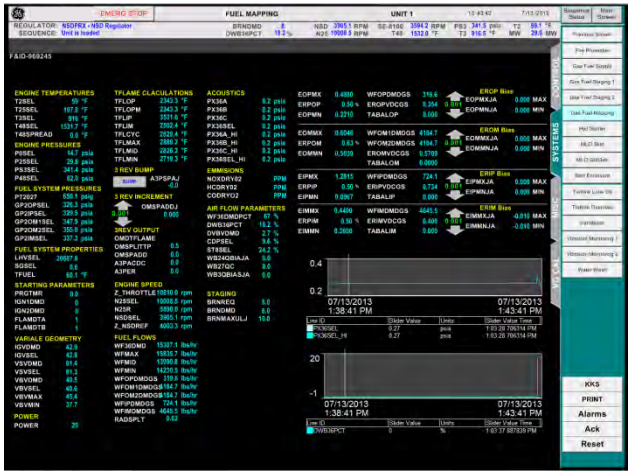
HMI – Alarm Summary

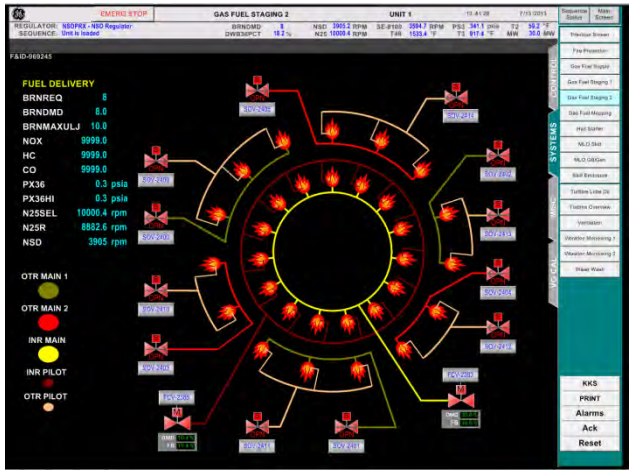




HMI – Data Recording



- Alarms
  - Logged daily in .ALM files and stored for 30 days by default
  - High speed alarm data is available on the OPC page of the HMI with a resolution up to 10msec
- Data Logs
  - Once/second data available through historical trending on HMI
    - Amount of data storage limited only by hard drive size
    - Data accessible through HMI, ODBC, and Excel
  - High-speed data logs (10msec) can be run from the HMI manually, and are also automatically collected upon a unit trip
    - Data points are pre-programed and mostly include turbine parameters



Sample HMI Screens

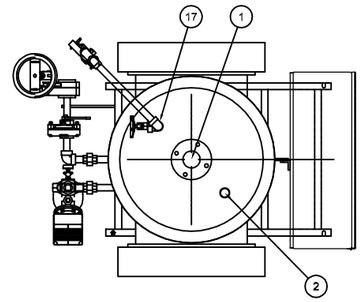
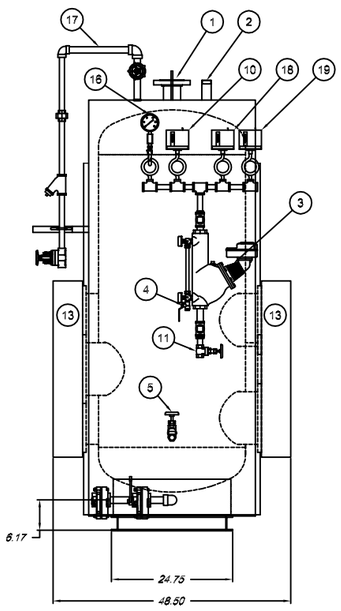
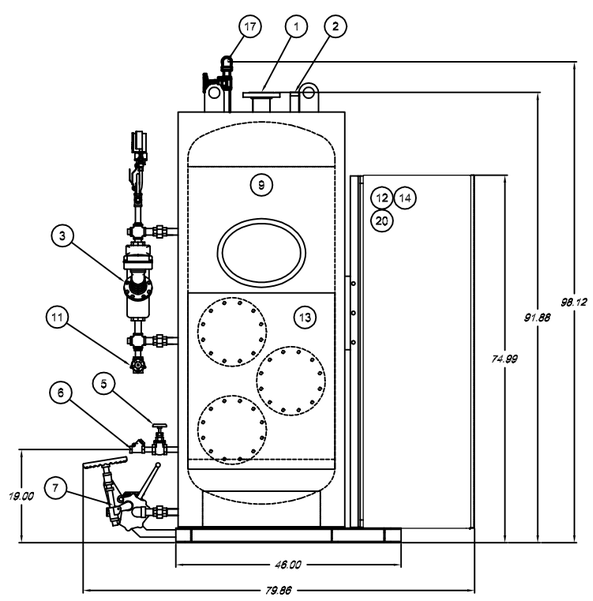
NOTES:



1) Boiler to be constructed per ASME Boiler and Pressure Vessel Code, Section I, "S" stamped and National Board registered.
2) Boiler will have a UL labeled panel
3) (a) Vessel is to be wrapped with 2" insulation with sheet metal lagging
   (b) One layer of standard 2" insulation is to be on control panel back plate and rear wall of the boiler casing
4) All valves to be mounted, hydro tested, & listed on applicable forms.
5) Boiler meets CSD–1 requirements



CAUTION



DIMENSIONS SHOWN ARE APPROXIMATE AND SHOULD NOT BE USED IN RESTRICTIVE LAYOUTS OR TO PREFABRICATE ASSEMBLIES UNLESS CLEAVER-BROOKS HAS BEEN CONSULTED. IT IS STRONGLY RECOMMENDED THAT THE CUSTOMER REQUEST AS-BUILT CERTIFIED DRAWINGS FOR THESE CASES.

BOILER MAY BE SHOWN WITH OPTIONAL EQUIPMENT IN LUEI OF STANDARD COMPONENTS.

Mechanical Completion Certificate

(a) "Mechanical Completion Certificate" means that the Equipment has been erected and installed in accordance with Contractor's Installation and Commissioning Manuals, including: (i) the setting of all equipment on foundations; (ii) the connection of all such equipment to other applicable equipment as required by way of piping, wiring, controls, and safety systems; and (iii) ensuring that:

(A) all such equipment and such related operating systems are individually cleaned, leak checked, lubricated,
(B) all initial fills have been completed,
(C) all instruments are calibrated and field verified,
(D) all relays are set with their initial setting(s),
(E) all equipment is checked out,
(F) all ground checks are made,
(G) all piping that is required to be pressure tested and/or flushed has been tested and/or flushed and certified clean,
(H) all motor rotation and alignment checks are complete,
(I) the generator panels have been energized,
(J) the electrical interconnection is complete and ready to backfeed,
(K) the gas interconnection is complete and ready to flow gas,
(L) demineralized water interconnection to the skid is complete,
(M) the GTG's fire system is operational,
(N) all electrical circuits have been point-to-point checked to verify that such equipment and operating systems have been correctly installed and verified to respond to simulated test signals equivalent to actual signals received during operation, , all loop checks have been completed and plant control system is fully operational,
(O) all equipment is ready for initial operation, and may be so operated, without damage thereto or to any other property and without injury to any person,
(P) the GTG has been first fired;

(b) all City and Contractor supplied equipment required for the operation of the Equipment has been installed, checked-out, and is ready for commissioning; and

(c) City and Contractor have certified the completion of the "Precommissioning Procedure Checklist" from Contractor's "Installation and Commissioning Manual."

INTRODUCTION

The following document contains installation and erection instructions for the Once Through Steam Generator (OTSG). It must be understood that an OTSG can be supplied in multiple configurations and incorporate various associated equipment. This document will specifically address the OTSGs supplied for the Southcentral Power Project and also outline installation instructions for the associated equipment supplied.

This procedure for erecting a conventional Once-Through Steam Generator (OTSG) and auxiliary equipment was prepared as an overview of the basic steps that should be followed to achieve a successful installation. This procedure is not intended to be a substitute for proper and thorough planning on the part of the erecting agency. However, it will attempt to familiarize the Erectors with the basic procedure for assembling this system in the manner in which it was designed to be assembled.

Contact Innovative Steam Technologies if further information is required:

Main Line: (519) 740-0757 Direct: (519) 740-0757 Fax: (519) 740-2051

Peter Hecimovic – Project Manager Ext. 222

James Tong – Project Engineering Ext. 283

Peter Finlin - Customer Service Supervisor Ext. 270

The Erector should be familiar with these instructions so as to understand the system, and the manner by which it was designed to be assembled.

IMPORTANT

Please be aware that the procedures outlined in this document are not intended to be a substitute for proper and thorough planning. The safe handling and correct placement of the equipment outlined herein is ultimately the responsibility of the customer and their Erector.

All Figures can be found in Appendix A

1 ERECTION PACKAGE DRAWING LIST

The following list identifies the complete set of drawings associated with this project that will be required to successfully complete the OTSG installation. Review the list and ensure that hard copies are available at the construction site. Please contact IST if any of the following drawings are required.

Drawing Number	Description
11303-0001	General Arrangement
11303-0002	Foundation Loading Diagram
11303-0003	Baseplate Layout Assembly
11303-0004	Feedwater Steam and Exhaust Flow Sheet
11303-0012	Inlet Transition Duct #1 Assembly
11303-0013	Inlet Transition Duct #2 Assembly
11303-0014	Dilution Air Duct Assembly
11303-0015	Lower Inlet Plenum Assembly

11303-0735	CO Catalyst Installation Kit
11303-0736	Cart Rail Extension Frame Assembly

2 RECOMMENDED CONSTRUCTION PRACTICES

2.1 LIFTING OF EQUIPMENT

It is recommended that the lifting procedure of all components utilize conventional hoisting methods. Recommended lifting arrangements are illustrated in Figure 6 to 21.

The final decision as to what lifting method is used remains the full responsibility of the Erector. IST recommends that the lifting arrangements shown in the attached figures be followed. General construction equipment such as spreader beams, choker cables, and shackles are not considered specialized and therefore are the responsibility of the contractor to provide.

2.2 ACCESSING CONNECTION POINTS

There are various methods that can be utilized to provide high elevation access for installing modules, erection plates and welding. Some of which is a man basket, mobile man lift (Genie Boom) or scaffolding (built from the ground up). The most commonly used method is the mobile man lift. Another option is to install temporary tank brackets to the component walls prior to the lift. Tank brackets can be temporarily installed on the vertical structural members and in turn support scaffolding planks and handrails. Brackets are to be installed approximately 3 ft (1 m) below the upper horizontal joint on each of the major components. These include the OTSG module, inlet plenum, and exhaust hood. These brackets will allow construction personnel fast and easy access to erection plates at all field joints, for both bolting and welding. The downside is that it takes time to install these in advance of the lift, and then all need to be

removed once equipment installation is complete and any grinding removal will require touch-up painting.

2.3 CHECKING THE OTSG COMPONENTS FOR LEVEL

To ensure proper fit, and to eliminate excessive gap on the horizontal joints, it is very important to measure the interface points of the each component (all OTSG modules, inlet plenums and exhaust hoods) for level. The number of measuring points should be at least four (4) for small units and six (6) for larger ones. A maximum difference of ¼" (6mm) between measured points on each component is acceptable. For that reason, the measuring method should provide at least 1/8" (3mm) accuracy. The use of water gauges or measuring tapes, measuring from ground elevations, would not provide an accurate measurement, especially for higher elevations. Acceptable measuring practices include utilizing laser type measuring instruments or positioning optical instruments on top of the measured component.
The plenum shall be leveled prior to placing any of the modules in position. The deviation from straightness of the top and bottom surface of the component sidewalls should be checked by running a line from endwall to endwall. Deviation of more than ¼" (6mm) must be reported prior to placing the next component as the modules are very rigid and will not flex to fill the gap.

3 PRE-CONSTRUCTION ACTIVITIES

3.1 SHIPPING DAMAGE

All components should be inspected for shipping damage prior to installation. Ducting components should be inspected for casing, liner, or structural damage. The OTSG modules should have a more thorough inspection that should also include tubing, end restraints and top support beams. Any damage should be reported to IST prior to lifting the component into place.

3.2 OFFLOADING AND SHIPPING BEAMS

In order to protect the OTSG components during shipment, and to facilitate transport, temporary shipping beams have been installed. When an OTSG component is off-loaded from the transport vehicle and placed to rest on the ground, it is necessary that the sidewalls be supported at the jacking points (as a minimum). The jacking points are clearly identified on the module sidewalls and cribbing should be used to spread the load to the vertical wall columns.

Consideration must be given to the placement of the cribbing / blocking so as to not interfere with the removal of the shipping beams. Block points are to be level to ensure no torsion forces are generated in the component.

To remove a shipping beam, unfasten the bolts holding the beam in position to the sidewalls (refer to Figure 1). Once the beam is removed, re-install the bolts in the holes (with the bolt heads on the outside) and seal weld them in position, this will create a gas tight seal.

All temporary structural components and shipping beams are painted yellow prior to shipment. IST must be contacted immediately if there are any doubts as to what items are to be removed.

3.3 OTSG MODULE SHIPPING BEAMS

All shipping beams in the bottom of OTSG lower module are to remain in position throughout the transporting of the module and offloading at site. Before the module is lifted into its final position, the Erector may elect to remove some of the module shipping beams (refer to Figures 2 and 4). A number of shipping beams must remain in place and are only to be removed after the module is in its final position, outer erection plates are installed and the internal seal welding is underway.

3.4 DUCTING COMPONENT SHIPPING BEAMS

Ducting components which include the inlet transition ducts, burner ducts, inlet plenum, SCR module, exhaust hoods, and stack, may also come equipped with shipping beams. All shipping beams within these components are to remain during any transportation of the component to site. Typically, ducting components are large in nature and are not designed with any permanent internal stiffening members. Unless otherwise instructed, IST recommends that all shipping beams remain installed during any placement or lifting of these components. The contractor may find it necessary to remove the odd shipping beam to assist with minor alignment adjustments. This is acceptable to IST but should be first reviewed with the IST site representative. Shipping beams can be removed after the component is in its final position and seal welding is under way.

4 BASE PLATES

Although the OTSG outside casing is a “cold casing” (i.e. insulated inside), provisions have been made to allow expansion of the OTSG unit in both the side-to-side and fore-and-aft directions. The instructions on the Base Plate Layout drawing 11303-0003 should be carefully followed.

The principle of the base plate design is to hold one corner of the OTSG fixed (usually the steam outlet piping corner). The corner base plate on the side opposite the “fixed” corner will allow expansion from side-to-side only and prevent any fore-and-aft movement. Base plates on the same side as the “fixed” base plate, which are parallel to the side of the OTSG, are installed in a manner that allows only fore-and-aft movement and not any side-to-side movement.

In order to allow thermal movements, all base plates, except the “fixed” base plates are to be installed with a Fabreeka pad. The Teflon side of this pad should face up and interface with the

stainless plate welded to the bottom of the base plate. In order to prevent any dust or contamination from damaging the Teflon surface, the slotted hole in the base plate is to be covered with an oversized washer.

At all locations where base plates are designed to move, anchor bolts are to be installed and secured with nuts. Nuts are to be installed "snug" tight then loosened ¼ turn and fixed in position with a tack weld or locked in position with a second nut (jam nut).

Anchor bolts at the "fixed" base plate location are to be installed with nuts. These nuts are to be installed "snug" tight then tightened an additional ¼ turn. The base plate is then required to be welded to the adjacent soleplate, per the Base Plate Layout drawing. All base plate and sole plate components shown on the Base Plate Layout drawing are designed and supplied by IST. All anchor bolts, foundation design, and grouting are designed and supplied by Erector.

The base plate layout drawing indicates all anchor bolt sizes used in the design of the base plate hole and slot sizes. If actual anchor bolts sizes are different than that shown, notify IST immediately.

During the final placement of the soleplates and base plates, survey personnel should ensure that elevations and centrelines are located per design. Centrelines should be scribed on the base plates to act as reference datum lines for the placement of the inlet plenum columns.

After installation of anchor bolts and welding of the inlet plenum columns to the base plates, the Erector is to perform touch-up painting over the welded areas in accordance with Appendix D. The Erector is responsible for the supply of all primer for touch-up required throughout the construction process.

5 ERECTION PLATES

During erection, ducting components are stacked on top of each other and bolted together with erection plates. The erection plates are subsequently welded to the ducting structural beams and internal seal welding is completed in accordance with IST Erection Diagram 11303-0027. At assembly, it is not necessary to perform all welding, however if time permitting, erection plate welding should be completed as the duct components are installed. The exception to this procedure being the lower inlet plenum to upper inlet plenum joint where all erection plate welding and structural welding must be completed prior to any further lifts.

Where ducting erection is completed without immediately welding out the joints, the erection plates and internal seal welding must be completed after the placement of the lower exhaust hood. Erection plate welding and internal seal welding should commence with the lowest joint – upper inlet plenum to lower OTSG module – and progressing upward.

Due to the potential for high winds that can occur during erection, it is necessary to erect the platform steel after the installation of the lower exhaust hood. The platform steel will provide bracing to the overall structure. The platform columns at locations [A1 through A7] on IST Platform Erection Plan and Details 11303-0021, cross beams, and ties will be erected with bolting only to the OTSG ducting prior to installing the upper exhaust hood and exhaust stack assemblies. The following requirements are to be met:

1) The lower inlet plenum and upper inlet plenum must first be aligned and levelled on their respective base plates. The columns must be securely welded to base plates and all erection plates joining the two assemblies must be securely welded before the balance of ducting and OTSG modules can be stacked on top.

2) The lower OTSG module, SCR module, upper OTSG module, and lower exhaust hood can be stacked on top and secured with erection plates by bolting properly tightened to AISC requirements (see Section 5.1). Due to the exhaust stack height, erection plate welding and some internal seal welding must be complete before the upper exhaust hood and exhaust stack can be installed. Refer to Section 7.5 for complete stack erection prerequisites.

3) The connection of the upper exhaust hood to exhaust stack shall be bolted together and immediately welded into position at the corners while the crane is supporting the stack adapter and exhaust hood respectively. Follow the welding instructions given on IST Erection Diagram 11303-0027.

The erection contractor should note that all erection plates are not always the same size, thickness, and the attachment hardware and welding may vary for each location. Please pay strict attention to the Erection Diagram 261027 for the location of applicable erection plates and securing specifics. If you are unsure please contact the on-site IST supervisor or IST head office.

5.1 ERECTION PLATE BOLT TIGHTENING PROCEDURE

Hex bolts are to be installed with the heads on the exterior of the erection plates in accordance with AISC requirements. Bolts shall be installed in all holes of the connection, and brought to a "snug" tight condition. "Snug" tight is defined as the tightness that exists when the plies of the joint are in firm contact. This may be attained by a few impacts of an impact wrench or from the full effort of a man using an ordinary spud wrench. The tightening process shall progress systematically from the most rigid part of the connection to the free edges, and then the bolts of the connection shall be re-tightened in a similar systematic manner until all bolts are simultaneously "snug" tight and the connection is fully compacted. Following this initial operation, all bolts in the connection shall be tightened further by 1/3 turn. During the tightening operation, there shall be no rotation of the part not turned by the wrench.

6 LIFTING INSTRUCTIONS

Refer to the attached Figures 6 to 21 for recommended lifting arrangements. Ensure proper spreader beams, rigging cables and shackles (supplied by others) are used at all times.

Lifts should be smooth and any form of load shock should be avoided. Take precaution to avoid weak axis lug bending.

7 DUCTING & MODULE INSTALLATION

7.1 ERECTION OF INLET PLENUM – General Procedure

a. The inlet plenum comprises of two (2) major components – a Lower Inlet Plenum, an Upper Inlet Plenum, four (4) loose columns, and a cross brace.

b. Installation of the Lower Inlet Plenum and four (4) loose columns should not be initiated until base plate installation is complete and grouting has taken place and given time to cure before imposing loads.

c. Remove tarps from the top framing of the Lower Inlet Plenum and Upper Inlet Plenum.

d. The Lower Inlet Plenum assembly is to be lifted and positioned such that each column rests centrally on its respective base plate, which were previously positioned and scribed during the initial layout (See "Base Plates" in Section 4). For the recommended lifting arrangement of the lower inlet plenum refer to Figure 12. Upon setting the lower inlet plenum assembly, ensure that the main columns are vertical and centered on the centerline of the base plates. At this time, check that the inlet opening centerline is aligned with the centerline of the gas turbine discharge. The most critical position is the "fixed" column, having this correctly located will ensure proper tie-in points to piping and ducting. The elevation height from the top of the lower inlet plenum to the base plate should be measured and confirmed with IST drawings. With a transit, check the top four (4) corners of the plenum for level before proceeding to weld columns to base plates.

e. Weld the column beams to the relevant base plates per IST Base Plate Layout Assembly drawing 11303-0003.

f. Stand in position and temporarily brace the four (4) loose vertical columns at grid lines 1 and 2. Loosely install the erection splice plates with the hardware provided. Ensure the columns are centered on their respective base plates.

g. The upper inlet plenum assembly is then lifted and placed on top of the lower inlet plenum assembly. Guide plates are installed on the perimeter horizontal beams to assist while lowering it into position. For the recommended lifting arrangement of the upper inlet plenum refer to Figure 13. Keep the upper inlet plenum on the crane hook as the four (4) columns at grid lines 1 and 2 are aligned and mechanically connected with erection splice plates and hardware provided. Once alignment of the columns with the upper inlet plenum is complete, weld the four (4) column beams to the relevant base plates per IST Base Plate Layout Assembly drawing 11303-0003.

h. Once the overall inlet plenum assembly is properly aligned and mechanically secured, weld all of the erection plates per IST Erection Diagram 11303-0027 and use full penetration welds at all required locations along the plenum joint. Closely follow the welding instructions on the IST Erection Diagram as various types and sizes of weld are required at different locations.

i. Weld the splice plates that attach the upper inlet plenum to the loose columns per IST Erection Diagram. Weld the column beams together where they meet and finally weld the columns to their respective base plate per IST Base Plate Layout Assembly drawing 11303-0003.

j. Once the erection plate welding is complete, internal seal welding at the casing interface can commence. Refer to IST Erection Diagram 11303-0027 for welding instructions.

k. Ensure that all upper inlet plenum to lower inlet plenum internal seal welding is complete. All temporary shipping beams can now be removed. Shipping beam bolts should be reinserted back into the open holes and seal welded around the bolt shoulder.

l. The Joint Assembly Kit (JAK) 11303-0506 between upper and lower inlet plenums can be installed immediately after internal seal welding is complete or at a later time at the discretion of the Erector.

m. Scaffolding should now be installed inside the upper inlet plenum to access the joint between the upper inlet plenum and lower OTSG module. A working platform should be created at an elevation that will accommodate internal seal welding and joint assembly kit installation.

n. If required, scaffolding external to the boiler can also be constructed to reach the joint assembly kit elevation. Alternatively, tank brackets can now be installed to the exterior columns as detailed Section 2.2.

o. Welding of all inlet plenum structural components must be complete before the OTSG module is installed to the Inlet Plenum assembly.

7.2 ERECTION OF LOWER OTSG MODULE – General Procedure

NOTE

The arrival of the IST site representative is coordinated with this point of the installation process. IST recommends that our representative be on site prior to continuing forward with the installation procedure.

a. Installation of the Lower OTSG Module should commence only after the inlet plenum is installed and all the required welding is complete. This will ensure proper structural integrity exists as the load on the inlet plenum is increased. Prior to lifting the module, ensure that all required scaffolding inside the inlet plenum is complete.

b. Ensure that only the identified shipping beams as specified in Figure 2 are removed. Once the beams are removed, re-install the bolts in the holes (with the bolt heads on the outside) and seal weld them in position to create a gas tight seal. A cross-section of the Lower OTSG Module is found in Figure 3.

c. Remove tarps from top of the module framing. Plywood is to be placed on the top surface of the fin tubes between the top support beams to prevent damage to finned tubes from falling debris and by distributing any weight placed on top of the tubes. Plywood is also to be placed on the top surface of the installed Ammonia Injection Grid (AIG) lances to prevent debris from plugging the injection holes and to distribute weight placed on top of the lances. Any weight placed on the AIG must be distributed over a minimum of four lances.

d. The joint assembly kit (JAK) 11303-0506 and lower module closure kit 11303-01601 may be placed on top of the CO catalyst frame prior to the lift or immediately after the lift. These components must be stored in the Lower OTSG Module prior to placing the SCR Module.

e. Scaffolding should now be installed inside the Lower OTSG Module to access the joint with the SCR Module. A working platform should be created at an elevation that will accommodate internal seal welding and joint assembly kit installation.

f. If required, scaffolding external to the boiler can also be constructed to reach the Lower OTSG Module and SCR Module joint elevation. Alternatively, tank brackets can now be installed to the exterior columns as detailed Section 2.2.

g. Lift the Lower OTSG Module vertically using spreader beams as per the lifting arrangement shown in Figure 14.

h. Carefully place the Lower OTSG Module on top of the Upper Inlet Plenum. Guide plates have been installed during fabrication to assist in the alignment during this installation process. Ensure that columns and stiffeners are aligned properly and that the top of the module is level. Mechanically secure erection plates at all connections using the supplied bolting hardware. Refer to Section 5.0 and IST Erection Diagram 11303-0027 for details.

i. It is recommended that erection plate welding and seam welding between the Upper Inlet Plenum and Lower OTSG Module be completed at this point. Only after all erection plates have been welded and seam welding between the Upper Inlet Plenum and Lower OTSG Module are complete can the remaining shipping beams at the base of the Lower OTSG Module and at the top of the Upper Inlet Plenum be removed. Shipping beams at the top of the Lower OTSG Module can be removed only after seal welding with the SCR Module has been completed. Remove the remaining shipping beams by unfastening the bolts holding the beam in position to the sidewalls. Once the beam is removed, re-install the bolts in the holes and seal weld them in position to create a gas tight seal. All temporary structural components and shipping beams are painted yellow prior to shipment. IST must be contacted immediately if there are any doubts as to what items are to be removed and/or when they are to be removed.

j. Top support beam end clip angles and studs should not be removed until the SCR Module is in position and the majority of the internal seal welding between the Lower OTSG Module and SCR Module is completed in order to prevent any sidewall deflection.

k. Due to the proximity with the main lifting points on the Lower OTSG Module, two (2) Ammonia Injection Grid (AIG) lance assemblies are shipped loose for assembly at site. The two AIG lances should be placed on the CO catalyst frame once the Lower OTSG Module is mechanically secured in place. The Erector has the option of continuing with the placement of the SCR module at this point or completing the AIG lance installation.

l. The 2" NPS Sch. 40 inlet nozzle of the lance assemblies are located directly behind the module lifting lugs on the non-platform side of the module. The lance assembly with an internal manifold from which four HSS 2" x 2" lances project towards the opposite wall. The four lances will be inserted into receptacles in the sidewalls while the inlet nozzle will protrude outside beyond the Lower OTSG Module casing. A stainless steel patch ring will be welded over the sidewall opening and be used to level and center the AIG lance assembly.

m. Internal insulation and the lower module closure kit 11303-0601 may be installed upon completion of the AIG lance assemblies. Internal insulation and the Upper Inlet Plenum to Lower OTSG Module JAK 261508 may also be installed at this time.

n.

NOTE

Prior to working on top of OTSG module, tubes and AIG lance assemblies shall be covered with plywood and fire blankets. Failure to do so will result in possible warranty invalidation. Extreme care must always be exercised to prevent any possible damage to the pressure tubes and AIG lances. Do not support heavy equipment or liner panels (greater than 200 lb [90 kg]) on the tubes and AIG lances and ensure that loads are spread over multiple tube surfaces.

7.3 ERECTION OF SCR MODULE – General Procedure

a. Installation of the SCR Module should commence only after installation of the Lower OTSG Module is complete. This will ensure proper structural integrity exists as the load on the inlet plenum is increased. Prior to lifting the module, ensure that all required scaffolding inside Lower OTSG Module is complete and that the Lower OTSG Module to SCR Module joint assembly kit 11303-0508 is placed inside. Ensure erection plates and hardware are placed in the lower sidewall beam gutters for easy access.

b. Remove tarp from top of the SCR Module framing

c. Ensure that all temporary shipping beams and bracing remain in the assembly until the SCR Module is mechanically secured.

d. The JAK 11303-0509 may be placed on top of SCR frame in the module prior to the lift or immediately after the lift. These components must be stored in the SCR Module prior to placing the Upper OTSG Module.

e. Lift the SCR Module vertically using spreader beams as per the lifting arrangement shown in Figure 15.

f. Carefully place the SCR Module on top of the Lower OTSG Module. Guide plates have been installed during fabrication to assist in the alignment during this installation process. Ensure that columns and stiffeners are aligned properly and that the top of the module is level. Mechanically secure erection plates at all connections using the supplied bolting hardware. Refer to Section 5.0 and IST Erection Diagram 11303-0027 for details.

g. It is recommended that erection plate welding and seam welding between the Lower OTSG Module and SCR Module be completed at this point. Only after all erection plates have been welded and seam welding between the Lower OTSG Module and SCR Module are complete can the remaining shipping beams and braces at the top of the Lower OTSG Module and at the base of the SCR Module be removed. Shipping beams at the top of the SCR Module can be removed once seal welding between the SCR Module and Upper OTSG Module have been completed. Remove the remaining shipping beams by

unfastening the bolts holding the beam in position to the sidewalls. Once the beam is removed, re-install the bolts in the holes and seal weld them in position to create a gas tight seal. All temporary structural components and shipping beams are painted yellow prior to shipment. IST must be contacted immediately if there are any doubts as to what items are to be removed and/or when they are to be removed.

h. SCR support beam end clip angles and studs should not be removed until the Upper OTSG Module is in position and the majority of the internal seal welding between the SCR Module and Upper OTSG Module is completed in order to prevent any sidewall deflection.

i. The support beam clip angles are temporary shipping restraints that are removed during the erection process. All support beam clip angles that are painted yellow must be removed. Once the angles are removed, the bolts are to be reinserted into their respective holes in the sidewall, their heads cut off with a grinder, and seal welded. Care must be taken to ensure that the remaining bolt body be either ground flush with the beam flange or be left in a position that allows sufficient clearance to the side of the support beam. Minimum clearance from the end of the support beam to any bolting inserted into the wall is 1" [25 mm]. For the support beam located closest to the head end, the beam is allowed to grow axially but prevented from moving laterally in the unit. The restraint angles are therefore not to be removed (hence they are not painted yellow). Only the stud restraining the support beam to the restraint angles is to be removed at both ends (refer to Figure 22).

j. Internal insulation and the Lower OTSG Module to SCR Module JAK 11303-0508 can be installed upon completion of the internal seal welding of the two assemblies.

7.4 ERECTION OF UPPER OTSG MODULE – General Procedure

a. Installation of the Upper OTSG Module should commence only after installation of the SCR Module is complete. This will ensure proper structural integrity exists as the load on the SCR Module is increased. Prior to lifting the module, ensure that all required scaffolding inside the SCR Module is complete.

b. Ensure that only the identified shipping beams as specified in Figure 4 are removed. Once the beams are removed, re-install the bolts in the holes (with the bolt heads on the outside) and seal weld them in position to create a gas tight seal. A cross section of the Upper OTSG Module is found in Figure 5.

c. Remove tarp from top of the module framing. Plywood is to be placed on the top surface of the fin tubes between the top support beams to prevent damage to finned tubes from falling debris and by distributing any weight placed on top of the tubes.

d. The JAK 11303-0510 may be placed on top of Upper OTSG Module prior to the lift or immediately after the lift. These components must be stored on top of the Upper OTSG Module prior to placing the Lower Exhaust Hood.

e. If required, scaffolding external to the boiler can also be constructed to reach the Upper OTSG Module and Lower Exhaust Hood joint elevation. Alternatively, tank brackets can now be installed to the exterior columns as detailed Section 2.2.

f. Lift the Upper OTSG Module vertically using spreader beams as per the lifting arrangement shown in Figure 16.

g. Carefully place the Upper OTSG Module on top of the SCR Module. Guide plates have been installed during fabrication to assist in the alignment during this installation process. Ensure that columns and stiffeners are aligned properly and that the top of the module is level. Mechanically secure erection plates at all connections using the supplied bolting hardware. Refer to Section 5.0 and IST Erection Diagram 11303-0027 for details.

h. It is recommended that erection plate welding and seam welding between the SCR Module and Upper OTSG Module be completed at this point. Only after all erection plates have been welded and seam welding between the SCR Module and Upper OTSG Module are complete can the remaining shipping beams and braces of the Upper OTSG Module and at the top of the SCR Module be removed. Remove the remaining shipping beams by unfastening the bolts holding the beam in position to the sidewalls. Once the beam is removed, re-install the bolts in the holes and seal weld them in position to create a gas tight seal. All temporary structural components and shipping beams are painted yellow prior to shipment. IST must be contacted immediately if there are any doubts as to what items are to be removed and/or when they are to be removed.

i. Upon completion of internal seal welding, internal insulation and installation of the Upper OTSG Module to SCR Module JAK 11303-0509 can be installed.

j. Top support beam end clip angles and studs should not be removed until the Lower Exhaust Hood is in position and the majority of the internal seal welding between the Upper OTSG Module and Lower Exhaust Hood is completed in order to prevent any sidewall deflection.

7.5 ERECTION OF LOWER EXHAUST HOOD – General Procedure

a. Installation of the Lower Exhaust Hood should commence only after installation of the Upper OTSG Module is complete. This will ensure proper structural integrity exists as the load on the Upper OTSG Module is increased.

b. Remove tarp from top of the Lower Exhaust Hood framing. Plywood is to be placed on the top surface of the silencer baffles to prevent damage to internal structure from falling debris and by distributing any weight placed on top of the baffle assembly.

c. Place the Lower Exhaust Hood to Upper Exhaust Hood JAK 11303-0511, the Upper Exhaust Hood to Stack Adaptor JAK 11303-0512, and the Stack Adaptor to Exhaust Stack JAK 11303-0513 on top of the silencer baffles prior to lifting the Lower Exhaust Hood. Otherwise, place these JAKs on the silencer baffles prior to placing the Upper Exhaust Hood assembly.

d. Temporary shipping beams are to be removed only after the internal seal welding is underway and erection plates are securely bolted and welded. They are only to be removed prior to the lift if there is interference with the top support beams. After removal of temporary shipping beams, the bolts are to be placed back into the holes and seal welded into position.

e. The Lower Exhaust Hood assembly is to be lifted vertically using spreader beams as designated in Figure 17. Guide plates have been installed during the fabrication to assist with alignment during erection. Ensure that columns and stiffeners are aligned properly and that the top of the Lower Exhaust Hood is level. Mechanically secure erection plates at all connections using the supplied bolting hardware. Refer to Section 5.0 and IST Erection Diagram 11303-0027 for details.

f. If gaps are evident at end joints between the Lower Exhaust Hood and the Upper OTSG Module as a result of the fit up, the outer most erection plates may be required to be left off until internal welding is complete. Some pressure jacking may be required to force gaps closed and minimize closure welds.

g. It is recommended that erection plate welding and seam welding between the Upper OTSG Module and Lower Exhaust Hood be completed at this point. Only after all erection plates have been welded and seam welding between the Upper OTSG Module and Lower Exhaust Hood are complete can the remaining shipping beams and braces at the bottom of the Lower Exhaust Hood be removed. Remove the remaining shipping beams by unfastening the bolts holding the beam in position to the sidewalls. Once the beam is removed, re-install the bolts in the holes and seal weld them in position to create a gas tight seal. All temporary structural components and shipping beams are painted yellow prior to shipment. IST must be contacted immediately if there are any doubts as to what items are to be removed and/or when they are to be removed.

h. Internal insulation and installation of the Upper OTSG Module to Lower Exhaust Hood JAK may commence after completion of the internal seal weld between the two assemblies.

i. Due to the potential for high winds that can occur during erection, it is necessary to erect the platform steel after the installation of the lower exhaust hood. The platform steel will provide bracing to the overall structure. See Section 10 for complete installation procedures for the platform steel.

7.6 ERECTION OF UPPER EXHAUST HOOD – General Procedure

a. Installation of the Upper Exhaust Hood should commence only after installation of the Lower OTSG Module and all platform steel is complete. This will ensure proper structural integrity exists as the load on the Lower Exhaust Hood is increased.

b. Remove tarps from top of the Upper Exhaust Hood framing.

c. Ensure erection plates and hardware are placed in the lower sidewall beam gutters for easy access. Safety handrailing should also be placed at the upper ends of exhaust hood for the benefit of the welders who will eventually be working in that region making the final bolting and welding of the stack adapter.

d. Temporary shipping beams are to be removed only after the internal seal welding is underway and erection plates are securely bolted and welded. After removal of temporary shipping beams, the bolts are to be placed back into the holes and seal welded into position.

e. The Upper Exhaust Hood assembly is to be lifted vertically using spreader beams as designated in Figure 18. Guide plates have been installed during the fabrication to assist with alignment during erection. Ensure that columns and stiffeners are aligned properly and that the top of the Upper Exhaust Hood is level. Mechanically secure erection plates at all connections using the supplied bolting hardware. Refer to Section 5.0 and IST Erection Diagram 11303-0027 for details.

f. A closure plate is installed to cover the gap in the front and rear wall casing between the Lower Exhaust Hood and Upper Exhaust Hood. The closure plate will be seal welded to the duct casing on the exterior and stitch welded on the inside. Refer to IST Erection Diagram 11303-0027 for details.

g. Internal insulation and installation of the Upper Lower Exhaust Hood to Upper Exhaust Hood JAK 11303-0512 may commence after completion of the internal seal weld between the two assemblies.

7.7 ERECTION OF STACK ADAPTER – General Procedure

a. Installation of the Stack Adapter should commence only after installation of the Upper Exhaust Hood is complete. This will ensure proper structural integrity exists as the load on the Upper Exhaust Hood is increased.

b. Remove tarps from top of the Stack Adapter assembly.

c. The adapter assembly should be shored up on the ground in the vertical position. Any temporary bracing inside the adapter assembly can be removed at this time.

d. Ensure erection plates and hardware are placed in the lower sidewall beam gutters for easy access. Safety handrailing should also be placed at the top of the stack adapter for the benefit of the welders who will eventually be working in that region making the final bolting and welding of the exhaust stack.

e. Once the overall adapter assembly has been made ready, it should be taken directly to the top of the upper exhaust hood for placement. The Stack Adapter assembly is to be lifted vertically using spreader beams as designated in Figure 19. **Note orientation of the adapter.**

f. The adapter assembly section will rest on the upper exhaust hood channel frame and holes on the mating faces must be aligned and secured with erection hardware provided. Ensure that the top of the stack adapter is level. Once secured atop the exhaust hood, welding of the internal and external seam at the upper exhaust hood to stack adapter joint will begin. It is recommended that a minimum of 12" (300 mm) of internal/external casing seam weld be completed at each corner before removing rigging from the top of the adapter. Refer to IST Erection Diagram 11303-0027 for details.

g. Full penetration continuous seal welding must be performed on the inside and outside perimeter of the exhaust hood to adapter joint as soon as possible.

h. Internal insulation and installation of the Upper Exhaust Hood to Stack Adapter JAK 11303-0513 may commence after completion of the internal seal weld between the two assemblies.

7.8 ERECTION OF EXHAUST STACK – General Procedure

a. Erection of the exhaust stack can only proceed after the following steps have been completed:

- All inlet plenum columns to base plate welds are complete and all base plates are secured to the anchor bolts.
- Inlet plenum diagonal bracing is installed and completely welded.
- All erection plates are completely welded at all ducting assembly joints.
- External and internal seal welding is complete for a length of at least 12" (305 mm) on either side of every column and at least 25% of the entire lengths of all seal welds are complete at all ducting assembly joints.
- Platform columns are erected and welded to their base plates which are secured to the anchor bolts.
- Beams between all platform columns and between the platform and the OTSG are installed and completely fastened.
- Cross bracing between the platform columns and the OTSG are installed and completely welded.

b. The Exhaust Stack assembly is designed to be lifted in a single section, although it may have its respective platform assembly installed on the ground prior to the lift. This requires that the stack section be offloaded on the ground in a horizontal position on solid temporary cribbing. Refer to horizontal and vertical rigging sketches Figures 20 and 21. Once the platform sections are attached, assembly can be lifted vertically into position.

c. Care should be taken when assembling the platforms to the stack. The Exhaust Stack should be shored up on the ground using temporary cribbing and having the orientation such that the top lifting lugs are on the strong axis for the subsequent vertical lift. Certain sections of the stack platform may have to be left off and installed once the stack is erected.

d. As soon as the platform assembly to the Exhaust Stack is completed, it can be simultaneously rotated and lifted. This can be accomplished using 2 lifting cranes – a main lift crane with rolling sheave blocks at the top of the stack to distribute loading equally to the lifting lugs and a tailing crane near the bottom of the stack to lift the end off the ground and prevent stack damage. Comprehensive planning is necessary on the part of the Erector to negotiate this complex lift from the horizontal to vertical position.

e. Once the stack / platform assembly is in the vertical position, it should be taken directly to the top of the exhaust hood for installation. Do not set the stack assembly back on the ground once it is lifted. This will avoid damaging the bottom casing of the Exhaust Stack.

f. The interface of the Exhaust Stack casing into the Stack Adapter has been designed as a clearance fit. If required, additional slitting of the stack casing lower corners will give additional flexibility to fit into the Stack Adapter opening.

g. The Exhaust Stack casing will insert into the Stack Adapter opening by approximately 2" (50 mm). Note the orientation of the stack before carefully lowering the Exhaust Stack

onto the Stack Adapter. The four Stack Adapter to Exhaust Stack erection plates are installed and secured with the erection hardware provided, leaving a 3/8" (10 mm) gap at the four vertical columns. Refer to the IST Erection Diagram 11303-0027 for details. The load is not to be released from the crane hook until the stitch and external seal welds between the Exhaust Stack and Upper Exhaust Hood are completed.

h. The stack shall be true and plumb to within 2" (50 mm) in 100 ft (30 m) based on ASME STS-1-2000 Steel Stacks.

i. Internal insulation and installation of the Stack Adapter to Exhaust Stack JAK 11303-0513 can commence once internal seam welding at the joint is completed.

j. The obstruction lights should be installed and made operational as soon as possible the exhaust stack assembly is erected.

7.9 ERECTION OF DILUTION AIR DUCT – General Procedure

a. The dilution air duct section is located upstream of the inlet plenum. The dilution air duct is designed to slip fit into the inlet plenum ductwork opening. It is up to the Erector to decide whether to build the ducting towards the gas turbine or upwards to the exhaust stack following the completion of the Inlet Plenum installation. This decision typically rests on the most effective use of available crane time on site.

b. Prior to obstructing all sizeable openings, ensure that the dilution air duct JAK 11303-0505 is inside the ducting. Otherwise some components will not fit through the access doors.

c. The Dilution Air Duct assembly is to be lifted vertically utilizing spreader beams and rigging as shown in Figure 13. This ductwork is to be lowered directly in front of the inlet plenum opening. Keeping the ductwork on the hook, pull the duct section into the frame of the Inlet Plenum. Ensure the alignment of the burner duct centerline with the gas turbine discharge centerline. The height from the top of the burner duct to top of concrete should be measured and confirmed with IST drawings. With a transit, check the top four (4) corners of the burner duct for level.

d. Once alignment of the duct is confirmed, the columns will be welded to the base plates in accordance with the instructions shown on Base Plate Layout Assembly drawing 11303-0003. Tack weld the dilution air duct to the inlet plenum before removing the lifting equipment.

e. Seal welding of the casing perimeter between Dilution Air Duct and Inlet Plenums can commence. Two gusset plates will be welded to the underside of Dilution Air Duct at

columns B7 and E7 as shown on the IST Erection Diagram 11303-0027 once seal welding of the casing perimeter is complete.

f. Any temporary bracing installed in the interior of the duct can be removed after all casing welds are complete. Internal insulation and JAK installation can commence after the completion of internal casing welds.

7.10 ERECTION OF INLET TRANSITION DUCT – General Procedure

a. The Inlet Transition Duct comprises of two (2) major assemblies – Inlet Transition Duct #1 and Inlet Transition Duct #2. Installation of Inlet Transition Duct #2 commences only after installation of the Dilution Air Duct is complete. Prior to obstructing all sizeable openings, ensure that all the appropriate joint assembly kits 11303-0503 and 11303-0504 are inside the ducting, otherwise some components will not fit through the access doors.

b. Inlet Transition Duct #2 is to be lifted vertically with a rigging arrangement as shown in Figure 9. This ductwork section is to be lowered directly in front of the dilution air duct opening. Keeping the duct on the hook, pull the duct section inside the opening of the burner duct. Ensure the alignment of the burner duct centerline with the gas turbine discharge centerline. The elevation height from the top of the inlet transition duct to the top of concrete should be measured and confirmed with IST drawings.

c. As Inlet Transition Duct #2 is not self-supported by columns, cribbing must be placed under the duct to support its weight until the installation of Inlet Transition Duct #2. Tack weld the duct to the dilution air duct before removing the lifting equipment.

d. Seal welding of the casing perimeter between Inlet Transition Duct #2 and Dilution Air Duct can commence.

e. Any temporary bracing installed in the interior of the duct can be removed after all casing welds are complete. Internal insulation and JAK installation can commence after the completion of internal casing welds.

f. Installation of Inlet Transition Duct #1 should commence only after the complete installation of Inlet Transition Duct #2. The duct assembly is to be lifted vertically utilizing spreader beams and rigging as shown in Figure 7. This ductwork is to be lowered directly in front of the Inlet Transition Duct #2 opening. Keeping the ductwork on the hook, pull the duct section such that the outlet frame fits over the Burner Duct #2 inlet opening. Center the columns of Burner Duct #1 over their respective base plates and rest the duct securely on the base plates. Ensure the alignment of the burner duct centerline with the gas turbine discharge centerline. The height from the top of the burner duct to top of concrete should be measured and confirmed with IST drawings.

g. Ensure the inlet flange is aligned with the gas turbine discharge centerline. The dimensional position of the Inlet Transition Duct should be checked and that it is centered accordingly and that a 20" [510 mm] gap from the Inlet Transition Duct flange to the GT flange is maintained for insertion of the expansion joint.

h. Weld columns to base plates as specified on IST Base Plate Layout Assembly drawing 11303-0003.

i. Seal welding of the casing perimeter between Inlet Transition Duct #2 and Inlet Transition Duct #1 can commence.

j. Any temporary bracing installed in the interior of the duct can be removed after completion of column to base plate welding.

k. The next piece to be installed to this group is the expansion joint. Break the tack welds on the inlet transition duct flange and adjust it back (if required). This will provide a larger opening for insertion of the expansion joint if needed and also allow for adjustment during the final fit up. Prior to lowering the expansion joint into position, gasket tape must first be applied to the inlet and outlet flange faces of the expansion joint assembly. The expansion joint is to be installed in its preset compressed condition by first attaching to the Inlet Transition Duct flange with the hardware provided.

l. Loosen designated bolts on the expansion joint preset bars as illustrated on the expansion joint drawing and expand the joint to its required cold operational setting. Bolt upstream expansion joint flange securely to gas turbine exhaust flange.

m. Once the expansion joint is installed and positioned properly, the angle flange on the inlet transition duct can be seal welded around the entire casing perimeter. Refer to IST Erection Diagram 11303-0027.

n. After the expansion joint is installed, internal installation of the joint assembly kit can commence.

7.11 ERECTION PLATE WELDING

NOTE

If any gaps exist at the interface of two components, it is recommended that the internal seal welding be performed prior to any erection plate welding. See Section 8.7 *Internal Seal Welding* for instructions. Slight adjustment to the erection plate holes may be necessary at site. It is at this time of the OTSG installation process that erection plates are welded to the structural beams that they are bolted to. Depending on which construction option was chosen in Section 8.0 *Ducting & Module Installation*, most erection plates may already be welded at this point. If not, continue erection plate welding until complete. Welding requirements are outlined on the IST Erection drawing.

During the OTSG installation process, erection plates are welded to the structural beams that they are bolted to. Depending on which construction option is chosen, erection plates may be welded while individual assemblies are erected or may be completed immediately after the installation of the Lower Exhaust Hood. Welding requirements are outlined on the IST Erection Diagram.

Erection plate welding shall be commenced as quickly as possible after the components have been assembled. The Erector shall minimize the amount of time the structure stands without full structural welding completed.

7.12 INTERNAL SEAL WELDING

After the installation of a component and once the associated erection plates are welded, internal seam welding should commence. Specific requirements for these welds are outlined on the IST Erection drawings. Seal welding is required at each interface of two components to form a gas tight enclosure.

During the fabrication of the large OTSG module and ductwork components, it is possible that any variance in straightness will result in gaps at either end. This is noticeable when two components are stacked upon each other. In order to compensate for these gaps it is best, during seal welding, to have two (2) welders inside the unit. Both welders should start welding at the middle point of the unit, one on the left wall and one on the right wall. They should weld simultaneously towards the end with the gap. The continuous welding in the one direction will effectively reduce a large portion of the existing gap. This will help to eliminate multiple closure weld passes at the end wall. The Erector may find that the erection plates on the end walls may need to be left off until this internal seal welding is complete. Hydraulic jacks may also be used to force gaps closed and minimize the closure welds.

Inspect all seal welds for adequate size and completeness. Once seal welding is complete, all temporary shipping beams and/or braces can be removed. Ensure that any bolt holes from these beams are covered by having the bolt re-installed and seal welded in place.

8 SUPPORTS AND RESTRAINTS

8.1 TUBESHEET TOP SUPPORT BEAMS

The tube bundles in the OTSG Modules are supported from tubesheets hung vertically from top support beams (refer to Figure 3 and 5) tubesheet support beams are end-supported on expansion pads that allow axial growth towards the sidewalls and to the rear (refer to Figure 22). In addition, all tubesheet support beams, except for the one farthest from the header end, are interconnected along the length of the unit via the use of "push" pipes. To accommodate thermal expansion, the ends of the support beams must not be restrained. During shipping, the ends of the beams are restrained with shipping angles. These angles, which are painted yellow, must be removed (refer to Figure 22). Once the shipping angles are removed, the bolts are to be reinserted into their respective holes in the sidewall, their heads cut off with a grinder, and seal welded. Care must be taken to ensure that the remaining bolt body be either ground flush with the beam flange or be left in a position that allows sufficient clearance to the side of the top support beam. Minimum clearance from the end of the top support beam to any bolting inserted into the wall is 1" [25 mm].

The shipping angles shall be removed only after the majority of the peripheral internal seal weld has been completed between all support beams. Once the angles are moved, the remaining seal welding can be completed.

For the top support beam located farthest from the header end, the beam is allowed to grow laterally (side to side) but prevented from moving longitudinally (fore and aft) within the module. The restraint angles are therefore not to be removed (hence they are not painted yellow). Only the studs restraining the support beam to the restraint angles is to be removed at both ends (refer to Figure 22).

When all required top support beam shipping angles have been removed and the inside periphery of the lower module to SCR module joint and the upper module to lower exhaust hood joint have been welded, the joint assembly kit may be installed. Refer to Section 9.0. Ensure that the joint assembly kit liner panels are installed such that tubesheet top support beam growth is not hindered.

8.2 PRESSURE PART RESTRAINT

The tube bundle is restrained in position with rods that extend from the end casing to the return bend restraint assemblies (refer to Figures 23 to 26). To prevent damage during shipping, rubber strips have been inserted between the return bend inner restraints and the inside surface of the return bends. All rubber strips must be removed prior to operation.

The return bend end pattern design of the internal pressure boundary matrix is a hybrid arrangement containing a zigzag arrangement in the economizer and evaporator sections and an

inline arrangement in the superheater section. The zigzag return bend restraints use a 'double bar' restraint located at the inside of the return bends. The inline return bend restraints use a "pipe" restraint located at the inside of the return bends. These restraints will be used to hold the tube bundle in position during operation.

Please note that throughout this document, reference will be made to the 'front' end. This end of the module will be at the feedwater box or header end.

At all restraint levels, the gap between the inside of the return bend and the double bar restraint is to be adjusted to have a gap of 0" to 1/16" [0 to 2 mm] maximum after the protective rubber is removed. Care must be taken not to damage the return bends. Note that it may be possible to remove the shipping rubber without having to readjust the restraints, provided the clearance after the rubber is removed is 0" to 1/16" [0 to 2 mm]. It is allowable to have minimal clearance between restraints at some of the return bends, but the majority should just touch.

For restraint positions 1, 3, 5, and 6 as shown on Figures 23 and 25, a gap of no more than ¼" [6 mm] must be maintained between the outside of the return bend and the push pipe restraint.

Once installed, all restraints at all levels must be checked at the wall bracket location to ensure that each is securely fastened.

CAUTION

The proper adjustment of the return bend restraints is critical to the reliable operation of the OTSG. Improperly adjusted restraints can lead to pressure part and restraint failure. It is highly recommended that an IST Service Representative be on site during this stage of the construction.

8.3 FEEDWATER BOX SHIPPING RESTRAINT

Temporary restraints consisting of lumber and zip ties are installed inside the feedwater box for shipping purposes. Completely remove these restraints prior to commissioning the OTSG.

9 JOINT ASSEMBLY KIT (JAK) INSTALLATION

Once the internal seam welding is completed, shipping beams removed, and all bolt holes plugged, the joint assembly kits can be installed. These kits comprise of insulation, stainless steel liner panels, retaining channels, washers, and nuts.

Proper planning by the Erector will ensure that all required joint assembly kit components are placed in their proper location, inside the unit, during installation of each OTSG assembly.

Concentrated loading of joint assembly kit components directly onto finned tubes is strictly prohibited. JAK liner panels should straddle top support beams or be distributed over the tube surface in several areas. Insulation bundles can be set directly on tubes between top support beams.

JAK installation is required at the following component interfaces:

1. Expansion Joint to Inlet Transition Duct #1
2. Inlet Transition Duct #1 to Inlet Transition Duct #2
3. Inlet Transition Duct #2 to Dilution Air Duct
4. Dilution Air Duct to Upper/Lower Inlet Plenum
5. Lower Inlet Plenum to Upper Inlet Plenum
6. Upper Inlet Plenum to Lower OTSG Module
7. Lower OTSG Module to SCR Module
8. SCR Module to Upper OTSG Module
9. Upper OTSG Module to Lower Exhaust Hood
10. Lower Exhaust Hood to Upper Exhaust Hood
11. Upper Exhaust Hood to Stack Adapter
12. Stack Adapter to Exhaust Stack

Prior to joint assembly kit installation, inspect all liner plates. They should be flat or have distortion less than a ½" [12 mm].

The installed insulation should be tight fitting and joints should be staggered to prevent hot spots, refer to the individual JAK drawings for details. All insulation being installed in JAK locations is clearly indicated in the JAK drawing. In the case of insulated joints with liners to achieve the required 6" [150 mm] thickness, insulation is to be installed in layers. The insulation is then compressed to 5½" [140 mm] when the liner panels are secured in place. The insulation density is provided in the individual joint assembly kit drawings.

Ensure that liner panels are installed in the correct, overlapping sequence. Once the joint assembly kit liner panels are placed in position, retaining channels, washers and then nuts can be installed.

The liner sections immediately adjacent to the top support beams are floating, as they must allow the beams to expand along the length of the unit, as well as side-to-side. These floating panels are to be installed directly after the placement of insulation and are to be placed local to the ends of the top support beam.

IMPORTANT

The nuts installed on the studs, at all JAK locations, should be "snug" tight, then backed off ¼ turn and then tack welded. This will ensure that the liner panel is not secured too tightly as to prohibit liner plate movement during thermal expansion.

10 PLATFORMS

Check that platforms are in conformance with IST supplied drawings and that the platforms and other OTSG attachments do not place any restraint on the OTSG thermal growth. The platform is an integral part of the OTSG structure and will have to be erected in sequence with the boiler. Due to the potential for high winds during construction, the platform steel must be installed prior to the placement of the Upper Exhaust Hood assembly. See Section 7.0. Refer to the IST Platform Arrangement drawing 11303-0021, installation detail drawings [TBD], and fabrication detail drawings [TBD] for all erection details.

At the start of platform installation, the major columns along gridline A are to be centred over their respective base plates and welded into place. Gusset plates for cross bracing along the base of gridline B must be welded to the duct columns and base plates at four locations prior to erecting the balance of the platform steel. The platform steel is designed to be bolted together during the erection phase. Bolt holes are drilled into the duct columns and platform columns for quick assembly of connecting beams in the field.

The connecting beams at column lines B1, B3, B5, and B7 have gusset plates that require field welding to the duct columns. It is permissible to bypass these field welds during the erection of the platforms as these bolted joints are designed to withstand wind loading on the OTSG during the construction phase. The connecting beam field welds must be completed immediately after the installation of the Exhaust Stack.

The platform steel is shipped with a coating of Carbozinc 11 primer. Coating removal and preparation for welding is the responsibility of the Erector. The Erector is responsible for cleaning and coating of welded joints and other surface imperfections. The Erector is responsible for the supply and application of all primer touch-up required throughout the construction process.

Grating penetration holes, for piping and conduit, are to be cut in the field by the Erector. The Erector will fabricate and install collars at all grating penetrations.

11 EXTERIOR SURFACE

Once the OTSG installation is complete, inspect all field welds made between the major components. Check the welds for adequate size, quality and completeness. Check all bolts for tightness, including all erection plate bolts and header restraint bolts. All ducting flange bolts (e.g. at expansion joint location) should be checked for tightness and seal welded if required.

External surfaces, where temporary shipping components have been removed, and any areas of grinding and welding, should be touched up with paint equivalent to that on the supplied equipment. All external joint seam welding and other surface imperfections are to be cleaned and coated following the instructions outlined in IST Paint Specification 11303-0450 attached in Appendix D for reference. The Erector is responsible for the supply and application of all primer touch-up required throughout the construction process.

12 ACCESS DOORS

OTSG access doors have a standard opening dimension of 18" x 18" [450 mm x 450 mm]. Install any access doors that may have been shipped loose. Verify that structural steel does not interfere with the door hardware when it is opened. Since the doors have considerable thickness, obstructions must not exist beside the hinge points, otherwise the insulation plug on the inside of the door will not open far enough to allow access into the OTSG.

Inspect all rope gaskets in the door to ensure that a continuous loop exists around the door perimeter. Close the door to check that the rope gasket seals around the entire perimeter of the door frame.

Ensure that the eyebolt has been coated with anti-seize compound.

After all internal inspections have been completed, close the doors and tighten the handle firmly.

13 PIPING AND VALVES

During OTSG installation, do not remove protective end caps from headers or piping until necessary. Install steam and feedwater external piping spools as detailed in the IST Piping drawings. Ensure all necessary post weld heat treatment and non-destructive examination has been completed. Refer to Appendix E for Hydrostatic testing requirements.

Check that the safety valves have been installed correctly, all seals are in tact and have the proper rating. Ensure that plugs and gags have been removed, if the hydrostatic test is complete, and confirm that operational disks have been installed. Check that the drain connections have been properly routed to ensure operator safety.

Safety valve vent stack pipes should be installed firmly supported and restrained. Sufficient clearance should exist between the safety valve discharge elbow and the vent pipe to allow for steam pipe thermal expansion. Refer to the IST Vent Stack Piping drawing for details. Refer to Section 14.2 for installation instructions.

Install all valves that were shipped loose. Take note of the correct flow direction. Motorized and pneumatic valves should be checked for proper operation. Operate the valves to ensure the linkages do not bind. Refer to the IST Flowsheet drawing 11303-0004 for tag number references.

Ensure that the flow nozzle meter run is installed in the direction of flow.

Check that all drains and vents are free of obstructions and that the lines have been properly and safely, routed and supported.

Check all pipe supports to ensure that guides act only as guides and that piping is restrained only at the points indicated on the Customer Engineering drawings. Steam pipe hanger supports are to be installed such that there are no external forces imposed on the OTSG header connection. All spring hanger supports are to be adjusted so that the load indicator is positioned at the desired "cold" setting. If travel stops are installed, have these removed prior to OTSG operation.

NOTE

Due to rapid temperature changes of the external piping during startup and shut down, welding of pipe supports to the steam piping should be avoided whenever possible.

Check that all bolts on flanged connections are tight and that proper gaskets have been installed.

All sampling ports off the OTSG casing and drain connection at the bottom of the inlet plenum should be capped or plugged.

All temporary pipe supports and bracing installed for erection and cleaning purposes must be removed before OTSG operation.

All blanking plates and hydro test plugs used for hydrostatic testing shall be removed once the hydro has passed test.

Ensure that all required feedwater strainers are installed. Their purpose is to safeguard control valves and to prevent damage and/or plugging of downstream flow orifices. They should be installed prior to water flushing and OTSG start up.

14 "JUMPER" TUBE INSTALLATION

As the OTSG pressure part assembly is distributed over three (3) modules – Lower OTSG Module, SCR Module, and Upper OTSG Module – the internal tube circuits have to be connected once all modules have been erected in place. Before the interconnecting tube welding can take place, the internal seam welding and JAK (joint assembly kit) between Lower, SCR and Upper Modules must first be completed. There are forty-one (41) 1"∅ jumper tube sets at the front end, each made up of two (2) sections of field installed tubing. This field installed tubing will require one hundred twenty three (123) field welds to be performed by an automated orbital TIG welding process.

For specific arrangement refer to IST drawing *Field Jumper Tube Arrangement* 11303-0650. The services to perform this activity are available to the customer at IST standard per diem rates. These rates and a tentative schedule are submitted separately to the customer for review. The Erector will be responsible for certain functions related to this activity and are outlined as follows:

- 480 Volt 60 Amp junction uninterrupted power source and hook-up service for IST orbital welding transformer, plus 110 / 220 Volt 100 Amp for tool crib container to provide lighting and use of power tools.
- Designated lay down area local to steam generator unit (preferably) for IST tool crib container.
- Provision of dry compressed air and designated area for air compressor local to steam generator unit.
- Twelve (12) 2,300 psig bottle manifold pack of argon with two (2) manifold connections for backing gas for orbital welding, plus six (6) loose bottles for welding machine shielding gas.
- Internal scaffold inside the ducting for the completion of orbital welds as required.
- Provision of salamander heaters, hoses of which to be fed into the inlet plenum access door. This is a requirement only if work is performed during winter months. These will also be required during the hydrostatic test in order to raise the temperature of the tube material.
- Tarpaulin over access doors in the event of inclement weather.
- Site safety induction lecture of IST personnel prior to commencement of site activities.
- Provision by customer for one (1) site personnel for safety watch while IST welding technicians work inside the ducting and one (1) other support personnel to assist with cutting, prepping and purging of tubes. In the event of two (2) shifts, a set of support personnel will be required for each shift.
- Designated lunch, smoking area, and washroom facilities.
- Provision and arrangement of any onsite permit requirements.
- Supply of ample demineralized water and pressurizing equipment to perform a hydrostatic test of each steam generator unit once jumper tube welding is complete and piping tie-ins are made.

- Coordinate activities with local authorities for approvals and witnessing of hydrostatic tests. All associated costs are the responsibility of the customer.

All associated costs to conduct the hydrotest, which may include the supply of pressurizing equipment, obtaining suitable water and the service fees of the local authorized inspector, are not covered by IST.

15 VENDOR SUPPLIED ITEMS

15.1 FABRIC EXPANSION JOINT (Gas Turbine Discharge)

Please reference the expansion joint manufacturers drawing & installation instructions *B25744-1* for additional details.

Before installing the expansion joint, the gas turbine exhaust diffuser must be located in its final, fixed position.

The fabric expansion joint should be preset compressed for installation into position and must be bolted directly to the gas turbine exhaust flange. The expansion joint preset bars should be intact at this time. The face-to-face distance between the gas turbine exhaust flange and the spool duct flange should be checked to ensure proper installation clearance.

Prior to lifting, identify the "TOP" position on the expansion joint. Be sure to apply the self adhesive, woven fibreglass gasket material to both the inlet and outlet flange faces of the expansion joint. Lift and place the expansion joint within the opening. Once the expansion joint is in position, securely fasten it to the gas turbine exhaust flange. Allow the joint to expand to the end of the slot. (Confirm the joint overall operational flange to flange distance is in accordance with specifications). The inlet transition duct flange (shipped tack welded) can now be repositioned if necessary to properly mate up to the expansion joint flange. The flange can now be seal welded in its final position to the inlet transition duct. Securely bolt the expansion joint outlet flange to the now fixed inlet flange of the inlet transition duct with the hardware provided.

Install insulation in the internal cavity between the inlet transition duct and the expansion joint as shown in the IST Erection Diagram 261027. Lap liner plates will be installed to cover the insulation between the expansion joint and inlet transition duct.

15.2 SAFETY VALVE SILENCER

Please refer to the following installation information for the safety valve silencer provided for this project. Refer to the silencer arrangement drawing *1170016-1* for detailed dimensional information.

IST is providing one (1) steam vent silencer on each OTSG that will facilitate two (2) HP safety relief vent lines, and one (1) HP start-up vent line with 30% capacity,

Upon receipt of the silencer at site, a thorough inspection should be performed. Look for any signs of shipping damage both internally and externally. If damage is found immediately contact IST. Any damaged surfaces on the silencer should be repaired according to IST Paint Specification attached in Appendix D. A zinc-rich primer coat of Carbozinc 11 is applied to the external casing. All touch up coatings to be supplied by the Erector.

The vent silencer will be shipped to site on its side. Use the lifting lugs supplied on the equipment for rotating and lifting. Lifting slings if used shall be properly located so that weight distribution is approximately equal on both slings. Spreader beams should be utilized to reduce minor axis bending of lifting lugs, where appropriate

The Erector must ensure all connecting piping are properly supported prior to connecting with the silencer flanges. Failure to comply can lead to excessive forces and moments applied to the nozzles causing damage to the silencer body.

The vent silencer is to be mounted onto support steel which is outlined on the Platform Arrangement drawing 11303-0021. The securing hardware to fasten the silencers to the support steel is called up on the erection diagram. Align the bolt holes and securely connect the four (4) base plates with the hardware provided.

Do not remove any protective end caps from the inlet and outlet nozzles until necessary during installation. Verify that all vent piping has been installed and supported per the design assembly drawings. The vent silencer is to be positioned with the orientation of the weather hood outlet facing towards the Gas Turbine.

Ensure that no interference exists between the silencer and any surrounding structures or piping. Flanged connections on the bottom of the silencer are designed to connect with the safety valve vent stack piping described Section 13.0. The flanged connections on the side of the silencer are designed to connect with the start-up vent piping provided by others. The Erector must ensure piping is properly supported prior to installation at the silencer connection flanges. Loading the connection flanges beyond the allowable loads and moments provided in silencer arrangement drawing *1170016-1* will cause damage to the silencer.

The vent silencer is constructed with connecting flanges with bolt holes straddling plan view centrelines. Install proper gaskets between the inlet flanges of the silencer and vent stack pipes. Bolt the pipe flanges in place with the hardware provided. Hardware and gaskets provided by IST are listed on the Vent Stack piping Assembly drawing 11303-0026 and will be shipped in a hardware kit associated with this equipment. Vent stack pipe flange connections may require re-tightening of the bolts after the unit reaches operating temperature.

A low point drain, off the silencer main body, is provided for removal of condensation or precipitation. Check that the silencer drain is free of obstructions and that the drain line has been properly routed to a safe location and supported.

Drain lines are to be supplied and installed by the Erector. Under no circumstances should liquids be allowed to accumulate in the upstream vent piping or the silencer prior to operation of the silencer as the resulting forces could result in mechanical failure of the silencer.

15.3 SELECTIVE CATALYST REDUCTION (SCR) SYSTEM

The following provides an overview of installation information for the Selective Catalyst Reduction (SCR) System. Detailed installation instructions for the SCR system can be found in the vendor drawings and manuals and SCR Catalyst Loading Arrangement drawing 11303-0734. A complete SCR system consists of the following components:

- Ammonia storage tanks (by Others)
- Ammonia forwarding pumps, interconnecting piping, and instrumentation (by Others)
- Ammonia Flow Control Unit (by IST)
- Ammonia Distribution Manifold (by IST)
- Aqueous and vaporized ammonia interconnecting piping (by Others)
- Ammonia Inject Grid (by IST)
- SCR catalyst support frame internal to the SCR Module (by IST)
- SCR catalyst blocks (by IST)
- SCR catalyst loading cart (by IST)

The Ammonia Flow Control Unit (AFCU) consists of a vaporizer vessel with immersion heater, dual dilution air blowers, and associated instruments and valves mounted on a steel skid. The equipment will be anchored to the concrete foundation. Anchoring hardware and grounding equipment will be supplied and installed by the Erector. Wiring to the control cabinet terminal points will be supplied and installed by the Erector. The Erector will be responsible for connecting electrical supply, ammonia supply, and instrument air supply to the unit. The AFCU will be controlled by the plant DCS using control logic supplied by Peerless Manufacturing Company.

The Ammonia Distribution Manifold (ADM) is located downstream of the AFCU skid and is mounted at grade close to the OTSG. The manifold branches off into thirteen branches leading to individual Ammonia Injection Grid assemblies. The ADM is to be placed on a concrete pad with anchor bolts supplied and installed by the Erector. Due to the temperature of the vaporized ammonia, the ADM is designed to grow thermally away from the manifold inlet. The Erector must ensure the anchoring hardware will accommodate the thermal growth of the ADM.

The fifteen (15) Ammonia Inject Grid (AIG) assemblies are installed inside the OTSG Lower Module. With the exception of two locations at the module lifting lugs, the AIG assemblies are

shop-installed by IST. For field instructions on the installation of the two remaining AIG assemblies, see Section 7.2.

Prior to loading the SCR catalysts into the OTSG, the OTSG internals must be heated by the gas turbine exhaust in order to remove any residual paint, oil, debris, and other chemicals that can contaminate the catalyst. The temperature during this burn-out process should reach the dry running design temperature of the OTSG which will cycle the SCR support frame through the full design thermal growth. An inspection of the frame prior to SCR catalyst installation will confirm the perimeter seals are able to accommodate the frame expansion. The following bur-out procedure shall be followed:

1. Run the gas turbine at synch-idle and hold for a minimum of two (2) hours. At no time should the gas turbine exhaust temperature be lower than 550°F (290°C) during the burn-out process. The gas turbine power level should be set accordingly.

2. After the previous step is completed, increase the gas turbine load such that the exhaust temperature is equal to the design dry running temperature +0/-50°F (+0/-28°C). It is preferred that the exhaust temperature reaches the dry running temperature at this stage. Hold for two (2) hours minimum at this steady state condition. The gas turbine will likely be close to 100% load at this time.

3. Reduce the gas turbine load back to synch-idle with an exhaust temperature not less than 550°F (290°C) and hold for a minimum of 10 hours. The burn-out process may be interrupted during the 10 hour burn-out period provided an additional 30 minutes is added to the heat soak time per restart. If the interim shut down is less than two hours, additional run time is not required.

4. As an alternative to the above burn-out procedure, the gas turbine can be brought up to full load with temperature equal to the design dry running temperature +0/-50°F (+0/-28°C) and maintained for a minimum of 14 hours.

It is required that an SCR vendor representative and an IST representative be present for the installation of the SCR catalyst.

To access the SCR catalyst loading area, three removable casing panels at the rear of the SCR Module must be unbolted and removed. The internal liner channels and seals behind the door will be removed from inside the ducting by entering through the closest access door. Next, the SCR cart rail assemblies will be placed and securely fastened to the support beams inside the ducting. A SCR cart rail extension assembly will be securely fastened to the SCR loading platform. Install scaffolding and planking to permit personnel to walk to the length of the unit between the SCR cart rails. Strips of plywood will be placed on top of the tube bundle in the Lower OTSG Module and on top of the AIG lances to prevent falling debris from damaging the finned tubes, AIG lances, and CO catalyst blocks.

IST has supplied a hydraulic SCR loading cart for the purpose of installing the SCR catalyst blocks. The hydraulic cart will be placed on the SCR loading platform to accept catalyst blocks. The catalyst blocks may be transported by truck, forklift, or hoist using a suitable lifting device. Precautions should be taken during transportation and hoisting to avoid shocks and jolts to the catalyst blocks.

Catalyst module assembly packaging should be removed just before installation into the SCR Module. Precautions must be taken to protect the catalyst from damage caused by tools, sharp objects, welding sparks, and other dangers caused by local work activities. Damaged catalyst blocks should not be placed into the SCR Module. Any damage shall be reported immediately to an IST representative.

Prior to installing the catalyst module assemblies, measure their length and compare it against the distance between the stop bars on the catalyst support frame to ensure there is sufficient room for thermal growth.

Woven fiberglass gasket material shall be applied to the catalyst support frame assembly. This will ensure a gas-tight seal between consecutive catalyst module assemblies.

A catalyst module assembly will be placed on the SCR loading cart with the lip at the bottom of blocks facing the rear of the OTSG. The operator will raise the hydraulic actuator to ensure the catalyst clears the catalyst support frame. Slowly push the catalyst module assembly towards the front of the OTSG. Ensure consecutive catalyst module assemblies fit tightly to ensure all catalyst blocks will fit on the support frame. Gently lower the hydraulic actuator and move the loading cart back once the catalyst module assembly is secured.

After all catalyst blocks are loaded, stitch weld the retaining bracket to the support framework at the rear end. The SCR cart rail assemblies and extensions are removed and the SCR loading door sections replaced. Ensure that gasket material is installed around the entire perimeter and that the door panels are installed in the correct sequence. Replace all internal flexible seals and liner channels. Tighten the bolting around the door panel flanges. If gas leaks are found to exist during gas turbine operation, seal welding door flanges may be required.

15.4 CARBON MONOXIDE (CO) CATALYST SYSTEM

The following provides an overview of installation information for the Carbon Monoxide (CO) Catalyst System. Detailed installation instructions for the SCR system can be found in the vendor drawings and manuals and CO Catalyst Installation drawing 11303-0735.

A complete CO catalyst system consists of the following components:

- CO catalyst support frame internal to the Lower OTSG Module (by IST)
- CO catalyst blocks (by IST)

NOTE

The following contaminants are known catalyst deactivators and contribute to shortened catalyst life – heavy and base metals such as lead, mercury, arsenic, antimony, sodium, potassium, lithium, zinc, copper, tin, iron, nickel, chrome, sulfur, silicon, phosphorous, fluorine, chlorine, bromine, and iodine. Hence the contents of these contaminants in the catalyst are recommended not to singularly or collectively accumulate to levels exceeding 10 mg/ft^3 (350 mg/m^3) of catalyst as determined by ICP-OES (Inductive Couple Plasma-Optical Emissions Spectroscopy) or glow discharge spectrophotometry. The presence of levels of the listed contaminants exceeding the stated limits will void the catalyst warranty unless otherwise expressly agreed in writing by EmeraChem.

Prior to loading the CO catalysts into the OTSG, the OTSG internals must be heated by the gas turbine exhaust in order to remove any residual paint, oil, debris, and other chemicals that can contaminate the catalyst. The temperature during this burn-out process should reach the dry running design temperature of the OTSG which will cycle the CO support frame through the full design thermal growth. An inspection of the frame prior to CO catalyst installation will confirm the perimeter seals are able to accommodate the frame expansion. The following burn-out procedure shall be followed:

1. Run the gas turbine at synch-idle and hold for a minimum of two (2) hours. At no time should the gas turbine exhaust temperature be lower than 550°F (290°C) during the burn-out process. The gas turbine power level should be set accordingly.

2. After the previous step is completed, increase the gas turbine load such that the exhaust temperature is equal to the design dry running temperature +0/-50°F (+0/-28°C). It is preferred that the exhaust temperature reaches the dry running temperature at this stage. Hold for two (2) hours minimum at this steady state condition. The gas turbine will likely be close to 100% load at this time.

3. Reduce the gas turbine load back to synch-idle with an exhaust temperature not less than 550°F (290°C) and hold for a minimum of 10 hours. The burn-out process may be interrupted during the 10 hour burn-out period provided an additional 30 minutes is added to the heat soak time per restart. If the interim shut down is less than two hours, additional run time is not required.

4. As an alternative to the above burn-out procedure, the gas turbine can be brought up to full load with temperature equal to the design dry running temperature +0/-50°F (+0/-28°C) and maintained for a minimum of 14 hours.

It is required that a CO vendor representative and an IST representative be present for the installation of the CO catalyst. It is advisable to complete SCR catalyst installation prior to CO catalyst installation to prevent debris from falling onto the CO catalyst blocks. In the event that

both catalysts are installed together, ensure there is sufficient planking above the CO catalyst installation to prevent debris from falling onto the catalyst blocks.
The CO catalyst blocks are fragile – both physically and chemically – and expensive. It is requested that the individual blocks be handled with extreme care.

A crane or other suitable lifting device will be used to deliver the CO catalyst blocks to the appropriate platform elevation. A removable CO catalyst door is located in the SCR Module above the AIG lances from which the CO catalyst blocks will be brought into the ducting. Plywood must be placed over the AIG lances to protect the lance nozzles and to prevent damage to the lances by distributing weight. The weight of workers and CO catalyst blocks must be distributed over a minimum of four AIG lances.

Gas seal panels at the rear of the ducting between the AIG lances and CO catalyst support frame will be removed to grant personnel access for the installation or removal of the CO catalyst blocks.

Individual CO catalyst blocks will be passed through the AIG lances to the installer positioned on the CO catalyst support frame. A fiberglass gasket is applied between the frame support and the catalyst block. Set the catalyst block onto the frame. Ensure the catalyst sits squarely in the frame and check from the sides, top, and bottom to ensure the gasket remains in place. Any gaps in the gasketing between the frame and catalyst will result exhaust gas bypassing the system and reducing CO catalyst performance.

CAUTION
Do not walk on CO catalyst surface.

After all the CO catalyst blocks have been installed in the support frame, install retaining washers and retaining nuts over the threaded studs as indicated in CO Catalyst Installation drawing 11303-0735. Apply a high temperature anti-seize compound (by IST) sparingly on the studs. Install the retaining washer followed by the first nut ensuring it is tightened to the proper torque. Install the second nut and ensure the first nut does not turn, thus changing its initial torque.

Once all the catalyst blocks have been loaded and the installation is considered adequate, the gas seal panels at the rear of the ducting between the AIG lances and CO catalyst frame will be reinstalled to its original state. Remove all plywood planking used during the installation. Reinstall the CO catalyst loading door ensuring that gaskets are used and bolts tightened to prevent gas leakage. If persistent gas leakage is found after the bolts are tightened, it may be necessary to seal weld the door joint.

15.5 DILUTION AIR SYSTEM

The following provides an overview of installation information for the Fossil Power Systems duct burner. Detailed installation instructions for the duct burner can be found in the Fossil Power Systems drawings and manuals.

A complete duct burner system consists of the following components:

- Six (6) dilution air elements and assembly (by IST)
- One (1) blower skid with inlet silencer (by IST)
- One (1) set of interconnecting ducting between blower skid and injection lances (by Others)
- Noise abatement barriers and ducting insulation (by Others as required)

The dilution air system has six (6) horizontal burner elements that are shipped loose and inserted widthwise into the Diluition Air Duct by the Erector. Each dilution air element is supplied with an end support that is welded to the platform side external casing of the duct during the dilution air element installation. The end support should be tack welded at four corners during initial installation. Prior to installing the dilution air elements, the end support will be lined with 6 lb/ft^3 (96 kg/m^3) soluble fiber insulation to minimize heat transfer to the duct exterior.

The dilution air elements are inserted through the duct casing openings on the non-platform side and supported on the opposite wall by the end supports. The burner elements are to be checked for position, level, elevation, and angular alignment upon installation. Once the correct installation of the individual dilution air elements is verified, the faceplates and end supports can be seal welded to the duct casing. 6 lb/ft^3 (96 kg/m^3) soluble fiber insulation will be installed in all casing cavities prior to the installation of the supplied closure liner plates and bolting hardware. Tack weld nuts on the inner securing studs once closure panels are secured in place.

The faceplates will act as the fixed point of the dilution air elements and thermal growth will be towards the expansion end supports. Ensure the installed elements are free to expand towards the end supports.

The dilution air blower skid is to be located and installed in an appropriate location designated by the Erector. The equipment will be anchored to the concrete foundation. Anchoring hardware and grounding equipment will be supplied and installed by the Erector. Wiring to the control cabinet terminal points will be supplied and installed by the Erector. The Erector will be responsible for connecting electrical supply, and instrument air supply to the skid.

15.6 STACK DAMPER

The following provides an overview of installation information for the stack damper. Detailed installation instructions for the stack damper can be found in the vendor drawing CF-2245-01-01 and manuals.

The stack damper actuator and rain skirts may be may be shipped loose to prevent damage to the components. Assembly of the actuator should be completed prior to installation of the stack damper on the exhaust stack.

The stack damper is not to be installed on the exhaust stack until it is mechanically secured and all internal and external seal welding is complete. A crane will be employed to lift the stack damper using the lifting lugs provided. The damper will be secured onto the exhaust stack lifting plates using the supplied hardware. The load is not to be released from the crane hook until the proper installation of the stack damper hardware is confirmed.

Any rain skirt panels that are shipped loose will be bolted into position after the stack damper is secured in place.

Wiring and power supply to the stack damper terminal points will be supplied and installed by the Erector.

16 INTERNAL COMPONENTS INSTALLATION

16.1 END SEALS

The end restraint adjustment procedure, outlined in Section 8.2, may require the removal of end seal panels (floor panels) to allow access. Once the restraint rod adjustment process is complete, the end seal panels should be replaced and inspected. No significant leakage paths between end seal panels should exist; otherwise adjustments should be made to eliminate any gaps.

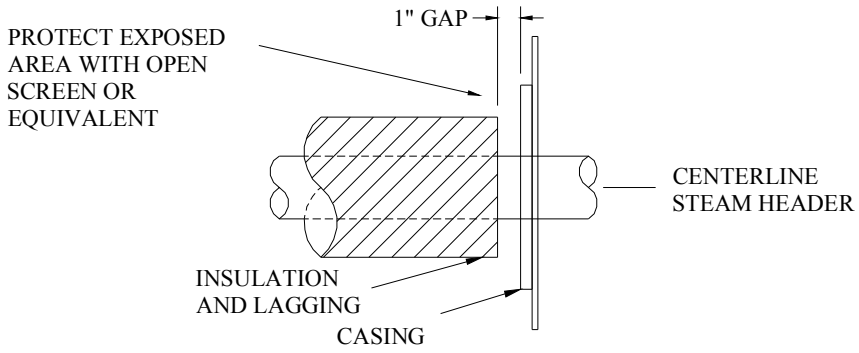
The end seal panels have been designed with oversized holes to allow for thermal expansion. To ensure these panels slide freely during operation, all bolts should be installed “snug” tight and backed off ¼ turn.

16.2 LOWER OTSG MODULE TUBESHEET THERMOCOUPLE INSTALLATION

Gas side thermocouples are required to be field installed on the tubesheet reinforcing pipes at three (3) locations across the width of the duct at eight (8) tubesheet locations. All thermocouple leads will be secured firmly to the tubesheet reinforcing pipes as they traverse to the Thermocouple Head Assembly. The junction head is to be installed on site into a pipe nipple provided on the external casing of the Lower OTSG Module on the platform side.

Each set of three (3) gas side thermocouples are to be field installed on the tubesheet reinforcing pipes. All three thermocouple wire leads will extend through the side casing by a pipe nipple provided to a single thermocouple junction head. Thermocouple instrumentation conduit cables (by others) are to be run from the junction head on the side casing back to the DCS in the control room. For detailed installation of the tubesheet thermocouples, refer to the IST Lower/AIG/CO Module Thermocouple Arrangement drawing 11303-0602. Ensure that the installation conforms to all notes shown in the drawing.

16.3 SCR MODULE THERMOCOUPLE INSTALLATION



Gas side thermocouples are required to be field installed on the underside of the catalyst block support pipes at three (3) locations across the width of the unit and at two (2) catalyst support pipe locations. All thermocouple leads will also in turn be secured firmly to the underside of the support pipes as they traverse to the Thermocouple Head Assembly. The junction head is to be installed on site into a pipe nipple provided on the external casing of the SCR Module on the platform side. Thermocouple instrumentation conduit cables (by others) are to be run from junction head on Exhaust Hood back to DCS in the control room. For detailed installation of SCR module thermocouples refer to the IST SCR Module Thermocouple Arrangement drawing 11303-0728. Ensure that the installation conforms to all notes shown in the drawing.

16.4 INSPECTION OF TUBES & SIDE SEAL GAS BAFFLES (V SEALS)

Except for the end restraint assemblies and connection to headers, the tubes should be free to expand. All debris must be removed from the top of the module so that no tubes are prevented from moving through the tubesheets. On either side of the tube bundle, the side seal gas baffles or "V-Seals" (refer to Figure 3 and 5) allow the bundle to thermally grow side-to-side while the outside casing remains a fixed size. Any debris that has fallen onto the top of the "V-Seals" must be removed prior to operation. Damage to the "V-Seals" will result during operation if all debris is not removed. Inspect all visible tubes for straightness and immediately report to IST any tubes that show any signs of bowing. Tube finning should be relatively undamaged. If there appears to be major areas of fin damage, the fins can be "combed" out. Leave the fins bent in areas of minor damage.

16.5 PIPING INSULATION AND LAGGING

All required external insulation and lagging for feedwater piping and their branches are to be supplied and installed by the Erector. Any areas requiring insulation or other materials for personnel protection shall be addressed. In general, this should cover all feedwater piping downstream of the heat exchanger including vents, drains, and transmitter connections. All steam piping insulation is the responsibility of the customer and their selected contractor. To prevent casing overheating, the steam pipe insulation shall not be insulated tight against the boiler casing. The insulation shall be stopped short of the casing by a minimum of 1" [25 mm] as shown in the Figure below.

1" GAP
PROTECT EXPOSED AREA WITH OPEN SCREEN OR EQUIVALENT
CENTERLINE STEAM HEADER
INSULATION AND LAGGING
CASING

17 PRE-SERVICE INSPECTION AND CHECK LIST

During construction and when the installation is complete, the unit should be completely inspected by an IST representative. This is required prior to the unit being exposed to gas turbine exhaust. If the unit is found not to be in conformance with the supplied drawings or descriptions outlined in this document, or if anything is found that will cause problems during operation, the IST representative will contact the Erector so that an immediate correction or resolution can be conducted.

The construction manager or appointed personnel should review the following checklist to ensure that all activities, associated with the ducting installation, are complete.

- Inspect all ducting components for shipping damage:
  - Gas Turbine Discharge Expansion Joint
  - Inlet Transition Duct #1
  - Inlet Transition Duct #2
  - Dilution Air Duct
  - Lower Inlet Plenum
  - Upper Inlet Plenum
  - Lower OTSG Module
  - SCR Module
  - Upper OTSG Module
  - Lower Exhaust Hood
  - Upper Exhaust Hood
  - Stack Adapter
  - Exhaust Stack

- Inspect all items listed below for shipping damage:
  - Safety Valve Silencer
  - Selective Catalyst Reduction (SCR) System
  - Carbon Monoxide (CO) Catalyst
  - Dilution Air System
  - Stack Damper
  - Valves and Instruments

- All base plates, soleplates and Fabreeka pads installed per drawing, level and in the correct position.
- Anchor bolts installed with nuts fixed in position by welding or jam nut.
- Lower Inlet Plenum installed, positioned properly, and level.
- Lower Inlet Plenum columns welded to base plates.
- Center the four (4) loose columns from the Upper Inlet Plenum onto their respective base plates and brace in place.
- Upper Inlet Plenum is lifted into proper position above the Lower Inlet Plenum.

- With the Upper Inlet Plenum still on the crane hook, the four loose columns are bolted to the Upper Inlet Plenum columns and welded to the base plates.
- Erection plates installed between the Lower Inlet Plenum and Upper Inlet Plenum, both bolted and welded.
- All shipping beams and braces in the Lower Inlet Plenum and along the base of the Upper Inlet Plenum are removed and all bolt holes are sealed.
- Internal and external seal weld between the Lower Inlet Plenum and Upper Inlet Plenum complete.
- Inlet Plenum diagonal brace installed.
- Lower OTSG Module installed, properly positioned, and level.
- Erection plates installed between Lower OTSG Module and Upper Inlet Plenum, both bolted and welded.
- Internal and external seal weld between Lower OTSG Module and Upper Inlet Plenum complete.
- All shipping beams and braces in the Upper Inlet Plenum and along the base of the Lower OTSG Module are removed and all bolt holes in the lower sidewall beams sealed.
- Remove four (4) lifting channels in the Lower OTSG Module sidewall and install the two remaining AIG lance assemblies.
- SCR Module installed, properly positioned, and level.
- Erection plates installed between SCR Module and Lower OTSG Module, both bolted and welded.
- Internal and external seal weld between SCR Module and Lower OTSG Module complete.
- All shipping beams and braces in the Lower OTSG Module and along the base of the SCR Module are removed and all bolt holes in the lower sidewall beams are sealed.
- All top support beam shipping restraint angles on Lower OTSG Module removed (except at the last tubesheet at the rear of the module) and sidewall bolt holes sealed.
- All Lower OTSG Module restraining studs removed at each end of all top support beams including the last support beam where the shipping angle remains.
- Upper OTSG Module installed, properly positioned, and level.
- Erection plates installed between Upper OTSG Module and SCR Module, both bolted and welded.
- Internal and external seal weld between Upper OTSG Module and Lower OTSG Module complete.
- All shipping beams and braces in the SCR Module and the Upper OTSG Module are removed and all bolt holes are sealed.
- All SCR catalyst support beam shipping restraint angles on the SCR Module removed (except at the front support closest to the header) and sidewall bolt holes are sealed.
- All SCR Module restraining studs removed at each end of all support beams including the front support beam where the shipping angle remains.
- Lower Exhaust Hood installed, properly positioned, and level.
- Erection Plates installed between Lower Exhaust Hood and Upper OTSG Module, both bolted and welded.
- All Lower Exhaust Hood shipping beams removed and all bolt holes sealed.

- Internal and external seal weld between Lower Exhaust Hood and Upper OTSG Module complete.
- All top support beam shipping restraint angles on Upper OTSG Module removed (except at the last rear tubesheet) and bolt holes sealed.
- All Upper OTSG Module restraining studs removed at each end of all the top support beams including the last beam (furthest from header end) where the shipping angle remains.
- All platform steel will be fully erected and bracing installed prior to the placement of the Upper Exhaust Hood.
- Upper Exhaust Hood installed, properly positioned, and level.
- Erection Plates installed between Upper Exhaust Hood and Lower Exhaust Hood, both bolted and welded.
- All Upper Exhaust Hood shipping beams removed and all bolt holes sealed.
- Internal and external seal weld between Upper Exhaust Hood and Lower Exhaust Hood complete.
- Closure plates between the Upper Exhaust Hood and Lower Exhaust Hood are seal welded to the casing exterior.
- Stack Adapter installed, properly positioned, and level.
- Erection Plates installed between Upper Exhaust Hood and Stack Adapter, both bolted and welded.
- Shipping braces in the Stack Adapter are removed and all bolt holes sealed.
- Internal and external seal weld between Upper Exhaust Hood and Stack Adapter complete.
- Exhaust Stack installed, properly positioned, and level.
- Erection Plates installed between the Exhaust Stack and Stack Adapter, both bolted and welded.
- Install obstruction lighting (supplied by Erector) and ensure they are operational as soon as erection of exhaust stack is complete.
- Dilution Air Duct installed, positioned properly, and level.
- Internal stitch and external seal weld between Dilution Air Duct and Inlet Plenum complete.
- Gusset plates to the underside of Dilution Air Duct at columns B7 and E7 are seal welded in place.
- Inlet Transition Duct #2 installed, positioned properly, and level.
- Internal stitch and external seal weld between Inlet Transition Duct #2 and Burner Duct #1 complete.
- Inlet Transition Duct #1 installed, positioned properly, and level.
- Internal stitch and external seal weld between Inlet Transition Duct #1 and Inlet Transition Duct #2 complete.
- Expansion joint installed and mechanically connected (bolted) to Inlet Transition Duct #1 support flange and gas turbine outlet flange. Expansion joint preset bars removed.
- All Joint Assembly Kit (JAK) installed accordingly,
  - Insulation used for JAKs on all OTSG duct work joints including expansion joint. Ensure insulation density applied at each joint is in accordance with drawings.
  - Insulation layers installed at a depth of 6” (150mm) and compressed to 5.5” (140mm).
  - Insulation layers are lapped to prevent hot spots.

- Liner panels overlapped in correct sequence.
- All nuts are installed correctly (not too tight to prevent thermal movement) and tack welded in position.
- JAK at Upper OTSG Module-to-Lower Exhaust Hood provides for expansion of top support beams.

- All closure kits are installed accordingly,
  - Insulation used for JAKs on all OTSG duct work joints including expansion joint. Ensure insulation density applied at each joint is in accordance with drawings.
  - Insulation layers installed at a depth of 6" (150mm) and compressed to 5.5" (140mm).
  - Insulation layers are lapped to prevent hot spots.
  - Liner panels overlapped in correct sequence.
  - All nuts are installed correctly (not too tight to prevent thermal movement) and tack welded in position.
- All intermodule field jumper installation installed.
- All debris is cleared from the module side gas baffles ("V seals") locations.
- All end seals and floors are installed and adjusted to prevent gas passage.
- All scaffolding and equipment removed from all OTSG components.
- All temporary shipping bracing removed from ducting components
- All temporary cribbing / supports removed.
- All return bend protective rubbers removed.
- All Pressure part restraint gaps adjusted per instructions.
- All damage to external surfaces has been touched-up with primer as specified which includes all areas of external casing welds, erection plate welding, and base plate welding.
- All access doors can be opened fully and then tightly sealed.
- Safety relief valves installed correctly.
- Safety relief valve vent pipes are properly supported and sufficient clearance exists between the vent pipe and the valve discharge pipe.
- All boiler external piping and valves are installed as required.
- All orifices and strainers are installed as required.
- All vents and drains are piped to safe or designated locations.
- All valves are installed in correct flow direction.
- All valves checked for proper operation (manual or automatic).
- All flanged connections tight and proper gaskets installed.
- All instruments installed (i.e. tubing and wiring).
- All sampling port and drain connections to the ducting are capped.
- Hydrostatic testing conducted according to the required regulations. Water used was demineralized and met IST water quality specification.
- Safety valve silencer installed and secured.
- Safety valve silencer drain line piped.
- Damaged silencer surfaces are primed and painted as required.
- Dilution air elements and end supports are installed and secured.

- Dilution air skid is installed and leveled on foundation per manufacturer's instructions. Ducting connection the dilution air skid and dilution air elements (supplied by Erector) are installed.
- Ammonia Flow Control Unit (AFCU) skid is placed and anchored to the foundation. Grounding cable is installed.
- Ammonia Distribution Manifold (ADM) is placed and anchored to the foundation.
- Interconnecting piping (supplied by Erector) between AFCU, ADM, and AIG is installed.
- Stack damper is installed and secured to Exhaust Stack.
- Instrumentation is wired to the DCS and all required control logic properly programmed.
- All utilities – including natural gas, aqueous ammonia, and instrument air – as required by the OTSG and IST supplied equipment is provided.
- Install grounding cables from foundation to grounding connections located on the Lower Inlet Plenum.

Checked by: _____ Date: _____

18 CUSTOMER / CONTRACTOR BACKCHARGE PROCEDURE

The customer, or the designated Erector, should be aware of the following:

Any work that is deemed as extra to the contract, by which IST is considered wholly or partially responsible for, should be first brought to the attention of IST by filling out a Backcharge Procedure form. After all the specific details have been defined and work scope identified, this form is to be faxed to IST head office for approval before proceeding. This provides IST with an opportunity to give input and/or engineering solutions, and the option to have either an on site vendor or an outside contractor perform the work. The Backcharge Procedure form can be found in Appendix B.

NOTE

IST will not honour extra work charges without prior approval.

19 SYSTEM CLEANING

19.1 DRY RUN OPERATION

An advantage to the Innovative Steam Technologies OTSG is the ability to operate dry without any water in the pressure circuits. This has significant advantages because the gas turbine can be commissioned before the OTSG has been fully completed and operational. It also allows for increased plant operation flexibility.

There are, however, several conditions that must be completed before dry run operation can commence.

- The OTSG must be flushed using demineralised feedwater meeting the IST specification ES-020 to remove any desiccant in the steam header and other impurities in the tubes. **Note that the OTSG pressure parts are supplied in a clean state and free of oils.**

- Internal OTSG mechanical construction must be completed and signed off. All punch list items completed. Refer to OTSG related items in the checklist found in Section 19.

- Steam and feedwater piping connections (if connected to the OTSG), must be fully supported placing no strain on the header nozzles. If the piping has not been attached to the OTSG, it is **strongly recommended** the open pipe connections be blanked off and vented to a safe

location to prevent personnel exposure to high temperature steam. Residual water from the flush will convert to steam and exit the feedwater and steam header openings.

- OTSG support columns must be installed and anchor bolt nuts adjusted as per the drawing requirements.
- Expansion joint alignment shipping brackets removed.
- During dry operation, the gas turbine exhaust gas temperature must be recorded on a regular schedule to ensure the maximum OTSG dry running temperature is not exceeded.
- Specific instructions with respect to the safety valve status must be given to the project site manager to be followed.

19.2 FEEDWATER SYSTEM CLEANING

To accomplish an effective cleaning and flush of the feedwater system, water flow rates should be as high as possible. The condensate and/or boiler feedwater pumps provide circulation and the condensate tank and condenser hotwell provide additional storage and surge capacity.

Prior to flushing the feedwater system, the condenser, hotwell, and deaerator storage tank are normally hand cleaned followed by a general hose washing. If there is a long delay before the deaerator is cleaned and brought to service, flash rusting will quickly occur. This will result in a dirty system that will require additional flushing and cleaning. A high-pressure water blast may be used to remove rust formed in the deaerator.

Demineralized water is used to flush the feedwater system. Flushing normally begins with the condenser hotwell, and continues stepwise through the condenser and feedwater systems up to the check valve on the OTSG feedwater inlet. Water flushing of the OTSG is not permitted until the feedwater piping is cleaned. Failure to do this may result in plugging the flow distribution orifices at the inlet flex tubes of the OTSG.

Any water that enters the OTSG tubing must meet the water requirements given IST Engineering Specification ES-020.

During the various cleaning operations, consideration must be given to the isolation and cleaning of all branch lines (drains, vents, isolation) to ensure an adequately cleaned system.

All feedwater control valves should be disassembled and the trim removed prior to flushing and orifice plates should not be installed until after the flush. Strainers are normally installed at the inlets to the condensate and feedwater pumps to protect them from damage by suspended material.

The high pressure feedwater check valve should be disassembled and undergo a full flush. Subsequently, stop the flush and inspect the feedwater flow control valve piping (or other low point in the feedwater piping) to ensure the line is clear and free of any grit. The flush should be repeated until the line is clear.

To aid in determining if the piping system is clean, collect a conductivity sample from the influent water supply and compare it to the effluent flush sample. When both conductivity readings are comparable, and within IST feedwater limits, the line is considered to be clean. After the flush, all strainers should be examined, cleaned and reinstalled.

The OTSG modules are assembled at the factory and the OTSG unit is assembled at site. An advantage to the OTSG is the elimination of grease and rolling oils that are used for the construction of drum type HRSG's. A simple flush is all that is required to clean the tubing of an IST OTSG. Once the entire unit is assembled and before the first steam production, demineralized water must be flushed through the unit to ensure a clear path and remove of any dirt particles or desiccant that may have been introduced during shipping.

This procedure can be accomplished in the following manner:

1. Ensure the water supply system upstream of the feedwater control valves is clean, tested, and meets the water specification (See ES-020).
2. Disconnect the feedwater flow meter impulse lines and remove the feedwater flow orifice.
3. Ensure the main steam pipe stop check valve is closed.
4. Open the main steam pipe drain valves located before the main steam pipe stop check valve, and then open feedwater control valves to flush the OTSG.
5. Observe the drain connections and continue to flush until the effluent water appears clean. Test the effluent water conductivity and ensure it is the same as the influent water.
6. Flush the feedwater meter impulse lines.
7. When the effluent water is clean, close the feedwater pipe block valve and completely drain the OTSG. Ensure the feedwater vent block valves are open. Dry the tubing as required in Engineering Specification ES-020.
8. Remove the attemperator feedwater flow orifice and disconnect the attemperator from the feedwater line.
9. Flush the attemperator feedwater line by opening the motorized feedwater block valve and then close the motorized valve when the line is clean.
10. Repeat the above procedure for all pressure circuits.

CAUTION

DO NOT INTRODUNCE ANY CAUSTIC OR ACIDIC SOLUTIONS INTO THE OTSG WITHOUT FIRST CONSULTING WITH IST.

Customer Backcharge Procedure and Authorization Form

Customer Backcharge Procedure and Authorization Form

IST is committed to offering our customers the best support possible for our world class technology. Please take the time to familiarize yourself and your staff with this very important procedure. This will help us to respond quickly to any backcharge related issues.

1.0 Introduction

A backcharge is considered to be a method by which a Customer can recover expenses and costs incurred to correct, repair, or replace an assigned item of IST's scope of supply. This includes, but is not limited to, malfunctions, failure to meet specifications, and overs, shorts or damages (OS&D).

2.0 Notification

On knowledge of a possible backcharge, Customer will notify IST on the pending backcharge and shall propose the method of handling, or otherwise request an IST proposed method of handling. IST will first be given the opportunity to inspect and correct the condition considering reasonable time parameters established by the Customer.

3.0 Execution

Customer shall evaluate all recommended methods of correction and select the method that is most economical and advantageous to all parties. Customer will prepare an estimate of charges before IST can approve the field work and any associated procurement. Any verbal instructions between the Customer and Contractor shall be followed by a letter of confirmation. Customer must make an attempt to obtain an IST signature on the backcharge before any work is performed. Failure to notify IST of potential backcharges before the initiation of work associated with the backcharge may result in non-coverage by IST. Backcharge claims received more than 30 calendar days after the work has been initiated will not be accepted by IST. If an IST Field Services Representative is on-site during the execution of a backcharge claim, then copies of all labour and equipment timesheets and all material and supply acquisitions will be handed over to IST Field Services Representative, in a timely manner, for review. Copies are also to be provided to IST together with the official backcharge claim.

4.0 Authorization

Included with this procedure is a form (Field Work Authorization for Backcharges, included as part of this SYS-126) to facilitate communication of acceptance. Other forms of communication/ acknowledgement may be considered valid as well. If an alternate Field Work Authorization form is to be considered then it shall be provided to IST ahead of time for review and understanding. Customer and IST are to jointly agree on the form that will be used prior to initiating the first backcharge event.

Customer's receipt of an approved/ accepted Field Work Authorization for Backcharge shall be the approval to proceed.

An AECON Company

P: +1.519.740.0036
F: +1.519.740.2051
www.otsg.com

5.0 Reconciliation

Backcharge Costs will be limited to the following:

1) Direct labour hours at fully burdened rate
2) Direct costs of 3rd party subcontractors, materials and supplies
3) Direct construction equipment usage will be based on actual hours used. Depending on the rental agreement, hourly rates shall be based on 1/217th of the monthly rental rate or 1/50th of the weekly rate or 1/10th of the daily rental rate. In cases where the equipment is rented solely for the execution of the backcharge work then the full rental cost is applied.
4) Direct design engineering hours at a fully burdened rate
5) Direct cost of 3rd party rentals
6) Mark-up fees for administration and overhead limited to 5%

6.0 Collection

The method for collection of backcharges shall be jointly agreed to between the Customer and IST and will include, but not be limited to, the following:

1) Debit memo applied to last invoice
2) Credit amendment
3) Set off against other monies owed by Customer to IST
4) Direct invoice for payment by IST

7.0 Dispute Resolution

Any backcharge dispute shall be resolved in accordance with the contract terms and conditions for dispute resolution.

Carbozinc®11 HS

Selection & Specification Data

Generic Type Solvent Based Inorganic Zinc

Description Ultra-low VOC member of the Carbozinc family with extraordinary performance characteristics. Carbozinc 11 HS combines unparalleled performance properties with a 2.4 lbs/gallon (unthinned) and 2.7 lbs/gallon (thinned) formulation that meets even the most stringent VOC restrictions.

Features

- Meets Class B slip co-efficient and creep testing criteria for use on faying surfaces
- Rapid cure. Dry to handle in 1 hour at 75°F (24°C) and 50% relative humidity
- Low temperature cure down to 15°F (-9°C)
- High zinc loading
- Very good resistance to salting
- May be applied with standard airless or conventional spray equipment
- May be used as a weldable pre-construction primer where VOC regulations prohibit traditional coatings. Exhibits long-term corrosion resistance during pre-construction and can be recoated or topcoated as specified for the intended service.
- VOC compliant to current AIM regulations

Color Green (0300)

Finish Flat

Primers Self Priming

Topcoats Not required for certain exposures. Can be topcoated with Epoxies, Polyurethanes, Acrylics, High-Heat Silicones and others as recommended by your Carboline sales representative. Under certain conditions, a mist coat is required to minimize topcoat bubbling.

Dry Film Thickness 2.0-3.0 mils (50-75 microns). Dry film thickness in excess of 6.0 mils (150 microns) per coat is not recommended. When used as a weldable pre-construction primer, the recommended DFT is 0.75-1.25 mils (19-31 microns).

Solids Content By Weight: 91% ± 2%

Zinc Content By Weight: 84% ± 2% in dry film

Theoretical Coverage Rate
1203 mil ft^2/gal (30.0 m^2/l at 25 microns)
401 ft^2 at 3.0 mils (10.0 m^2/l at 75 microns)
Allow for loss in mixing and application

VOC Values
EPA Method 24
Supplied:: 2.4 lbs./gal (288 g/l)
Thinned:
15 oz/gal w/ #26, #33, or #230: 2.95 lbs./gal (354 g/l)
(11 oz/.72 gal. kit or 55 oz/3.6 gal kit)
15 oz/gal w/ #237: 2.77 lbs/gal (332 g/l)
(11 oz/.72 gal. kit or 55 oz/3.6 gal kit)
These are nominal values.

Thinned (As pre-construction primer):
38 oz/gal w/ #26: 3.6 lbs./gal (435 g/l)
27 oz/.72 gallon kit or 138 oz/3.6 gallon kit

Selection & Specification Data Cont.

Dry Temp. Resistance

Untopcoated:
Continuous: 750°F (399°C)
Non-Continuous: 800°F (427°C)
With recommended high heat topcoats:
Continuous: 1000°F (538°C)
Non-Continuous: 1200°F (649°C)

Substrates & Surface Preparation

General Surfaces must be clean and dry. Employ adequate methods to remove dirt, dust, oil and all other contaminants that could interfere with adhesion of the coating.

Steel SSPC-SP6
Surface Profile: 1.0-3.0 mils (25-75 micron)

Performance Data

Test Method	System	Results	Report #
ASTM D3363 Pencil hardness	1 ct. CZ11HS	Pencil Hardness 3H	03278
ASTM A-325 or A-490 Slip co-efficient	1 ct. CZ11HS	0.58 meets requirements for Class B rating	08510
AASHTO M300	Blasted steel 1ct. CZ11HS	No blistering or rusting of coating or any bare steel areas.	02934
ASTM B117 Salt Spray	Blasted Steel 1 ct. CZ11HS	No rusting or blistering; slight rust in scribe, no creepage at scribe after 70,000 hours	SR 380

Test reports and additional data available upon written request.

Application Equipment

Listed below are general equipment guidelines for the application of this product. Job site conditions may require modifications to these guidelines to achieve the desired results.

General Guidelines:

Spray Application (General) The following spray equipment has been found suitable and is available from manufacturers such as Binks, DeVilbiss and Graco. Keep material under mild agitation during application. If spraying stops for more than 10 minutes, recirculate the material remaining in the spray line. Do not leave mixed primer in the hoses during work stoppages.

Conventional Spray Agitated pressure pot equipped with dual regulators, 3/8" I.D. minimum material hose, with a maximum length of 50', .070" I.D. fluid tip and appropriate air cap.

Airless Spray
Pump Ratio: 30:1 (min.)
GPM Output: 3.0 (min.)
Material Hose: 3/8" I.D. (min.)
Tip Size: .017-.021"
Output PSI: 2100-2500
Filter Size: 60 mesh
Teflon packings are recommended and available from the pump manufacturer.

Brush For touch-up of areas less than one square foot only. Use medium bristle brush and avoid rebrushing.

Roller Not recommended

November 2009 replaces August 2009

0249

Carbozinc®11 HS

Mixing & Thinning

Mixing

Power mix base, then combine and power mix as follows. Pour zinc filler very slowly into premixed base with continuous agitation. Mix until free of lumps. Then add activator and mix for another 2 minutes. Pour mixture through a 30 mesh screen. DO NOT MIX PARTIAL KITS. **Note**: Carbozinc 11 HS will not cure without the use of the Activator as defined below.
Tip: Sifting zinc through a window screen will aid in the mixing process by breaking up or catching dry zinc lumps.

Ratio

	.72 Gal Kit	3.6 Gal Kit
Part A:	1 gal. (short fill)	5 gals. (short fill)
Activator:	6.4 fl. oz.	32 fl. oz.
Zinc Filler:	14.6 lbs	73 lbs

Thinning

Normally not required but may be thinned up to 11 oz per .72 gal kit or 55 oz per 3.6 gal kit with Thinner #26, #33, #230 or #237. Use of thinners other than those supplied by Carboline may adversely affect product performance and void product warranty, whether expressed or implied.

For use as a weldable zinc primer to achieve a recommended DFT of 0.75-1.25 mils, thin this product 30% with Thinner #26.

Carboline Thinner #236E may also be used to thin this product to minimize HAP and VOC emissions. Consult Carboline Technical Service for guidance.

Pot Life

8 Hours at 75°F (24°C) and less at higher temperatures. Pot life ends when coating becomes too viscous to use.

Cleanup & Safety

Cleanup

Use Thinner #21 or Isopropyl Alcohol. In case of spillage, absorb and dispose of in accordance with local applicable regulations.

Safety

Read and follow all caution statements on this product data sheet and on the MSDS for this product. Employ normal workmanlike safety precautions. Hypersensitive persons should wear protective clothing, gloves and use protective cream on face, hands and all exposed areas.

Ventilation

When used in enclosed areas, thorough air circulation must be used during and after application until the coating is cured. The ventilation system should be capable of preventing the solvent vapor concentration from reaching the lower explosion limit for the solvents used. In addition to ensuring proper ventilation, appropriate respirators must be used by all application personnel.

Caution

This product contains flammable solvents. Keep away from sparks and open flames. All electrical equipment and installations should be made and grounded in accordance with the National Electric Code. In areas where explosion hazards exist, workmen should be required to use non-ferrous tools and wear conductive and non-sparking shoes.

Application Conditions

Condition	Material	Surface	Ambient	Humidity
Normal	60°-85°F (16°-29°C)	40°-95°F (4°-35°C)	40°-95°F (4°-35°C)	40-90%
Minimum	15°F (-9°C)	15°F (-9°C)	15°F (-9°C)	30%
Maximum	95°F (35°C)	150°F (66°C)	120°F (49°C)	95%

This product simply requires the substrate temperature to be above the dew point. Condensation due to substrate temperatures below the dew point can cause flash rusting on prepared steel and interfere with proper adhesion to the substrate. Special application techniques may be required above or below normal application conditions.

Curing Schedule

Surface Temp. & 50% Relative Humidity	Dry to Handle	Dry to Topcoat
15°F (-9°C)	16 Hours	7 Days
40°F (4°C)	4 Hours	72 Hours
60°F (16°C)	2 Hours	36 Hours
75°F (24°C)	1 Hour	18 Hours
100°F (32°C)	¾ Hour	14 Hours

These times are based on a 3.0 mil (75 micron) dry film thickness. Higher film thickness, insufficient ventilation or cooler temperatures will require longer cure times and could result in solvent entrapment and premature failure. Humidity levels below 50% will require longer cure times. **Notes**: Any salting that appears on the zinc surface as a result of prolonged weathering exposure must be removed prior to the application of additional coatings. Also, loose zinc must be removed from the cured film by rubbing with fiberglass or aluminum screen wire when "dry spray/overspray" is evident on the cured film and a topcoat will be applied. For **accelerated curing** or **where the relative humidity is below 40%**, allow an initial 2-hour ambient cure followed by misting with water or steam to keep the coated surface wet for a minimum of 8 hours and/or until the coated surface achieves a "2H" pencil hardness per ASTM D3363.

Packaging, Handling & Storage

Shipping Weight (Approximate)

.72 Gallon Kit	3.6 Gallon Kit
22 lbs (10 kg)	103 lbs (47 kg)

Flash Point (Setaflash)

Carbozinc 11 HS base: 55°F (13°C)
HS Activator: 90°F (33°C)
Zinc Filler: N/A

Storage (General)

Store Indoors.

Storage Temperature & Humidity

40° -100°F (4-38°C).
0-90% Relative Humidity

Shelf Life

Part A: 12 months at 75°F (24°C)
Part B: 24 months at 75°F (24°C)
Part C: Min. 24 months at 75°F (24°C)

***Shelf Life: (actual stated shelf life) when kept at recommended storage conditions and in original unopened containers.**

Section 3 - Hazards Identification

Emergency Overview: Warning! Flammable. Harmful if inhaled. Causes eye and skin irritation. Aspiration may cause lung damage. May cause dizziness and drowsiness. Keep away from heat, sparks, flame. Avoid breathing vapor. Avoid contact with eyes, skin and clothing. Do not swallow. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling.

Effects Of Overexposure - Eye Contact: May cause eye irritation.

Effects Of Overexposure - Skin Contact: Direct skin contact may cause irritation. May be harmful if absorbed through the skin.

Effects Of Overexposure - Inhalation: Harmful if inhaled, may affect the brain or nervous system, causing dizziness, headache, or nausea. May cause nose and throat irritation.

Effects Of Overexposure - Ingestion: Harmful if swallowed.

Effects Of Overexposure - Chronic Hazards: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage.

Primary Route(s) Of Entry: Skin Contact, Skin Absorption, Inhalation, Ingestion, Eye Contact

Medical Conditions Prone to Aggravation by Exposure: If you have a condition that could be

aggravated by exposure to dust or organic vapors, see a physician prior to use.

Section 4 - First Aid Measures

First Aid - Eye Contact: If material gets into eyes, flush with water immediately for 15 minutes. Consult a physician.

First Aid - Skin Contact: In case of contact, immediately flush skin with plenty of water while removing contaminated clothing and shoes. Launder clothing before reuse. If rash or irritation develops, consult a physician.

First Aid - Inhalation: If inhaled, remove to fresh air. Administer oxygen if necessary. Consult a physician if symptoms persist or exposure was severe.

First Aid - Ingestion: If swallowed do not induce vomiting. Seek immediate medical attention.

Section 5 - Fire Fighting Measures

Flash Point, F: 55F (12C) (Setaflash)

Lower Explosive Limit, %: 1.2
Upper Explosive Limit, %: 36.0

Extinguishing Media: Carbon Dioxide, Dry Chemical, Foam, Water Fog

Unusual Fire And Explosion Hazards: Flammable Liquid. Vapors are heavier than air and will accumulate. Vapors will form explosive concentrations with air. Vapors travel long distances and will flashback. Use mechanical ventilation when necessary to keep percent vapor below the "Lower Explosion Level" (LEL). Eliminate all ignition sources. Keep away from sparks, open flames and heat sources. All electric equipment and installations should be made and grounded in accordance with the National Electrical Code. In areas where explosion hazards exist, workers should be required to use non-ferrous tools and to wear conductive and non-sparking shoes.

Special Firefighting Procedures: Flammable. Cool fire-exposed containers using water spray.

Section 6 - Accidental Release Measures

Steps To Be Taken If Material Is Released Or Spilled: Eliminate all ignition sources. Handling equipment must be grounded to prevent sparking. Evacuate the area of unprotected personnel. Wear appropriate personal protection clothing and equipment. Follow exposure controls/personal protection guidelines in Section 8. Contain and soak up residual with an aborbent (clay or sand). Take up absorbant material and seal tightly for proper disposal. Dispose of in accordance with local, state and federal regulations. Refer to Section 15 for SARA Title III and CERCLA information.

Section 7 - Handling And Storage

Handling: Do not get in eyes, on skin, or on clothing. Keep container tightly closed when not in use. Wear personal protection equipment. Do not breathe vapors. Wash thoroughly after handling. If pouring or transferring materials, ground all containers and tools. Do not weld, heat, cut or drill on full or empty containers. Use only in accordance with Carboline application instructions, container label and Product Data Sheet. Avoid breathing vapors or spray mist.

Storage: Keep away from heat, sparks, open flames and oxidizing agents. Keep containers closed. Store in a cool, dry place with adequate ventilation.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use explosion-proof ventilation when required to keep below health exposure guidelines and Lower Explosion Limit (LEL).

Respiratory Protection: Use only with ventilation to keep levels below exposure guidelines listed in Section 2. User should test and monitor exposure levels to ensure all personnel are below guidelines. If

not sure, or not able to monitor, use MSHA/NIOSH approved supplied air respirator. Follow all current OSHA requirements for respirator use. For silica containing coatings in a liquid state, and/or if no exposure limits are established in Section 2 above, supplied air respirators are generally not required.

Skin Protection: Recommend impervious gloves and clothing to avoid skin contact. If material penetrates to skin, change gloves and clothing. The use of protective creams may be beneficial to certain individuals. Protective creams should be applied before exposure.

Eye Protection: Recommend safety glasses with side shields or chemical goggles to avoid eye contact.

Other protective equipment: Eye wash and safety showers should be readily available.

Hygienic Practices: Wash with soap and water before eating, drinking, smoking, applying cosmetics, or using toilet facilities. Use of a hand cleaner is recommended. Launder contaminated clothing before reuse. Leather shoes can absorb and allow hazardous materials to pass through. Check shoes carefully after soaking before reuse.

Section 9 - Physical And Chemical Properties

Boiling Range:	149 F (65 C) - 248 F (120 C)	**Vapor Density:**	Heavier than Air
Odor:	Solvent	**Odor Threshold:**	N/D
Appearance:	Viscous Green, Grey or Red Liquid	**Evaporation Rate:**	Slower Than Ether
Solubility in H2O:	N/D		
Freeze Point:	N/D	**Specific Gravity:**	1.26
Vapor Pressure:	N/D	**PH:**	N/D
Physical State:	Liquid		

(See section 16 for abbreviation legend)

Section 10 - Stability And Reactivity

Conditions To Avoid: Heat, sparks and open flames.

Incompatibility: Keep away from strong oxidizing agents, heat and open flames.

Hazardous Decomposition Products: Carbon monoxide, nitrogen oxides, and unidentified organic compounds. Consider all smoke and fumes from burning material as very hazardous. Welding, cutting or abrasive grinding can create smoke and fumes. Do not breathe any fumes or smoke from these operations.

Hazardous Polymerization: Will not occur under normal conditions.

Stability: This product is stable under normal storage conditions.

Section 15 - Regulatory Information

CERCLA - SARA HAZARD CATEGORY

This product has been reviewed according to the EPA Hazard Categories promulgated under Sections 311and 312 of the Superfund Amendment and Reauthorization Act of 1986 (SARA Title III) and is considered, under applicable definitions, to meet the following categories:

IMMEDIATE HEALTH HAZARD, CHRONIC HEALTH HAZARD, FIRE HAZARD

SARA SECTION 313

This product contains the following substances subject to the reporting requirements of Section 313 of Title III of the Superfund Amendment and Reauthorization Act of 1986 and 40 CFR part 372:

No Section 313 Substances exist in this product

TOXIC SUBSTANCES CONTROL ACT

All components of this product are listed on the TSCA inventory.

This product contains the following chemical substances subject to the reporting requirements of TSCA 12(B) if exported from the United States:

No TSCA 12(B) Substances exist in this product

U.S. STATE REGULATIONS AS FOLLOWS:

NEW JERSEY RIGHT-TO-KNOW

The following materials are non-hazardous, but are among the top five components in this product.

Chemical Name	CAS Number
CERAMIC MICROSPHERES	66402-68-4

PENNSYLVANIA RIGHT-TO-KNOW

The following non-hazardous ingredients are present in the product at greater than 3%.

Chemical Name	CAS Number
CERAMIC MICROSPHERES	66402-68-4
IRON OXIDE	1332-37-2

CALIFORNIA PROPOSITION 65

Warning: The following ingredients present in the product are known to the state of California to cause Cancer:

Protective & Marine Coatings

ZINC CLAD® II ETHYL SILICATE
INORGANIC ZINC-RICH COATING

PART E	B69V3	BINDER
PART F	B69D11	ZINC DUST

Revised 1/11

PRODUCT INFORMATION

6.02

PRODUCT DESCRIPTION

ZINC CLAD II ETHYL SILICATE is a solvent-based two-package, inorganic ethyl silicate, zinc-rich coating.

- Meets Class B requirements for Slip Coefficient and Creep Resistance, .56
- Meets AASHTO M-300 specification
- 85% zinc content in dry film
- Coating self-heals to resume protection if damaged
- Provides cathodic/sacrificial protection by the same mechanism as galvanizing. Also protects steel by forming an inorganic moisture and solvent barrier

PRODUCT CHARACTERISTICS

Finish:	Flat
Color:	Gray-green
Volume Solids:	62% ± 2%, ASTM D2697, mixed
Weight Solids:	82% ± 2 %, mixed
VOC (calculated): mixed	Unreduced: <500 g/L; 4.17 lb/gal Reduced 10%: <500 g/L; 4.17 lb/gal
Zinc Content in Dry Film:	85% by weight
Mix Ratio:	2 components; premeasured 5 gallons (18.9L) mix

Recommended Spreading Rate per coat:

	Minimum	Maximum
Wet mils (microns)	**3.5** (88)	**6.5** (163)
Dry mils (microns)	**2.0** (50)	**4.0** (100)
~Coverage sq ft/gal (m^2/L)	**248** (6.1)	**496** (12.2)
Theoretical coverage **sq ft/gal** (m^2/L) @ 1 mil / 25 microns dft	**995** (24.3)	

Dry film thickness in excess of 6.0 mils (150 microns) per coat is not recommended.

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Drying Schedule @ 5.0 mils wet (125 microns):

	@ 55°F/13°C	@ 77°F/25°C *50% RH*	@ 100°F/38°C
Rain resistant:	1 hour	20-30 minutes	15 minutes
To touch:	30 minutes	15 minutes	5 minutes
To handle:	3 hours	1-2 hours	20 minutes
To recoat:	48 hours	18 hours	18 hours
To cure:	7 days	7 days	7 days
Immersion service:	14 days	14 days	14 days
Drying time is temperature, humidity, and film thickness dependent.			
Pot Life:	18 hours	8 hours	6 hours

Note: High humidity will shorten the pot life.

Sweat-in-Time: None required

Shelf Life:	Part E: 9 months, unopened Part F: 24 months, unopened Store indoors at 40°F (4.5°C) to 100°F (38°C).
Flash Point:	55°F (13°C), PMCC, mixed
Reducer/Clean Up:	
Below 80°F (27°C):	Xylene, R2K4
Above 80°F (27°C):	Reducer #58, R7K58 or Reducer 100, R2K5

RECOMMENDED USES

For use over properly prepared blasted steel.

- As a one-coat maintenance coating or as a permanent primer for severely corrosive environments (pH range 5-9)
- Economical replacement for galvanizing with similar performance
- Ideal for application at low temperatures or service at high temperatures and/or humidity conditions
- Water intake and discharge lines (non-potable)
- Where abrasion resistance and hardness is required
- Bridges, refineries, drilling rigs
- Shop or field application
- Not recommended for severe acid or alkali exposure
- This product meets specific design requirements for non-safety related nuclear plant applications in Level II, III and Balance of Plant, and DOE nuclear facilities*.
  - Nuclear Power Plants
  - Nuclear fabrication shops
  - DOE Nuclear Fuel Facilities
  - DOE Nuclear Weapons Facilities

* Nuclear qualifications are NRC license specific to the facility.

PERFORMANCE CHARACTERISTICS

Substrate*: Steel

Surface Preparation*: SSPC-SP10/NACE 2

System Tested*:

1 ct. Zinc Clad II @ 3.0 mils dft (75 microns)

*unless otherwise noted below

Test Name	Test Method	Results
Abrasion Resistance	ASTM D4060, CS17 wheel, 1000 cycles, 1 kg load	326 mg loss
Adhesion	ASTM D4541	6.77 MPa = 982 lb psi
Direct Impact Resistance	ASTM D2794	60 in. lbs.
Dry Heat Resistance	ASTM D2485	750°F (399°C)
Immersion Resistance (untopcoated)	1 year	Acceptable for: crude oil, fresh and demineralized water, gasoline
Moisure Condensation Resistance	ASTM D4585, 100°F (38°C), 2000 hours	No Failure
Pencil Hardness	ASTM D3363	3H
Radiation Tolerance	ASTM D4082 / ANSI 5.12	Pass at 5 mils (125 microns)
Salt Fog Resistance	ASTM B117, 2000 hours	No Failure
Slip Coefficient (zinc only)	AISC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts	Class B, 0.56
Wet Heat Resistance	Non-immersion	115°F (46°C)

Provides performance comparable to products formulated to Federal Specifications: Mil-P-38336, Mil-P-46105, and SSPC Paint 20.

Steel, Epoxy Topcoat, atmospheric:			
1 ct.	Zinc Clad II Ethyl Silicate	2.0-4.0	(50-100)
1-2 cts.	Macropoxy HS	3.0-6.0	(75-150)
Steel, Epoxy Topcoat, atmospheric:			
1 ct.	Zinc Clad II Ethyl Silicate	2.0-4.0	(50-100)
2 cts.	Tile-Clad HS Epoxy	3.0-4.0	(75-100)
Steel, Urethane Topcoat, atmospheric:			
1 ct.	Zinc Clad II Ethyl Silicate	2.0-4.0	(50-100)
1 ct.	Macropoxy HS	3.0-6.0	(75-150)
1 ct.	Sherthane 2K Urethane	2.0-4.0	(50-100)

NOTE: 1 ct. of DTM Wash Primer or Pro-Cryl Universal Primer can be used as an intermediate coat under recommended topcoats to prevent pinholing.

Steel, Class B Compliant System			
1 ct.	Zinc Clad II Ethyl Silicate	2.0-4.0	(50-100)
1 ct.	Steel Spec Epoxy Primer (red)	4.0-6.0	(100-150)

The systems listed above are representative of the product's use, other systems may be appropriate.

DISCLAIMER

The information and recommendations set forth in this Product Data Sheet are based upon tests conducted by or on behalf of The Sherwin-Williams Company. Such information and recommendations set forth herein are subject to change and pertain to the product offered at the time of publication. Consult your Sherwin-Williams representative to obtain the most recent Product Data Information and Application Bulletin.

SURFACE PREPARATION

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Refer to product Application Bulletin for detailed surface preparation information.

Minimum recommended surface preparation:
Iron & Steel
Atmospheric: SSPC-SP6/ NACE 3, 2 mil (50 micron) profile
Immersion: SSPC-SP10/NACE 2, 2 mil (50 micron) profile

Surface Preparation Standards

	Condition of Surface	ISO 8501-1 BS7079:A1	Swedish Std. SIS055900	SSPC	NACE
White Metal		Sa 3	Sa 3	SP 5	1
Near White Metal		Sa 2.5	Sa 2.5	SP 10	2
Commercial Blast		Sa 2	Sa 2	SP 6	3
Brush-Off Blast		Sa 1	Sa 1	SP 7	4

Power Tool Cleaning	Rusted	C St 3	C St 3	SP 3	-
	Pitted & Rusted	D St 3	D St 3	SP 3	-

TINTING

Do not tint.

APPLICATION CONDITIONS

Temperature:	
air and surface:	0°F (-7°C) minimum, 120°F (49°C) maximum
material:	40°F (4.5°C) minimum At least 5°F (2.8°C) above dew point
Relative humidity:	40% - 90% maximum Water misting may be required at humidities below 50%

Refer to product Application Bulletin for detailed application information.

ORDERING INFORMATION

Packaging:	5 gallons (18.9L) mixed
Part E:	3.75 gallons (14.2L) in a 5 gallon (18.9L) can
Part F:	73 lb (33.1 Kg) zinc dust
Weight:	20.9 ± 0.2 lb/gal ; 2.5 Kg/L, mixed

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

WARRANTY

The Sherwin-Williams Company warrants our products to be free of manufacturing defects in accord with applicable Sherwin-Williams quality control procedures. Liability for products proven defective, if any, is limited to replacement of the defective product or the refund of the purchase price paid for the defective product as determined by Sherwin-Williams. NO OTHER WARRANTY OR GUARANTEE OF ANY KIND IS MADE BY SHERWIN-WILLIAMS, EXPRESSED OR IMPLIED, STATUTORY, BY OPERATION OF LAW OR OTHERWISE, INCLUDING MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Protective & Marine Coatings

ZINC CLAD® II ETHYL SILICATE
INORGANIC ZINC-RICH COATING

PART E	B69V3	BINDER
PART F	B69D11	ZINC DUST

Revised 1/11

APPLICATION BULLETIN

6.02

SURFACE PREPARATIONS

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Zinc rich coatings require direct contact between the zinc pigment in the coating and the metal substrate for optimum performance.

Iron & Steel (atmospheric service)
Remove all oil and grease from surface by Solvent Cleaning per SSPC-SP1. Minimum surface preparation is Commercial Blast Cleaning per SSPC-SP6/NACE 3. For better performance, use Near White Metal Blast Cleaning per SSPC-SP10/NACE 2. Blast clean all surfaces using a sharp, angular abrasive for optimum surface profile (2 mils / 50 microns). Prime any bare steel the same day as it is cleaned or before flash rusting occurs.

Iron & Steel (immersion service)
Remove all oil and grease from surface by Solvent Cleaning per SSPC-SP1. Minimum surface preparation is Near White Metal Blast Cleaning per SSPC-SP10/NACE 2. Blast clean all surfaces using a sharp, angular abrasive for optimum surface profile (2 mils / 50 microns). Remove all weld spatter and round all sharp edges by grinding. Prime any bare steel the same day as it is cleaned or before flash rusting occurs.

Note: If blast cleaning with steel media is used, an appropriate amount of steel grit blast media may be incorporated into the work mix to render a dense, angular 1.5-2.0 mil (38-50 micron) surface profile. This method may result in improved adhesion and performance.

Surface Preparation Standards

	Condition of Surface	ISO 8501-1 BS7079:A1	Swedish Std. SIS055900	SSPC	NACE
White Metal		Sa 3	Sa 3	SP 5	1
Near White Metal		Sa 2.5	Sa 2.5	SP 10	2
Commercial Blast		Sa 2	Sa 2	SP 6	3
Brush-Off Blast		Sa 1	Sa 1	SP 7	4
Hand Tool Cleaning	Rusted	C St 2	C St 2	SP 2	-
	Pitted & Rusted	D St 2	D St 2	SP 2	-
Power Tool Cleaning	Rusted	C St 3	C St 3	SP 3	-
	Pitted & Rusted	D St 3	D St 3	SP 3	-

APPLICATION CONDITIONS

Temperature:
- air and surface: 0°F (-7°C) minimum, 120°F (49°C) maximum
- material: 40°F (4.5°C) minimum
  At least 5°F (2.8°C) above dew point

Relative humidity: 40% - 90% maximum
Water misting may be required at humidities below 50%

APPLICATION EQUIPMENT

The following is a guide. Changes in pressures and tip sizes may be needed for proper spray characteristics. Always purge spray equipment before use with listed reducer. Any reduction must be compliant with existing VOC regulations and compatible with the existing environmental and application conditions.

Reducer/Clean Up
Below 80°F (27°C) .....Xylene, R2K4
Above 80°F (27°C).....Reducer #58, R7K58 or Reducer 100, R2K5

Airless Spray
(use Teflon packings and continuous agitation)
Pressure.....1800 - 2000 psi
Hose.....3/8" ID
Tip .....017" - .021"
Reduction.....As needed up to 10% by volume

Conventional Spray
(continuous agitation required)
Gun .....Binks 95
Fluid Nozzle 66
Air Nozzle.....63PB
Atomization Pressure.....30 - 40 psi
Fluid Pressure.....10 - 20 psi
Reduction.....As needed up to 10% by volume

Keep pressure pot at level of applicator to avoid blocking of fluid line due to weight of material. Blow back coating in fluid line at intermittent shutdowns, but continue agitation at pressure pot.

Brush .....For touch-up only

If specific application equipment is not listed above, equivalent equipment may be substituted.

continued on back

Protective & Marine Coatings

ZINC CLAD® II ETHYL SILICATE
INORGANIC ZINC-RICH COATING

PART E	B69V3	BINDER
PART F	B69D11	ZINC DUST

APPLICATION BULLETIN

6.02

APPLICATION PROCEDURES

Surface preparation must be completed as indicated.

Zinc Clad II comes in 2 premeasured containers which when mixed provides 5 gallons (18.9L) of read-to-apply material.

Mixing Instructions: Thoroughly agitate Binder Part E using low speed continuous air driven agitation. Slowly mix all of Zinc Dust Part F into all of Binder Part E until mixture is completely uniform. After mixing, pour mixture through 30-60 mesh screen. Mixed material must be used within 8 hours. Do not mix previously mixed material with new.
If reducer solvent is used, add only after both components have been thoroughly mixed.
Continuous agitation of mixture during application is required, otherwise zinc dust will quickly settle out.

Apply paint at the recommended film thickness and spreading rate as indicated below:

Recommended Spreading Rate per coat:

	Minimum	Maximum
Wet mils (microns)	**3.5** (88)	**6.5** (163)
Dry mils (microns)	**2.0** (50)	**4.0** (100)
~Coverage sq ft/gal (m^2/L)	**248** (6.1)	**496** (12.2)
Theoretical coverage **sq ft/gal** (m^2/L) @ 1 mil / 25 microns dft	**995** (24.3)	

Dry film thickness in excess of 6.0 mils (150 microns) per coat is not recommended.

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Drying Schedule @ 5.0 mils wet (125 microns):

	@ 55°F/13°C	@ 77°F/25°C *50% RH*	@ 100°F/38°C
Rain resistant:	1 hour	20-30 minutes	15 minutes
To touch:	30 minutes	15 minutes	5 minutes
To handle:	3 hours	1-2 hours	20 minutes
To recoat:	48 hours	18 hours	18 hours
To cure:	7 days	7 days	7 days
Immersion service:	14 days	14 days	14 days

Drying time is temperature, humidity, and film thickness dependent.

Pot Life:	18 hours	8 hours	6 hours

Note: High humidity will shorten the pot life.

Sweat-in-Time: None required

Application of coating above maximum or below minimum recommended spreading rate may adversely affect coating performance.

CLEAN UP INSTRUCTIONS

Clean spills and spatters immediately with Xylene, R2K4. Clean tools immediately after use with Xylene, R2K4. Follow manufacturer's safety recommendations when using any solvent.

DISCLAIMER

The information and recommendations set forth in this Product Data Sheet are based upon tests conducted by or on behalf of The Sherwin-Williams Company. Such information and recommendations set forth herein are subject to change and pertain to the product offered at the time of publication. Consult your Sherwin-Williams representative to obtain the most recent Product Data Information and Application Bulletin.

PERFORMANCE TIPS

Topcoating: Note minimum cure times at normal conditions before topcoating. Longer drying periods are required if primer cannot be water mist sprayed when humidity is low. Water misting may be required at humidities below 50%.
Occasionally topcoats will pinhole or delaminate from zinc-rich coatings. This is usually due to poor ambient conditions or faulty application of topcoats. This can be minimized by:

- Providing adequate ventilation and suitable application and substrate temperature.
- Avoid dry spray of topcoat.
- If pinholing develops, apply a mist coat of the topcoat, reduced up to 50%. Allow 10 minutes flash off and follow with a full coat.
- Applying a wet full coat, but at minimum film build, prior to applying a complete full coat.

Excessive film build, poor ventilation, and cool temperatures may cause solvent entrapment and premature coating failure.

Any salting on the zinc surface due to weathering exposure must be removed prior to topcoating.

Stripe coat all crevices, welds, and sharp angles to prevent early failure in these areas.

When using spray application, use a 50% overlap with each pass of the gun to avoid holidays, bare areas, and pinholes. If necessary, cross spray at a right angle.

Spreading rates are calculated on volume solids and do not include an application loss factor due to surface profile, roughness or porosity of the surface, skill and technique of the applicator, method of application, various surface irregularities, material lost during mixing, spillage, overthinning, climatic conditions, and excessive film build.

Excessive reduction of material can affect film build, appearance, and performance.

Do not mix previously catalyzed material with new.

Do not apply the material beyond recommended pot life.

In order to avoid blockage of spray equipment, clean equipment before use or before periods of extended downtime with Xylene, R2K4.

Keep pressure pot at level of applicator to avoid blocking of fluid line due to weight of material. Blow back coating in fluid line at intermittent shutdowns, but continue agitation at pressure pot.

Application above recommended film thickness may result in mud cracking.

Not recommended for severe acid or alkali exposures.

Oil base, alkyd, epoxy ester, and silicone alkyd topcoats are not recommended.

Polyurethane topcoats require a tie coat of catalyzed epoxy or Pro-Cryl Universal Primer.

Topcoats may be applied once 50 MEK double rubs are achieved. No zinc or only slight traces should be visible. Coin hardness test can also be used.

Cured films of inorganic zinc coatings contain no appreciable amounts of combustible materials. Both Fire and Smoke Indices would be expected to approach 0.

Refer to Product Information sheet for additional performance characteristics and properties.

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

WARRANTY

The Sherwin-Williams Company warrants our products to be free of manufacturing defects in accord with applicable Sherwin-Williams quality control procedures. Liability for products proven defective, if any, is limited to replacement of the defective product or the refund of the purchase price paid for the defective product as determined by Sherwin-Williams. NO OTHER WARRANTY OR GUARANTEE OF ANY KIND IS MADE BY SHERWIN-WILLIAMS, EXPRESSED OR IMPLIED, STATUTORY, BY OPERATION OF LAW OR OTHERWISE, INCLUDING MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

SECTION 3 — HAZARDS IDENTIFICATION

ROUTES OF EXPOSURE
INHALATION of vapor or spray mist.
EYE or SKIN contact with the product, vapor or spray mist.
Contains alcohols and acetates which can be absorbed through the skin.

HMIS Codes

Health	3*
Flammability	3
Reactivity	0

EFFECTS OF OVEREXPOSURE

EYES: Irritation.
SKIN: Prolonged or repeated exposure may cause irritation.
INHALATION: Irritation of the upper respiratory system.

May cause nervous system depression. Extreme overexposure may result in unconsciousness and possibly death.
Prolonged overexposure to hazardous ingredients in Section 2 may cause adverse chronic effects to the following organs or systems:

- the liver
- the urinary system
- the reproductive system

SIGNS AND SYMPTOMS OF OVEREXPOSURE

Headache, dizziness, nausea, and loss of coordination are indications of excessive exposure to vapors or spray mists.
Redness and itching or burning sensation may indicate eye or excessive skin exposure.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE

None generally recognized.

CANCER INFORMATION

For complete discussion of toxicology data refer to Section 11.

SECTION 4 — FIRST AID MEASURES

EYES: Flush eyes with large amounts of water for 15 minutes. Get medical attention.
SKIN: Wash affected area thoroughly with soap and water.
Remove contaminated clothing and launder before re-use.
INHALATION: If affected, remove from exposure. Restore breathing. Keep warm and quiet.
INGESTION: Do not induce vomiting. Get medical attention immediately.

SECTION 5 — FIRE FIGHTING MEASURES

FLASH POINT	LEL	UEL	FLAMMABILITY CLASSIFICATION
60 °F PMCC	1.0	36.5	RED LABEL -- Flammable, Flash below 100 °F (38 °C)

EXTINGUISHING MEDIA

Carbon Dioxide, Dry Chemical, Foam

UNUSUAL FIRE AND EXPLOSION HAZARDS

Closed containers may explode when exposed to extreme heat.
Application to hot surfaces requires special precautions.
During emergency conditions overexposure to decomposition products may cause a health hazard. Symptoms may not be immediately apparent. Obtain medical attention.

SPECIAL FIRE FIGHTING PROCEDURES

Full protective equipment including self-contained breathing apparatus should be used.
Water spray may be ineffective. If water is used, fog nozzles are preferable. Water may be used to cool closed containers to prevent pressure build-up and possible autoignition or explosion when exposed to extreme heat.

SECTION 6 — ACCIDENTAL RELEASE MEASURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

Remove all sources of ignition. Ventilate the area.
Remove with inert absorbent.

SECTION 7 — HANDLING AND STORAGE

STORAGE CATEGORY

DOL Storage Class IB

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE

Contents are FLAMMABLE. Keep away from heat, sparks, and open flame.
During use and until all vapors are gone: Keep area ventilated - Do not smoke - Extinguish all flames, pilot lights, and heaters - Turn off stoves, electric tools and appliances, and any other sources of ignition.
Consult NFPA Code. Use approved Bonding and Grounding procedures.
Keep container closed when not in use. Transfer only to approved containers with complete and appropriate labeling. Do not take internally. Keep out of the reach of children.

SECTION 8 — EXPOSURE CONTROLS/PERSONAL PROTECTION

PRECAUTIONS TO BE TAKEN IN USE

Use only with adequate ventilation.
Avoid contact with skin and eyes. Avoid breathing vapor and spray mist.
Wash hands after using.

This coating may contain materials classified as nuisance particulates (listed "as Dust" in Section 2) which may be present at hazardous levels only during sanding or abrading of the dried film. If no specific dusts are listed in Section 2, the applicable limits for nuisance dusts are ACGIH TLV 10 mg/m3 (total dust), 3 mg/m3 (respirable fraction), OSHA PEL 15 mg/m3 (total dust), 5 mg/m3 (respirable fraction).

VENTILATION

Local exhaust preferable. General exhaust acceptable if the exposure to materials in Section 2 is maintained below applicable exposure limits. Refer to OSHA Standards 1910.94, 1910.107, 1910.108.

RESPIRATORY PROTECTION

If personal exposure cannot be controlled below applicable limits by ventilation, wear a properly fitted organic vapor/particulate respirator approved by NIOSH/MSHA for protection against materials in Section 2.

When sanding or abrading the dried film, wear a dust/mist respirator approved by NIOSH/MSHA for dust which may be generated from this product, underlying paint, or the abrasive.

PROTECTIVE GLOVES

Wear gloves which are recommended by glove supplier for protection against materials in Section 2.

EYE PROTECTION

Wear safety spectacles with unperforated sideshields.

OTHER PROTECTIVE EQUIPMENT

Use of barrier cream on exposed skin is recommended.

OTHER PRECAUTIONS

Intentional misuse by deliberately concentrating and inhaling the contents can be harmful or fatal.

SECTION 9 — PHYSICAL AND CHEMICAL PROPERTIES

PRODUCT WEIGHT	8.17 lb/gal	978 g/l
SPECIFIC GRAVITY	0.98	
BOILING POINT	148 - 335 °F	64 - 168 °C
MELTING POINT	Not Available

VOLATILE ORGANIC COMPOUNDS (VOC Theoretical - As Packaged)

5.24 lb/gal	628 g/l	Less Water and Federally Exempt Solvents
5.10 lb/gal	612 g/l	Emitted VOC

SECTION 10 — STABILITY AND REACTIVITY

STABILITY — Stable

CONDITIONS TO AVOID

None known.

INCOMPATIBILITY

None known.

HAZARDOUS DECOMPOSITION PRODUCTS

By fire: Carbon Dioxide, Carbon Monoxide

HAZARDOUS POLYMERIZATION

Will not occur

SECTION 11 — TOXICOLOGICAL INFORMATION

CHRONIC HEALTH HAZARDS

Reports have associated repeated and prolonged overexposure to solvents with permanent brain and nervous system damage.

Ethylbenzene is classified by IARC as possibly carcinogenic to humans (2B) based on inadequate evidence in humans and sufficient evidence in laboratory animals. Lifetime inhalation exposure of rats and mice to high ethylbenzene concentrations resulted in increases in certain types of cancer, including kidney tumors in rats and lung and liver tumors in mice. These effects were not observed in animals exposed to lower concentrations. There is no evidence that ethylbenzene causes cancer in humans.

Crystalline Silica (Quartz, Cristobalite) is listed by IARC and NTP. Long term exposure to high levels of silica dust, which can occur only when sanding or abrading the dry film, may cause lung damage (silicosis) and possibly cancer.

SECTION 12 — ECOLOGICAL INFORMATION

ECOTOXICOLOGICAL INFORMATION

No data available.

SECTION 13 — DISPOSAL CONSIDERATIONS

WASTE DISPOSAL METHOD

Waste from this product may be hazardous as defined under the Resource Conservation and Recovery Act (RCRA) 40 CFR 261.
Waste must be tested for ignitability to determine the applicable EPA hazardous waste numbers.
Incinerate in approved facility. Do not incinerate closed container. Dispose of in accordance with Federal, State/Provincial, and Local regulations regarding pollution.

SECTION 14 — TRANSPORT INFORMATION

Multi-modal shipping descriptions are provided for informational purposes and do not consider container sizes. The presence of a shipping description for a particular mode of transport (ocean, air, etc.), does not indicate that the product is packaged suitably for that mode of transport. All packaging must be reviewed for suitability prior to shipment, and compliance with the applicable regulations is the sole responsibility of the person offering the product for transport.

WARNING: This product contains chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

TSCA CERTIFICATION

All chemicals in this product are listed, or are exempt from listing, on the TSCA Inventory.

SECTION 16 — OTHER INFORMATION

This product has been classified in accordance with the hazard criteria of the Canadian Controlled Products Regulations (CPR) and the MSDS contains all of the information required by the CPR.

The above information pertains to this product as currently formulated, and is based on the information available at this time. Addition of reducers or other additives to this product may substantially alter the composition and hazards of the product. Since conditions of use are outside our control, we make no warranties, express or implied, and assume no liability in connection with any use of this information.

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE
Use entire container at one time. Do not reseal opened containers containing Zinc dust. Do not transfer Zinc dust to other containers. Keep out of the reach of children.

SECTION 8 -- EXPOSURE CONTROLS/PERSONAL PROTECTION

PRECAUTIONS TO BE TAKEN IN USE
Use only with adequate ventilation. Avoid eye and prolonged skin contact with dust. Avoid generating or breathing airborne dust. Wash hands after using.

This product may contain materials classified as nuisance particulates (listed "as Dust" in Section 2) which may be present at hazardous levels only during sanding or abrading of the dried film. If no specific dusts are listed in Section 2, the applicable limits for nuisance dusts are ACGIH TLV 10 mg/m3 (total dust), 3 mg/m3 (respirable fraction), OSHA PEL 15 mg/m3 (total dust), 5 mg/m3 (respirable fraction).

VENTILATION
Local exhaust preferable. General exhaust acceptable if the exposure to materials in Section 2 is maintained below applicable exposure limits. Refer to OSHA Standards 1910.94, 1910.107, 1910.108.

RESPIRATORY PROTECTION
If personal exposure cannot be controlled below applicable limits by ventilation, wear a properly fitted particulate respirator approved by NIOSH/MSHA for protection against materials in Section 2.

PROTECTIVE GLOVES
Required for long or repeated contact.

EYE PROTECTION
Wear safety spectacles with unperforated sideshields.

SECTION 9 -- PHYSICAL AND CHEMICAL PROPERTIES

PRODUCT WEIGHT	58.6 lb/gal 7020 g/l
SPECIFIC GRAVITY	7.053
BOILING POINT	Not Applicable
MELTING POINT	Not Available
VOLATILE VOLUME	0%
EVAPORATION RATE	N.A.
VAPOR DENSITY	N.A.
SOLUBILITY IN WATER	N.A.

VOLATILE ORGANIC COMPOUNDS (VOC Theoretical - As Packaged)
0.0 lb/gal 0 g/l Less Water and Federally Exempt Solvents
0.0 lb/gal 0 g/l Emitted VOC

Continued on page 4

SECTION 10 -- STABILITY AND REACTIVITY

STABILITY -- Stable

CONDITIONS TO AVOID
Avoid contamination of Zinc dust or Zinc-containing mixtures with water. Avoid excess dusting of Zinc dust portions.

INCOMPATIBILITY
Contamination with Water, Acids, or Alkalis can cause evolution of hydrogen, which may result in dangerously increased pressures in closed containers.

HAZARDOUS DECOMPOSITION PRODUCTS
By fire: Oxides of Metals in Section 2

HAZARDOUS POLYMERIZATION -- Will not occur

SECTION 11 -- TOXICOLOGICAL INFORMATION

CHRONIC HEALTH HAZARDS
No ingredient in this product is an IARC, NTP or OSHA listed carcinogen.

TOXICOLOGY DATA

CAS No.	Ingredient Name	
7440-66-6	Zinc	
	LC50 RAT 4HR	Not Available
	LD50 RAT	Not Available

SECTION 12 -- ECOLOGICAL INFORMATION

No data available.

SECTION 13 -- DISPOSAL CONSIDERATIONS

WASTE DISPOSAL METHOD
Waste from this product is not hazardous as defined under the Resource Conservation and Recovery Act (RCRA) 40 CFR 261. Dispose of in accordance with Federal, State/Provincial, and Local regulations regarding pollution.

Continued on page 5

SECTION 14 -- TRANSPORT INFORMATION

US Ground (DOT)
Not Regulated for Transportation.

DOT (Dept of Transportation) Hazardous Substances & Reportable Quantities
Zinc 1000 lb RQ

Bulk Containers may be Shipped as (check reportable quantities):
RQ, UN3077, ENVIRONMENTALLY HAZARDOUS SUBSTANCES, SOLID, N.O.S. (ZINC), 9, PG III, (ERG#171)

Canada (TDG)

IMO
Not Regulated for Transportation.

SECTION 15 -- REGULATORY INFORMATION

SARA 313 (40 CFR 372.65C) SUPPLIER NOTIFICATION

CAS No.	CHEMICAL/COMPOUND	% by WT	% Element
	Zinc		97

CALIFORNIA PROPOSITION 65
WARNING: This product contains chemicals known to the State of California to cause birth defects or other reproductive harm.

TSCA CERTIFICATION
All chemicals in this product are listed, or are exempt from listing, on the TSCA Inventory.

SECTION 16 -- OTHER INFORMATION

This product has been classified in accordance with the hazard criteria of the Canadian Controlled Products Regulations (CPR) and the MSDS contains all of the information required by the CPR.

The above information pertains to this product as currently formulated, and is based on the information available at this time. Addition of reducers or other additives to this product may substantially alter the composition and hazards of the product. Since conditions of use are outside our control, we make no warranties, express or implied, and assume no liability in connection with any use of this information.

AMERCOAT®

Dimetcote® 9

9 Series — *Inorganic-zinc silicate primer*

Product Data/ Application Instructions

- A heavy-duty primer that protects with a single coat.
- Outstanding application characteristics over a wide range of atmospheric conditions.
- Can be applied by airless or conventional spray leaving a smooth film with negligible overspray even in hot weather.
- Excellent heavy-build film tolerance in corners and angles.
- High-metallic zinc content provides long-term corrosion protection that reduces maintenance costs.
- Abrasion resistance and minimum burn-back during welding reduce touch-up requirements.
- Applied over blasted or pickled surfaces.

Typical Uses

As a single coat, Dimetcote 9 resists severe weathering and marine environments. As a primer with recommended topcoats, Dimetcote 9 is resistant to industrial chemical exposure as well as marine exposure above the saltwater splash zone, structural steel and piping, tank exteriors, bridges, offshore platforms, marine hulls above water line, superstructures and decks.

Qualifications

SSPC – Paint 20

AASHTO – M300

AASHTO – Standard Specification for Highway Bridges Table 10.32.3C Allowable Load for Slip Critical Connections Class B

AISC – Specification for Structural Joints Using ASTM A325 or A490 Bolts RCSC Specification for Structural Joints Table 3 Class B

Resistance

Dimetcote 9 without a topcoat has excellent resistance to weathering and ultraviolet exposure, water and neutral salts, refined petroleum products, alcohols and solvents, animal and vegetable oils (up to 2½% free fatty acid). In addition to the above, with suitable topcoats Dimetcote 9 is recommended for fumes and splash of mild alkalies, dilute acids (fumes only), salt solutions of most types.

Dimetcote 9 is not recommended for immersion service or spillage of acid or alkaline solutions. For specific recommendations, consult your PPG representative.

Physical Data

Finish	Flat
Color	Green

Note: At temperatures over 350°F the Dimetcote 9 green color will change to a reddish-brown.

Components	2
Curing mechanism	Solvent release and reaction with atmospheric moisture
Dry film thickness	2.0 - 5.0 mils
Coats	1

Theoretical coverage	ft²/gal	m²/L
1 mil (25 microns)	992	24.3
2½ mils (65 microns)	397	9.7

VOC	lb/gal	g/L
mixed	4.1	491
mixed/thinned (1 pt/gal)	5.0	599

Temperature resistance, dry	°F	°C
	750	399

Flash point	°F	°C
liquid	60	15
mixed	58	14
Amercoat 65	81	27
Amercoat 101	145	63
Amercoat 12	2	-17

Application Data

Applied over	Prepared steel, galvanizing
Surface preparation	Abrasive blast SSPC-SP6 or 10
Method	Airless or conventional spray
Mixing ratio (by volume)	As packaged – 1- and 5-gal units

Pot life (hours)	°F/°C
	70/21
	24

Environmental conditions		
Temperature	°F	°C
air	0 to 120	-18 to 49
surface	0 to 130	-18 to 54
Relative humidity	50-90%	

Surface temperatures must be at least 5°F (3°C) above dew point to prevent condensation. At freezing temperatures, surface must be free of ice.

Drying time (ASTM D1640) 2½ mils and 50-90% RH

	°F/°C
	70/21
touch (minutes)	10
through (minutes)	18
topcoat with most topcoats (hours)	24

Thinner	
below 70°F (21°C)	Amercoat 65
above 70°F (21°C)	Amercoat 101
Equipment cleaner	Amercoat 12

Surface Preparation

Steel – New without pits or depressions – Dry abrasive blast, SSPC-SP6 or pickle.

Previously painted or pitted – Dry abrasive blast, SSPC-SP10. Remove all traces of previous organic coatings as Dimetcote 9 will not adhere to organic coatings.

Blast to achieve a 1- to 3-mil (25- to 75-microns) profile as determined with a Keane-Tator Surface Profile Comparator, Testex Tape or similar device. Rougher profiles are acceptable but require increased film thickness for equivalent protection.

Apply Dimetcote 9 as soon as possible to avoid rusting or other recontamination. Do not leave blasted steel uncoated overnight. Spot reblast if needed.

Galvanizing – Remove oil, soap film or grease with neutral detergent or emulsion cleaner and blast lightly with fine abrasive to SSPC-SP7.

Environmental Conditions

Temperature	°F	°C
air	0 to 120	-18 to 49
surface	0 to 130	-18 to 54

Surface temperature must be at least 5°F (3°C) above dew point to prevent condensation. At freezing temperatures, surface must be free of ice.

Application Equipment

The following is a guide; suitable equipment from other manufacturers may be used. Changes in pressure, hose and tip size may be needed for proper spray characteristics.

Airless spray – Standard equipment, such as Graco Bulldog Hydra-Spray or Speeflo Alaskan PZ and a fluid tip with a 0.021-inch (0.53 mm) orifice or larger

Conventional spray – Industrial equipment such as a DeVilbiss MBC gun with 2E or 704E cap/tip, or a Binks 18 gun with a 66SS x 67PB nozzle setup. A variable speed agitator in the pressure pot and an oil and moisture trap in the main air supply line are essential. Separate air and fluid pressure regulators are recommended.

Power mixer – Jiffy Mixer, powered by an air or explosion-proof electric motor

Application Procedure

Dimetcote 9 is packaged in the correct proportions which must be mixed together before use.

1. Flush all equipment with thinner or Amercoat® 12 to remove any moisture which that may be present. Moisture can cause hardening of coating in equipment.
2. Stir liquid with an explosion-proof power mixer.
3. Discard desiccant bag from powder can and gradually stir powder into liquid. Continue stirring until powder is well dispersed, and uniformly blended to a workable consistency.
4. Strain material through 30 mesh screen to remove undispersed material and to prevent possible clogging of equipment.
5. Do not mix more coating than will be used within the following times:

Pot life (hours)	°F/°C			
	120/49	90/32	70/21	50/10
	4	12	24	72

***Important** – At the end of the pot life, "kick-out" or separation of liquid and solids occurs, together with gassing. Do not keep mixed material which will not be used before the end of the pot life in tightly closed containers as gassing can create enough pressure to cause containers to burst. Cover containers loosely.*

6. Keep containers loosely covered until ready to use to prevent skinning or gelling due to moisture in air. Skins should be skimmed off the top and the material strained through cheesecloth or 30 mesh screen to remove any remaining pieces of skin. Discard gelled material.
7. Thin only for workability or when a rough film or "dry spray" is obtained due to fast solvent evaporation during hot weather or high wind. Use no more than 1 pint thinner per gallon mixed coating, as follows:

Surface temperature	Thinner
above 70°F	Amercoat 101
below 70°F	Amercoat 65

8. Adjust spray equipment to apply an even wet coat with minimum overspray.
9. Continue slow stirring during application to maintain uniformity of material. Avoid fast stirring as this may cause a rise in material temperature, shortening pot life.
10. Apply in even, parallel passes; overlap each pass 50 percent. Pay special attention to welds, cut-outs, sharp edges, rivets, bolts, etc., to insure proper thickness. Keep pressure pot at approximately the same elevation as spray gun for proper material delivery to gun.
11. Prevent contact with water until the freshly applied coating is dry to touch.

Drying time (ASTM D1640) 2½ mils and 50-90% RH

	°F/°C
	70/21
touch (minutes)	10
through (minutes)	18
topcoat with most topcoats (hours)	24

12. When dry through, check film thickness with a nondestructive dry film thickness gauge. Recoat if greater thickness is required. Normal average thickness range is 2.0 - 5.0 mils. Spot readings should not exceed 8 mils as higher thicknesses may develop cracking. For high temperature applications, a maximum of 3 mils dry film thickness is required.

***Note** – Drying and topcoating times will be longer when film thickness is over 2½ mils, ventilation and air movement are restricted, temperatures are lower or relative humidities are lower. A water mist sprayed over the coating when the film is dry to touch will accelerate hardening at lower humidities.*

13. Random pinholes, holidays and small damaged or bare areas can be touched up by brush when film is dry to touch. Larger areas should be resprayed.
14. In confined areas, ventilate with clean air during application and drying until all solvents are removed. Temperature and relative humidity of the ventilating air must be such that moisture will not condense on the surface until after dry to touch.
15. Clean equipment with thinner or Amercoat 12 cleaner immediately after use or at least at the end of each working day or shift. Clean spray guns more often during hot weather. When left in equipment, Dimetcote 9 will harden and plug spray equipment.

Topcoating

Dimetcote 9 surface must be clean and dry before topcoating. Water soluble contaminants may be washed off with water. Remove grease and similar contaminants with an emulsion type cleaner or neutral detergent. Rinse with clean water and allow to dry. Solvent wiping is not satisfactory as contamination may only be spread and not removed. In some cases a mist coat/full coat technique may be required to prevent application bubbling.

Repair

Spot-blast rusted areas in accordance with surface preparation instructions before touching up with Dimetcote 9. When blasting is not practical, Amercoat 68HS may be used for repair. See primer product literature for selection according to topcoat compatibility.

Topcoats

Dimetcote 9 may be topcoated with epoxies, vinyls, acrylics, chlorinated rubbers or other topcoats when used in industrial or marine maintenance systems. Typical PPG topcoats are Amercoat® 385, Amerlock® 400 or Amercoat 370. In some cases a mist coat/full coat technique may be required to prevent application bubbling.

Safety Precautions

Read each component's material safety data sheet before use. Mixed product has hazards of each component. Safety precautions must be strictly followed during storage, handling and use.

CAUTION – Improper use and handling of this product can be hazardous to health and cause fire or explosion.

Do not use this product without first taking all appropriate safety measures to prevent property damage and injuries. These measures may include, without limitation: implementation of proper ventilation, use of proper lamps, wearing of proper protective clothing and masks, tenting and proper separation of application areas. Consult your supervisor. Proper ventilation and protective measures must be provided during application and drying to keep spray mists and vapor concentrations within safe limits and to protect against toxic hazards. Necessary safety equipment must be used and ventilation requirements carefully observed, especially in confined or enclosed spaces, such as tank interiors and buildings.

This product is to be used by those knowledgeable about proper application methods. PPG makes no recommendation about the types of safety measures that may need to be adopted because these depend on application environment and space, of which PPG is unaware and over which it has no control.

If you do not fully understand these warnings and instructions or if you cannot strictly comply with them, do not use the product.

Note: Consult Code of Federal Regulations Title 29, Labor, parts 1910 and 1915 concerning occupational safety and health standards and regulations, as well as any other applicable federal, state and local regulations on safe practices in coating operations.

This product is for professional use only. Not for residential use in California.

Shipping Data

Packaging units	1 gal	5 gal
Shipping weight (approx)	lb	kg
1-gal unit		
liquid	7.6	3.4
powder	14.5	6.6
5-gal unit		
liquid	36	16.4
powder	71	32.2

Shelf life when stored indoors at 40 to 100°F (5 to 38°C)

powder	2 years from shipment date
liquid	18 months from manufacture date

Numerical values are subject to normal manufacturing tolerances, color and testing variances. Allow for application losses and surface irregularities.

The mixed product is nonphotochemically reactive as defined by the South Coast Air Quality Management District's Rule 102 or equivalent regulations.

Material Safety Data Sheet

Date of issue 22 December 2010
Version 3

1 . Product and company identification

Product name : DIMETCOTE 9 LIQUID
Code : DI9-A/01
Supplier : PPG Industries, Inc.
One PPG Place
Pittsburgh, PA 15272
Emergency telephone number : (412) 434-4515 (U.S.)
(514) 645-1320 (Canada)
01-800-00-21-400 (Mexico)
Technical Phone Number : (412) 492-5200 (ALLISON PARK, PA) 8:00 a.m. - 5:00 p.m. EST

2 . Hazards identification

Emergency overview : DANGER!

FLAMMABLE LIQUID AND VAPOR. HARMFUL IF INHALED. CAUSES RESPIRATORY TRACT AND EYE IRRITATION. MAY BE HARMFUL IF SWALLOWED. SANDING AND GRINDING DUSTS MAY BE HARMFUL IF INHALED. ASPIRATION HAZARD. CAN ENTER LUNGS AND CAUSE DAMAGE. PROLONGED OR REPEATED CONTACT MAY DRY SKIN AND CAUSE IRRITATION. CONTAINS MATERIAL THAT CAN CAUSE TARGET ORGAN DAMAGE. CANCER HAZARD - CONTAINS MATERIAL WHICH CAN CAUSE CANCER.

Keep away from flames, such as a pilot light, and any object that sparks, such as an electric motor. Keep away from heat. Do not smoke. Do not breathe vapor or mist. Do not swallow. Avoid contact with eyes, skin and clothing. Use only with adequate ventilation. Keep container tightly closed and sealed until ready for use. Wash thoroughly after handling.

Potential acute health effects

Inhalation : Harmful if inhaled. Severely irritating to the respiratory system. Can irritate eyes, nose, mouth and throat.
Ingestion : May be harmful if swallowed. Aspiration hazard if swallowed. Can enter lungs and cause damage.
Skin : May cause skin dryness and irritation.
Eyes : Irritating to eyes.

Over-exposure signs/symptoms

Repeated exposure to high vapor concentrations may cause irritation of the respiratory system and permanent brain and nervous system damage. Inhalation of vapor/aerosol concentrations above the recommended exposure limits causes headaches, drowsiness and nausea and may lead to unconsciousness or death. There is some evidence that repeated exposure to organic solvent vapors in combination with constant loud noise can cause greater hearing loss than expected from exposure to noise alone. This product contains crystalline silica which can cause lung cancer or silicosis. The risk of cancer depends on the duration and level of exposure to dust from sanding surfaces or mist from spray applications.

Medical conditions aggravated by over-exposure : Pre-existing disorders involving any target organs mentioned in this MSDS as being at risk may be aggravated by over-exposure to this product.

This Material Safety Data Sheet has been prepared in accordance with Canada's Workplace Hazardous Materials Information System (WHMIS) and the OSHA Hazard Communication Standard (29 CFR 1910.1200).

See toxicological information (Section 11)

Powered by ATRION

3 . Composition/information on ingredients

Name	CAS number	%
Isopropanol	67-63-0	15 - 40
Silicic acid, ethyl ester	11099-06-2	10 - 30
Kaolin	1332-58-7	7 - 13
1-Methoxy-2-propanol	107-98-2	5 - 10
tetraethyl silicate	78-10-4	5 - 10
Toluene	108-88-3	1 - 5
Silicate, mica	12001-26-2	1 - 5
Ethanol	64-17-5	0.1 - 1
zinc chloride	7646-85-7	0.1 - 1
Quartz (SiO2) (<10 microns)	14808-60-7	0.1 - 1

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.

4 . First aid measures

If ingestion, irritation, any type of overexposure or symptoms of overexposure occur during or persists after use of this product, contact a POISON CONTROL CENTER, EMERGENCY ROOM OR PHYSICIAN immediately; have Material Safety Data Sheet information available. Never give anything by mouth to an unconscious or convulsing person.

Eye contact : Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Seek immediate medical attention.

Skin contact : Remove contaminated clothing and shoes. Wash skin thoroughly with soap and water or use recognized skin cleanser. Do NOT use solvents or thinners.

Inhalation : Remove to fresh air. Keep person warm and at rest. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel.

Ingestion : If swallowed, seek medical advice immediately and show this container or label. Keep person warm and at rest. Do not induce vomiting.

Notes to physician : No specific treatment. Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.

5 . Fire-fighting measures

Flammability of the product : Flammable liquid. In a fire or if heated, a pressure increase will occur and the container may burst, with the risk of a subsequent explosion. Vapors may accumulate in low or confined areas or travel a considerable distance to a source of ignition and flash back. Runoff to sewer may create fire or explosion hazard.

Extinguishing media

Suitable : Use dry chemical, CO_2, water spray (fog) or foam.

Not suitable : Do not use water jet.

Special exposure hazards : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training. Move containers from fire area if this can be done without risk. Use water spray to keep fire-exposed containers cool.

Hazardous combustion products : Decomposition products may include the following materials:
carbon oxides
metal oxide/oxides

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Powered by ATRION

6 . Accidental release measures

Personal precautions : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Shut off all ignition sources. No flares, smoking or flames in hazard area. Avoid breathing vapor or mist. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment (see Section 8).

Environmental precautions : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

Large spill : Stop leak if without risk. Move containers from spill area. Approach release from upwind. Use spark-proof tools and explosion-proof equipment. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see section 13). Dispose of via a licensed waste disposal contractor. Contaminated absorbent material may pose the same hazard as the spilled product. Note: see section 1 for emergency contact information and section 13 for waste disposal.

Small spill : Stop leak if without risk. Move containers from spill area. Use spark-proof tools and explosion-proof equipment. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

7 . Handling and storage

Handling : Put on appropriate personal protective equipment (see Section 8). Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Do not breathe vapor or mist. Do not swallow. Do not get in eyes or on skin or clothing. Use only with adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Do not enter storage areas and confined spaces unless adequately ventilated. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Store and use away from heat, sparks, open flame or any other ignition source. Use explosion-proof electrical (ventilating, lighting and material handling) equipment. Use non-sparking tools. Take precautionary measures against electrostatic discharges. Vapors are heavier than air and may spread along floors. To avoid fire or explosion, dissipate static electricity during transfer by grounding and bonding containers and equipment before transferring material. Empty containers retain product residue and can be hazardous. Do not reuse container. If this material is part of a multiple component system, read the Material Safety Data Sheet(s) for the other component or components before blending as the resulting mixture may have the hazards of all of its parts.

Storage : Store in accordance with local regulations. Store in a segregated and approved area. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see section 10) and food and drink. Eliminate all ignition sources. Separate from oxidizing materials. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination. Do not store above the following temperature: 120F / 49C.

Consult local authorities for acceptable exposure limits.

Recommended monitoring procedures : If this product contains ingredients with exposure limits, personal, workplace atmosphere or biological monitoring may be required to determine the effectiveness of the ventilation or other control measures and/or the necessity to use respiratory protective equipment.

Powered by ATRION

8 . Exposure controls/personal protection

Engineering measures : Use only with adequate ventilation. Use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. The engineering controls also need to keep gas, vapor or dust concentrations below any lower explosive limits. Use explosion-proof ventilation equipment.

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal protection

Eyes : Safety glasses with side shields.

Hands : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.

Gloves : For prolonged or repeated handling, use the following type of gloves:

Recommended: nitrile rubber, foil, fluor rubber

Respiratory : If workers are exposed to concentrations above the exposure limit, they must use appropriate, certified respirators. Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Skin : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Environmental exposure controls : Emissions from ventilation or work process equipment should be checked to ensure they comply with the requirements of environmental protection legislation. In some cases, fume scrubbers, filters or engineering modifications to the process equipment will be necessary to reduce emissions to acceptable levels.

9 . Physical and chemical properties

Physical state : Liquid.

Flash point : Closed cup: 15.56°C (60°F)

Explosion limits : Lower: 1.8%

Color : Not available.

Odor : Not available.

pH : Not available.

Boiling/condensation point : >37.78°C (>100°F)

Melting/freezing point : Not available.

Specific gravity : 1.02

Density (lbs / gal) : 8.51

Vapor pressure : 4 kPa (30.2 mm Hg) [20°C]

Vapor density : Not available.

Volatility : 76% (v/v), 60.64% (w/w)

Odor threshold : Not available.

Evaporation rate : 254 (butyl acetate = 1)

Partition coefficient: n-octanol/water : Not available.

% Solid. (w/w) : 39.36

Powered by ATRION

10 . Stability and reactivity

Stability : The product may not be stable under certain conditions of storage or use.

Conditions to avoid : Avoid all possible sources of ignition (spark or flame). Do not pressurize, cut, weld, braze, solder, drill, grind or expose containers to heat or sources of ignition. Avoid increased storage temperature. Pressure hazard

Materials to avoid : Reactive or incompatible with the following materials:,water,acids,oxidizing materials,strong alkalis

Hazardous decomposition products : Under normal conditions of storage and use, hazardous decomposition products should not be produced.

Hazardous polymerization : Under normal conditions of storage and use, hazardous polymerization will not occur.

11 . Toxicological information

Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
Isopropanol	LD50 Oral	Rat	4.396 g/kg	-
	LD50 Dermal	Rabbit	12800 mg/kg	-
	LC50 Inhalation Vapor	Rat	72600 mg/m3	4 hours
Kaolin	LD50 Oral	Rat	>5000 mg/kg	-
1-Methoxy-2-propanol	LD50 Oral	Rat	5.2 g/kg	-
	LD50 Dermal	Rabbit	13 g/kg	-
tetraethyl silicate	LD50 Oral	Rat	6.27 g/kg	-
	LD50 Dermal	Rabbit	5.878 g/kg	-
Toluene	LD50 Oral	Rat	636 mg/kg	-
	LD50 Dermal	Rabbit	8.39 g/kg	-
	LC50 Inhalation	Rat	49 g/m3	4 hours

	LC50 Inhalation	Rat	124700 mg/m3	4 hours
zinc chloride	LD50 Oral	Rat	0.35 g/kg	-

Chronic toxicity

Conclusion/Summary : Not available.

Defatting irritant? : Prolonged or repeated contact can defat the skin and lead to irritation, cracking and/or dermatitis.

Target organs : Contains material which causes damage to the following organs: lungs, brain, eyes, central nervous system (CNS).
Contains material which may cause damage to the following organs: blood, kidneys, liver, heart, upper respiratory tract, skin, stomach.

Carcinogenicity

Carcinogenicity : Contains material which can cause cancer. Risk of cancer depends on duration and level of exposure.

Classification

Product/ingredient name	ACGIH	IARC	EPA	NIOSH	NTP	OSHA
Isopropanol	A4	3	-	-	-	-
Kaolin	A4	-	-	-	-	-
Toluene	A4	3	-	-	-	-
Quartz (SiO2) (<10 microns)	A2	1	-	+	Proven.	-

Mutagenicity

Mutagenicity : No known significant effects or critical hazards.

Teratogenicity

Teratogenicity : Contains material which may cause birth defects, based on animal data.

Reproductive toxicity

Developmental effects : Contains material which may cause developmental abnormalities, based on animal data.

Fertility effects : Contains material which may impair male fertility, based on animal data. Contains material which may impair female fertility, based on animal data.

	Acute EC50 100 ug/L Fresh water	Daphnia - Water flea - Daphnia magna	48 hours
	Chronic NEL 170 ug/L Fresh water	Daphnia - Water flea - Daphnia magna	2 days

13 . Disposal considerations

Waste disposal : The generation of waste should be avoided or minimized wherever possible. Significant quantities of waste product residues should not be disposed of via the foul sewer but processed in a suitable effluent treatment plant. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Empty containers or liners may retain some product residues. Vapor from product residues may create a highly flammable or explosive atmosphere inside the container. Do not cut, weld or grind used containers unless they have been cleaned thoroughly internally. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

Disposal should be in accordance with applicable regional, national and local laws and regulations.

Refer to Section 7: HANDLING AND STORAGE and Section 8: EXPOSURE CONTROLS/PERSONAL PROTECTION for additional handling information and protection of employees. Section 6. Accidental release measures

Carbozinc® 859

MARINE/OFFSHORE COATINGS product data

Selection & Specification Data

Generic Type Organic Zinc-Rich Epoxy

Description Low VOC organic zinc epoxy steel primer with extremely fast cure-to-topcoat characteristics for in-shop applications and quick turnaround requirements in the field. Carbozinc 859 has less than 3.0 lbs/gallon VOC (thinned) and is used extensively in virtually all industrial markets.

Features

- Meets Class B slip co-efficient and creep testing criteria for use on faying surfaces
- Rapid cure. Dry to recoat in 30 minutes at 75°F (24°C) and 50% relative humidity.
- Low temperature cure down to 35°F (2°C)
- Excellent adhesion
- Protects against undercutting corrosion
- Available in ASTM D520, Type II zinc version
- Field proven primer that applies well by spray methods
- Excellent touch-up primer by brush or roll for small areas.
- VOC compliant to current AIM regulations

Color Green (0300)

Finish Flat

Primers Self Priming

Topcoats Can be topcoated with Epoxies, Polyurethanes, Acrylics and others as recommended by your Carboline sales representative. Under certain conditions, a mist coat is required to minimize topcoat bubbling.

Dry Film Thickness 3.0-5.0 mils (75-125 microns). Dry film thickness in excess of 10.0 mils (250 microns) per coat is not recommended.

Solids Content* By Volume: 66% ± 2%
*Tested in accordance with ASTM D2697

Zinc Content By Weight: 81% ± 2% in dry film

Theoretical Coverage Rate 1,059 mil ft^2 (24.0 m^2/l at 25 microns)
353 ft^2 at 3.0 mils (8.0 m^2/l at 75 microns)
Allow for loss in mixing and application

VOC Values As Supplied: 2.72 lbs./gal (326 g/l)

Dry Temp. Resistance Continuous: 400°F (204°C)
Non-Continuous: 425°F (218°C)

Substrates & Surface Preparation

General Surfaces must be clean and dry. Employ adequate methods to remove dirt, dust, oil and all other contaminants that could interfere with adhesion of the coating.

Steel SSPC-SP6 with a 1.0-3.0 mil (25-75 micron) surface profile.
SSPC-SP2 or SP3 for touch-up.

Performance Data

Test Method	System	Results	Report #
ASTM D4541 Adhesion	A. Carbozinc 859 B. 859 / Polyurethane C. 859/Epoxy/ Polyurethane	A. 841 psi Pneumatic B. 1,100 min. psi Pneumatic C. 602 psi Elcometer	03343 03343 03390
ASTM D522 Flexibility	A. 859 B. 859 / Polyurethane	A. > 6% B. > 5%	03343
ASTM D2794 Impact	A. 859 B. 859 / polyurethane Gardner Impact Tester,Direct (intrusion), inch-pounds, over 1/8" steel	A. 160 B. 100 min.	03343
Slip Co-Efficient	Carbozinc 859 A-490 bolt spec; 6 mils dry film maximum, 10% max. thinning	Meets requirements for class B rating	03617
ASTM D970 Immersion	A. Carbozinc 859/Epoxy/ Polyurethane Salt Water (5% sodium chloride) at 75°F,30 days B. 859 / Epoxy / Polyurethane Fresh water at 75°F,30 days	A & B had no rusting in the scribe; and no blistering, softening or discoloration with either environment	03390

Test reports and additional data available upon written request.

Application Equipment

Listed below are general equipment guidelines for the application of this product. Job site conditions may require modifications to these guidelines to achieve the desired results.
General Guidelines:

Spray Application (General) The following spray equipment has been found suitable and is available from manufacturers such as Binks, DeVilbiss and Graco. Keep material under mild agitation during application.

Conventional Spray Agitated pressure pot equipped with dual regulators, 3/8" I.D. minimum material hose, .070" I.D. fluid tip and appropriate air cap.

Airless Spray

Pump Ratio:	30:1 (min.)*
GPM Output:	3.0 (min.)
Material Hose:	3/8" I.D. (min.)
Tip Size:	.017-.023"
Output PSI:	2000-2200
Filter Size:	60 mesh

*Teflon packings are recommended and available from the pump manufacturer.

Brush/Roller For small areas and touch-up only. Preferred method for large areas is spray application.

To the best of our knowledge the technical data contained herein is true and accurate on the date of publication and is subject to change without prior notice. User must contact Carboline Company to verify correctness before specifying or ordering. No guarantee of accuracy is given or implied. We guarantee our products to conform to Carboline quality control. We assume no responsibility for coverage, performance or injuries resulting from use. Liability, if any, is limited to replacement of products. NO OTHER WARRANTY OR GUARANTEE OF ANY KIND IS MADE BY CARBOLINE, EXPRESS OR IMPLIED, STATUTORY, BY OPERATION OF LAW, OR OTHERWISE, INCLUDING MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Carboline® and Carbozinc® are registered trademarks of Carboline Company.

Carbozinc® 859

Mixing & Thinning

Mixing Power mix Part A completely. Then slowly sift in the zinc filler under agitation. Power mix Part B separately and add slowly to the mixture. Pour mixture through a 30 mesh screen. DO NOT MIX PARTIAL KITS.
Tip: Sifting zinc through a window screen will aid in mixing process by breaking up or catching dry zinc lumps.

	.80 Gal Kit	4.00 Gal. Kit
Ratio	Part A: .35 gallons	1.77 gallons
	Part B: .20 gallons	1 gallon
	Zinc Filler: 14.6 lbs	73 lbs

Thinning Normally not required but may be thinned up to 13 oz/gal (10%) with Thinner #2 or Thinner #76. In hot or windy conditions, may be thinned up to 13 oz/gal with Thinner #33. Use of thinners other than those supplied by Carboline may adversely affect product performance and void product warranty, whether expressed or implied.

Carboline Thinner #236E may also be used to thin this product to minimize HAP and VOC emissions. Consult Carboline Technical Service for guidance.

Pot Life 4 Hours at 75°F (24°C) and less at higher temperatures. Pot life ends when coating loses body and begins to sag.

Cleanup & Safety

Cleanup Use Thinner #2 or Acetone. In case of spillage, absorb and dispose of in accordance with local applicable regulations.

Safety Read and follow all caution statements on this product data sheet and on the MSDS for this product. Employ normal workmanlike safety precautions. Hypersensitive persons should wear protective clothing, gloves and use protective cream on face, hands and all exposed areas.

Ventilation When used in enclosed areas, thorough air circulation must be used during and after application until the coating is cured. The ventilation system should be capable of preventing the solvent vapor concentration from reaching the lower explosion limit for the solvents used. In addition to ensuring proper ventilation, appropriate respirators must be used by all application personnel.

This product contains flammable solvents. Keep away from sparks and open flames. All electrical equipment and installations should be made and grounded in accordance with the National Electric Code. In areas where explosion hazards exist, workmen should be required to use non-ferrous tools and wear conductive and non-sparking shoes.

Application Conditions

Condition	Material	Surface	Ambient	Humidity
Normal	60°-85°F (16°-29°C)	60°-90°F (16°-32°C)	60°-90°F (16°-32°C)	0-90%
Minimum	40°F (4°C)	35°F (2°C)	35°F (2°C)	0%
Maximum	90°F (32°C)	120°F (49°C)	110°F (43°C)	95%

Industry standards are for the substrate temperatures to be 5°F (3°C) above the dew point. This product simply requires the substrate temperature to be above the dew point. Condensation due to substrate temperatures below the dew point can cause flash rusting on prepared steel and interfere with proper adhesion to the substrate. Special application techniques may be required above or below normal application conditions.

Curing Schedule

Surface Temp. & 50% Relative Humidity	Dry to Handle	Dry to Topcoat
35°F (2°C)	8 Hours	6 Hours
50°F (10°C)	5 Hours	2 Hours
75°F (24°C)	2 Hours	30 Minutes
100°F (32°C)	1 Hour	30 Minutes

These times are based on a 3.0 mil (75 micron) dry film thickness. Higher film thickness, insufficient ventilation or cooler temperatures will require longer cure times and could result in solvent entrapment and premature failure. **Specific topcoat products can be used in a much shorter re-coat interval. Consult Carboline for recommendations and test results.**
Maximum Recoat: Unlimited. Must have a clean, dry surface for topcoating. “Loose” chalk or salts must be removed in accordance with good painting practice. Consult Carboline Technical Service for specific information.

Packaging, Handling & Storage

Shipping Weight (Approximate)	.80 Gallon Kit 22 lbs (10 kg)	4.00 Gallon Kit 105 lbs (48 kg)

ETHYL BENZENE	100-41-4	0.7	100 PPM	125 PPM	435 MGM3	N/E

Section 3 - Hazards Identification

Emergency Overview: Warning! Flammable. Harmful if inhaled. Causes eye and skin irritation. Aspiration may cause lung damage. May cause dizziness and drowsiness. Keep away from heat, sparks, flame. Avoid breathing vapor. Avoid contact with eyes, skin and clothing. Do not swallow. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling.

Effects Of Overexposure - Eye Contact: May cause eye irritation.

Effects Of Overexposure - Skin Contact: Direct skin contact may cause irritation. May cause allergic skin reaction. May be harmful if absorbed through the skin.

Effects Of Overexposure - Inhalation: Harmful if inhaled, may affect the brain or nervous system, causing dizziness, headache, or nausea. May cause nose and throat irritation.

Effects Of Overexposure - Ingestion: Harmful if swallowed.

Effects Of Overexposure - Chronic Hazards: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage.

Primary Route(s) Of Entry: Skin Contact, Skin Absorption, Inhalation, Ingestion, Eye Contact

Medical Conditions Prone to Aggravation by Exposure: If you have a condition that could be aggravated by exposure to dust or organic vapors, see a physician prior to use. If sensitized to amines, epoxies, or other chemicals do not use. See a physician if a medical condition exists.

Section 4 - First Aid Measures

First Aid - Eye Contact: If material gets into eyes, flush with water immediately for 15 minutes. Consult a physician.

First Aid - Skin Contact: In case of contact, immediately flush skin with plenty of water while removing contaminated clothing and shoes. Launder clothing before reuse. If rash or irritation develops, consult a physician.

First Aid - Inhalation: If inhaled, remove to fresh air. Administer oxygen if necessary. Consult a physician if symptoms persist or exposure was severe.

First Aid - Ingestion: If swallowed do not induce vomiting. Seek immediate medical attention.

Section 5 - Fire Fighting Measures

Flash Point, F: 49F (9C) (Setaflash)

Lower Explosive Limit, %: 0.9
Upper Explosive Limit, %: 11.2

Extinguishing Media: Carbon Dioxide, Dry Chemical, Foam, Water Fog

Unusual Fire And Explosion Hazards: Flammable Liquid. Vapors are heavier than air and will accumulate. Vapors will form explosive concentrations with air. Vapors travel long distances and will flashback. Use mechanical ventilation when necessary to keep percent vapor below the "Lower Explosion Level" (LEL). Eliminate all ignition sources. Keep away from sparks, open flames and heat sources. All electric equipment and installations should be made and grounded in accordance with the National Electrical Code. In areas where explosion hazards exist, workers should be required to use non-ferrous tools and to wear conductive and non-sparking shoes.

Special Firefighting Procedures: Flammable. Cool fire-exposed containers using water spray.

Section 6 - Accidental Release Measures

Steps To Be Taken If Material Is Released Or Spilled: Eliminate all ignition sources. Handling equipment must be grounded to prevent sparking. Evacuate the area of unprotected personnel. Wear appropriate personal protection clothing and equipment. Follow exposure controls/personal protection guidelines in Section 8. Contain and soak up residual with an aborbent (clay or sand). Take up absorbant material and seal tightly for proper disposal. Dispose of in accordance with local, state and federal regulations. Refer to Section 15 for SARA Title III and CERCLA information.

Section 7 - Handling And Storage

Handling: Do not get in eyes, on skin, or on clothing. Keep container tightly closed when not in use. Wear personal protection equipment. Do not breathe vapors. Wash thoroughly after handling. If pouring or transferring materials, ground all containers and tools. Do not weld, heat, cut or drill on full or empty containers. Use only in accordance with Carboline application instructions, container label and Product Data Sheet. Avoid breathing vapors or spray mist.

Storage: Keep away from heat, sparks, open flames and oxidizing agents. Keep containers closed. Store in a cool, dry place with adequate ventilation.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use explosion-proof ventilation when required to keep below health exposure guidelines and Lower Explosion Limit (LEL).

Respiratory Protection: Use only with ventilation to keep levels below exposure guidelines listed in Section 2. User should test and monitor exposure levels to ensure all personnel are below guidelines. If not sure, or not able to monitor, use MSHA/NIOSH approved supplied air respirator. Follow all current OSHA requirements for respirator use. For silica containing coatings in a liquid state, and/or if no exposure limits are established in Section 2 above, supplied air respirators are generally not required.

Skin Protection: Recommend impervious gloves and clothing to avoid skin contact. If material penetrates to skin, change gloves and clothing. The use of protective creams may be beneficial to certain individuals. Protective creams should be applied before exposure.

Eye Protection: Recommend safety glasses with side shields or chemical goggles to avoid eye contact.

Other protective equipment: Eye wash and safety showers should be readily available.

Hygienic Practices: Wash with soap and water before eating, drinking, smoking, applying cosmetics, or using toilet facilities. Use of a hand cleaner is recommended. Launder contaminated clothing before reuse. Leather shoes can absorb and allow hazardous materials to pass through. Check shoes carefully after soaking before reuse.

Section 9 - Physical And Chemical Properties

Boiling Range:	175 F (79 C) - 486 F (252 C)	**Vapor Density:**	Heavier than Air
Odor:	Solvent	**Odor Threshold:**	N/D
Appearance:	Viscous Liquid, Various Colors	**Evaporation Rate:**	Slower Than Ether
Solubility in H2O:	N/D		
Freeze Point:	N/D	**Specific Gravity:**	1.30
Vapor Pressure:	N/D	**PH:**	N/D
Physical State:	Liquid		

(See section 16 for abbreviation legend)

Section 10 - Stability And Reactivity

Conditions To Avoid: Heat, sparks and open flames.

Incompatibility: Keep away from strong oxidizing agents, heat and open flames.

Hazardous Decomposition Products: Carbon monoxide, nitrogen oxides, and unidentified organic compounds. Consider all smoke and fumes from burning material as very hazardous. Welding, cutting or abrasive grinding can create smoke and fumes. Do not breathe any fumes or smoke from these operations.

Hazardous Polymerization: Will not occur under normal conditions.

Stability: This product is stable under normal storage conditions.

Ecological Information: No data

Section 13 - Disposal Information

Disposal Information: Dispose of in accordance with State, Local, and Federal Environmental regulations. Responsibility for proper waste disposal is with the owner of the waste.

Section 14 - Transportation Information

DOT Proper Shipping Name:	Paint	**Packing Group:**	II
DOT Technical Name:	N/A	**Hazard Subclass:**	N/A
DOT Hazard Class:	3	**Resp. Guide Page:**	128
DOT UN/NA Number:	UN1263		

Additional Notes: None.

Section 15 - Regulatory Information

CERCLA - SARA HAZARD CATEGORY

This product has been reviewed according to the EPA Hazard Categories promulgated under Sections 311and 312 of the Superfund Amendment and Reauthorization Act of 1986 (SARA Title III) and is considered, under applicable definitions, to meet the following categories:

IMMEDIATE HEALTH HAZARD, CHRONIC HEALTH HAZARD, FIRE HAZARD

SARA SECTION 313

This product contains the following substances subject to the reporting requirements of Section 313 of Title III of the Superfund Amendment and Reauthorization Act of 1986 and 40 CFR part 372:

Chemical Name	CAS Number
TOLUENE	108-88-3
META-XYLENE	108-38-3
N-BUTANOL	71-36-3
ETHYL BENZENE	100-41-4

TOXIC SUBSTANCES CONTROL ACT

All components of this product are listed on the TSCA inventory.

This product contains the following chemical substances subject to the reporting requirements of TSCA 12(B) if exported from the United States:

No TSCA 12(B) Substances exist in this product

U.S. STATE REGULATIONS AS FOLLOWS:

NEW JERSEY RIGHT-TO-KNOW

The following materials are non-hazardous, but are among the top five components in this product.

Chemical Name	CAS Number
CERAMIC MICROSPHERES	66402-68-4
NEPHELINE SYENITE	37244-96-5
BLACK IRON OXIDE	1317-61-9

PENNSYLVANIA RIGHT-TO-KNOW

The following non-hazardous ingredients are present in the product at greater than 3%.

Chemical Name	CAS Number
CERAMIC MICROSPHERES	66402-68-4
NEPHELINE SYENITE	37244-96-5
BLACK IRON OXIDE	1317-61-9
TITANIUM DIOXIDE	13463-67-7
IRON OXIDE	1332-37-2
YELLOW IRON OXIDE	51274-00-1

CALIFORNIA PROPOSITION 65

Warning: The following ingredients present in the product are known to the state of California to cause Cancer:

Chemical Name	CAS Number
CARBON BLACK	1333-86-4
ETHYL BENZENE	100-41-4
FORMALDEHYDE	50-00-0
MICROCRYSTALLINE SILICA	14808-60-7

Warning: The following ingredients present in the product are known to the state of California to cause birth defects, or other reproductive hazards:

Chemical Name	CAS Number
TOLUENE	108-88-3

INTERNATIONAL REGULATIONS AS FOLLOWS:

CANADIAN WHMIS

This MSDS has been prepared in compliance with Controlled Product Regulations except for the use of the 16 headings.

CANADIAN WHMIS CLASS: B2 D2A D2B

Section 3 - Hazards Identification

Emergency Overview: Warning! Flammable. Harmful if inhaled. Causes eye and skin irritation. Aspiration may cause lung damage. May cause dizziness and drowsiness. Keep away from heat, sparks, flame. Avoid breathing vapor. Avoid contact with eyes, skin and clothing. Do not swallow. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling. Skin and eye irritant.

Effects Of Overexposure - Eye Contact: Can cause eye burns.

Effects Of Overexposure - Skin Contact: May be harmful if absorbed through the skin. Can cause skin burns.

Effects Of Overexposure - Inhalation: Harmful if inhaled, may affect the brain or nervous system, causing dizziness, headache, or nausea. May cause nose and throat irritation. May cause lung irritation. May cause allergic respiratory reaction, effects may be permanent.

Effects Of Overexposure - Ingestion: Harmful if swallowed.

Effects Of Overexposure - Chronic Hazards: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage.

Primary Route(s) Of Entry: Skin Contact, Skin Absorption, Inhalation, Ingestion, Eye Contact

Medical Conditions Prone to Aggravation by Exposure: If you have a condition that could be aggravated by exposure to dust or organic vapors, see a physician prior to use. If sensitized to amines, epoxies, or other chemicals do not use. See a physician if a medical condition exists.

Section 4 - First Aid Measures

First Aid - Eye Contact: If material gets into eyes, flush with water immediately for 15 minutes. Consult a physician.

First Aid - Skin Contact: In case of contact, immediately flush skin with plenty of water while removing contaminated clothing and shoes. Launder clothing before reuse. If rash or irritation develops, consult a physician.

First Aid - Inhalation: If inhaled, remove to fresh air. Administer oxygen if necessary. Consult a physician if symptoms persist or exposure was severe.

First Aid - Ingestion: If swallowed do not induce vomiting. Seek immediate medical attention.

Section 5 - Fire Fighting Measures

Flash Point, F: 38F (3C) (Setaflash)

Lower Explosive Limit, %: 1.0

Upper Explosive Limit, %: 12.0

Extinguishing Media: Carbon Dioxide, Dry Chemical, Foam, Water Fog

Unusual Fire And Explosion Hazards: Flammable Liquid. Vapors are heavier than air and will accumulate. Vapors will form explosive concentrations with air. Vapors travel long distances and will flashback. Use mechanical ventilation when necessary to keep percent vapor below the "Lower Explosion Level" (LEL). Eliminate all ignition sources. Keep away from sparks, open flames and heat sources. All electric equipment and installations should be made and grounded in accordance with the National Electrical Code. In areas where explosion hazards exist, workers should be required to use non-ferrous tools and to wear conductive and non-sparking shoes.

Special Firefighting Procedures: Evacuate hazard area of unprotected personnel. Use a NIOSH approved self-contained breathing unit and complete body protection. Cool surrounding containers with water in case of fire exposure. Flammable. Cool fire-exposed containers using water spray.

Section 6 - Accidental Release Measures

Steps To Be Taken If Material Is Released Or Spilled: Eliminate all ignition sources. Handling equipment must be grounded to prevent sparking. Evacuate the area of unprotected personnel. Wear appropriate personal protection clothing and equipment. Follow exposure controls/personal protection guidelines in Section 8. Contain and soak up residual with an aborbent (clay or sand). Take up absorbant material and seal tightly for proper disposal. Dispose of in accordance with local, state and federal regulations. Refer to Section 15 for SARA Title III and CERCLA information.

Section 7 - Handling And Storage

Handling: Do not get in eyes, on skin, or on clothing. Keep container tightly closed when not in use. Wear personal protection equipment. Do not breathe vapors. Wash thoroughly after handling. If pouring or transferring materials, ground all containers and tools. Do not weld, heat, cut or drill on full or empty containers. Use only in accordance with Carboline application instructions, container label and Product Data Sheet.

Storage: Keep away from heat, sparks, open flames and oxidizing agents. Keep containers closed. Store in a cool, dry place with adequate ventilation.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use explosion-proof ventilation when required to keep below health exposure guidelines and Lower Explosion Limit (LEL).

Respiratory Protection: Use only with ventilation to keep levels below exposure guidelines listed in Section 2. User should test and monitor exposure levels to ensure all personnel are below guidelines. If not sure, or not able to monitor, use MSHA/NIOSH approved supplied air respirator. Follow all current OSHA requirements for respirator use. For silica containing coatings in a liquid state, and/or if no exposure limits are established in Section 2 above, supplied air respirators are generally not required.

Skin Protection: Recommend impervious gloves and clothing to avoid skin contact. If material penetrates to skin, change gloves and clothing. The use of protective creams may be beneficial to certain individuals. Protective creams should be applied before exposure.

Eye Protection: Recommend safety glasses with side shields or chemical goggles to avoid eye contact.

Other protective equipment: Eye wash and safety showers should be readily available.

Hygienic Practices: Wash with soap and water before eating, drinking, smoking, applying cosmetics, or using toilet facilities. Use of a hand cleaner is recommended. Launder contaminated clothing before reuse. Leather shoes can absorb and allow hazardous materials to pass through. Check shoes carefully after soaking before reuse.

Section 9 - Physical And Chemical Properties

Boiling Range:	176 F (80 C) - 284 F (140 C)	**Vapor Density:**	Heavier than Air
Odor:	Solvent	**Odor Threshold:**	N/D
Appearance:	Thin, Brown Liquid	**Evaporation Rate:**	Slower Than Ether
Solubility in H2O:	N/D		
Freeze Point:	N/D	**Specific Gravity:**	0.88
Vapor Pressure:	N/D	**PH:**	N/D
Physical State:	Liquid		

(See section 16 for abbreviation legend)

Section 10 - Stability And Reactivity

Conditions To Avoid: Heat, sparks and open flames.

Incompatibility: Keep away from strong oxidizing agents, heat and open flames.

Hazardous Decomposition Products: Carbon monoxide, nitrogen oxides, and unidentified organic compounds. Consider all smoke and fumes from burning material as very hazardous. Welding, cutting or abrasive grinding can create smoke and fumes. Do not breathe any fumes or smoke from these operations.

Hazardous Polymerization: Will not occur under normal conditions.

Stability: This product is stable under normal storage conditions.

Section 16 - Other Information

HMIS Ratings
Health: 3 **Flammability:** 3 **Reactivity:** 0 **Personal Protection:** X

VOLATILE ORGANIC COMPOUNDS, GR/LTR MIXED (UNTHINNED): 326

REASON FOR REVISION: Changes made in Section(s) 1, 2, 3, 5, 8, 11, and 15.

Legend: N.A. - Not Applicable, N.E. - Not Established, N.D. - Not Determined

The information contained herein is, to the best of our knowledge and belief accurate. However, since the conditions of handling and use are beyond our control, we make no guarantee of results, and assume no liability for damages incurred by use of this material. It is the responsibility of the user to comply with all applicable federal, state, and local laws and regulations

Carboguard® 890 & 890 LT

carboline®

MARINE/OFFSHORE COATINGS product data

Selection & Specification Data

Generic Type
Cycloaliphatic Amine Epoxy

Description
Highly chemical resistant epoxy mastic coating with exceptionally versatile uses in all industrial markets. Self-priming and suitable for application over most existing coatings, and tightly adherent to rust. Carboguard 890 serves as stand-alone system for a variety of chemical environments. Carboguard 890 is also designed for various immersion conditions.

Features
- Excellent chemical resistance
- Surface tolerant characteristics
- Conventional and low-temperature versions
- Self-priming and primer/finish capabilities
- Very good abrasion resistance
- VOC compliant to current AIM regulations
- Suitable for use in USDA inspected facilities

Color
Refer to Carboline Color Guide. Certain colors may require multiple coats for hiding. Note: The low temperature formulation will cause most colors to yellow or discolor more than normal in a short period of time. (Epoxies lose gloss, discolor and chalk in sunlight exposure.)

Finish
Gloss

Primers
Self-priming. May be applied over inorganic zinc primers and other tightly adhering coatings. A mist coat may be required to minimize bubbling over inorganic zinc primers.

Topcoats
Acrylics, Epoxies, Polyurethanes

Dry Film Thickness
4.0-6.0 mils (100-150 microns) per coat
6.0-8.0 mils (150-200 microns) over light rust and for uniform gloss over inorganic zincs.
Don't exceed 10 mils (250 microns) in a single coat. Excessive film thickness over inorganic zincs may increase damage during shipping or erection.

Solids Content
By Volume (890): 75% ± 2%
(890LT): 80% ± 2%

Theoretical Coverage Rate
890: 1203 mil ft^2 (30.0 m^2/l at 25 microns)
241 ft^2 at 5 mils (6.0 m^2/l at 125 microns)
890LT: 1283 mil ft^2 (31.0 m^2/l at 25 microns)
257 ft^2 at 5 mils (6.3 m^2/l at 125 microns)
Allow for loss in mixing and application

VOC Values

	890	890 LT
As supplied	1.7lbs/gal (214 g/l)	1.5lbs/gal (180g/l)
Thinned w/#2*:	7oz/gal=2.0lbs/gal (250g/l) 13oz/gal=2.2lbs/gal (271g/l)	15oz/gal=2.0lbs/gal (250g/l)
Thinned w/#33*:	7oz/gal=2.0lbs/gal (250g/l) 16oz/gal=2.3lbs/gal (285g/l)	14oz/gal=2.0 lbs/gal (250g/l) 16oz/gal=2.1lbs/gal (258g/l)

*Use Thinner #76 up to 8 oz/gal for 890 and 16 oz/gal for 890 LT where non-photochemically reactive solvents are required.

Dry Temp. Resistance
Continuous: 250°F (121°C)
Non-Continuous: 300°F (149°C)
Discoloration and loss of gloss is observed above 200°F (93°C).

Limitations
Do not apply over latex coatings. For immersion projects use only factory made material in special colors. Consult Technical Service for specifics. Carboguard 890 LT should not be used for immersion and should only be used as a primer or intermediate coat. Discoloration may be objectionable if used as a topcoat.

Substrates & Surface Preparation

General
Surfaces must be clean and dry. Employ adequate methods to remove dirt, dust, oil and all other contaminants that could interfere with adhesion of the coating.

Steel
Immersion: SSPC-SP10
Non-immersion: SSPC-SP6
1.5-3.0 mils (38-75 microns)
SSPC-SP2 or SP3 are suitable cleaning methods for mild environments.

Galvanized Steel
Prime with specific Carboline primers as recommended by your Carboline Sales Representative. Refer to the specific primer's Product Data Sheet for substrate preparation requirements.

Concrete or CMU
Concrete must be cured 28 days at 75°F (24°C) and 50% relative humidity or equivalent. Prepare surfaces in accordance with ASTM D4258 Surface Cleaning of Concrete and ASTM D4259 Abrading Concrete. Voids in concrete may require surfacing. Mortar joints should be cured a min of 15 days. Prime with itself, Carboguard® 1340, or suitable filler/sealer.

Drywall & Plaster
Joint compound and plaster should be fully cured prior to coating application. Prime with Carbocrylic® 120 or Carboguard 1340.

Previously Painted Surfaces
Lightly sand or abrade to roughen surface and degloss the surface. Existing paint must attain a minimum 3B rating in accordance with ASTM D3359 "X-Scribe" adhesion test.

Performance Data

Test Method	System	Results	Report #
ASTM D3359 Adhesion	Blasted Steel 1 ct. 890	5A	0270
ASTM D4060 Abrasion	Blasted Steel 1 ct. Epoxy Pr. 1 ct. 890	85 mg. loss after 1000 cycles, CS17 wheel, 1000 gm. load	02411
ASTM B117 Salt Fog	Blasted Steel 2 cts. 890	No effect on plane, rust in scribe. 1/16" undercutting at scribe after 2000 hours	02594
ASTM B117 Salt Fog	Blasted Steel 1 ct. IOZ 1 ct. 890	No effect on plane, no rust in scribe and no undercutting after 4000 hours	L40-42,45,95
ASTM D1735 Water Fog	Blasted Steel 1 ct. Epoxy Pr. 1 ct. 890	No blistering, rusting or delamination after 2800 hours	08564
ASTM D3363 Pencil Hardness	Blasted Steel 2 cts. 890	Greater than 8H	02775
ASTM D2486 Scrub Resistance	Blasted Steel 1 ct. 890	93% gloss retained after 10,000 cycles w/ liquid scrub medium	03142
ASTM E84 Flame and Smoke	2 ct. 890	5 Flame 5 Smoke Class A	03110

Test reports and additional data available upon written request.

Carboguard® 890 & 890 LT

Application Equipment

Listed below are general equipment guidelines for the application of this product. Job site conditions may require modifications to these guidelines to achieve the desired results. **General Guidelines**:

Spray Application (General) This is a high solids coating and may require adjustments in spray techniques. Wet film thickness is easily and quickly achieved. The following spray equipment has been found suitable and is available from manufacturers such as Binks, DeVilbiss and Graco.

Conventional Spray Pressure pot equipped with dual regulators, 3/8" I.D. minimum material hose, .070" I.D. fluid tip and appropriate air cap.

Airless Spray

Pump Ratio:	30:1 (min.)*
GPM Output:	3.0 (min.)
Material Hose:	3/8" I.D. (min.)
Tip Size:	.017"-.021"
Output PSI:	2100-2300
Filter Size:	60 mesh

*Teflon packings are recommended and available from the pump manufacturer.

Brush & Roller (General) Multiple coats may be required to obtain desired appearance, recommended dry film thickness and adequate hiding. Avoid excessive re-brushing or re-rolling. For best results, tie-in within 10 minutes at 75°F (24°C).

Brush Use a medium bristle brush.

Roller Use a short-nap synthetic roller cover with phenolic core.

Mixing & Thinning

Mixing Power mix separately, then combine and power mix. DO NOT MIX PARTIAL KITS.

Ratio 890 and 890 LT 1:1 Ratio (A to B)

Thinning* Spray: Up to 13 oz/gal (10%) w/ #2
Brush: Up to 16 oz/gal (12%) w/ #33
Roller: Up to 16 oz/gal (12%) w/ #33
Thinner #33 can be used for spray in hot/windy conditions. Use of thinners other than those supplied or recommended by Carboline may adversely affect product performance and void product warranty, whether expressed or implied.
*See VOC values for thinning limits.

Pot Life 890 3 Hours at 75°F (24°C)
890 LT 2 Hours at 75°F (24°C)
Pot life ends when coating loses body and begins to sag. Pot life times will be less at higher temperatures.

Cleanup & Safety

Cleanup Use Thinner #2 or Acetone. In case of spillage, absorb and dispose of in accordance with local applicable regulations.

Safety Read and follow all caution statements on this product data sheet and on the MSDS for this product. Employ normal workmanlike safety precautions. Hypersensitive persons should wear protective clothing, gloves and use protective cream on face, hands and all exposed areas.

Ventilation When used as a tank lining or in enclosed areas, thorough air circulation must be used during and after application until the coating is cured. The ventilation system should be capable of preventing the solvent vapor concentration from reaching the lower explosion limit for the solvents used. User should test and monitor exposure levels to insure all personnel are below guidelines. If not sure or if not able to monitor levels, use MSHA/NIOSH approved supplied air respirator.

Caution This product contains flammable solvents. Keep away from sparks and open flames. All electrical equipment and installations should be made and grounded in accordance with the National Electric Code. In areas where explosion hazards exist, workmen should be required to use non-ferrous tools and wear conductive and non-sparking shoes.

Application Conditions

890

Condition	Material	Surface	Ambient	Humidity
Normal	60°-85°F (16°-29°C)	60°-85°F (16°-29°C)	60°-90°F (16°-32°C)	0-80%
Minimum	50°F (10°C)	50°F (10°C)	50°F (10°C)	0%
Maximum	90°F (32°C)	125°F (52°C)	110°F (43°C)	80%

890 LT

Normal	60-85°F (16-29°C)	60-85°F (16-29°C)	60-90°F (16-32°C)	10-80%
Minimum	40°F (4°C)	35°F (2°C)	35°F (2°C)	0%
Maximum	90°F (32°C)	125°F (52°C)	110°F (43°C)	80%

This product simply requires the substrate temperature to be above the dew point. Condensation due to substrate temperatures below the dew point can cause flash rusting on prepared steel and interfere with proper adhesion to the substrate. Special application techniques may be required above or below normal application conditions.

Curing Schedule

890 (Based on 4–8 mils, 100-200 microns dry film thickness.)

Surface Temp. & 50% Relative Humidity	Dry to Recoat	Dry to Topcoat w/ Other Finishes	Final Cure	
			General	Immersion
50°F (10°C)	12 Hours	24 Hours	3 Days	N/R
60°F (16°C)	8 Hours	16 Hours	2 Days	10 Days
75°F (24°C)	4 Hours	8 Hours	1 Day	5 Days
90°F (32°C)	2 Hours	4 Hours	16 Hours	3 Days

890 LT (Based on 5 mils, 125 microns dry film thickness.)

Surface Temp. & 50% Relative Humidity	Dry to Touch	Dry to Handle	Dry to Recoat & Topcoat w/ Others	Final Cure General Service
35°F (2°C)	5 Hours	18 Hours	20 Hours	7 Days
40°F (4°C)	4.5 Hours	15.5 Hours	16 Hours	5 Days
50°F (10°C)	3.5Hours	6.5 Hours	12 Hours	3 Days
60°F (16°C)	2 Hours	5 Hours	8 Hours	2 Days
75°F (24°C)	1.5Hours	2 Hours	4 Hours	24 Hours
90°F (32°C)	1 Hour	1.5 Hours	2 Hours	16 Hours

Higher film thickness, insufficient ventilation or cooler temperatures will require longer cure times and could result in solvent entrapment and premature failure. Excessive humidity or condensation on the surface during curing can interfere with the cure, can cause discoloration and may result in a surface haze. Any haze or blush must be removed by water washing before recoating. During high humidity conditions, it is recommended that the application be done while temperatures are increasing. **Maximum recoat/topcoat times are 30 days for epoxies and 90 days for polyurethanes at 75ºF (24ºC)**. If the maximum recoat times have been exceeded, the surface must be abraded by sweep blasting or sanding prior to the application of additional coats. 890 LT applied below 50°F (10°C) may temporarily soften as temperatures rise to 60°F (16°C). This is a normal condition and will not affect performance.

Packaging, Handling & Storage

Shipping Weight (Approximate)	2 Gallon Kit 29 lbs (13 kg)	10 Gallon Kit 145 lbs (66 kg)

Flash Point (Setaflash) 89°F (32°C) for Part A; 890 & 890 LT
73°F (23°C) for Part B; 890 & 890 LT
71°F (22°C) for 890 mixed
85°F (29°C) for 890 LT mixed

Storage Temperature & Humidity 40° -110°F (4°-43°C) Store indoors.
0-100% Relative Humidity

Shelf Life: 890 & 890LT Part A: 36 months at 75°F (24°C)
890 Part B: 15 months at 75°F (24°C)
890 LT Part B: 15 months at 75°F (24°C)

***Shelf Life: (actual stated shelf life) when kept at recommended storage conditions and in original unopened containers.**

Section 3 - Hazards Identification

Emergency Overview: Warning! Flammable. Harmful if inhaled. Causes eye and skin irritation. Aspiration may cause lung damage. May cause dizziness and drowsiness. Keep away from heat, sparks, flame. Avoid breathing vapor. Avoid contact with eyes, skin and clothing. Do not swallow. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling. Warning! May cause allergic skin reactions. May cause irritation. Contains SILICA which can cause cancer. Risk of Cancer depends on duration and level of exposure.

Effects Of Overexposure - Eye Contact: May cause eye irritation.

Effects Of Overexposure - Skin Contact: May cause allergic skin reaction. Direct skin contact may cause irritation.

Effects Of Overexposure - Inhalation: Harmful if inhaled, may affect the brain or nervous system, causing dizziness, headache, or nausea. May cause nose and throat irritation.

Effects Of Overexposure - Ingestion: Harmful if swallowed.

Effects Of Overexposure - Chronic Hazards: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Crystalline silica is known to cause silicosis. Crystalline silica (Quartz) is classified as a known human carcinogen (Group 1) by IARC. Exposure is by route of inhalation. If material is in a liquid matrix it is unlikely to be inhaled. However, when sanding or grinding the finished product, there may be potential for crystalline silica to become airborne.

Primary Route(s) Of Entry: Skin Contact, Skin Absorption, Inhalation, Ingestion, Eye Contact

Medical Conditions Prone to Aggravation by Exposure: If you have a condition that could be aggravated by exposure to dust or organic vapors, see a physician prior to use. If sensitized to amines, epoxies, or other chemicals do not use. See a physician if a medical condition exists.

Section 4 - First Aid Measures

First Aid - Eye Contact: If material gets into eyes, flush with water immediately for 15 minutes. Consult a physician.

First Aid - Skin Contact: In case of contact, immediately flush skin with plenty of water while removing contaminated clothing and shoes. Launder clothing before reuse. If rash or irritation develops, consult a physician.

First Aid - Inhalation: If inhaled, remove to fresh air. Administer oxygen if necessary. Consult a physician if symptoms persist or exposure was severe.

First Aid - Ingestion: If swallowed do not induce vomiting. Seek immediate medical attention.

Section 5 - Fire Fighting Measures

Flash Point, F: 89F (31C) (Setaflash)

Lower Explosive Limit, %: 0.5

Upper Explosive Limit, %: 7.0

Extinguishing Media: Carbon Dioxide, Dry Chemical, Foam, Water Fog

Unusual Fire And Explosion Hazards: Flammable Liquid. Vapors are heavier than air and will accumulate. Vapors will form explosive concentrations with air. Vapors travel long distances and will flashback. Use mechanical ventilation when necessary to keep percent vapor below the "Lower Explosion Level" (LEL). Eliminate all ignition sources. Keep away from sparks, open flames and heat sources. All electric equipment and installations should be made and grounded in accordance with the National Electrical Code. In areas where explosion hazards exist, workers should be required to use non-ferrous tools and to wear conductive and non-sparking shoes.

Special Firefighting Procedures: Flammable. Cool fire-exposed containers using water spray.

Section 6 - Accidental Release Measures

Steps To Be Taken If Material Is Released Or Spilled: Eliminate all ignition sources. Handling equipment must be grounded to prevent sparking. Evacuate the area of unprotected personnel. Wear appropriate personal protection clothing and equipment. Follow exposure controls/personal protection guidelines in Section 8. Contain and soak up residual with an aborbent (clay or sand). Take up absorbant material and seal tightly for proper disposal. Dispose of in accordance with local, state and federal regulations. Refer to Section 15 for SARA Title III and CERCLA information.

Section 7 - Handling And Storage

Handling: Do not get in eyes, on skin, or on clothing. Keep container tightly closed when not in use. Wear personal protection equipment. Do not breathe vapors. Wash thoroughly after handling. If pouring or transferring materials, ground all containers and tools. Do not weld, heat, cut or drill on full or empty containers. Use only in accordance with Carboline application instructions, container label and Product

Data Sheet. Avoid breathing vapors or spray mist.

Storage: Keep away from heat, sparks, open flames and oxidizing agents. Keep containers closed. Store in a cool, dry place with adequate ventilation.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use explosion-proof ventilation when required to keep below health exposure guidelines and Lower Explosion Limit (LEL).

Respiratory Protection: Use only with ventilation to keep levels below exposure guidelines listed in Section 2. User should test and monitor exposure levels to ensure all personnel are below guidelines. If not sure, or not able to monitor, use MSHA/NIOSH approved supplied air respirator. Follow all current OSHA requirements for respirator use. For silica containing coatings in a liquid state, and/or if no exposure limits are established in Section 2 above, supplied air respirators are generally not required.

Skin Protection: Recommend impervious gloves and clothing to avoid skin contact. If material penetrates to skin, change gloves and clothing. The use of protective creams may be beneficial to certain individuals. Protective creams should be applied before exposure.

Eye Protection: Recommend safety glasses with side shields or chemical goggles to avoid eye contact.

Other protective equipment: Eye wash and safety showers should be readily available.

Hygienic Practices: Wash with soap and water before eating, drinking, smoking, applying cosmetics, or using toilet facilities. Use of a hand cleaner is recommended. Launder contaminated clothing before reuse. Leather shoes can absorb and allow hazardous materials to pass through. Check shoes carefully after soaking before reuse.

Section 9 - Physical And Chemical Properties

Boiling Range:	175 F (79 C) - 486 F (252 C)	**Vapor Density:**	Heavier than Air
Odor:	Epoxy	**Odor Threshold:**	N/D
Appearance:	Viscous liquid, Various colors	**Evaporation Rate:**	Slower than Ether
Solubility in H2O:	N/D		
Freeze Point:	N/D	**Specific Gravity:**	app. 1.40
Vapor Pressure:	N/D	**PH:**	N/D
Physical State:	Liquid		

(See section 16 for abbreviation legend)

Section 10 - Stability And Reactivity

Conditions To Avoid: Heat, sparks and open flames.

Incompatibility: Keep away from strong oxidizing agents, heat and open flames.

Hazardous Decomposition Products: Carbon monoxide, nitrogen oxides, and unidentified organic compounds. Consider all smoke and fumes from burning material as very hazardous. Welding, cutting or abrasive grinding can create smoke and fumes. Do not breathe any fumes or smoke from these operations.

Hazardous Polymerization: Will not occur under normal conditions.

Stability: This product is stable under normal storage conditions.

Section 15 - Regulatory Information

CERCLA - SARA HAZARD CATEGORY

This product has been reviewed according to the EPA Hazard Categories promulgated under Sections 311and 312 of the Superfund Amendment and Reauthorization Act of 1986 (SARA Title III) and is considered, under applicable definitions, to meet the following categories:

IMMEDIATE HEALTH HAZARD, CHRONIC HEALTH HAZARD, FIRE HAZARD

SARA SECTION 313

This product contains the following substances subject to the reporting requirements of Section 313 of Title III of the Superfund Amendment and Reauthorization Act of 1986 and 40 CFR part 372:

Chemical Name	CAS Number
META-XYLENE	108-38-3
TOLUENE	108-88-3
PARA-XYLENE	106-42-3
ETHYL BENZENE	100-41-4
ORTHO-XYLENE	95-47-6

TOXIC SUBSTANCES CONTROL ACT

All components of this product are listed on the TSCA inventory.

This product contains the following chemical substances subject to the reporting requirements of TSCA

12(B) if exported from the United States:

Chemical Name	CAS Number
PARA-XYLENE	106-42-3

U.S. STATE REGULATIONS AS FOLLOWS:

NEW JERSEY RIGHT-TO-KNOW

The following materials are non-hazardous, but are among the top five components in this product.

Chemical Name	CAS Number
TITANIUM DIOXIDE	13463-67-7

PENNSYLVANIA RIGHT-TO-KNOW

The following non-hazardous ingredients are present in the product at greater than 3%.

Chemical Name	CAS Number
TITANIUM DIOXIDE	13463-67-7
ORGANIC PIGMENT	31837-42-0
AZO PIGMENT	2786-76-7
IRON OXIDE	1332-37-2
ORGANIC PIGMENT	5567-15-7

CALIFORNIA PROPOSITION 65

Warning: The following ingredients present in the product are known to the state of California to cause Cancer:

Chemical Name	CAS Number
MICROCRYSTALLINE SILICA	14808-60-7
CARBON BLACK	1333-86-4
ETHYL BENZENE	100-41-4

Warning: The following ingredients present in the product are known to the state of California to cause birth defects, or other reproductive hazards:

Chemical Name	CAS Number
TOLUENE	108-88-3

INTERNATIONAL REGULATIONS AS FOLLOWS:

CANADIAN WHMIS

This MSDS has been prepared in compliance with Controlled Product Regulations except for the use of the 16 headings.

CANADIAN WHMIS CLASS: B2 D2A D2B

Section 3 - Hazards Identification

Emergency Overview: Warning! Flammable. Harmful if inhaled. Causes eye and skin irritation. Aspiration may cause lung damage. May cause dizziness and drowsiness. Keep away from heat, sparks, flame. Avoid breathing vapor. Avoid contact with eyes, skin and clothing. Do not swallow. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling. Contains SILICA which can cause cancer. Risk of Cancer depends on duration and level of exposure. Skin and eye irritant.

Effects Of Overexposure - Eye Contact: Can cause eye burns.

Effects Of Overexposure - Skin Contact: Can cause skin burns. May be harmful if absorbed through the skin.

Effects Of Overexposure - Inhalation: Harmful if inhaled, may affect the brain or nervous system, causing dizziness, headache, or nausea. May cause nose and throat irritation. May cause lung irritation. May cause allergic respiratory reaction, effects may be permanent.

Effects Of Overexposure - Ingestion: Harmful if swallowed.

Effects Of Overexposure - Chronic Hazards: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Crystalline silica is known to cause silicosis. Crystalline silica (Quartz) is classified as a known human carcinogen (Group 1) by IARC. Exposure is by route of inhalation. If material is in a liquid matrix it is unlikely to be inhaled. However, when sanding or grinding the finished product, there may be potential for crystalline silica to become airborne.

Primary Route(s) Of Entry: Skin Contact, Skin Absorption, Inhalation, Ingestion, Eye Contact

Medical Conditions Prone to Aggravation by Exposure: If you have a condition that could be aggravated by exposure to dust or organic vapors, see a physician prior to use. If sensitized to amines, epoxies, or other chemicals do not use. See a physician if a medical condition exists.

Section 4 - First Aid Measures

First Aid - Eye Contact: If material gets into eyes, flush with water immediately for 15 minutes. Consult a physician.

First Aid - Skin Contact: In case of contact, immediately flush skin with plenty of water while removing contaminated clothing and shoes. Launder clothing before reuse. If rash or irritation develops, consult a physician.

First Aid - Inhalation: If inhaled, remove to fresh air. Administer oxygen if necessary. Consult a physician if symptoms persist or exposure was severe.

First Aid - Ingestion: If swallowed do not induce vomiting. Seek immediate medical attention.

Section 5 - Fire Fighting Measures

Flash Point, F: 71F (21C) (Setaflash)

Lower Explosive Limit, %: 0.8

Upper Explosive Limit, %: 12.0

Extinguishing Media: Carbon Dioxide, Dry Chemical, Foam, Water Fog

Unusual Fire And Explosion Hazards: Flammable Liquid. Vapors are heavier than air and will accumulate. Vapors will form explosive concentrations with air. Vapors travel long distances and will flashback. Use mechanical ventilation when necessary to keep percent vapor below the "Lower Explosion Level" (LEL). Eliminate all ignition sources. Keep away from sparks, open flames and heat sources. All electric equipment and installations should be made and grounded in accordance with the National Electrical Code. In areas where explosion hazards exist, workers should be required to use non-ferrous tools and to wear conductive and non-sparking shoes.

Special Firefighting Procedures: Evacuate hazard area of unprotected personnel. Use a NIOSH approved self-contained breathing unit and complete body protection. Cool surrounding containers with water in case of fire exposure. Flammable. Cool fire-exposed containers using water spray.

Section 6 - Accidental Release Measures

Steps To Be Taken If Material Is Released Or Spilled: Eliminate all ignition sources. Handling equipment must be grounded to prevent sparking. Evacuate the area of unprotected personnel. Wear appropriate personal protection clothing and equipment. Follow exposure controls/personal protection guidelines in Section 8. Contain and soak up residual with an aborbent (clay or sand). Take up absorbant material and seal tightly for proper disposal. Dispose of in accordance with local, state and federal regulations. Refer to Section 15 for SARA Title III and CERCLA information.

Section 7 - Handling And Storage

Handling: Avoid breathing vapors or spray mist. Do not get in eyes, on skin, or on clothing. Keep container tightly closed when not in use. Wear personal protection equipment. Do not breathe vapors. Wash thoroughly after handling. If pouring or transferring materials, ground all containers and tools. Do not weld, heat, cut or drill on full or empty containers. Use only in accordance with Carboline application

instructions, container label and Product Data Sheet.

Storage: Keep away from heat, sparks, open flames and oxidizing agents. Keep containers closed. Store in a cool, dry place with adequate ventilation.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use explosion-proof ventilation when required to keep below health exposure guidelines and Lower Explosion Limit (LEL).

Respiratory Protection: Use only with ventilation to keep levels below exposure guidelines listed in Section 2. User should test and monitor exposure levels to ensure all personnel are below guidelines. If not sure, or not able to monitor, use MSHA/NIOSH approved supplied air respirator. Follow all current OSHA requirements for respirator use. For silica containing coatings in a liquid state, and/or if no exposure limits are established in Section 2 above, supplied air respirators are generally not required.

Skin Protection: Recommend impervious gloves and clothing to avoid skin contact. If material penetrates to skin, change gloves and clothing. The use of protective creams may be beneficial to certain individuals. Protective creams should be applied before exposure.

Eye Protection: Recommend safety glasses with side shields or chemical goggles to avoid eye contact.

Other protective equipment: Eye wash and safety showers should be readily available.

Hygienic Practices: Wash with soap and water before eating, drinking, smoking, applying cosmetics, or using toilet facilities. Use of a hand cleaner is recommended. Launder contaminated clothing before reuse. Leather shoes can absorb and allow hazardous materials to pass through. Check shoes carefully after soaking before reuse.

Section 9 - Physical And Chemical Properties

TOXIC SUBSTANCES CONTROL ACT

All components of this product are listed on the TSCA inventory.

This product contains the following chemical substances subject to the reporting requirements of TSCA 12(B) if exported from the United States:

Chemical Name	CAS Number
PARA-XYLENE	106-42-3

U.S. STATE REGULATIONS AS FOLLOWS:

NEW JERSEY RIGHT-TO-KNOW

The following materials are non-hazardous, but are among the top five components in this product.

PENNSYLVANIA RIGHT-TO-KNOW

The following non-hazardous ingredients are present in the product at greater than 3%.

CALIFORNIA PROPOSITION 65

Warning: The following ingredients present in the product are known to the state of California to cause Cancer:

Chemical Name	CAS Number
MICROCRYSTALLINE SILICA	14808-60-7
ETHYL BENZENE	100-41-4
FORMALDEHYDE	50-00-0

Warning: The following ingredients present in the product are known to the state of California to cause birth defects, or other reproductive hazards:

Chemical Name	CAS Number
TOLUENE	108-88-3

INTERNATIONAL REGULATIONS AS FOLLOWS:

CANADIAN WHMIS

This MSDS has been prepared in compliance with Controlled Product Regulations except for the use of the 16 headings.

CANADIAN WHMIS CLASS: B2 D2A D2B

Section 16 - Other Information

HMIS Ratings
Health: 3 **Flammability:** 3 **Reactivity:** 0 **Personal Protection:** X

VOLATILE ORGANIC COMPOUNDS, GR/LTR MIXED (UNTHINNED): 214

REASON FOR REVISION: Routine Update

Legend: N.A. - Not Applicable, N.E. - Not Established, N.D. - Not Determined

The information contained herein is, to the best of our knowledge and belief accurate. However, since the conditions of handling and use are beyond our control, we make no guarantee of results, and assume no liability for damages incurred by use of this material. It is the responsibility of the user to comply with all applicable federal, state, and local laws and regulations

Interzinc 22HS

Inorganic Zinc Silicate

PRODUCT DESCRIPTION

A two pack inorganic zinc-rich silicate based primer providing good abrasion resistance and outstanding corrosion protection for correctly prepared steel surfaces. Contains 82% zinc in the dry film for long term corrosion protection. Low VOC.

INTENDED USES

A primer for a wide range of above water organic coating schemes to greatly enhance corrosion resistance. For use at Newbuilding or Maintenance & Repair.

PRODUCT INFORMATION

Color	QH5055H-Reddish Grey
Finish/Sheen	Matt
Part B (Curing Agent)	QH5056H (zinc dust)
Volume Solids	78% ±2% (ASTM D2697-86)
Mix Ratio	1 weight(s) Part A to 2.86 weight(s) Part B
Typical Film Thickness	3 mils dry (3.8 mils wet)
Theoretical Coverage	417 ft²/US Gal at 3 mils dft, allow appropriate loss factors. * Coverage rates are calculated based upon volume solids test (ISO 3233:1998) determinations. Conduct usage rate observation for best determination of actual coverage.
Method of Application	Airless Spray, Conventional Spray
Flash Point	Part A 67°F; Part B Non-infamable; Mixed 70°F (Setaflash) (ASTM D-3278)
Induction Period	Not required

Drying Information	50°F	59°F	77°F	104°F
Touch Dry [ASTM D1640 7.5.1]	30 mins	25 mins	15 mins	15 mins
Hard Dry [ASTM D1640 7.7]	2 hrs	1.5 hrs	60 mins	60 mins
Pot Life	12 hrs	10 hrs	8 hrs	4 hrs

Overcoating Data - see limitations

	Substrate Temperature							
	50°F		59°F		77°F		104°F	
Overcoated By	Min	Max	Min	Max	Min	Max	Min	Max
Intergard 269	48 hrs	ext	37 hrs	ext	24 hrs	ext	24 hrs	ext

Note Overcoating is dependent upon ambient conditions. The figures above have been determined at the quoted temperature and 50% relative humidity.

REGULATORY DATA

VOC 340 g/lt (2.83 lbs/US gal) as supplied (EPA Method 24)

Note: VOC values are typical and are provided for guidance purposes only. These may be subject to variation depending on factors such as differences in color and normal manufacturing tolerances.

MIL SPEC Refer to Chapter 631 - Naval Ships Technical Manual, Paragraph 631-8.23.2.1

Complies with: SSPC Paint Specification No.20 Type 1C.

SYSTEMS AND COMPATIBILITY

Consult your International Paint representative for the system best suited for the surfaces to be protected.

SURFACE PREPARATIONS

Paint only clean, dry surfaces. Remove all grease, oil, soluble contaminants and other foreign matter by "solvent cleaning" (SSPC-SP1).

NEWBUILDING
Dependent on yard procedures. Consult International Paint.

Steel:
For optimum performance "Near White Blast Cleaning" (SSPC-SP10) is recommended.
Surface profile should be between 2 mils and 2.5 mils.

Shop Primed Surfaces:
Consult your International Paint representative for specific recommendations.

Prior to overcoating, Interzinc 22 HS must be clean, dry and free from both soluble salts and excessive zinc corrosion products.

Applied Film Thickness:
As a characteristic with high solids coatings, care should be taken to maintain the recommended wet film thickness in order to avoid excessive dry film thickness.
Excessive film thickness and/or over-application of Interzinc 22 HS will lead to mudcracking, which will require complete removal of the affected areas by abrasive blasting and re-application in accordance with the original specification.

Topcoating:
Overcoating time will vary depending upon the generic type of top coat and specific application conditions. (1) Allow to cure a minimum of 24 hours at greater than 77°F and 50% relative humidity with good air circulation. Since cure times may vary with conditions, check for cure to accept topcoats by performing a solvent rub test in accordance with ASTM D4752. (2) Before topcoating, clean surface thoroughly, removing all dirt grease, oil or other contaminants. (3) Prepare corroded, welded or damaged areas by abrasive blasting (SSPC-SP10) and prime these recleaned areas with an inhibitive, organic primer. (4) When applying topcoats a mist coat may be required. As necessary, apply a mist coat of topcoat material followed by a full coat at proper film thickness to help prevent solvent bubbling. (5) Apply only topcoats specifically recommended by International Paint.
It is recommended that prior to overcoating a solvent rub test to ASTM D-4752 should be undertaken. A value of 4 indicates a satisfactory degree of cure for overcoating purpose.
The minimum overcoating interval is dependant upon the relative humidity during cure. Below 55% relative humidity the minimum recoat period will normally be at least 24 hours, but will be dependent upon the ambient temperature and relative humidity during the application and curing period.

APPLICATION

Apply by conventional spray or airless spray. When spraying, pressure (material) tank must be located above or on the same level as work, material hoses should be extended full length - avoid loops, sags and coils. Allow for losses due to surface irregularities and application methods. Strain material through a minimum 60 mesh screen before application. Apply 3.8 mils wet which will yield 3.0 mils dry film thickness. Consult the following equipment recommendations or utilize suitable equal.
Note: Do not apply in excess of 5.0 mils dry film thickness.

The curing time will vary depending upon dry film thickness and conditions that exist during the application and throughout the curing period.

Mixing

Material is supplied in 2 containers as a unit. Always mix a complete unit in the proportions supplied. (1) Agitate Part A with a power agitator, (2) Remove moisture absorbent packing from Powder (Part B) and discard. (3) Slowly add Powder into Part A (Liquid) while agitating with power mixer and allow to mix at least 5 minutes. (4) Strain material through a 30-60 mesh screen into air agitator equipped tank, container or pressure pot. (5) Operate air agitator at low speed (approximately 20 R.P.M.) sufficient to keep powder in suspension. (6) Keep system closed, free of moisture. Pot life will be reduced and material may "set up" if excessive moisture is present during mixing or in equipment. Pot life varies with temperature and humidity conditions.

Thinner

DO NOT THIN BEYOND YOUR STATE'S COMPLIANCY. Material is supplied at spray viscosity and normally does not need thinning. If thinning is necessary, thin up to a maximum of 8 ounces per gallon with International GTA138, or for tropical conditions use GTA027.

Airless Spray

Minimum 30:1 ratio pump, with Teflon packings. Use 60 mesh filter in pump manifold or an in-line filter. 0.015"-0.021" (381-533 microns) orifice tip; 3/8" (9.5mm) ID high pressure hose.

Conventional Spray

DeVilbiss MBC or JGA gun with a heavy mastic spring, E tip and 704 or 765 air cap, 3/8" (9.5 mm) ID material hose, 50 feet (15.2 m) length maximum; double regulated air agitator equipped pressure tank with oil and moisture separator.

Work Stoppages and Cleanup

Maintain material under constant low speed agitation. Clean all equipment immediately after use with International GTA138 Thinner. Spray equipment requires flushing with this solvent. It is good working practice to periodically flush out spray equipment during the course of the working day. Frequency will depend upon factors such as amount sprayed, temperature and elapsed time including work stoppages. Monitor material condition. Do not exceed pot life limitations.

Welding

In the event welding or flame cutting is performed on metal coated with this product, dust and fumes will be emitted which will require the use of appropriate personal protective equipment and adequate local exhaust ventilation. In North America do so in accordance with instruction in ANSI/ASC Z49.1 "Safety in Welding and Cutting."

SAFETY

All work involving the application and use of this product should be performed in compliance with all relevant national Health, Safety & Environmental standards and regulations.

Prior to use, obtain, consult and follow the Material Safety Data Sheet for this product concerning health and safety information. Read and follow all precautionary notices on the Material Safety Data Sheet and container labels. If you do not fully understand these warnings and instructions or if you can not strictly comply with them, do not use this product. Proper ventilation and protective measures must be provided during application and drying to keep solvent vapor concentrations within safe limits and to protect against toxic or oxygen deficient hazards. Take precautions to avoid skin and eye contact (ie. gloves, goggles, face masks, barrier creams etc.) Actual safety measures are dependant on application methods and work environment.
EMERGENCY CONTACT NUMBERS:
USA/Canada - Medical Advisory Number 1-800-854-6813
Europe - Contact (44) 191 4696111. For advice to Doctors & Hospitals only contact (44) 207 6359191
R.O.W. - Contact Regional Office

LIMITATIONS

Apply in good weather when air and surface temperatures are above 41°F. Surface temperatures must be at least 5° F above dew point. For optimum application properties, bring material to 70-81°F prior to mixing and application.
Unmixed material (in closed containers) should be maintained in protected storage between 40 and 95°F.
Care should be taken at temperatures close to freezing that surfaces are free from ice.
At relative humidities below 50%, curing will be severely retarded and humidity may need to be increased by use of steam or water spraying.
For high temperature systems the thickness of Interzinc 22HS should be restricted to 2 mils d.f.t. Continuous dry temperature resistance of Interzinc 22HS is 752°F if left untopcoated. However, if this product is used as a primer for Intertherm 50, the dry temperature resistance will be 1004°F.
Interzinc 22HS is not suitable for exposure in acid or alkaline conditions.
When applying Interzinc 22HS in confined spaces, ensure adequate ventilation.
Overcoating information is given for guidance only and is subject to regional variation depending upon local climate and environmental conditions. Consult your local International Paint representative for specific recommendations.
Technical and application data herein is for the purpose of establishing a general guideline of the coating and proper coating application procedures. Test performance results were obtained in a controlled laboratory environment and International Paint makes no claim that the exhibited published test results, or any other tests, accurately represent results actually found in all field environments. As application, environmental and design factors can vary significantly, due care should be exercised in the selection, verification of performance and use of the coating.
In the overcoating data section 'ext' = extended overcoating period. Please refer to our Marine Painting Guide - Definitions and Abbreviations available on our website.

UNIT SIZE

Unit Size	Part A		Part B	
	Vol	Pack	Vol	Pack
3.5 US gal	2.32 US gal	5 US gal	1.18 US gal	3 US gal

For availability of other unit sizes consult International Paint

UNIT SHIPPING WEIGHT

Unit Size	Unit Weight
3.5 US gal	100 lb

STORAGE

Shelf Life	Part A Binder: 6 months from date of manufacture when maintained in protected storage at 40 -95°F Part B Zinc Dust: 12 months from date of manufacture when maintained in protected storage at 40-95°F Subject to reinspection thereafter. Store in dry, shaded conditions away from sources of heat and ignition.

WORLDWIDE AVAILABILITY

Consult International Paint.

IMPORTANT NOTE

The information in this data sheet is not intended to be exhaustive: any person using the product for any purpose other than that specifically recommended in this data sheet without first obtaining written confirmation from us as to the suitability of the product for the intended purpose does so at their own risk. All advice given or statements made about the product (whether in this data sheet or otherwise) is correct to the best of our knowledge but we have no control over the quality or the condition of the substrate or the many factors affecting the use and application of the product. Therefore, unless we specifically agree in writing to do so, we do not accept any liability at all for the performance of the product or for (subject to law) any loss or damage arising out of the use of the product. All products supplied and technical advice given are subject to our Conditions of Sale. You should request a copy of this document and review it carefully. The information contained in this data sheet is liable to modification from time to time in the light of experience and our policy of continuous development. It is the user's responsibility to check with their local International Paint representative that this data sheet is current prior to using the product.

1. GENERAL INFORMATION

Product Identity: INTERZINC 22HS GRAY

Bulk Sales Reference No: QH5067H

IMPORTANT: Read this MSDS before handling or disposing of this product, and provide this information to the employee, customers, and users of this product. PLEASE NOTE THE MSDS REVISION NUMBER AT THE TOP OF THIS PAGE. If the MSDS Revision Number posted at the top of this page does not match the MSDS Revision Number on the product label, please contact Customer Service at the phone number included above for the correct MSDS. This product is covered by the OSHA Hazard Communication Standard and this document has been prepared in accordance with requirements of this standard.
NOTICE: OSHA hazardous chemicals are listed in Section 2 if present at 1% or more. Carcinogens and extraordinarily/special hazardous chemicals are listed in Section 2 if present at .1% or more. Additional regulatory information for specific chemical categories is included in Section 15.

3. HAZARD IDENTIFICATION

Overview:	NOTICE: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal. Avoid contact with eyes, skin and clothing.		
Inhalation:	Harmful if inhaled. Causes nose and throat irritation. Vapors may affect the brain or nervous system causing dizziness, headache or nausea.		
Eyes:	Causes severe eye irritation. Do not get in eyes.		
Skin:	Causes skin irritation. May be harmful if absorbed through the skin.		
Ingestion:	Harmful if swallowed. May cause abdominal pain, nausea, vomiting, diarrhea, or drowsiness.		
Chronic Effects:	Contains an ingredient which can cause organ damage (See Section 2 and Section 15 for each ingredient). Birth defect hazard. Contains an ingredient which can cause birth defects (See Section 2 and Section 15 for each ingredient). Cancer hazard. Contains an ingredient which can cause cancer (See Section 2 and Section 15 for each ingredient). Risk of cancer depends on duration and level of exposure.		
HMIS Rating:	Health: 2*	Flammability: 3	Reactivity: 0

4. FIRST AID MEASURES

General:	Remove contaminated clothing and shoes. Get medical attention immediately. Wash clothing before reuse. Thoroughly clean or destroy contaminated shoes.
Inhalation:	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.
Eyes:	In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention immediately.
Skin:	In case of contact, immediately flush skin with soap and plenty of water. Get medical attention immediately.
Ingestion:	If swallowed, immediately contact Poison Control Center at 1-800-854-6813. DO NOT induce vomiting unless instructed to do so by medical personnel. Never give anything by mouth to an unconscious person.

5. PROTECTIVE EQUIPMENT AND CONTROL MEASURES

Respiratory:	Select equipment to provide protection from the ingredients listed in Section 2 of this document. Ensure fresh air entry during application and drying. If you experience eye watering, headache or dizziness or if air monitoring demonstrates dust, vapor, or mist levels are above applicable limits, wear an appropriate, properly fitted respirator (NIOSH approved) during and after application. Follow respirator manufacturer's directions for respirator use. FOR USERS OF 3M RESPIRATORY PROTECTION ONLY: For information and assistance on 3M occupational health and safety products, call OH&ESD Technical Service toll free in U.S.A. 1-800-243-4630, in Canada call 1-800-267-4414. Please do not contact these numbers regarding other manufacturer's respiratory protection products. 3M does not endorse the accuracy of the information contained in this Material Safety Data Sheet.
Eyes:	Do not get in eyes. Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site-specific conditions of use, safety glasses, chemical goggles, and/or head and face protection may be required to prevent contact. The equipment must be thoroughly cleaned, or discarded after each use.

Skin/Hand:	Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site-specific conditions of use, protective gloves, apron, boots, head and face protection may be required to prevent contact. The equipment must be thoroughly cleaned, or discarded after each use.
Engineering Controls:	Prevent build-up of vapors by opening all windows and doors to achieve cross-ventilation.
Other Work Practices:	Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Use good personal hygiene practices. Wash hands before eating, drinking, using toilet facilities, etc. Promptly remove soiled clothing and wash clothing thoroughly before reuse. Shower after work using plenty of soap and water.

6. FIRE AND EXPLOSION INFORMATION

Flash Point:	F: 67 C: 19
Lower Explosive Limit (LEL):	1.1 (%vol in air) at Normal Atmospheric Temp and Pressure
Fire and Explosion Hazards:	Flammable liquid and vapor. FLAMMABLE/COMBUSTIBLE MATERIALS: Will be easily ignited by heat, sparks or flames. Vapors may form explosive mixtures with air. Vapors may travel to source of ignition and flash back. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks) creating a vapor explosion hazard. Runoff to sewers may create fire or explosion hazard. Containers may explode when heated.
Fire Fighting Procedures:	CAUTION: This product has a very low flashpoint. Use of water spray when fighting fire may be inefficient. SMALL FIRES: Use dry chemical, CO2, water spray or alcohol-resistant foam. LARGE FIRES: Use water spray, fog, or alcohol-resistant foam. Do not use straight streams. Move containers from fire area if you can do so without risk. Runoff from fire control may cause pollution. Dike fire control water for later disposal. Do not scatter the material. **Also Reference Emergency Response Guide Number:** 127

7. PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Liquid
pH:	Not Determined
Specific Gravity:	1.23458
Boiling Point (F):	169
Vapor Density:	Heavier than air
VOC Content (lbs):	Refer to the Technical Data Sheet for this product.
Evaporation Rate:	Slower than ether

8. STABILITY AND REACTIVITY DATA

General:	This product is stable and hazardous polymerization will not occur.
Incompatible Materials:	Strong oxidizing agents.
Hazardous Decompostion:	May produce hazardous fumes when heated to decomposition as in welding. Fumes may produce Carbon Dioxide and Carbon Monoxide.

9. HANDLING AND STORAGE

Storage Temperature:	Store between 32 and 120 F
Handling and Storage Precautions:	Keep away from heat, sparks and flame. Do not smoke. Extinguish all flames and pilot lights, and turn off stoves, heaters, electric motors and other sources of ignition during use and until all vapors are gone. Vapors may cause flash fire or ignite explosively. Prevent build-up of vapors by opening all windows and doors to achieve cross-ventilation. Do not get in eyes, on skin or clothing. Close container after each use. Wash thoroughly after handling.

10. TOXICOLOGICAL DATA

General:	NOTICE: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal. No additional information provided for this product. See Section 2 for chemical specific data.

11. ECOLOGICAL DATA

General:	No additional information provided for this product. See Section 2 for chemical specific data.

12. ACCIDENTAL RELEASE MEASURES

Spill Response Procedures:	ELIMINATE ALL IGNITION SOURCES (no smoking, flares, sparks or flames in immediate area). Use only non-sparking equipment to handle spilled material and absorbent. Do not touch or walk through spilled material. Stop leak if you can do so without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. Use non-sparking tools to collect absorbed material.
Public Safety:	CALL CHEMTREC at (800)-424-9300 for emergency response. Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions. Keep unauthorized personnel away. Stay upwind. Keep out of low areas. Ventilate closed spaces before entering. LARGE SPILLS: Consider initial downwind evacuation for at least 300 meters (1000 feet). **Also, Reference Emergency Response Guide Number: 127**

13. DISPOSAL CONSIDERATION

Waste Disposal:	Dispose of in accordance with local, state and federal regulations. (Also reference RCRA information in Section 15 if listed).

14. TRANSPORTATION INFORMATION

DOT (Domestic Surface Transportation)		**IMO / IMDG (Ocean Transportation)**	
DOT Proper Shipping Name: PAINT		**IMDG Proper Shipping Name:** PAINT	
DOT Hazard Class:	3	**IMDG Hazard Class:**	3.2 - Intermediate flashpoint flammable liquids
UN / NA Number:	UN 1263	**UN Number:**	UN 1263
DOT Packing Group:	II	**IMDG Packing Group:**	II
CERCLA/DOT RQ:	4469 gal. / 45956 lbs.	**System Reference Code:**	28

15. REGULATORY INFORMATION

Regulatory Overview:	The regulatory data in Section 15 is not intended to be all-inclusive, only selected regulations are represented. All ingredients of this product are listed on the TSCA (Toxic Substance Control Act) Inventory or are not required to be listed on the TSCA Inventory. **Note:** Any chemical ingredients listed in Section 15, that do not also appear in Section 2, are contained in the product at a concentration below the applicable OSHA threshold level of 1% or 0.1%.

1. GENERAL INFORMATION

Product Identity: INTERZINC 22HS PART B

Bulk Sales Reference No: QH5056H

IMPORTANT: Read this MSDS before handling or disposing of this product, and provide this information to the employee, customers, and users of this product. PLEASE NOTE THE MSDS REVISION NUMBER AT THE TOP OF THIS PAGE. If the MSDS Revision Number posted at the top of this page does not match the MSDS Revision Number on the product label, please contact Customer Service at the phone number included above for the correct MSDS. This product is covered by the OSHA Hazard Communication Standard and this document has been prepared in accordance with requirements of this standard.

NOTICE: OSHA hazardous chemicals are listed in Section 2 if present at 1% or more. Carcinogens and extraordinarily/special hazardous chemicals are listed in Section 2 if present at .1% or more. Additional regulatory information for specific chemical categories is included in Section 15.

3. HAZARD IDENTIFICATION

Overview:	Avoid contact with eyes, skin and clothing.
Inhalation:	Harmful if inhaled. Causes nose and throat irritation.
Eyes:	Causes severe eye irritation. Do not get in eyes. Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site–specific condition of use, safety glasses, chemical goggles, and/or head and face protection may be required to prevent contact. The equipment must be thouroughly cleaned, or discarded after each use.
Skin:	Causes skin irritation. May be harmful if absorbed through the skin.
Ingestion:	Harmful if swallowed. May cause abdominal pain, nausea, vomiting, diarrhea, or drowsiness.
Chronic Effects:	Contains an ingredient which can cause organ damage (See Section 2 and Section 15 for each ingredient).
HMIS Rating:	Health: 2* Flammability: 1 Reactivity: 0

4. FIRST AID MEASURES

General:	Remove contaminated clothing and shoes. Get medical attention immediately. Wash clothing before reuse. Thoroughly clean or destroy contaminated shoes.
Inhalation:	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.
Eyes:	In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention immediately.
Skin:	In case of contact, immediately flush skin with soap and plenty of water. Get medical attention immediately.
Ingestion:	If swallowed, immediately contact Poison Control Center at 1–800–854–6813. DO NOT induce vomiting unless instructed to do so by medical personnel. Never give anything by mouth to an unconscious person.

5. PROTECTIVE EQUIPMENT AND CONTROL MEASURES

Respiratory:	Avoid breathing dust. Use a NIOSH approved respirator in accordance with 29CFR 1910.134 to remove particulates (and vapors if there is overexposure to vapors generated during the processing of this product). FOR USERS OF 3M RESPIRATORY PROTECTION ONLY: For information and assistance on 3M occupational health and safety products, call OH&ESD Technical Service toll free in U.S.A. 1–800–243–4630, in Canada call 1–800–267–4414. Please do not contact these numbers regarding other manufacturer's respiratory protection products. 3M does not endorse the accuracy of the information contained in this Material Safety Data Sheet.
Eyes:	Do not get in eyes. Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site–specific condition of use, safety glasses, chemical goggles, and/or head and face protection may be required to prevent contact. The equipment must be thouroughly cleaned, or discarded after each use. Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site–specific conditions of use, safety glasses, chemical goggles, and/or head and face protection may be required to prevent contact. The equipment must be thoroughly cleaned, or discarded after each use.
Skin/Hand:	Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site–specific conditions of use, protective gloves, apron, boots, head and face protection may be required to prevent contact. The equipment must be thoroughly cleaned, or discarded after each use.
Engineering Controls:	Depending on the site–specific conditions of use, provide adequate ventilation.
Other Work Practices:	Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Use good personal hygiene practices. Wash hands before eating, drinking, using toilet facilities, etc. Promptly remove soiled clothing and wash clothing thoroughly before reuse. Shower after work using plenty of soap and water. Avoid contact with eyes and clothing. Avoid prolonged or repeated contact with skin.

6. FIRE AND EXPLOSION INFORMATION

Flash Point:	F: No Established Limit C: No Established Limit
Lower Explosive Limit (LEL):	No Established Limit (%vol in air) at Normal Atmospheric Temp and Pressure
Fire and Explosion Hazards:	May react violently or explosively on contact with water. Material may be transported in flammable liquids. May be ignited by friction, heat, sparks, or flames. May burn with intense heat. Dust or fumes may form

	explosive mixtures in air. Containers may explode when heated. May re–ignite after fire is extinguished.
Fire Fighting Procedures:	SMALL FIRES: DO NOT USE WATER, FOAM, OR CO2. Dousing metallic fires with water may generate hydrogen gas, an extremely dangerous explosion hazard, particularly if fire is in a confined area. Use DRY sand, graphite powder, dry sodium chloride based extinguishers, G–1 or Met–L–X powder. Confining or smothering metal fires is preferable rather than applying water. Move containers from fire area if you can do so without risk. Also Reference Emergency Response Guide Number: 170

7. PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Solid
pH:	No Established Limit
Specific Gravity:	7.1
Boiling Point (F):	No Established Limit
Vapor Density:	Not Applicable
VOC Content (lbs):	Refer to the Technical Data Sheet for this product.
Evaporation Rate:	Not Applicable

8. STABILITY AND REACTIVITY DATA

General:	This product is stable and hazardous polymerization will not occur. Not sensitive to mechanical impact. Excessive heat and fumes generation can occur if improperly handled.
Incompatible Materials:	Strong oxidizing agents.
Hazardous Decompostion:	May produce hazardous fumes when heated to decomposition as in welding. Fumes may produce Carbon Dioxide and Carbon Monoxide.

9. HANDLING AND STORAGE

Storage Temperature:	Store between 40–100F (4–38C).
Handling and Storage Precautions:	Keep away from heat, sparks and flame. Do not smoke. Extinguish all flames and pilot lights, and turn off stoves, heaters, electric motors and other sources of ignition during use and until all vapors are gone. Finely divided powders are potentially explosive when suspended in air. Isolate from heat, sparks, electrical equipment and open flame. Do not get in eyes, on skin or clothing. Do not breathe dust. Close container after each use. Wash thoroughly after handling.

10. TOXICOLOGICAL DATA

General:	No additional information provided for this product. See Section 2 for chemical specific data.

11. ECOLOGICAL DATA

General:	No additional information provided for this product. See Section 2 for chemical specific data.

12. ACCIDENTAL RELEASE MEASURES

Spill Response Procedures:	ELIMINATE ALL IGNITION SOURCES (no smoking, flares, sparks or flames in immediate area). Do not touch or walk through spilled material. Stop leak if you can do so without risk. Prevent entry into waterways, sewers, basements or confined areas. Use non–sparking equipment to collect spilled material and transfer to containers for later disposal. DO NOT GET WATER INSIDE CONTAINERS.
Public Safety:	CALL CHEMTREC at (800)–424–9300 for emergency response. Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions. Keep unauthorized personnel away. Stay upwind. Also, Reference Emergency Response Guide Number: 170

13. DISPOSAL CONSIDERATION

Waste Disposal:	Dispose of in accordance with local, state and federal regulations. (Also reference RCRA information in Section 15 if listed).

14. TRANSPORTATION INFORMATION

DOT (Domestic Surface Transportation)		IMO / IMDG (Ocean Transportation)	
DOT Proper Shipping Name: ZINC DUST (NOT HAZARDOUS BY TESTING IN ACCORDANCE WITH UN MANUAL OF TESTS AND CRITERIA)		IMDG Proper Shipping Name: ZINC DUST

16. OTHER INFORMATION

The information and recommendations contained herein are based upon data believed to be correct. However, no guarantee or warranty of any kind, expressed or implied, is made with respect to the information contained herein. We accept no responsibility and disclaim all liability for any harmful effects which may be caused by exposure to our products. Customers/users of this product must comply with all applicable health and safety laws, regulations, and orders.

FOR PROFESSIONAL USE ONLY

IMPORTANT NOTE The information in this data sheet is not intended to be exhaustive and is based on the present state of our knowledge and on current laws: any person using the product for any purpose other than that specifically recommended in the technical data sheet without first obtaining written confirmation from us as to the suitability of the product for the intended purpose does so at his own risk. It is always the responsibility of the user to take all necessary steps to fulfill the demands set out in the local rules and legislation. Always read the Material Data Sheet and the Technical Data Sheet for this product if available. All advice we give or any statement made about the product by us (whether in this data sheet or otherwise) is correct to the best of our knowledge but we have no control over the quality or the condition of the substrate or the many factors affecting the use and application of the product. Therefore, unless we specifically agree in writing otherwise, we do not accept any liability whatsoever for the performance of the product or for any loss or damage arising out of the use of the product. All products supplied and technical advice given are subject to our standard terms and conditions of sale. You should request a copy of this document and review it carefully. The information contained in this data sheet is subject to modification from time to time in the light of experience and our policy of continuous development. It is the user's responsibility to verify that this data sheet is current prior to using the product.

Brand names mentioned in this data sheet are trademarks of or are licensed to Akzo Nobel.

End Of Document

Intertherm 50

High Temperature Silicone

PRODUCT DESCRIPTION

A single component, high temperature coating, based on a moisture curing silicone binder.

The moisture curing crosslinking mechanism allows multiple coats to be applied without heat curing. Suitable for temperatures up to 1004°F (540°C).

INTENDED USES

For the protection of steel from corrosion on areas including flare stacks, chimneys, exhausts, vents and pipework, at temperatures up to 1004°F (540°C).

Where maximum corrosion protection is required, application should be over a zinc silicate primer (e.g. Interzinc 22).

PRACTICAL INFORMATION FOR INTERTHERM 50

Color	Aluminum, Black
Gloss Level	Not applicable
Volume Solids	45%
Typical Thickness	1 mils (25 microns) dry equivalent to 2.2 mils (56 microns) wet
Theoretical Coverage	722 sq.ft/US gallon at 1 mils d.f.t and stated volume solids 18 m²/liter at 25 microns d.f.t and stated volume solids
Practical Coverage	Allow appropriate loss factors
Method of Application	Air Spray, Brush, Roller

Drying Time

			Overcoating Interval with recommended topcoats	
Temperature	**Touch Dry**	**Hard Dry**	*Minimum*	*Maximum*
41°F (5°C)	90 minutes	5 hours	24 hours	Extended□
59°F (15°C)	60 minutes	3 hours	16 hours	Extended□
77°F (25°C)	30 minutes	2 hours	12 hours	Extended□
104°F (40°C)	15 minutes	1 hour	6 hours	Extended□

□See International Protective Coatings Definitions & Abbreviations

REGULATORY DATA

Flash Point	77°F (25°C)	
Product Weight	9.4 lb/gal (1.13 kg/l)	
VOC	4.13 lb/gal (495 g/lt) 509 g/kg	EPA Method 24 EU Solvent Emissions Directive (Council Directive 1999/13/EC)

See Product Characteristics section for further details

SURFACE PREPARATION

All surfaces to be coated should be clean, dry and free from contamination. Prior to paint application, all surfaces should be assessed and treated in accordance with ISO 8504:2000.

Oil or grease should be removed in accordance with SSPC-SP1 solvent cleaning.

Abrasive Blast Cleaning

Abrasive blast clean to a minimum of SSPC-SP6 or Sa2 (ISO 8501-1:2007). If oxidation has occurred between blasting and application of Intertherm 50, the surface should be reblasted to the specified visual standard.

Surface defects revealed by the blast cleaning process, should be ground, filled, or treated in the appropriate manner.

A surface profile of 1-2 mils (25-50 microns) is recommended.

Hand or Power Tool Preparation

Any coatings present on the surface must be removed prior to the application of Intertherm 50.
Hand or power tool clean to a minimum SSPC-SP3 or St3 (ISO 8501-1:2007).
Note, all scale must be removed and areas which cannot be prepared adequately by chipping or needle gun should be spot blasted to a minimum standard of SSPC-SP6 or Sa2 (ISO 8501-1:2007). Typically this would apply to C or D grade rusting in this standard.

Primed Surfaces

Intertherm 50 is suitable for application to unweathered steelwork freshly coated with zinc silicate shop primers. If the zinc shop primer shows extensive or widely scattered breakdown, or excessive zinc corrosion products, overall sweep blasting will be necessary. Other types of shop primer are not suitable for overcoating and will require complete removal by abrasive blast cleaning.

Weld seams and damaged areas should be blast cleaned to SSPC-SP6 or Sa2 (ISO 8501-1:2007).

Aluminium Metal Spray

Metal sprayed surfaces should be fresh, clean and free from moisture, or surface contamination.

APPLICATION

Mixing	This material is a one component coating and should always be mixed thoroughly with a power agitator before application.	
Mix Ratio	Not applicable	
Airless Spray	Not recommended	
Air Spray (Pressure Pot)	Recommended	Gun DeVilbiss MBC or JGA Air Cap 704 or 765 Fluid Tip E
Air Spray (Conventional)	Recommended	Use suitable proprietary equipment.
Brush	Suitable - Small areas only	Typically 0.6-0.8 mils (15-20 microns) can be achieved
Roller	Suitable - Small areas only	Typically 0.6-0.8 mils (15-20 microns) can be achieved
Thinner	International GTA007	Do not thin more than allowed by local environmental legislation
Cleaner	International GTA007	

Work Stoppages

Do not allow material to remain in hoses, gun or spray equipment. Thoroughly flush all equipment with International GTA007. Partially filled containers may show surface skinning and/or a viscosity increase of the material after storage.

Clean Up

Clean all equipment immediately after use with International GTA007. It is good working practice to periodically flush out spray equipment during the course of the working day. Frequency of cleaning will depend upon amount sprayed, temperature and elapsed time, including any delays.

All surplus materials and empty containers should be disposed of in accordance with appropriate regional regulations/legislation.

PRODUCT CHARACTERISTICS

Intertherm 50 is moisture curing, and does not evolve water vapor during the heat curing mechanism as with standard silicones. Application at thicknesses of 1 mil (25 microns) are therefore possible rather than normal thicknesses of 0.6 mil (15 microns).

Maximum thickness which can be applied in a single coat without subsequent blistering on heating is 1.6 mil (40 microns).

Up to 3 coats at a maximum of 1 mil (25 microns) per coat can be applied without the requirement of heating between coats. This provides maximum corrosion protection when it is not possible to use a zinc silicate priming system.

Intertherm 50 is available in an aluminium or black version. It is recommended that the aluminium version is always used where possible due to its superior performance. The black version should only be used for specialist applications / requirements. For further information contact International Protective Coatings.

Intertherm 50 Aluminium version is suitable for the protection of abrasive blast cleaned steel operating at continuous dry temperatures up to 1004°F (540°C). However, the maximum service temperature over hand prepared substrates is 752°F (400°C).

Intertherm 50 Black version is suitable for the protection of abrasive blast cleaned steel operating at continuous dry temperatures up to 752°F (400°C). However, the maximum service temperature over hand prepared substrates is 572°F (300°C).

When using high heat coatings over inorganic zinc primer, the products should be applied in strict accordance with film thickness specifications, since application of excessive thicknesses may cause blistering. Determine that the inorganic zinc primer is thoroughly cured prior to application of the high heat coating by following the curing instructions given on the relevant product data sheet.

When using a zinc silicate primer to obtain maximum corrosion resistance the recommended thickness of zinc silicate is 2 mils (50 microns) dry film thickness to ensure maximum surface strength for any subsequent temperature cycling and to avoid flaking of topcoats..

It is preferable to overcoat zinc silicate before weathering but in cases where this is not possible then the zinc silicate surface should be clean and free of zinc corrosion products.

In corrosive environments, the use of Intertherm 50 Black directly over zinc silicate primer can lead to a marked color change from black to grey due to the salting of the underlying primer. This color change can be significantly reduced by first sealing the zinc silicate primer with a single coat of Intertherm 50 Aluminium prior to the application of Intertherm 50 Black. The maximum dry temperature resistance of this system is 752°F (400°C).

Intertherm 50 is not suitable for exposure in acid or alkaline environments.

Intertherm 50 Aluminium version has the following specification approvals:
- BS5493 (1977) : CP7
- Shell Specification DEP 40.48.00.30 Gen. Chapter VI (h)

Note: VOC values are typical and are provided for guidance purpose only. These may be subject to variation depending on factors such as differences in color and normal manufacturing tolerances.

Low molecular weight reactive additives, which will form part of the film during normal ambient cure conditions, will also affect VOC values determined using EPA Method 24.

SYSTEMS COMPATIBILITY

This specialist coating is only compatible with a very limited number of products.
Suitable primers are:

Interzinc 22

Suitable topcoats are:

Intertherm 50

For other suitable primers consult International Protective Coatings.

ADDITIONAL INFORMATION

Further information regarding industry standards, terms and abbreviations used in this data sheet can be found in the following documents available at www.international-pc.com:

- Definitions & Abbreviations
- Surface Preparation
- Paint Application
- Theoretical & Practical Coverage

Individual copies of these information sections are available upon request.

SAFETY PRECAUTIONS

This product is intended for use only by professional applicators in industrial situations in accordance with the advice given on this sheet, the Material Safety Data Sheet and the container(s), and should not be used without reference to the Material Safety Data Sheet (MSDS) which International Protective Coatings has provided to its customers.

All work involving the application and use of this product should be performed in compliance with all relevant national, Health, Safety & Environmental standards and regulations.

In the event welding or flame cutting is performed on metal coated with this product, dust and fumes will be emitted which will require the use of appropriate personal protective equipment and adequate local exhaust ventilation.

If in doubt regarding the suitability of use of this product, consult International Protective Coatings for further advice.

PACK SIZE

Unit Size	Vol	Pack
5 US gal	5 US gal	5 US gal
5 liter	5 liter	5 liter

For availability of other pack sizes contact International Protective Coatings

SHIPPING WEIGHT

Unit Size	
5 liter	6.2 kg
5 US gal	50.5 lb

STORAGE

Shelf Life	12 months minimum at 77°F (25°C). Subject to re-inspection thereafter. Store in dry, shaded conditions away from sources of heat and ignition.

Important Note

The information in this data sheet is not intended to be exhaustive: any person using the product for any purpose other than that specifically recommended in this data sheet without first obtaining written confirmation from us as to the suitability of the product for the intended purpose does so at their own risk. All advice given or statements made about the product (whether in this data sheet or otherwise) is correct to the best of our knowledge but we have no control over the quality or the condition of the substrate or the many factors affecting the use and application of the product. Therefore, unless we specifically agree in writing to do so, we do not accept any liability at all for the performance of the product or for (subject to law) any loss or damage arising out of the use of the product. All products supplied and technical advice given are subject to our Conditions of Sale. You should request a copy of this document and review it carefully. The information contained in this data sheet is liable to modification from time to time in the light of experience and our policy of continuous development. It is the user's responsibility to check with their local International Paint representative that this data sheet is current prior to using the product.

INTERTHERM 50 ALUMINUM

MSDS Revision No: A7 -4
MSDS Revision Date: 10/14/2002

International Paint Inc.
6001 Antoine Drive
Houston, Texas 77091

EMERGENCY NUMBERS:

(800) 424-9300	CHEMTREC (USA)
(703) 527-3887	CHEMTREC (Intl)
(800) 854-6813	Poison Control Center

CUSTOMER SERVICE: (Non-Emergency)

(800) 589-1267	International Paint
(800) 631-7481	Interlux

1. GENERAL INFORMATION

Product Identity: INTERTHERM 50 ALUMINUM

Bulk Sales Reference No: HTA097

IMPORTANT: Read this MSDS before handling or disposing of this product, and provide this information to the employee, customers, and users of this product. PLEASE NOTE THE MSDS REVISION NUMBER AT THE TOP OF THIS PAGE. If the MSDS Revision Number posted at the top of this page does not match the MSDS Revision Number on the product label, please contact Customer Service at the phone number included above for the correct MSDS. This product is covered by the OSHA Hazard Communication Standard and this document has been prepared in accordance with requirements of this standard.

3. HAZARD IDENTIFICATION

Overview:	NOTICE: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal. Avoid contact with eyes, skin and clothing.
Inhalation:	Harmful if inhaled. Causes nose and throat irritation. Vapors may affect the brain or nervous system causing dizziness, headache or nausea.
Eyes:	Causes severe eye irritation. Do not get in eyes.
Skin:	Causes skin irritation. May be harmful if absorbed through the skin.
Ingestion:	Harmful if swallowed. May cause abdominal pain, nausea, vomiting, diarrhea, or drowsiness.
Chronic Effects:	Contains an ingredient which can cause organ damage (See Section 2 and Section 15 for each ingredient). Possible cancer hazard. Contains an ingredient which may cause cancer based on animal data (See Section 2 and Section 15 for each ingredient). Risk of cancer depends on duration and level of exposure.
HMIS Rating:	Health: 2* Flammability: 3 Reactivity: 0

4. FIRST AID MEASURES

General:	Remove contaminated clothing and shoes. Get medical attention immediately. Wash clothing before reuse. Thoroughly clean or destroy contaminated shoes.
Inhalation:	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.
Eyes:	In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention immediately.
Skin:	In case of contact, immediately flush skin with soap and plenty of water. Get medical attention immediately.
Ingestion:	If swallowed, immediately contact Poison Control Center at 1-800-854-6813. DO NOT induce vomiting unless instructed to do so by medical personnel. Never give anything by mouth to an unconscious person.

5. PROTECTIVE EQUIPMENT AND CONTROL MEASURES

Respiratory:	Select equipment to provide protection from the ingredients listed in Section 2 of this document. Ensure fresh air entry during application and drying. If you experience eye watering, headache or dizziness or if air monitoring demonstrates dust, vapor, or mist levels are above applicable limits, wear an appropriate, properly fitted respirator (NIOSH approved) during and after application. Follow respirator manufacturer's directions for respirator use. FOR USERS OF 3M RESPIRATORY PROTECTION ONLY: For information and assistance on 3M occupational health and safety products, call OH&ESD Technical Service toll free in U.S.A. 1-800-243-4630, in Canada call 1-800-267-4414. Please do not contact these numbers regarding other manufacturer's respiratory protection products. 3M does not endorse the accuracy of the information contained in this Material Safety Data Sheet.
Eyes:	Do not get in eyes. Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site-specific conditions of use, safety glasses, chemical goggles, and/or head and face protection may be required to prevent contact. The equipment must be thoroughly cleaned, or discarded after each use.
Skin/Hand:	Protective equipment should be selected to provide protection from exposure to the chemicals listed in Section 2 of this document. Depending on the site-specific conditions of use, protective gloves, apron, boots, head and face protection may be required to prevent contact. The equipment must be thoroughly cleaned, or discarded after each use.
Engineering Controls:	Prevent build-up of vapors by opening all windows and doors to achieve cross-ventilation.
Other Work Practices:	Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure. Use good personal hygiene practices. Wash hands before eating, drinking, using toilet facilities, etc. Promptly remove soiled clothing and wash clothing thoroughly before reuse. Shower after work using plenty of soap and water.

6. FIRE AND EXPLOSION INFORMATION

Flash Point:	F: 77 C: 25
Lower Explosive Limit (LEL):	.9 (%vol in air) at Normal Atmospheric Temp and Pressure
Fire and Explosion Hazards:	Flammable liquid and vapor. FLAMMABLE/COMBUSTIBLE MATERIALS: Will be easily ignited by heat, sparks or flames. Vapors may form explosive mixtures with air. Vapors may travel to source of ignition and flash back. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks) creating a vapor explosion hazard. Runoff to sewers may create fire or explosion hazard. Containers may explode when heated.
Fire Fighting Procedures:	CAUTION: This product has a very low flashpoint. Use of water spray when fighting fire may be inefficient. SMALL FIRES: Use dry chemical, CO2, water spray or alcohol-resistant foam. LARGE FIRES: Use water spray, fog, or alcohol-resistant foam. Do not use straight streams. Move containers from fire area if you can do so without risk. Runoff from fire control may cause pollution. Dike fire control water for later disposal. Do not scatter the material. **Also Reference Emergency Response Guide Number:** 127

7. PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Liquid
pH:	Not Determined
Specific Gravity:	1.140262
Boiling Point (F):	148
Vapor Density:	Heavier than air
VOC Content (lbs):	Refer to the Technical Data Sheet for this product
Evaporation Rate:	Slower than ether

8. STABILITY AND REACTIVITY DATA

General:	This product is stable and hazardous polymerization will not occur.
Incompatible Materials:	Strong oxidizing agents.
Hazardous Decompostion:	May produce hazardous fumes when heated to decomposition as in welding. Fumes may produce Carbon Dioxide and Carbon Monoxide.

9. HANDLING AND STORAGE

Storage Temperature:	Store between 32 and 120 F
Handling and Storage Precautions:	Keep away from heat, sparks and flame. Do not smoke. Extinguish all flames and pilot lights, and turn off stoves, heaters, electric motors and other sources of ignition during use and until all vapors are gone. Vapors may cause flash fire or ignite explosively. Prevent build-up of vapors by opening all windows and doors to achieve cross-ventilation. Do not get in eyes, on skin or clothing. Close container after each use. Wash thoroughly after handling.

10. TOXICOLOGICAL DATA

General:	NOTICE: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal. No additional information provided for this product. See Section 2 for chemical specific data.

11. ECOLOGICAL DATA

General:	No additional information provided for this product. See Section 2 for chemical specific data.

12. ACCIDENTAL RELEASE MEASURES

Spill Response Procedures:	ELIMINATE ALL IGNITION SOURCES (no smoking, flares, sparks or flames in immediate area). Use only non-sparking equipment to handle spilled material and absorbent. Do not touch or walk through spilled material. Stop leak if you can do so without risk. Prevent entry into waterways, sewers, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to containers. Use non-sparking tools to collect absorbed material.
Public Safety:	CALL CHEMTREC at (800)-424-9300 for emergency response. Isolate spill or leak area immediately for at least 25 to 50 meters (80 to 160 feet) in all directions. Keep unauthorized personnel away. Stay upwind. Keep out of low areas. Ventilate closed spaces before entering. LARGE SPILLS: Consider initial downwind evacuation for at least 300 meters (1000 feet). **Also, Reference Emergency Response Guide Number: 127**

13. DISPOSAL CONSIDERATION

Waste Disposal:	Dispose of in accordance with local, state and federal regulations. (Also reference RCRA information in Section 15 if listed).

14. TRANSPORTATION INFORMATION

DOT (Domestic Surface Transportation)		**IMO / IMDG (Ocean Transportation)**	
DOT Proper Shipping Name: PAINT		**IMDG Proper Shipping Name:** PAINT	
DOT Hazard Class:	3	**IMDG Hazard Class:**	3.3 - High flashpoint flammable liquids
UN / NA Number:	UN 1263	**UN Number:**	UN 1263

1.0 INTRODUCTION 1
2.0 WATER QUALITY REQUIREMENTS 1
2.1 Hydrotest Water Specification 1
2.2 Post Hydrotest Drying Requirements 4
2.3 Water Quality Inspection 5

1.0 INTRODUCTION

This specification details the water quality required for a hydrotest of an Innovative Steam Technologies (IST) Once Through Steam Generator (OTSG) and auxiliary piping. Deviations from the limits and requirements must have specific written approval from Innovative Steam Technologies.

The technical criteria for formulating these guidelines includes:

- Prevention of corrosion in the OTSG and external piping. If necessary, more stringent limits can be used based on the requirements for other components in the system, which may be more sensitive to impurities.
- Prevention of suspended solids from entering the OTSG, which could end up plugging the stabilization orifices.

2.0 WATER QUALITY REQUIREMENTS

2.1 Hydrotest Water Specification

The rationale for determination of the water quality requirements for these guidelines is based on the requirements for the OTSG and auxiliary piping. The following water quality requirements provided in Tables 1.0 or 2.0 shall be met.

If a mixed bed unit is used to purify the water and the de-ionized water is sent directly to the steam generator to fill the unit, then the water quality measurements shall be taken at the mixed bed outlet.

If the de-ionized water is stored in a tank, then the water quality measurements shall be taken at the tank outlet.

Conductivity and pH readings shall be continuously monitored. Chlorides and sulfates shall be measured as required to ensure compliance during the hydro fill.

Parameter	Limit	Unit	Notes
pH	≥ 7.0	------	3, 9
Water Specific Conductivity	≤ 0.077	µS/cm	5, 7, 8
Water Specific Resistivity	≥ 13.0	megohm/cm	
Suspended Solids	Not detectable	ppb	2

Table 1.0 Hydrotest water quality specification without measuring chloride and sulfate levels.

Table 1.0 Notes:

1) Conductivity and pH measured at 25°C.
2) Suspended solids must be prevented to avoid clogging of feedwater orifices. Suspended solids are commonly measured by examining the undissolved material trapped on a 0.45 micrometer filter after filtration. Material that passes through is referred to as dissolved solids.
3) pH below 7.0 is prohibited.
4) No turbidity, oil or sediment is allowed.
5) Water test temperature to be in accordance with ASME Section I or B31.1 guidelines.
6) Water resistivity is the reciprocal of water conductivity and either parameter may be used.
7) Resistivity level corresponds to Total Dissolved Solids at 10 ppb.
8) To help achieve the resistivity levels, it may be necessary to recirculate the water through the mixed bed polisher before the water is flowed through the bed and into the OTSG.
9) The pH reading must be made on a moving flow stream without exposure to the atmosphere (i.e. inside the pipe). Carbon dioxide in the air will lower the pH in the water by naturally forming carbonic acid.

Parameter	Limit	Unit	Notes
pH	≥ 7.0	------	3, 9
Water Specific Conductivity	≤ 0.27	µS/cm	6, 7, 8
Water Specific Resistivity	≥ 3.70	megohm/cm	
Chloride (Organic and inorganic)	< 10	ppb	
Sulfate (Organic and inorganic)	< 10	ppb	
Suspended Solids	Not detectable	ppb	2

Table 2.0 Hydrotest water quality specification when chloride and sulfate levels are measured.

Table 2.0 Notes:

1) Conductivity and pH measured at 25°C.
2) Suspended solids must be prevented to avoid clogging of feedwater orifices. Suspended solids are commonly measured by examining the undissolved material trapped on a 0.45 micrometer filter after filtration. Material that passes through is referred to as dissolved solids.
3) pH below 7.0 is prohibited.
4) No turbidity, oil or sediment is allowed.
5) Water test temperature to be in accordance with ASME Section I or B31.1 guidelines.
6) Water resistivity is the reciprocal of water conductivity and either parameter may be used.
7) Chloride and sulfate levels must be initially met and maintained in order to use the conductivity level in this table.
8) To help achieve the resistivity levels in Table 1.0, it may be necessary to recirculate the water through the mixed bed polisher before the water is flowed through the bed and into the OTSG.
9) The pH reading must be made on a moving flow stream without exposure to the atmosphere (i.e. inside the pipe). Carbon dioxide in the air will lower the pH in the water by naturally forming carbonic acid.

2.2 Post Hydrotest Drying Requirements

The OTSG and associated piping should be hydrotested with water in accordance with the specifications given in Table 1.0 or 2.0. After testing is completed, the OTSG and associated piping shall be thoroughly drained and dried (all high point vents should be open during draining).

The tube surface must be dried to remove any chlorides or bacteria which can lead to corrosion. Acceleration of corrosion can occur as a result of the influence of microbial activity. Certain strains of bacteria can grow on the metal surface and provide a location of stagnant and highly acidic water between the growth and tube surface. Iron bacteria called Gallionella, and iron/manganese bacteria called Siderocapsa, have been documented to cause severe corrosion. These problems can be avoided provided the water is not allowed to stay on the metal surface for extended periods of time. For this reason, the boiler and piping must be drained and dried of hydrotest water immediately after testing.

The following procedures are to be followed:

Shop Hydrotest

Idle Time Between Hydrotest and Transportation by Rail or Truck	Drying Requirements
Up to 1 week	OTSG will be drained using gravity immediately after hydrotest. Prior to loading the module on the rail car, the OTSG will be rocked in the fore and aft direction on the trailer until no water exits the steam header. A slow rocking pattern will be used to give the water time to run down through the tubing.
Greater than 1 week	The tubing will be dried using high pressure oil free compressed air. Each circuit will be individually isolated and purged. Isolating dams will be required at the inlet headers to isolate individual circuits. In modules with mixing headers, nitrogen shall be used for drying the tubes.

Field Hydrotest

Idle Time Between Hydrotest and OTSG Start-Up	Drying Requirements
Up to 1 week	OTSG will be drained using gravity immediately after the hydrotest. OTSG start up to occur within 1 week time span
Greater than 1 week	The tubing and piping will be dried using nitrogen. The gas will be fed through the feedwater piping and towards the steam outlet pipe. Once dry, the OTSG can remain off-line as long as required. In marine of other corrosive locations, the pressure parts will be given a nitrogen purge once the inside surface has been dried.

The following notes are applicable:

a) Ensure that the pressure tubing is protected from water freezing in cold climates. If a potential of freezing exists, the water is to be drained and the tubing immediately blown dry, or if in the field, the tubing heated with the gas turbine to boil out the remaining water.
b) The field hydrotest should not be conducted until after a thorough flush of the module and feedwater piping has occurred.
c) Confirmation of the final field weld X-rays and inspections on both the steam and feedwater piping must be submitted to the site contractor before filling and pressurizing the circuits during the field hydrotest.
8 d) During hydrotest, the extra weight of the water will impose additional loads on the steam piping. Additional pipe supports and/or stops may be required during hydrotest to minimize the transfer of these loads to the OTSG steam outlet header.
e) The Authorized Inspector must be present for the hydrotesting.

2.3 Water Quality Inspection

The hydrotest water shall be inspected by Quality Control prior to hydrotesting to ensure it meets the requirements of Table 1.0 or 2.0, as applicable. Maintaining the conductivity limits in Table 1.0 will ensure the chloride and sulfate levels are within acceptable limits and separate measurements of chloride and sulfates are not required.

ISO form SYS-116 shall be filled out and included in the document control package for each shop hydrotested OTSG. The calibration record of the conductivity (resistivity) meter shall be recorded on the form.

04	Added Incoloy to Section 2.0 Additional notes added to Section 2.2			October 23/09
05	Added Section 4.0 - cleaning requirements for carbon steel piping	AB	JL	Dec 3/09
06	Added note requiring steam headers to be internally cleaned. Altered title of sections 3.0 and 4.0	CK	JL	Sept 27/11

Table of Contents

Paragraph Number		Page
1.0	Scope	1
2.0	Stainless steel and Incoloy (NO8800 & NO8825) pipe cleaning requirements	1
3.0	Chromoly steel pipe cleaning requirements	1
4.0	Carbon steel pipe cleaning requirements	1

1.0 Scope - This specification outlines cleaning requirements for boiler piping.

2.0 Stainless steel and Incoloy (NO8800 & NO8825) pipe cleaning requirements

2.1 Remove all weld flux and splatter using power or hand tools as necessary. Verify all nozzle inside surfaces at run pipe welded connections are free of weld grapes and other obstructions.

2.2 Surface damage caused by cleaning tools is to be avoided, such as burrs and sharp cuts. In order to avoid trace amounts of material transfer that cause rust, do not use cutting or cleaning tools that have been used on carbon steel.

2.3 Thoroughly clean the inside of pipe using a compressed air blow with special care taken to ensure all welded nozzles/branches are free of obstructions.

2.4 Immediately following the air blow, pipe and branch ends are to be sealed with plastic end caps securely fastened. Care should be taken to ensure there is no ingress of foreign material into the pipe at this stage.

2.5 If the pipe has been hydro tested, <u>all</u> water must be removed prior to the sealing of the pipe and branch ends.

2.6 Water for hydro test must conform with specification ES-020.

3.0 Chroloy pipe cleaning requirements for steam headers and piping not subject to steam blows prior to operation

3.1 Remove all weld flux and splatter using power or hand tools as necessary. Verify all nozzle inside surfaces at run pipe welded connections are free of weld grapes and other obstructions.

3.2 Surface damage caused by cleaning tools is to be avoided, such as burrs and sharp cuts.

3.3 Following post weld heat treatment, sand blast inside pipe surface per

SSPC-SP10.

3.4 Thoroughly blow out, using compressed air, all sand residue from inside of pipe following sand blasting, and immediately coat the inside surface with CORTEC VCI-307 or equal corrosion inhibitor.

3.5 Following the application of the inhibitor, all pipe and branch ends are to be sealed with plastic end caps securely fastened. Care should be taken to ensure there is no ingress of foreign material into the pipe at this stage.

3.6 Should a hydrostatic test be performed on the pipe following the application of the corrosion inhibitor, the pipe must be completely dried and re-coated with the inhibitor.

3.7 Water for hydro test must conform with specification ES-020.

3.8 Steam headers require internal cleaning as sufficient velocity in not developed within the header to adequately clean them during a steam blow.

4.0 Carbon steel pipe cleaning requirements for piping not subject to steam blows prior to operation

4.1 Remove all weld flux and splatter using power or hand tools as necessary. Verify all nozzle inside surfaces at run pipe welded connections are free of weld grapes and other obstructions.

4.2 Surface damage caused by cleaning tools is to be avoided, such as burrs and sharp cuts.

4.3 Thoroughly blow out, using compressed air, all residue from inside of pipe following assembly.

4.4 Should a hydrostatic test be performed, the pipe must be completely dried after the test and confirmed using a humidity meter at the pipe exit.

4.5 All pipe and branch ends are to be sealed with plastic end caps

securely fastened. Care should be taken to ensure there is no ingress of foreign material into the pipe at this stage.

4.6 Water for hydro test must conform with specification ES-020.

1.0 SCOPE.....1

2.0 APPLICABLE DOCUMENTS.....1

3.0 PACKING REQUIREMENTS..... 1
- 3.1 General Requirements
- 3.2 Pipe Openings and Connections
- 3.3 Tubing Bundles
- 3.4 Ducting Components
- 3.5 Vendor Equipment

4.0 QUALITY ASSURANCE PROVISIONS.....3

1.0 SCOPE

This specification covers the outdoor storage and shipping protection of components supplied by Innovative Steam Technologies. If prolonged storage of the units is required (over 3 months), contact IST for additional requirements.

2.0 APPLICABLE DOCUMENTS

The following documents form a part of this specification to the extent specified herein. Documents not identified by date, revision or amendment shall be of the latest issue on the date of this specification.

SPECIFICATIONS

Innovative Steam Technologies

Engineering Specification ES-010	Paint Specification
Engineering Specification ES-021	Pipe Cleaning Specification

3.0 PACKING REQUIREMENTS

3.1 General Requirements

- Packaging shall be adequate to prevent contamination, mechanical damage, or deterioration of the components supplied.
- All expendable materials, such as tapes, barriers, plugs, desiccants, desiccant bags, caps, inhibitors etc. to be in contact with austenitic stainless steel or nickel alloys shall not contribute to corrosion during the storage period.
- Metal fasteners, straps, or covers shall not be tack welded to any manufactured part, and shall be of a material compatible with the equipment material to avoid any corrosion.
- Prior to packaging, all components shall be inspected for cleanliness, completely drained and thoroughly dry.
- The packing instructions are applicable immediately after manufacture. Items not immediately packaged after manufacture shall be protected from contamination.

3.2 Pipe Openings and Connections

3.2.1 Prior to packaging of piping, the piping shall be cleaned in accordance with IST Engineering Specification ES-021 (Pipe Cleaning Specification).

3.2.2 All openings shall be closed with temporary closures to prevent entry of dust, dirt, precipitation, moisture or other foreign matter. All openings shall be protected by plastic caps designed to cover the entire weld end area and secured fastened.

3.2.3 Threaded or socket weld connections shall be closed with screwed or snap-in type plastic protectors. Cast iron plugs are not acceptable for shipping protection unless part of the final field assembly.

3.2.4 All exterior unpainted machined surfaces and threaded connections shall be coated with an easily removable rust preventative suitable for six months outdoor storage.

3.2.5 All exposed threads of external bolting shall be coated with an anti-seize compound following assembly.

3.3 Tubing Bundles

3.3.1 All tube bundle module tops shall be covered for outdoor storage and transportation. To prevent contamination from dust, dirt, salt, spray and other forms of contaminants exposed portions of tube bundle module bottoms shall be covered.

3.3.2 Items shall be covered by tarpaulins (or equivalent) to minimize the wetting of the insulation and to prevent contamination from dust, dirt, salt, spray and other forms of contaminants. Cover installation shall be made so that air circulates under the cover to prevent condensation.

3.3.3 Modules are to be stored on a level surface and blocked up a minimum of four inches off the ground at jacking locations. If the module is to be stored for more than two weeks the module shall be blocked up at each column location and at the module ends.

3.3.4 All access doors shall be secured closed.

03 3.3.5 Overseas ship transportation shall be below deck stowage and protected from salt spray. On-deck transportation is strictly prohibited.

03 3.3.6 When the module is sitting on dock for longer than 48 hours or during periods of severe weather, it shall be protected from salt water spray by being fully covered with tarps.

3.4 Ducting Components (including inlet plenum, exhaust hood and exhaust stack)

3.4.1 Ducting components are to be prepared and coated in accordance with IST Engineering Specification ES-010 prior to packaging.

3.4.2 Insulation is to be protected against precipitation if stored outdoors. Open insulated ends of ducting components are to be covered for transportation or outdoor storage.

3.4.3 All ducting openings shall be covered if the ducting is to be transported or stored in a salt air environment.

3.4.4 Items shall be covered by tarpaulins (or equivalent) where possible to prevent contamination from dust, dirt, salt, spray and other forms of contaminants. Cover installation shall be made so that air circulates under the cover to prevent condensation. If the components cannot be covered by tarpaulins (or equivalent), all ducting components shall be thoroughly cleaned by power water wash (or equivalent while minimizing the wetting of insulation) prior to assembly. This is to be the site erector's responsibility.

3.4.5 All access doors shall be secured closed.

3.5 Vendor Equipment

3.5.1 Follow the manufacturers recommended procedures for long term storage of individual components.

4. QUALITY ASSURANCE PROVISIONS

Quality Control shall be responsible to verify compliance with the requirements of this specification by issuing and implementing a quality control plan prior to commencing with the storage of ducting. Engineering and Manufacturing shall approve the quality control plan prior to being issued

1.0 PURPOSE

This specification covers the minimum requirements for moving, draining, handling, outdoor storage and shipping protection during transportation of an OTSG module supplied by Innovative Steam Technologies.

2.0 APPLICABLE DOCUMENTS

The following documents form a part of this specification to the extent specified herein. Documents not identified by date, revision or amendment shall be of the latest issue on the date of this specification.

SPECIFICATIONS

IST Engineering Specification ES-023, Outdoor Storage and Shipping Protection
IST Engineering Specification ES-025, OTSG Pre-Operational Long Term Storage
IST Work Instruction 028
IST Work Instruction 029
IST Contract Specific Drawing "Rail Car Tie-down Reinforcing Plate Assembly and Arrangement" Drawing No. XXX888 (XXX to be replaced with contract ID No.)

3.0 MODULE HANDLING INSTRUCTIONS

With the possible exception of the IST lifting links (which are available for rental), there is no special lifting gear required for handling this equipment. The module lifting lugs have been designed for VERTICAL equalized lifts only. Casing structural damage and/or lug failure may result if the cables are not maintained vertical or the load is not equalized.

Refer to Figure 1.0 for a typical lifting arrangement for the module.

Correct length spreader beams are required in BOTH directions to ensure the cable remains vertical and the load is equalized as shown in the figure. Lifting links can be used to connect the lifting cable to the module lifting points as shown in Figure 2.0. ONLY the lifting points designated in Figure 1.0 may be used for lifting the component. Attachment to other locations is strictly prohibited.

The lift shall be accomplished in a smooth and level motion without jerking. Component impacts during lifting or descent are prohibited.

If the module is to be placed temporarily in an area for storage (intermediate moves etc.), it shall be on a level surface, clear of debris. The unit shall be supported at eight locations on a firm foundation to prevent settling resulting in twisting of the unit. These locations shall be directly below the OTSG side wall vertical beams, on either side of the module lift points. All supports are to be level prior to the module being set down. The unit is NOT to be supported on the flange tips at the eight locations but a beam, suitably sized as indicated below if the unit is to be jacked, or 6 inch x8 inch hardwood blocks if the unit is to be pulled up, is to be inserted between the flanges (Fig.4) and the unit blocked off its lower surface.

It is recommended that lifting/jacking equipment be in conformance with ASME B30.20 (Standards for Below the Hook Lifting Devices), that a written lift procedure be prepared, that a prelift safety meeting be held (to minimize personnel in the lift area, discuss any safety issues and implement any required changes, clarify the jobs of the required personnel, designate the person in charge of the lift and designate a signalman, etc.). On lifts where the work is being done by an IST contractor, or his subcontractor, the above are requirements and all custom equipment used (spreaders, lifting beams etc.) as well as any required ground surveys will be stamped by a Professional Engineer and submitted with the Lift Procedure prior to the lift.

If the module is to be jacked up, a member is to be placed within the bottom beam as shown in Figure 4.0, Detail "A". The member is to be of sufficient strength to carry a moment equal to the following:

$$M_{minimum} = \frac{\text{Module weight}}{8} \text{ (lbs) x } \frac{40.375}{2} = \text{in * lbs}$$

$$M_{minimum} = 2.52 \text{ x Module weight} = \text{in * lbs}$$

The member minimum moment of inertia shall be 200 in^4. Alternatively, the design shall permit the structural member to deflect independently of the sidewall beam

The weight on the module assembly drawing will be used to size the rigging for the initial lift however the module shall be weighed prior to loading and transport, and adjustments made to the rigging if necessary. Modules at IST will be weighed using calibrated load cells according to Work Instruction 028.

Before the Module is loaded on a railcar or truck, but prior to it moving outdoors when the expected minimum outdoor temperature will be less than 40F, it shall be rocked from end to end to remove any water remaining in the unit. The rocking procedure will be per Work Instruction 029. Modules will be rocked a minimum of 6 full times (i.e. each end is raised above the other end a minimum of 6 times) after the last time that water was seen to drain from the unit.

Any damage to the equipment or lifting lugs shall be immediately reported to IST.

4.0 MODULE ATTACHMENT TO RAILCAR OR TRUCK

Prior to loading the unit 1"x 6" softwood lumber is to be laid along the length of the carrier, close to the outer edges of the deck to soften the load on the shipping beams located across the bottom of the unit and the endwall beams. The height of the softener is to be adjusted to compensate for any bow in the carrier so that the load on the shipping beams and end walls is equalized. The method of attachment to the railcar is the responsibility of the shipping contractor.

The module restraints are required to resist the forces resulting from fore-aft, lateral and upward loading during transportation.

Tie-down lugs are used to secure the boiler to the bed of the railcar for transportation in one of two standard configurations:

- single bolt tie-down lugs on the bottom beams of the module end walls (figure 3.2)
- single bolt tie-down lugs on the bottom beams of the module side walls (figure 3.3)

On modules weighing up to 200,000 pounds, the rail-car tie down restraint configuration in Figure 3.1a shall be used.

On Modules weighing between 200,001 and 400,000 pounds, the rail-car tie down restraint configuration in Figure 3.1b shall be used.

~~All Modules require two tie down rods at each corner extending down from the top of the unit to, and usually through, the railcar bed. Two 1 3/8 inch diameter holes have been provided in the upper corners of the module for attachment and it is recommended that as a minimum the rods be 1 ¼ inch diameter steel with a minimum yield of 50,000 psi. It is preferred that the rods run directly from the holes provided in the unit to the railcar with no bends which might affect their function. Depending on the connection between the Module attachment holes and the rod welding may be required and if so, the rod material should be such that its yield stress is not reduced by that welding below the design value.~~

07

07

The method of attachment suggested by IST is for information only. The tie-down lugs, fore and aft restraint plates and lateral restraint plates have been sized to resist the transportation loads. It is the responsibility of the contractor to ensure the transportation attachments to the bed are adequate and meet with carrier requirements. Tie down locations other than those specified herein by IST are strictly prohibited.

08 Special precautions shall be made to ensure that NO HUMPING of railcars is allowed. A maximum 3g longitudinal and 2g lateral acceleration force is allowed.

Please refer to IST standards ES-023 and ES-025 for additional shipping and weather protection instructions.

5.0 ITEMS REQUIRED FOR HANDLING MODULE

Equipment	Supply	Comments
Lifting links	By Others (see Note 1 below)	Links can be rented from IST
Module tie down lugs on endwalls	By IST	Total 4 (2 per end) See Fig. 3.2 or 3.3
07 ~~Module end wall attachment holes for tying to railcar~~	~~By IST~~	~~Tie down rods, etc. to rail deck by others~~
Module tie down plates to railcar including rods and nuts	By Others	IST can provide 4 tie down plates see Fig. 3.2 or 3.3
Spreader Beams for lifting	By Others	Common Erection Equipment
Chokers & Shackles for lifting	By Others	Common Erection Equipment
Fore and Aft restraint plates	By Others	IST can provide 4 restraint plates See Fig. 3.1

Note 1) For overseas projects, one set of lifting links is included in IST's scope of supply. Additional lifting links can be purchased from IST.

6.0 WEATHER PROTECTION

Until the unit is ready to be erected, the module is to be protected at the top from rain, snow etc. by tarping or other suitable means. For storage instructions see IST standards ES-023 and ES-025

All test ports, instrumentation connections, header openings etc. are to be capped during transportation and the header caps are to be taped to the header (drain hole to be provided in header cap at the bottom)

7.0 PROTECTION FROM ROAD CHEMICALS

If during the transportation period, road conditions exist such that the road salt or other chemicals may be deposited up into the bottom of the OTSG module, protection is to be provided to ensure that no deposition is allowed to take place and the tubes and fins remain clean.

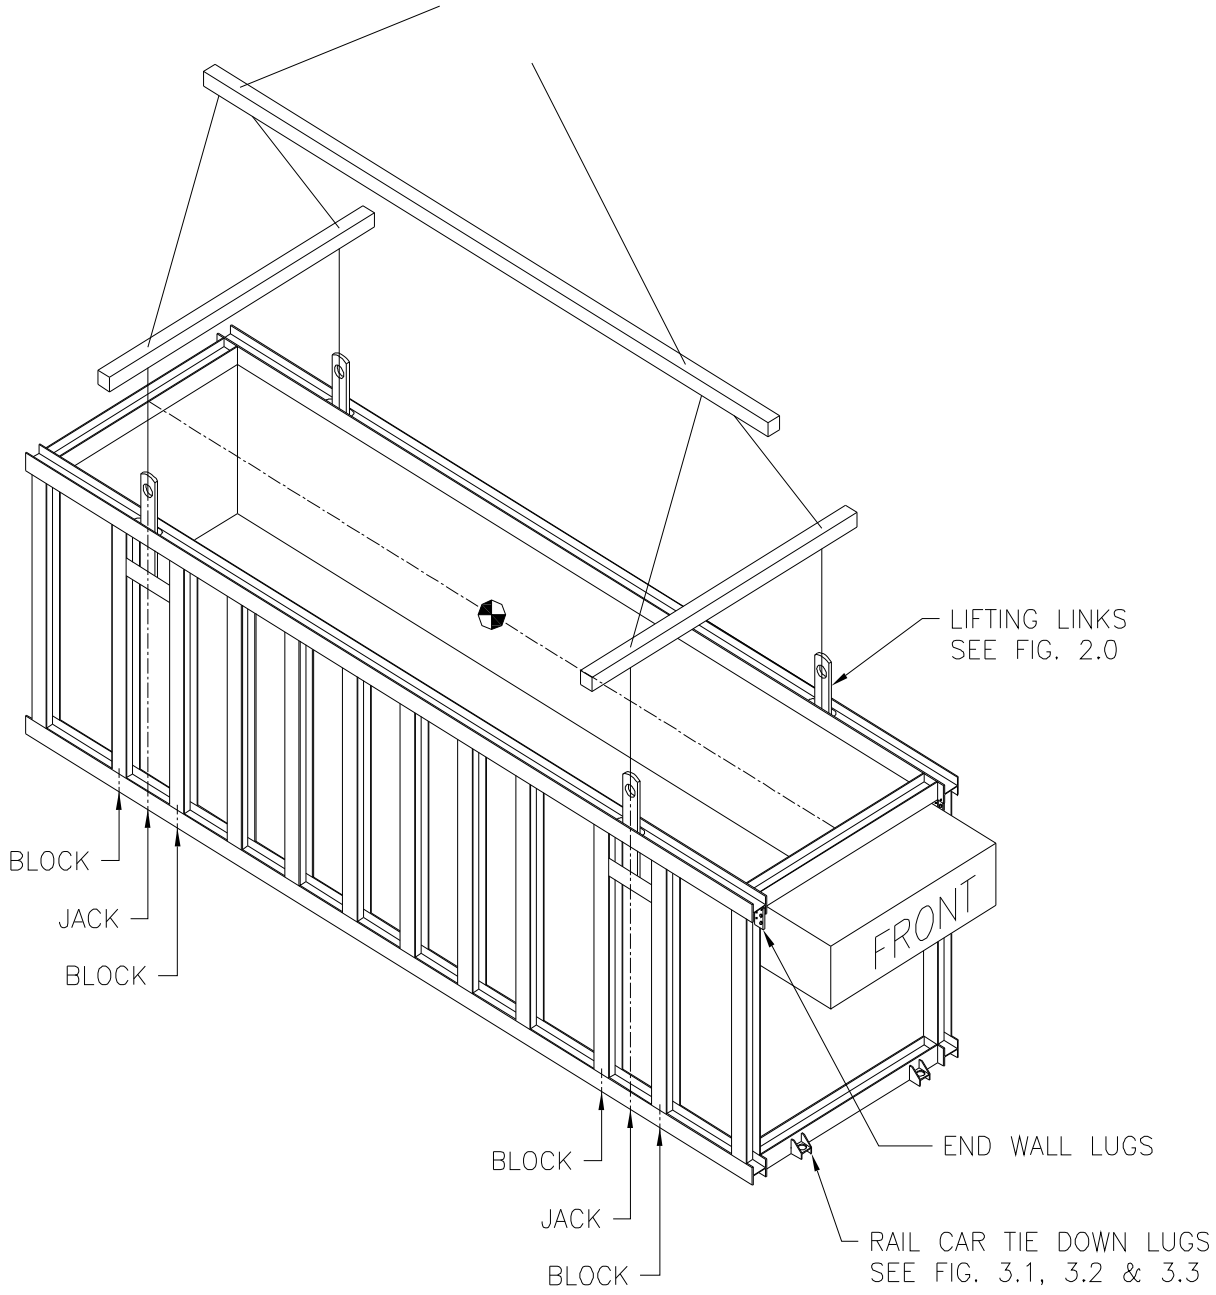

Figure 1.0

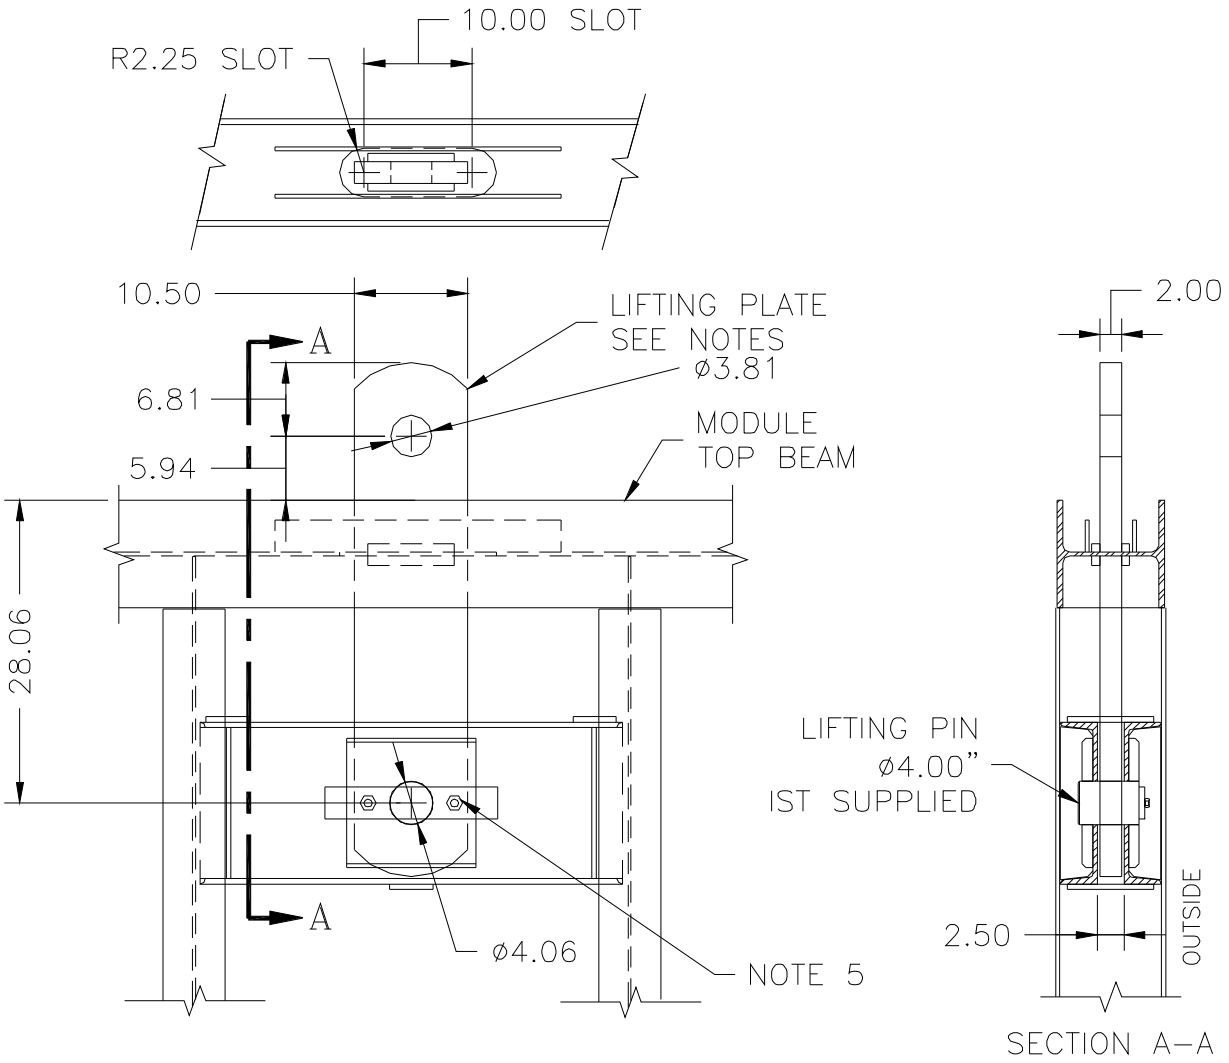
NOTE:

1. Rail car tie down lugs quantity and style are project specific
2. See following figures



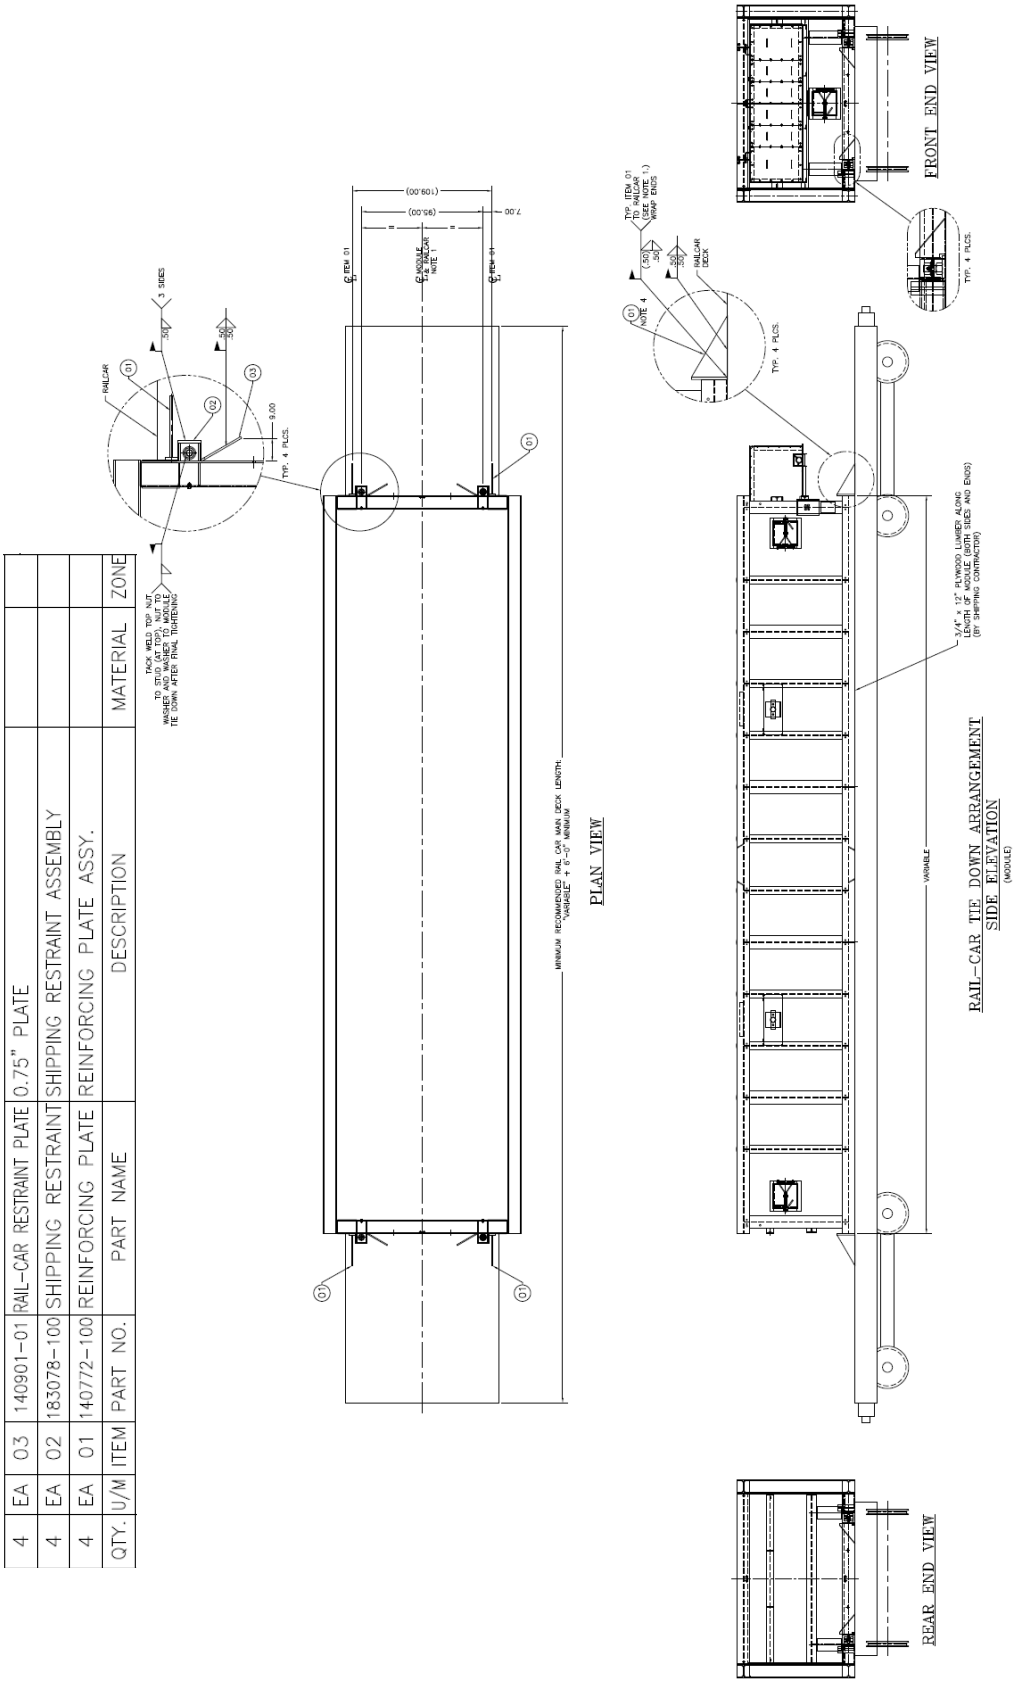


Figure 2.0

Notes:

1. Lifting link supplied by others or requested from IST. Refer to supply list.
2. Depending on module weight a direct cable connection to the 4" pin can be used. Erector to determine feasibility.
3. If others supply lifting link, the contractor is to determine the appropriate design of plate for given load.
4. Dimensions are in inches.
5. Ensure bolts are tightened and pin is completely installed prior to lift.

QTY.	U/M	ITEM	PART NO.	PART NAME	DESCRIPTION	MATERIAL	ZONE

07

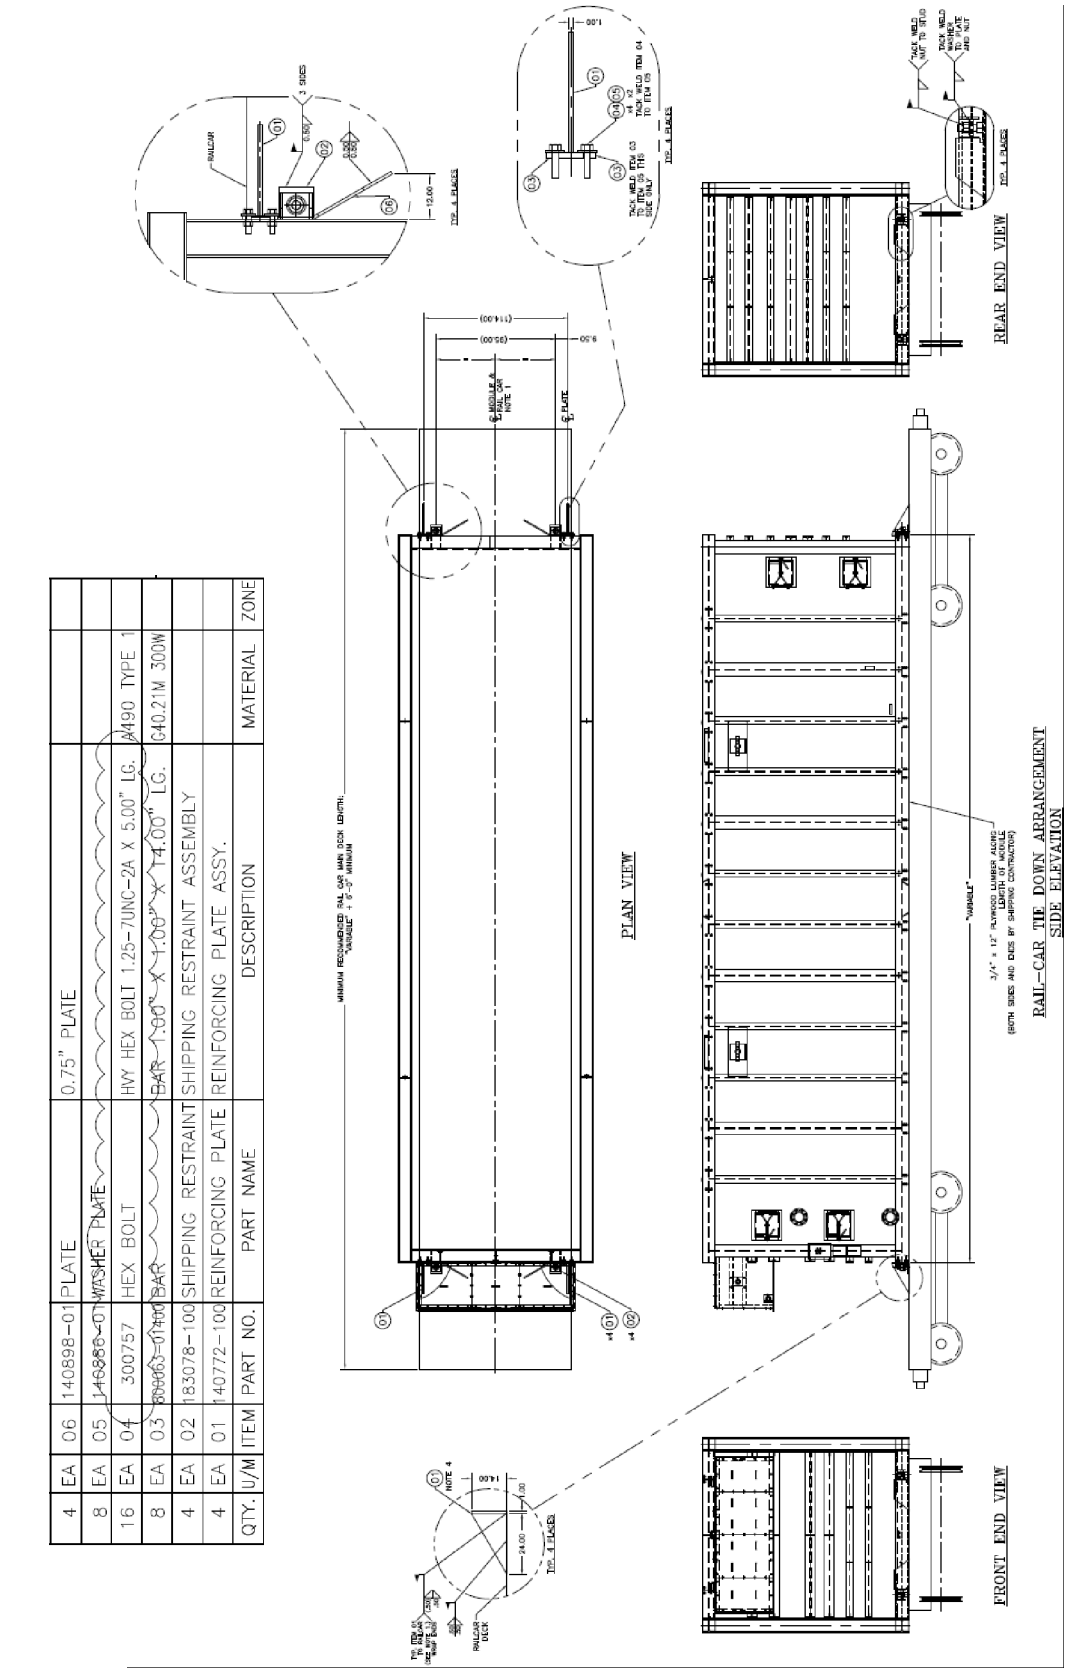

Figure 3.1a
(Notes on Next Page)

Figure 3.1a notes:

1. Shipping contractor shall be responsible for positioning and securing module to rail car. No allowances have been given for module to be off-centre of railcar.
2. The contractor shall confirm adequacy of IST proposed tie-down arrangement and devices. Additional securing devices (not shown) may be required as determined by the contractor such as chains, tie rods, etc.
3. Installation of tie-down devices to the rail car (incl. welding) shall be by the contractor.
4. Tighten shipping restraint nuts (item 02) prior to welding on triangular gusset plate.
5. Rail car and no. of axles shown may changed, as freight forward is to select appropriate car.
6. Welding must be performed by a welder certified in accordance with AAR or American Welding Society (AWS) standards or CWB standards
7. To retain nuts in their original position, three or more threads on rods or bolts must be nicked, chisel-checked, flattened, or otherwise distorted immediately behind single or double nuts, or nuts may be tack welded to the rods to ensure that the nuts will not back off.

07

8. ~~Consult IST engineering if this dimension is < 0.6 H due to the configuration of the rail car.~~
9. ~~Rod to clear inlet header on the outward side by at least 1".~~
10. Refer to supply table for supply of hardware, nuts and rods.
11. Dimensions are in inches.
12. See contract specific drawing "Rail Car Tie-down Reinforcing Plate Assembly and Arrangement" for weld sizes and other details. Drawing No. XXX888 ("XXX" to be replaced with contract ID No.)

TABLE OF CONTENTS

Paragraph No. Page

1.0 OVERVIEW.....4

2.0 PURPOSE.....4

3.0 REFERENCED STANDARDS.....4

4.0 MATERIALS.....4

1.0 OVERVIEW

1.1 This document details the requirements to be applied to the supply of soluble fibre insulation.

2.0 PURPOSE

2.1 The purpose of this specification is to document the technical requirements that shall be applied to the supply of soluble fiber insulation to IST.

3.0 REFERENCED STANDARDS

3.1 ASTM C167-Standard Test Methods for Thickness and Density of Blanket or Batt Thermal Insulation

3.2 ASTM C177-Standard Test Method for Steady State Heat Flux Measurements and Thermal Transmission Properties by means of the Guarded-Hot-Plate Apparatus

3.3 ASTM C892-Standard Specification for High-Temperature Fibre Blanket Thermal Insulation

(Note that most recent addition at order placement applies)

4.0 MATERIALS

The soluble fibre material shall be exonerated from any carcinogenic classification in the countries of the European Union under the provisions of the European Commission Directive 97/69/EC. Certificates of independent animal testing consistent with EU protocol are required.

The insulation shall be free from any visible imperfections including holes, pockets, or local compressed areas which may adversely affect its service qualities. The insulation shall contain no asbestos.

Material nominal thickness and densities shall be as specified on IST Purchase Order. Only spun fibre is acceptable. Material shall contain no binder. Material shall maintain its physical properties once dried, if exposed to water. Material should not dissolve when exposed to rain water.

4.1 Material Composition – Material shall have a composition in accordance with the following limits:

CaO - 25% to 35%
MgO - 2% to 7%
SiO2 - 60% to 70%

4.2 Material Shrinkage – Shrinkage of the soluble fiber shall be < 3% average linear shrinkage after 24 hours at 1800 F.

4.3 Material Strength – Material strength shall be in accordance with the following:

Tensile Strength: 2.5 psi minimum (6 pcf)
4.0 psi minimum (8 pcf)
4.5 psi minimum (10 pcf)

4.4 Density -The density of the supplied product shall not be less than the nominal density specified on the purchase order i.e. no under tolerance is allowed. Density shall be checked per ASTM C167 or equivalent and the results shall be shipped with the order.

4.5 Thickness-The insulation thickness will be measured per ASTM C167 or equivalent. An under tolerance (including measurement error) of 7% and an over tolerance of 25% is acceptable.

4.6 Only new materials shall be used (used or reclaimed material is not permitted).

4.7 Width –Tolerance on specified width shall be -2% ,+10% (per ASTM C892).

4.8 Workmanship, Finish and Appearance –The insulation shall indicate good workmanship in fabrication by a uniform appearance, shall not have visible defects such as tears and holes that will adversely affect the service quality, and shall be free from foreign materials (ASTM C 892 para . 8).

4.9 Unfiberized shot content to be in accordance with Table 5 ASTM C892. Alternative testing may be used for unfiberized shot content but must be equivalent to ASTM C892.

4.9 Thermal Conductivity

Thermal Conductivity shall be tested in accordance with ASTM C177 and, on average, shall not exceed the following values (Btu-in/hr sq. ft .F):

Temperature (°F)	6 lb/ft^3 density	8 lb/ft^3 density	10 lb/ft^3 density
200	0.43	0.41	0.39
400	0.46	0.46	0.46
600	0.63	0.61	0.59
800	0.86	0.79	0.76
1000	1.18	1.03	0.96
1200	1.53	1.29	1.21
1400	1.86	1.64	1.50
1600	2.39	2.07	1.86

1.0 INTRODUCTION

1.1 Background

This specification details the requirements of feedwater quality for Innovative Steam Technologies Once Through Steam Generators (OTSG's) producing superheated steam. Deviations from the limits and requirements must have specific written approval from Innovative Steam Technologies.

This specification addresses the following:
- all-volatile treatment (AVT) for applications with and without copper alloys in the pre-boiler and steam user systems
- oxygenated treatment for applications with all ferrous (no copper) pre-boiler systems

The technical criteria for formulating these guidelines includes:
- Avoidance of scale formation in the OTSG. Solids (dissolved or suspended) which are carried into the OTSG are either deposited in the tubing or carried through as a solid or vapour into the dry out zone where deposition may occur. Deposits may restrict flow as well as heat transfer and potentially act as corrosion sites.
- Suspended solids could end up plugging the stabilization orifices, which would restrict the flow to individual circuits.
- Prevention of corrosion and deposition in the OTSG. If necessary, more stringent limits can be used based on the requirements for other components in the system, which may be more sensitive to impurities.
- Generation of high purity steam

This specification is not a substitute for complete cycle chemistry guidelines, which should include monitoring of additional cycle streams as required. Successful implementation of this specification requires proper training of operators and is the responsibility of the owner.

1.2 Treatment Options

In once-through boilers, there are only two available options for water treatment, all volatile treatment (AVT) and oxygenated treatment (OT). Both treatments are feedwater treatments.

If copper alloys are used, OT cannot be used because the presence of oxygen accelerates copper alloy corrosion. If polishers are not to be used, or copper is present in the pre-boiler cycle, then AVT is the only option. With polishers and all ferrous pre-boiler metallurgy, either AVT or OT can be used.

Some of the chemicals referred to in this specification are hazardous to human health and/or environment and should be handled with care.

All-Volatile Treatment (AVT) is used to minimize corrosion and erosion corrosion in the pre-boiler system by using deaerated high purity water with an elevated pH. The pH elevation is achieved by the addition of ammonia. The target range for pH depends upon the metallurgy of the pre-boiler system (all-ferrous or Fe-Cu mixed). The oxygen concentration in the feedwater is reduced using an oxygen scavenger, such as hydrazine or carbohydrazide. The result of AVT treatment is a layer of magnetite (Fe_3O_4) on all steel surfaces which protects the metal from corrosion.

Oxygenated Treatment (OT) uses oxygenated high purity water to minimize corrosion and erosion-corrosion in the pre-boiler system. Oxygen, hydrogen peroxide, or air is injected into the feedwater to achieve an oxidizing environment. The pH is adjusted using ammonia, but the target pH range is lower than in AVT. IST has no operating experience to date with oxygenated treatment and as such IST has not

provided recommended feedwater limits for OT.

1.3 Makeup and Condensate Return Treatment

Raw water used for makeup contains impurities that must be removed before the water enters the OTSG. The extent of makeup water purification is system dependent (dependent on makeup rate) and site specific (dependent on raw water quality).

Condensate return water may contain impurities that must be removed before the water enters the OTSG. The extent of purification is system dependent (dependent on where steam is being used and how it is being contaminated).

1.4 Demineralizer and Polisher

The production of good quality feedwater is usually a function of a makeup demineralizer and a condensate polisher, although depending on system requirements, one of these items can sometimes be eliminated. Where demineralizer or polisher requirements are minimal, replacement resin bottles can minimize system capital and operating costs. This can eliminate the need for onsite acid and caustic facilities used for regeneration.

1.5 Organic Compounds

Precautions must be taken to eliminate organics prior to the water reaching the boiler since they can break down to acid type compounds at boiler operating temperatures. These acids can be harmful to the tubing of the OTSG and may have a negative affect on the feedwater treatment system resins.

Corrosion and flow-accelerated corrosion effects and removal of harmful decomposition products must be considered when selecting the type of feedwater treatment and the water treatment chemicals. Use of organic feedwater treatment chemicals (amines and oxygen scavengers) needs to be thoroughly evaluated concerning their decomposition, monitoring, analytical interferences, and toxicity.

Amines are not recommended for control of feedwater pH. They thermally decompose in the boiler and the steam circuits, forming organic acids, carbon dioxide, ammonia, and other decomposition products. This also happens to oxygen scavengers other than hydrazine. The harmful effects of some of the decomposition products may be reduced when condensate polishers are used. Hydrazine or carbohydrazide can be used for oxygen scavenging. Hydrazine is preferred since carbohydrazide decomposes forming acid species making it difficult to meet cation conductivity limits.

1.6 Control Parameters

The most important control parameter for the IST OTSG proper is feedwater cation conductivity. Dissolved oxygen and pH are to be continuously monitored to control corrosion in the pre-boiler system. Conductivity measurement is recommended because there is a direct correlation between dissolved solids and conductivity. The purpose of the cation conductivity measurement is to remove the masking effect of the ammonia/amines and its derivatives, in the water. Specific conductivity is not recommended and is not addressed in this specification.

ORP (oxidation reduction potential) is a method of grading a solution as oxidizing or reducing. The ORP value is a direct reading of the activity of the oxidizing and reducing agents in the water as they correspond to oxidation-reduction reactions. The oxidation-reduction reaction is an electrochemical process in which metal atoms are oxidized to form positive ions (cations) while other chemical species (O_2, H_2O, H+ and other cations) are reduced. This results in a flow of electrons from one site on the metal surface to another. For example, if the ORP is negative, a reducing environment exists that can reduce or eliminate a protective layer of magnetite.

Steam and feedwater conductivity measurements are both required to alert the operator of any components breaking down in the OTSG.

1.7 Chemical Feed Points

The chemical feed points for ammonia and the oxygen scavenger should be after the condensate polishers, since these compounds can be removed by the polisher. However, if the polishers are operated in the ammonia form, the ammonia addition can be at the exit of the condensate pumps. If there is a deaerator in the pre-boiler system, the best location to add the oxygen scavenger is into the drop leg of the deaerator. This allows a greater residence time of the scavenger in the feedwater, increasing its effectiveness.

1.8 Sample Points

To monitor the OTSG, it is recommended that sample points be located on the feedwater piping at the OTSG inlet and on the steam piping at the exit of the OTSG, after attemperating sprays (if installed). In cycles with reheat, hot reheat steam can be monitored instead.

It has been shown that for sampling of superheated steam, an isokinetic sampling nozzle is needed. Multi-port nozzles which are installed in the superheated steam piping are not isokinetic and do not give a representative sample. The same isokinetic sampling is needed when sampling feedwater for suspended oxides (Fe, Cu oxides) to ensure a representative sample.

When sampling cation conductivity a calibration check of the measuring instrument should be made using a standard solution of known value. If the reading is high, the measurement probe may need replacing.

2.0 CONTROL PARAMETERS AND LIMITS

2.1 Cycle Chemistry Limits

The rationale for determination of the cycle chemistry limits for these guidelines is based on the requirements for the OTSG. If necessary, more stringent limits can be used based on the requirements for other components in the system, which may be more sensitive to impurities.

The control limits to be used during normal operation are shown in Tables 1 and 2 for units on AVT. Oxygenated treatment (OT) is presently under investigation and limits have not been provided. These tables also include recommended monitoring frequencies and action levels, which allow exceeding the normal limits for short durations.

Parameter		Monitoring Frequency	Target Value	Action Level 1	Action Level 2	Action Level 3	Action Level 4
pH (see Note 7)	All ferrous	C	9.3 to 9.6	<9.3 or >9.6	-	-	-
	All stainless	C	8.0 to 8.5	<8.0 or >8.5	-	-	-
	Mixed Fe-Cu	C	8.8 to 9.1	<8.8 or >9.1	-	-	-
Water Cation Conductivity (µS/cm)		C	< 0.25	0.25 to 0.45	>0.45 to 0.85	>0.85 to 1.0	> 1.0
Steam Cation Conductivity (µS/cm)		W	< 0.25	0.25 to 0.45	>0.45 to 0.85	>0.85 to 1.0	>1.0
ORP (mV)	All ferrous	T	0 to +100	-	-	-	-
	Mixed Fe-Cu	T	-350 to -300	-	-	-	-
Hydrazine (ppb)	All ferrous	T	0 to 10	> 10	-	-	-
	Mixed Fe-Cu	T	< 20	> 20	-	-	-
Dissolved Oxygen (ppb) (see Notes 5 and 6)	All ferrous	C	< 7	> 7	-	-	-
	All stainless (Water Temp ≤ 50 C) (Water Temp ≤ 100 C)	C C	< 800 < 300	> 800 > 300	- -	- -	- -
	Mixed Fe-Cu	C	< 5	> 5	-	-	-
Sodium (ppb)		W	< 6	6 to 12	>12 to 24	> 24 to 30	> 30
Chloride (Organic and inorganic) (ppb)		T	< 6	6 to 12	>12 to 24	> 24 to 30	> 30
Sulfate (Organic and Inorganic) (ppb)		T	< 6	6 to 12	>12 to 24	> 24 to 30	> 30
Silica (ppb)		D	< 20	20 to 40	>40 to 80	> 80 to 100	> 100
Iron (ppb)		W	< 10	10 – 20	>20 to 40	> 40 to 50	> 50
Copper (ppb)		W	< 2	2 to 4	>4 to 8	> 8 to 10	> 10
Total Organic Carbon (TOC) (ppb)		W	< 100	> 100	-	-	-
Hardness (ppb)		T	< 1	> 1	-	-	-
Suspended Solids (ppb) (see Note 4)		T	Not detectable	-	-	-	-

* Nomenclature and notes follow Table 2. Action levels are given in Section 2.2.

Table 1.0 - All volatile Treatment (AVT) without Reheat

Parameter	Monitoring Frequency	Target Value	Action Level 1	Action Level 2	Action Level 3	Action Level 4

pH (see Note 7)	All ferrous	C	9.3 to 9.6	<9.3 or > 9.6	-	-	-
	All stainless	C	8.0 to 8.5	<8.0 or >8.5	-	-	-
	Mixed Fe-Cu	C	8.8 to 9.1	<8.8 or >9.1	-	-	-
Water Cation Conductivity (µS/cm)		C	< 0.15	0.15 to 0.25	0.25 to 0.45	>0.45 to 0.5	>0.5
Steam Cation Conductivity (µS/cm)		W	< 0.15	0.15 to 0.25	0.25 to 0.45	>0.45 to 0.5	>0.5

* Nomenclature and notes follow Table 2. Action levels are given in Section 2.2.

Table 2.0 - All-volatile Treatment (AVT) with Reheat

Nomenclature:

C = continuous
D = grab sample, once per day
W = grab sample, once per week
T = troubleshooting and commissioning

Notes (Table 1 and Table 2):

1) Conductivity and pH measured at 25°C.
2) Grab samples are to be more frequent during startup. Grab samples should be once per day until benchmark levels are obtained.
3) In start-up situations feedwater must be circulated to reduce the dissolved material and suspended particles and should not be introduced into the OTSG until the cation conductivity is below 1.0 µS/cm (or 0.27 µS/cm for specific conductivity)
4) Suspended solids must be prevented to avoid clogging of feedwater orifices. Suspended solids is commonly measured by examining the undissolved material trapped on a 0.45 micrometer filter after filtration. Material that passes through is referred to as dissolved solids.
5) IST can review the allowable oxygen levels for feedwater temperatures less than 50°C.
6) IST can review the allowable oxygen levels for systems with feedwater piping fabricated from stabilized stainless steel material (i.e. 347SS, 321SS etc.).
7) The recommended pH value for all stainless metallurgy is based on achieving improved condensate polisher performance. The pH values recommended for all ferrous metallurgy (i.e. 9.3 to 9.6) are also acceptable for all stainless metallurgy. The pH values recommended for all ferrous metallurgy (i.e. 9.3 to 9.6) should be used for a system with both ferrous and stainless metallurgy.

2.2 Action Levels

Operation at the lowest achievable impurity levels, with the shortest and least frequent excursions, is the most desirable mode of operation. The probability of corrosion damage and deposit formation grows significantly with increasing impurity concentration, and the damage is proportional to the exposure time. When corrosive impurities concentrate on metal surfaces, the breakdown of passivity (damage to the protective oxide layer) occurs within a few minutes to several hours.

To give more flexibility in the water and steam chemistry control, particularly during startups, three action levels are recommended. The target values for Action Levels 1, 2, and 3 were established to allow for and provide guidance during transient or abnormal operating conditions. If the problem is not corrected within the time allotted to each action level, the next higher action level takes effect.

Normal - Values are consistent with long-term system reliability. A safety margin has been provided to avoid concentration of contaminants at surfaces.

Action Level 1 - There is potential for the accumulation of contaminants and corrosion. Normal Limit can be exceeded for one week with the total yearly accumulation of two weeks. If the time allotted is exceeded an orderly shutdown should occur.

Action Level 2 - The accumulation of impurities and corrosion will occur. Operation is limited to 24 hours with the total yearly accumulation of 48 hours. If the time allotted is exceeded an orderly shutdown should occur.

Action Level 3 - The accumulation of impurities and corrosion will occur very quickly. Operation is limited to 4 hours maximum with the total yearly accumulation of 8 hours. Damage to the OTSG can occur when operating in this condition and immediate action is required to return the feedwater to the target value.

During excursions, when the impurity concentration increases sharply, the accumulation of impurities in the cycle occurs quickly, but the subsequent cleanup upon return to good chemistry may take weeks. Therefore, yearly time accumulations were also established as a guide. If the unit is shutdown due to water or steam chemistry (i.e. a major condenser leak), it should be an orderly shutdown, not a trip.

Action Level 4 – Impurity levels are too high and severe damage may occur to the OTSG. Immediate orderly shutdown of the OTSG is recommended.

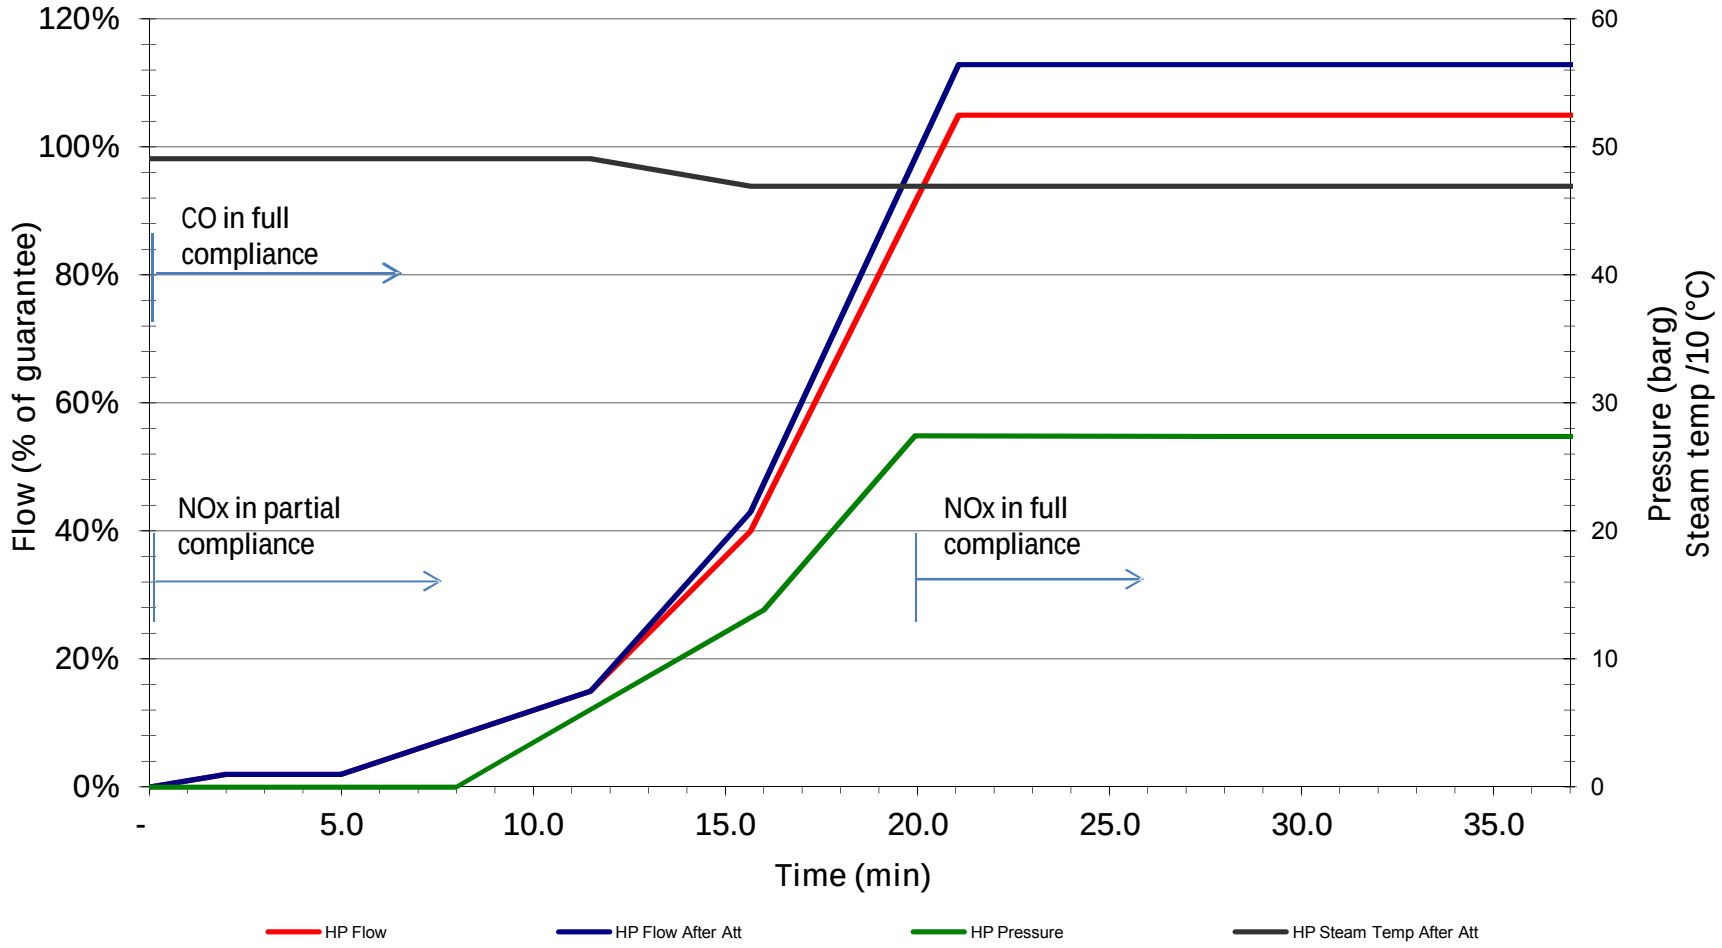
2.3 Corrective Actions

Typical corrective actions to respond to out-of-specification steam and/or water chemistry conditions are listed in this Section. These corrective actions are not meant to be all-inclusive or universally applicable. Each utility and/or plant should establish plant-specific corrective actions that consider plant design features and other plant-specific concerns. Successful implementation of this specification requires proper training of operators and is the responsibility of the owner. ONLY AFTER DETERMINING THE ROOT CAUSES OF AN EXCURSION CAN A PERMANENT SOLUTION BE SELECTED.

The action to be taken to confirm and correct water and the time to confirm and correct a water chemistry upset depends on the severity of the chemical excursion. On-line and grab sample analysis data must be used to determine the source(s) of ingress of various impurities. Possible causes of feedwater chemistry excursions are described below. Corrective actions for each monitored parameter are listed below

Possible Causes of Feedwater Chemistry Excursions

Out of Limit Parameter	Condenser Leak	Bad Makeup	NH_3 Feed System	O_2 Scavenger Feed	Air In Leakage	Condensate Polisher Malfunction
1) Sodium	X	X				X
2) Chloride	X	X			X	X
3) Sulfate	X	X			X	X
4) Silica		X			X	X
5) Cation/specific conductivity	X	X			X	X
6) Total organic carbon		X				X
7) pH			X		X	X
8) ORP	X			X	X	
9) Iron	X		X	X	X	
10) Copper	X		X	X	X	
11) High dissolved oxygen (AVT)	X	X		X	X	



Corrective Actions for Chemistry Excursions

Parameter	Corrective Action
pH	Check ammonia feed and adjust as necessary within allowed limits. Identify sources of possible contaminants by checking: • makeup purity • condensers for tube and air leakage • purity of chemical feeds
Ammonia	Check pH, and adjust chemical feed as necessary.
Cation Conductivity	Identify source of contaminants by checking: • performance of condensate polisher, resin leakage • makeup purity • condensers for tube and air in leakage • purity of chemical feeds
Dissolved Oxygen and Hydrazine	Identify source of dissolved oxygen by checking: • condensers for air in leakage • feedwater train for air in leakage (pump suction, etc.) • condensate storage tanks – saturation in air Check hydrazine residual, and increase hydrazine feed to maintain oxygen within limits. Do not overfeed hydrazine.
ORP	Check hydrazine residual, and adjust hydrazine feed to maintain ORP within limits. Reduce air in leakage.
Sodium, Chloride, Sulfate, Silica, TOC	Identify source of contaminants by checking: • performance of condensate polisher, resin leakage • makeup purity • condensers for tube and air leakage • purity of chemical feeds
Iron and/or Copper	Identify cause by checking: • iron and copper in all streams and lay-up protection • pH and ORP of feedwater • dissolved oxygen in condensate and feedwater, optimize feed and concentration of oxygen scavenger • condensers for air in leakage • erosion-corrosion of carbon steel piping and other cycle components by downtime inspection (wall thickness measurement) and/or iron and copper pickup • exfoliation in the steam pipes

The Construction Process

Baseplate Installation

- Baseplate assemblies consist of a concrete foundation, anchor bolts, sole plates, Fabreeka pads, baseplates, dust covers and nuts.

- OTSG Baseplate are designed to allow thermal expansion. One Baseplate location is fixed. “Fixed” column does not have a Fabreeka Pad.

- Steel/Platform column Baseplate assemblies do not have a sole plate or Fabreeka pad.

- It is IMPORTANT **to** Check levels & elevations at T.O.C. (top of concrete) using a transit. Avoid installation of shims below the sole plates.

Baseplate Installation (con't)

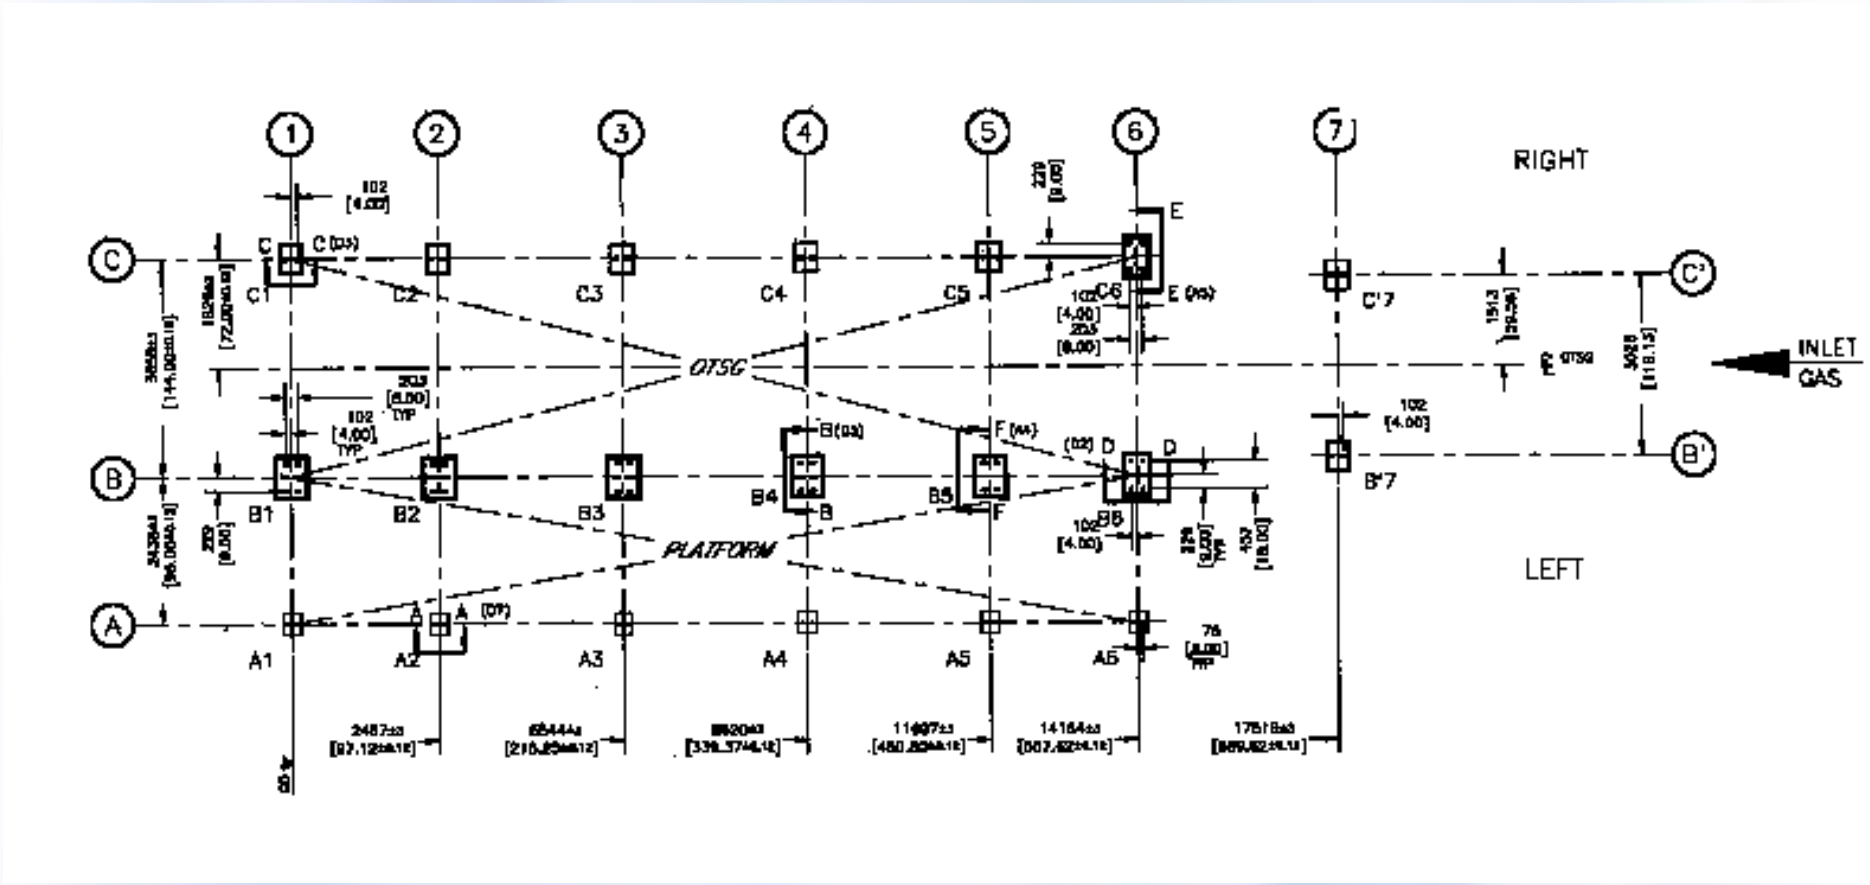
- Place and center:
  - •Sole Plates in the concrete foundations for the OTSG (verify elevations).
  - •Fabreeka pads on top of sole plates (except at fixed base plate location).
  - •Baseplates on top of Fabreeka pads (Note: the stainless side of the base-plate must sit on the Teflon face of the Fabreeka pad).
  - •Cover slotted holes on baseplates with a special washers "dust cover".

Baseplate Installation (con't)

•Verify levels & elevations of baseplates using a transit.

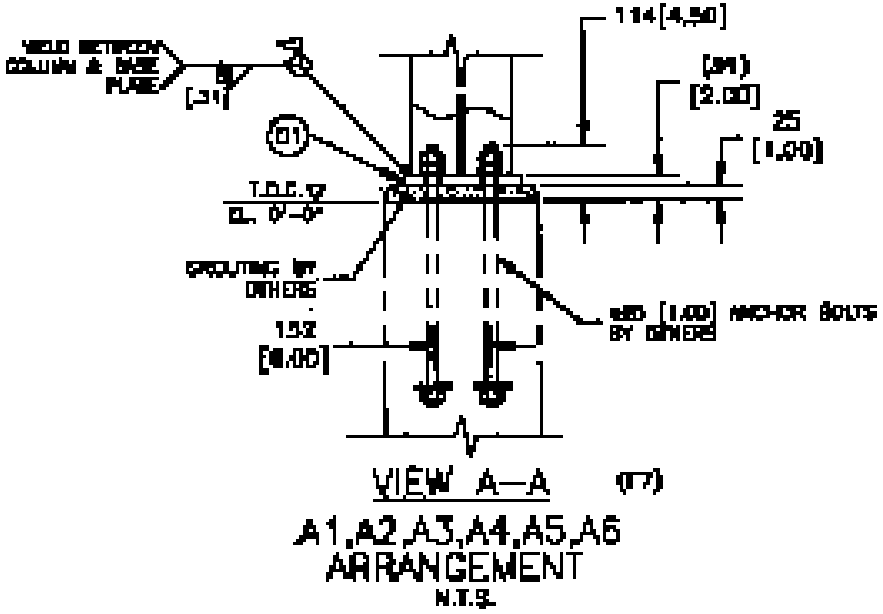
• All OTSG anchor bolt nuts are to be installed "Snug" tight.
(Except fixed column location)

• "Fixed Column" Anchor bolt nuts on the base plate are to be tightened an additional 1/4 turn and the base plate is welded to the sole plate.

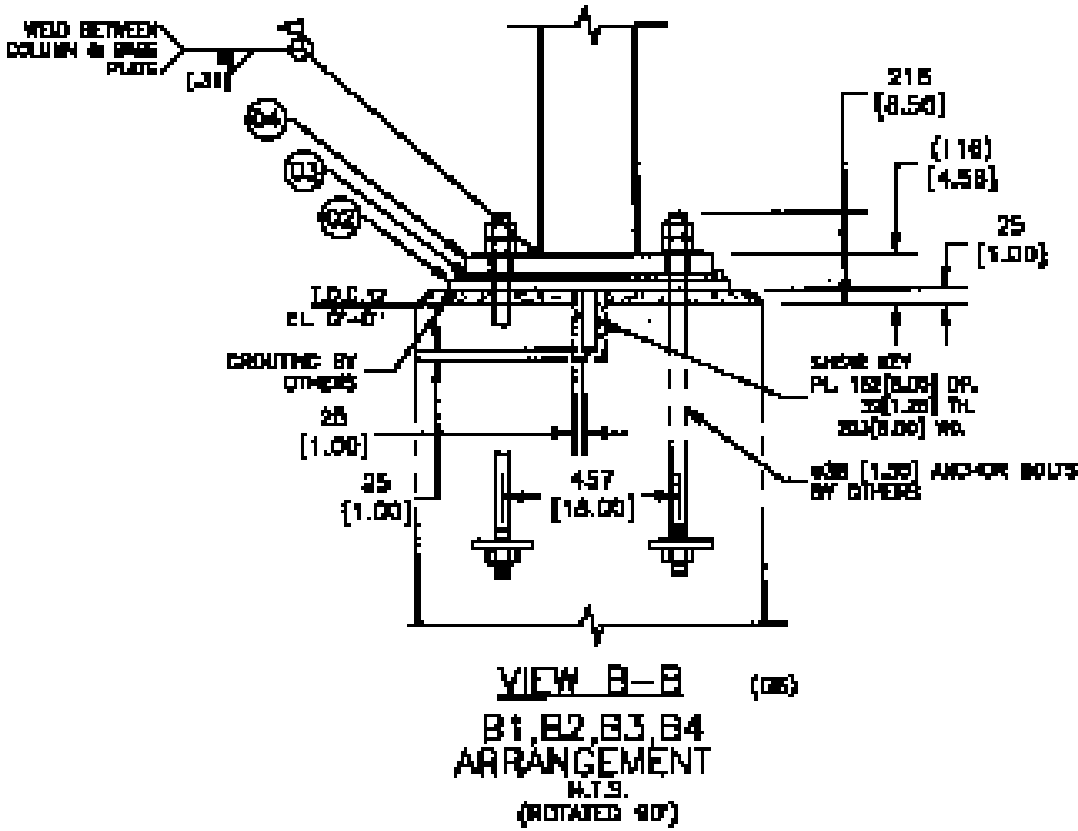


• Lock all anchor bolt nuts in position with a tack weld, or by using a jam nut.

• Measure and scribe centerlines on all baseplates.

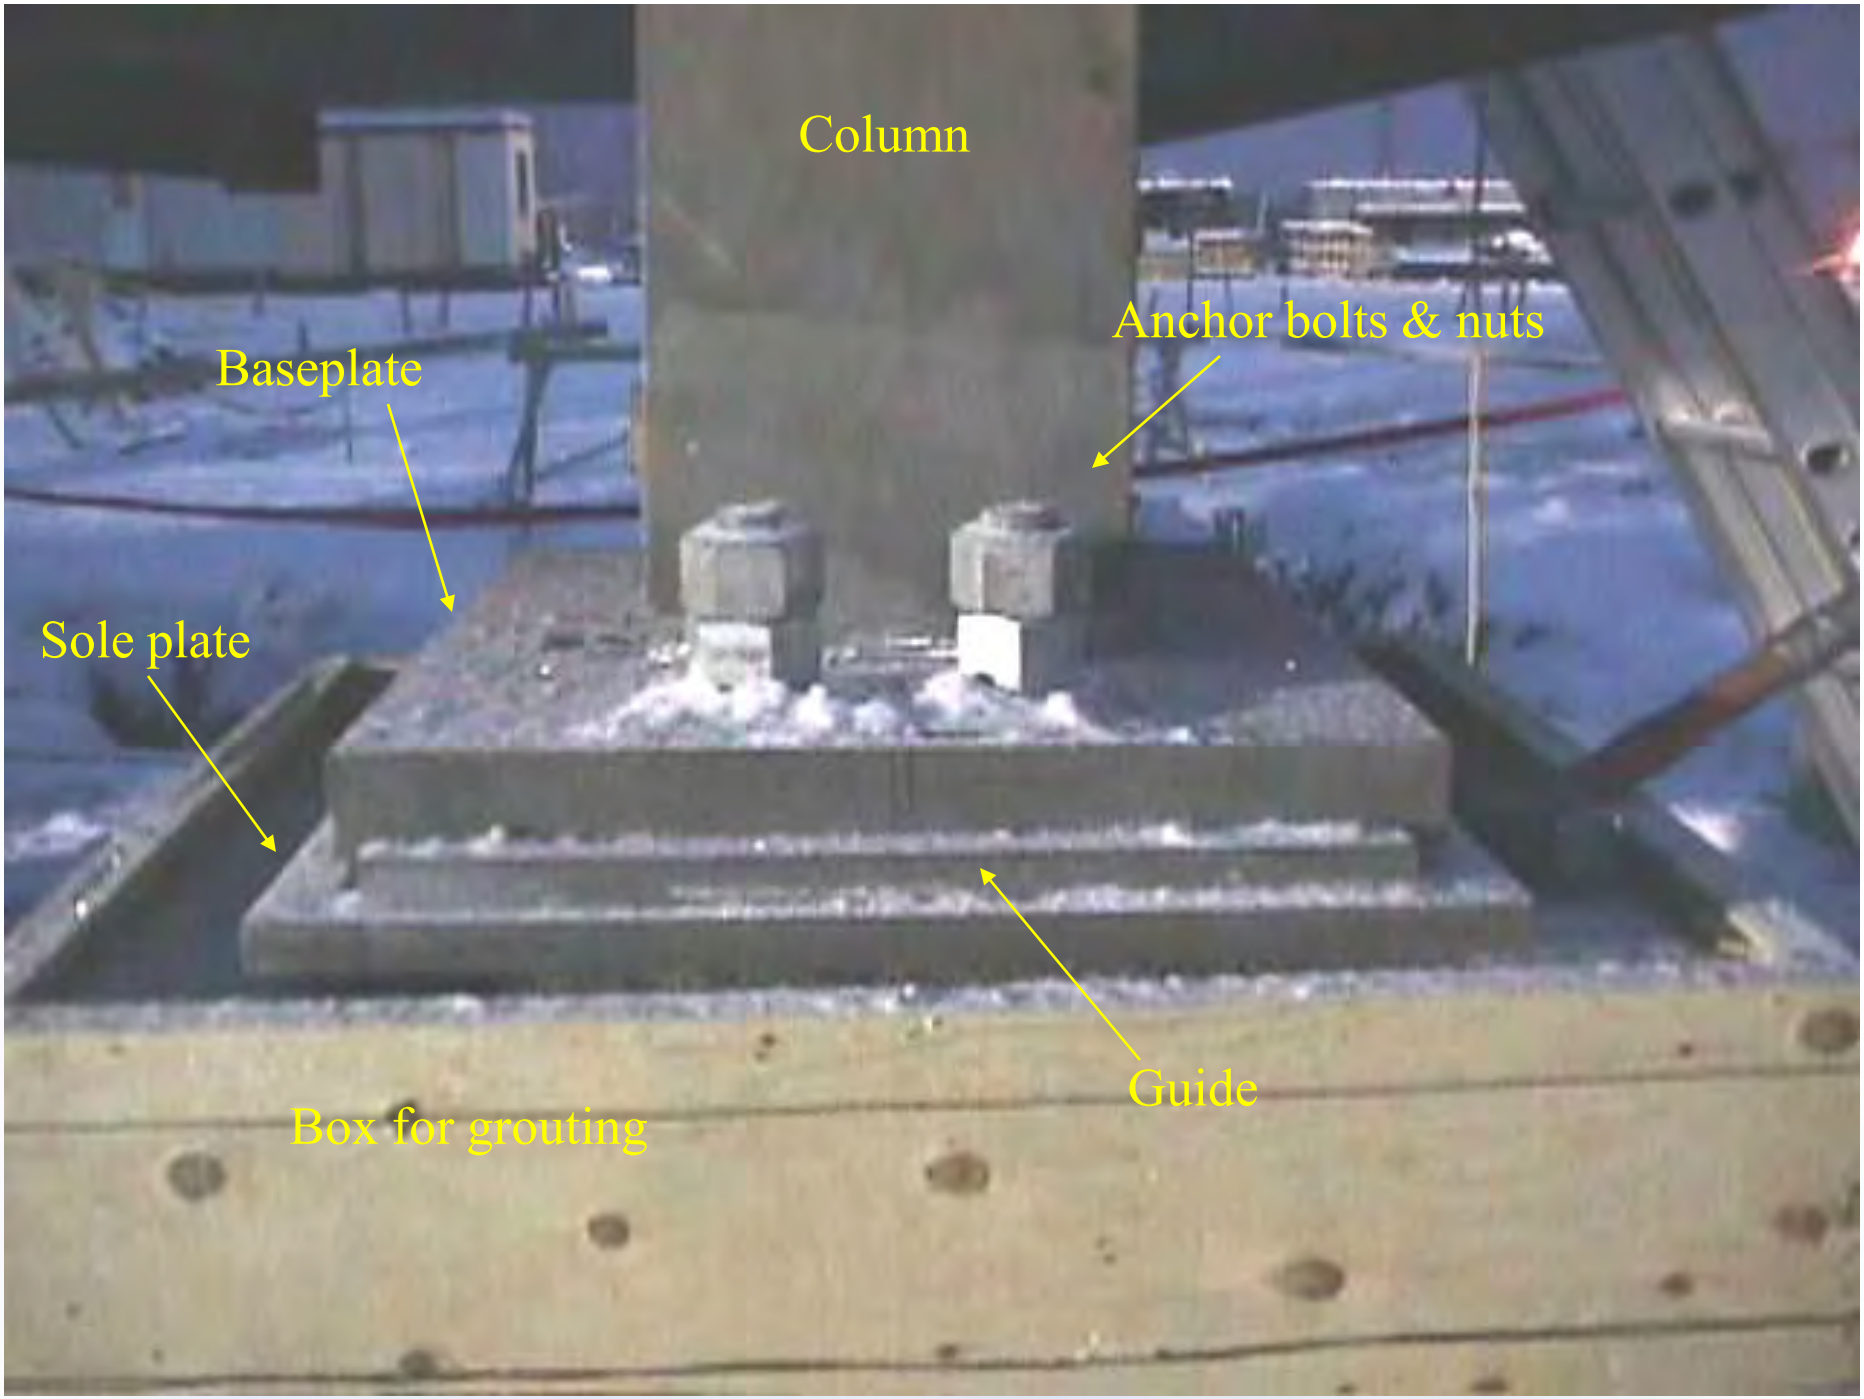


• Grouting of sole plates must be complete prior to the installation of Inlet Plenum.

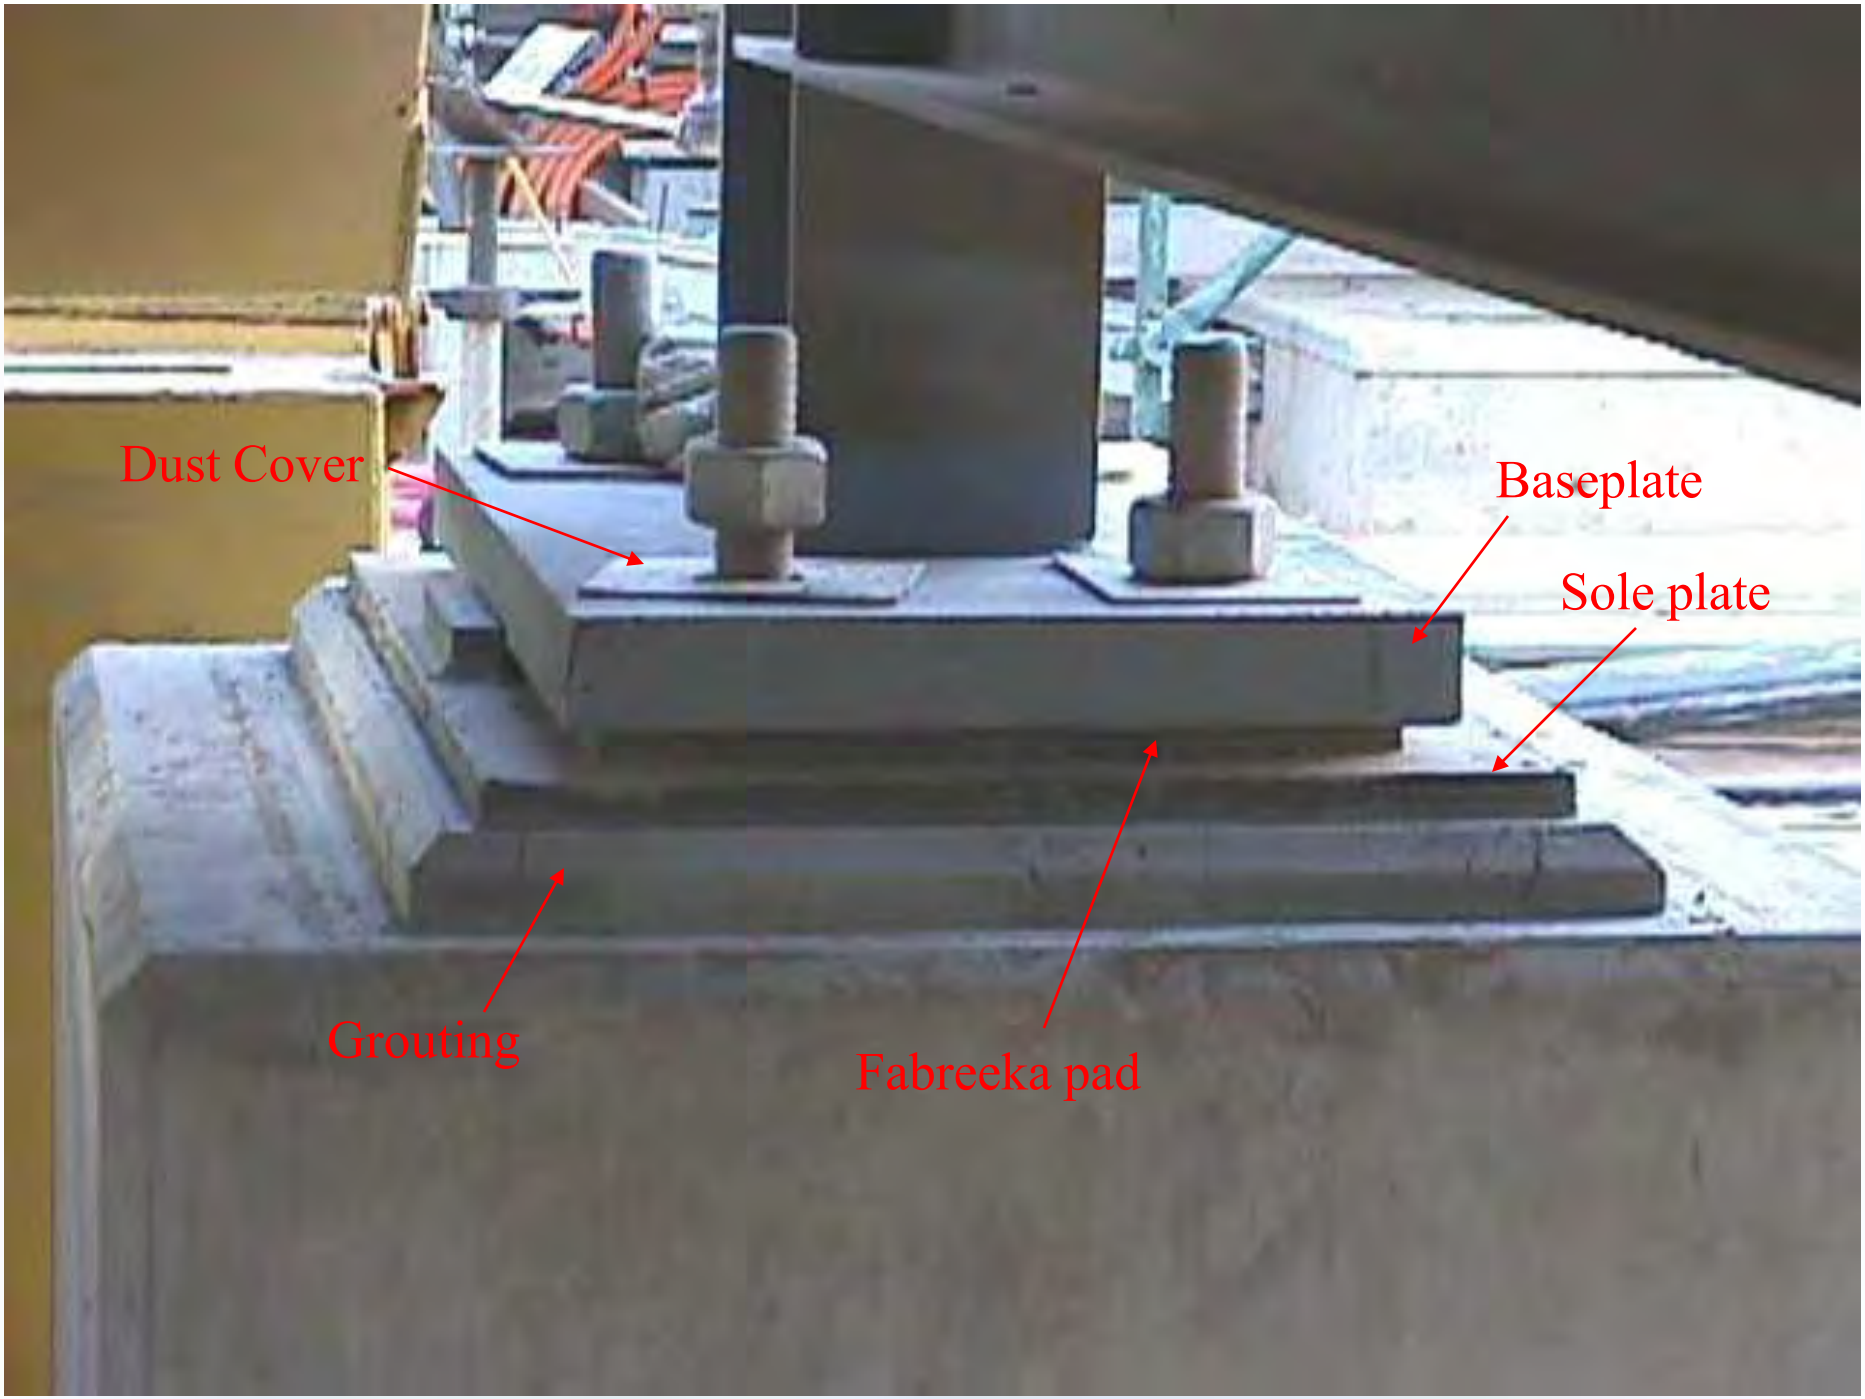


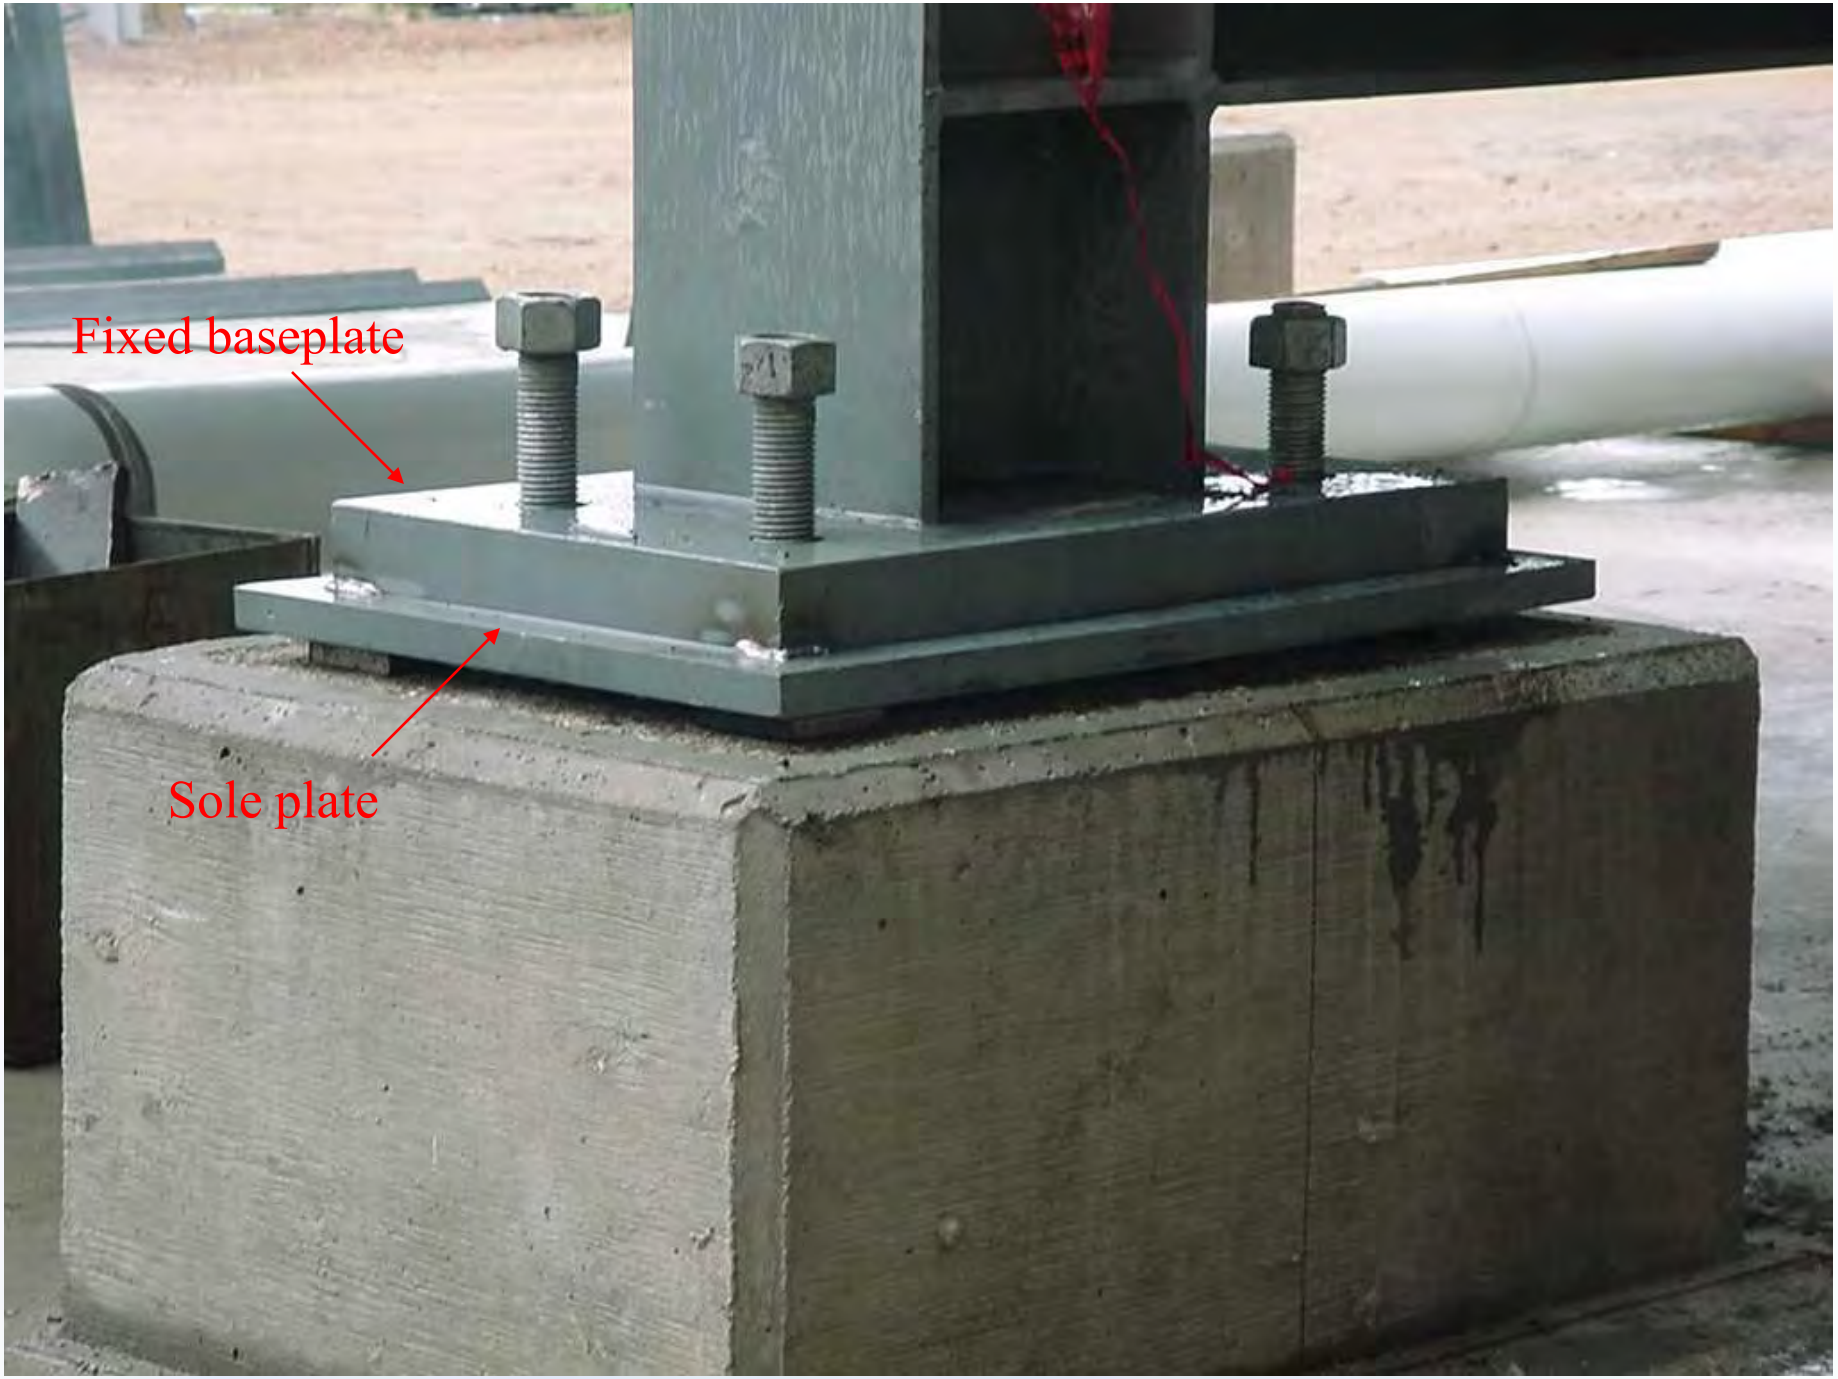
Note:
Perform Check that all baseplates and sole plates are placed in the correct positions

Typical Baseplate Layout



Typical Baseplate Arrangements





Picture 1: Baseplates and Sole Plates Shipping

Picture 2: Baseplate Assembly

Picture 3: Baseplate Assembly

Picture 4: Typical Fixed Baseplate Assembly

Inlet Plenum Installation

• For easy access to external joint any scaffolding external brackets, planking, and handrails can be installed or have a mobile man-lift available.

• Lift the inlet plenum into position so that each column rests centrally on its respective Baseplate.

Note: It is critical that centerline of the fixed column is verified.

• Check centerline distances to gas turbine discharge to ensure fit-up dimensions are aligned and correct.

• Check the elevation dimension at the four top corners of the inlet plenum, to ensure that the plenum is level and matches the specified elevation on the drawings.

•Once aligned and position is verified, weld out can proceed of inlet plenum columns to base plates.

Note: It is critical the inlet opening is level and centerline is aligned with the centerline of the gas turbine discharge.

Inlet Plenum Installation

• Remove all shipping beams from the top of inlet plenum. Plug holes by reinstalling bolts and seal welding.

• Install scaffolding inside of inlet plenum in preparation for seal welding plenum to Module.

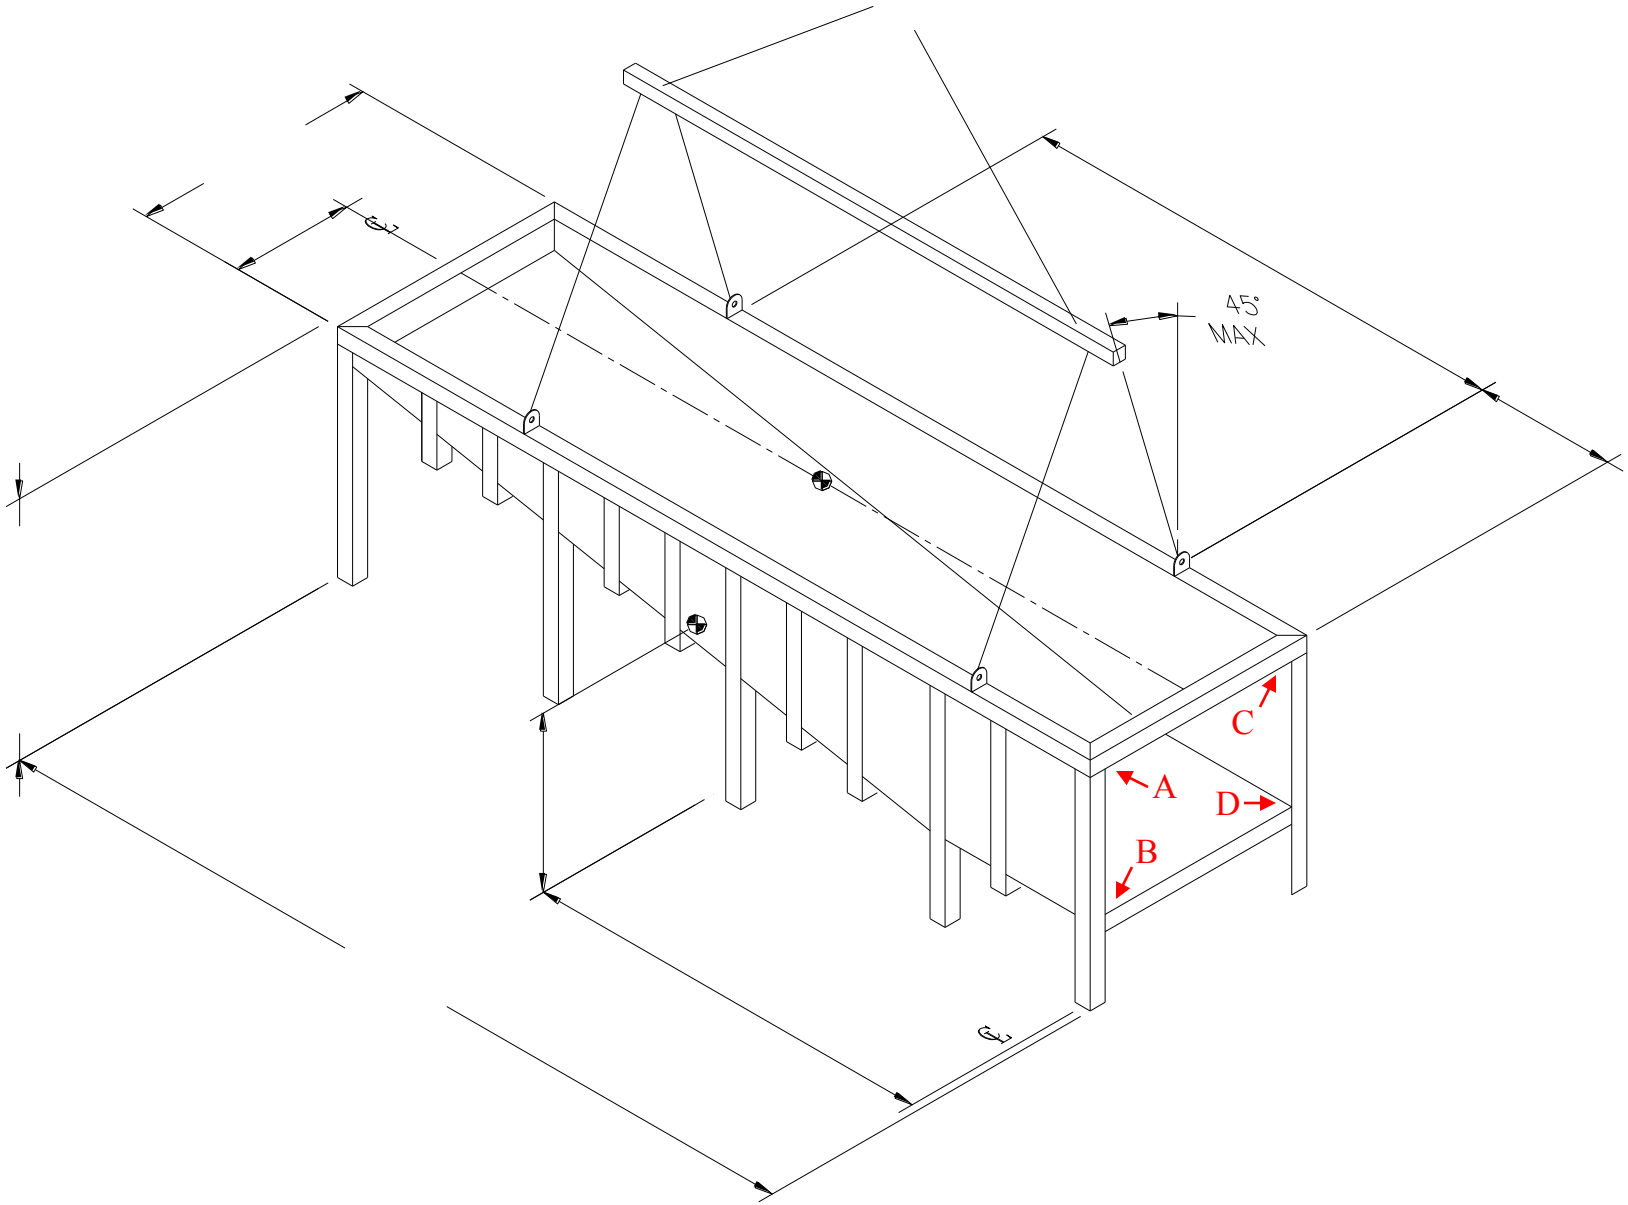


Figure 5: Inlet Plenum Lifting Diagram (using 1 spreader beam)

Picture 6: Inlet Plenum Vertical Lift

Picture 7: Inlet Plenum Lifting Lug

Picture 8: Inlet Plenum with external brackets

Picture 9: Inlet Plenum with external scaffolding

Picture 10: Inlet Plenum external scaffolding detail

Picture 11: Inlet Plenum internal scaffolding

Picture 12: Inlet Plenum Shipping Beams

Picture 13: Inlet Plenum Installed

Inlet Plenum Configurations

1. Single Component
2. Double Component
3. Triple Component

All double and triple component style inlet plenums will have split rear columns. These spilt columns will have special installation instructions.

Once the bottom inlet plenum is installed, the second and/or third inlet plenum components are installed using the same procedure. For these installations, there will be one or two additional joints that will require erection plates to install, a larger internal scaffold, additional seal welding and the installation of one or two more JAKs.

Erection Plate Installation

• Erection plates are installed at all columns and vertical stiffener locations the entire perimeter (Hardware should be easily accessible).

•Bolts are installed “snug” tight to the exterior of the erection plate and tightened by an additional 1/4 turn.

• Tightening shall progress systematically, from the most rigid part of the joint to its free edges.

• After erection plates are installed around the entire perimeter, weld the erection plates to the beams on 3 edges (top and sides).

Erection Plate Installation

- If the holes are misaligned...
  - 1) Install all erection plates that can be installed
  - 2) Open up any misaligned holes with a carbide burr bit.

- If side or end beams do not align…
  - 1) Install shims or spacers to make plate flush or
  - 2) For minor discrepancies just install the plate tightly, slightly bending the plate.

- If the end perimeter joint has gaps at either end, leave the erection plates unbolted until internal seal welding is complete. Follow Erection instructions on welding sequencing.

Erection Plates

Erection Plates (Inlet Plenum to Module)

Installed Erection Plates

SCR Module Placement

Upper Module Installation

OTSG Lower Module Installation

• Position crane (or cranes) as required in preparation for lift.

• Transfer OTSG module to the lifting location and securely place OTSG module on concrete/steel stool approximately 3’ above the ground in ensure to use blocking per IST Specification and in prescribed locations marked on the module.

• “Prepare” the module by removing the protective tarp, cutting the plywood into strips and set the plywood down in between the top support beams on top of the fin tubes for protection.

• Remove all shipping beams (painted yellow) on the bottom of the lower module except the ones designated to remain in place (see Erection Instructions Manual).

• Plug the holes left by the shipping beams by re-inserting the bolts and seal welding.

OTSG Lower Module Installation

•After loosely installing erection plates around the perimeter of the Module lower beam OR inlet plenum upper beam place the remaining required hardware in the web of the lower module lower beam. So its readily available prior to lifting the lower module.

•Check the inlet plenum and bottom lower module perimeter beams for any obvious obstructions.

• Place the Joint Assembly Kit (JAK), for the joint between OTSG lower module & the SCR module on top of the OTSG lower module prior to the lift.

•Lifting plates (painted yellow) are shipped loose and must be installed prior to hoisting. Lift the OTSG module as recommended with the lifting plates.

• With the crane, position the module at top the inlet plenum such that all perimeter gaps are minimised.

OTSG Lower Module Installation

•Install brackets, scaffold planks and handrails or have man-lift equipment available.

•When the module is positioned on Plenum install all lower erection plates before completely releasing the crane.

• Remove the lifting plates, reinstall and secure the lifting pins.

Notes:
• If gaps are evident at the ends of the module to plenum perimeter joint, reducing the gap can be done by utilizing weld control by starting welding from the center of the perimeter joint and traveling to each end.

• Some erection plates on the ends will have to be left loose to allow welding control.

•See erection instructions for complete details.

Picture 37: Lifting Pins

OTSG Lower Module Configurations

1. OTSG tube bundle only
2. OTSG tube bundle with CO Catalyst Support and AIG piping

Both lower module options listed above can be installed in the same manner.

SCR Module

• Depending on the project scope of supply the OTSG can be equipped with an SCR module that will eventually contain catalyst used for reducing NOx emissions.

• At the time of installation, the SCR module will be basically an empty shell and will only contain the catalyst support structure.

• Removable panel doors are located at the rear of the module. These will be used later, during catalyst installation. IST recommends that the panel doors be kept in place during the SCR module lift.

• Prior to installing the SCR module, it must be “prepped” in the same manner as the OTSG lower module (i.e. shipping beams removed, erection plates temporarily installed, etc.)

Picture 43: SCR Module Vertical Lift

Picture 44: SCR Module Vertical Lift

Picture 45: SCR Module Placed

Picture 46: SCR Module Internal View

OTSG Upper Module

•The Upper module contains pressure part tubing and the feedwater inlet headers

• Installation of the Upper module can be done using the same procedure as the Lower module outlined previously.

• Prior to installing the Upper module, it must be “prepped” in the same manner as the OTSG Lower module (i.e. shipping beams removed, erection plates temporarily installed, tubes protected etc.)

•The upper modules come equipped with a cabling restraint system that must be removed once the module is installed and secured.

Picture 50: Upper Module Shipping Arrangement

Picture 51: Upper Module Transfer Arrangement

Picture 56: Upper Module Vertical Lift

Picture 57: Upper Module Vertical Lift

Picture 58: Upper Module Vertical Lift

Picture 59: Upper Module Installation

Picture 60: Upper Module Cabling Restraint

Exhaust Hood Installation

• Check and compare all inside opening dimensions on the bottom of the exhaust hood and top of OTSG module.

• Check the underside of the exhaust hood perimeter beams and top perimeter beams of the module for any obvious obstructions.

• Brackets and scaffold planks with hand railing can be installed prior to lift (optional).

• Prior to installing the Exhaust hood, it must be “prepped” in the same manner as the other modules (i.e. shipping beams removed, erection plates temporarily installed, etc.)

•Corner (4)erection plates can be installed to the upper beam of the exhaust hood. These will connect with the stack. (When applicable)

• Lift, place hood and install all OTSG Module to Hood erection plates. Prior to weld out

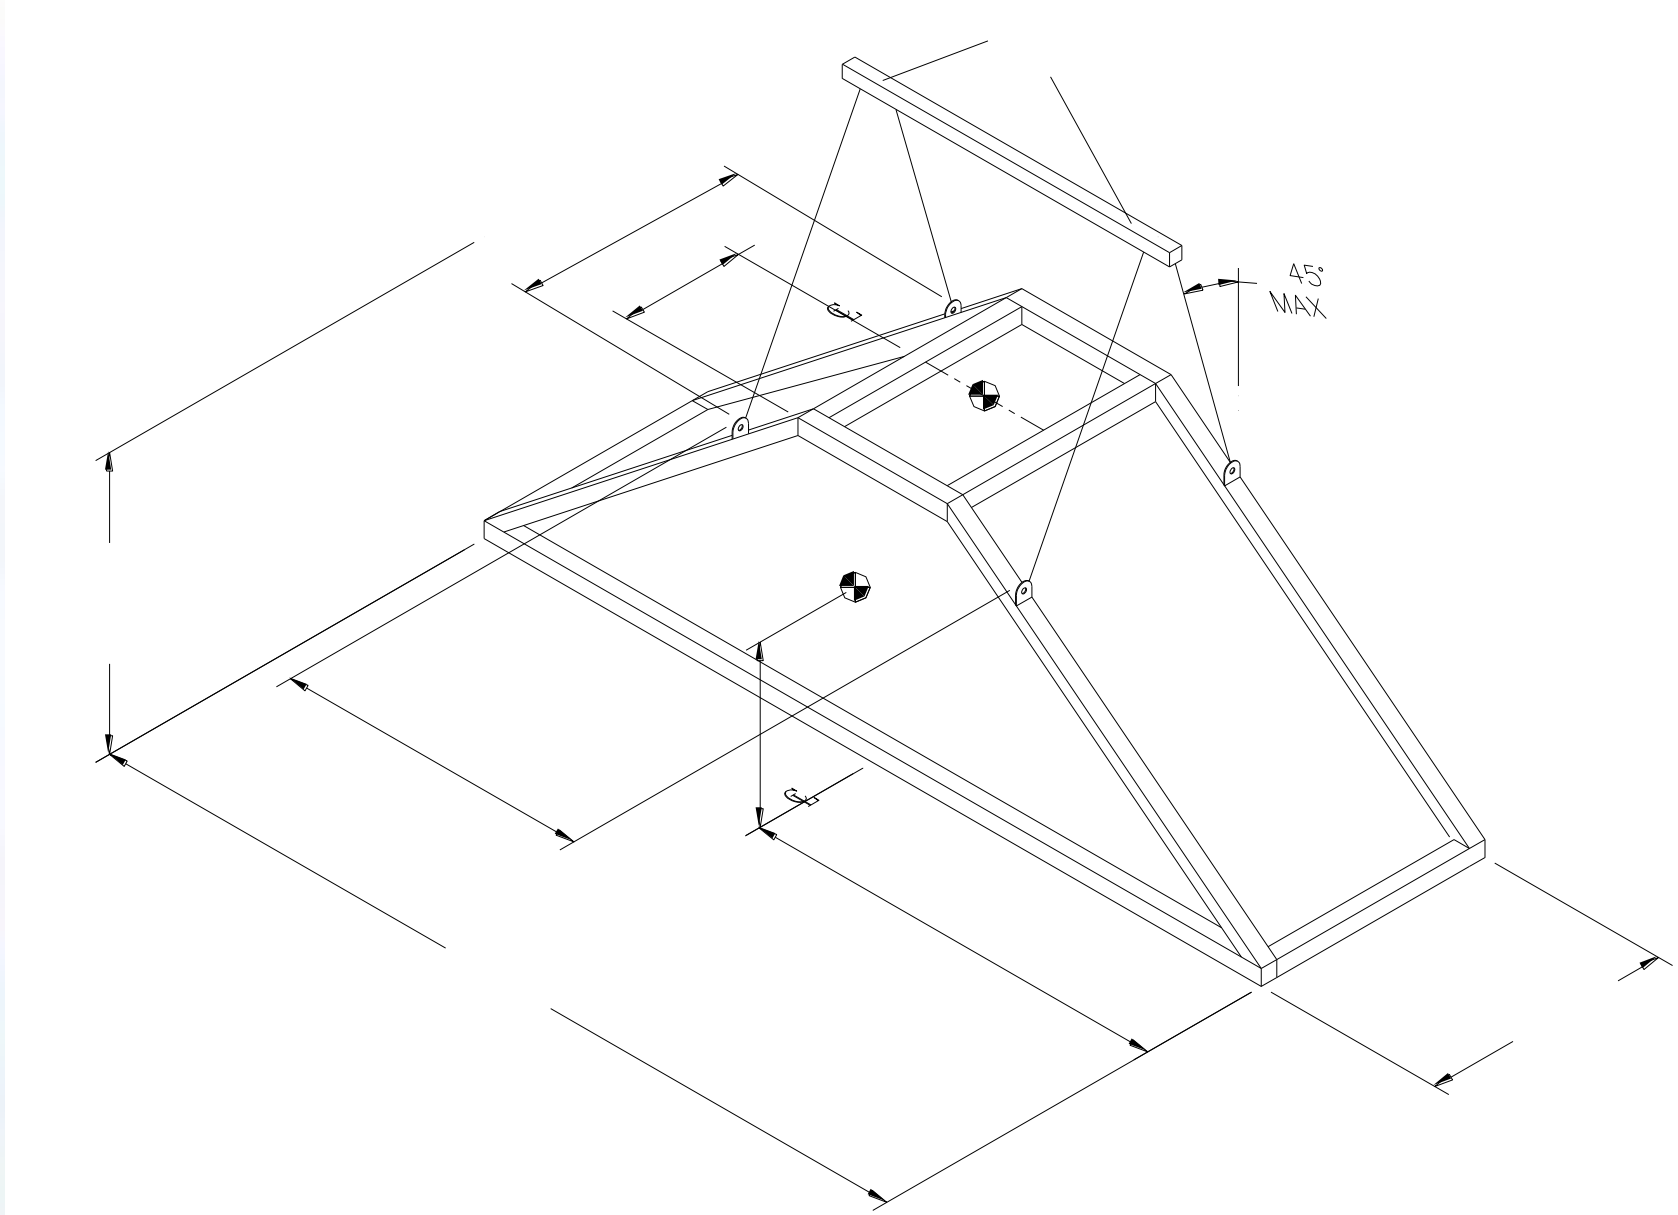

Figure 8: Exhaust Hood Lifting Arrangement

Picture 61: Exhaust Hood Vertical Lift (using 1 spreader beam)

Picture 62: Exhaust Hood in place

Picture 63: Inlet Plenum Vertical Lift (using 2 cranes)

Picture 64: Exhaust Hood Vertical Lift

Picture 65: Exhaust Hood Vertical Lift

Picture 66: Erection Plates - Exhaust Hood to Upper Module

Exhaust Stack

• At site, unload the stack and place it on dunnage such that the strong axis of the top lifting lugs face vertically up.
•If using round stack, adaptor piece and round stack assembly can be assembled at grade.

• Locate position of stack platform attachment clips and weld into place.

• Install the platform, handrails and ladder while the stack is in the horizontal position on the ground (optional).

• Split the lower inlet corners of the stack casing, thus giving it some flexibility for installation into the exhaust hood (optional).

• Lift exhaust stack using 2 cranes; the main crane lifting the 4 lug points at the top and a tailing crane lifting the load at the bottom. Continue lift until the full load of the stack (now in vertical position) is on the main crane boom.

• Raise the stack and insert it into the top of the exhaust hood opening.

• Install the 4 erection plates.

• Full penetration welds are required at the base of each of the 4 corner main structural beams on the stack.

Picture 67: Stack Platform

Picture 68: Stack Vertical Position with Platform Installed

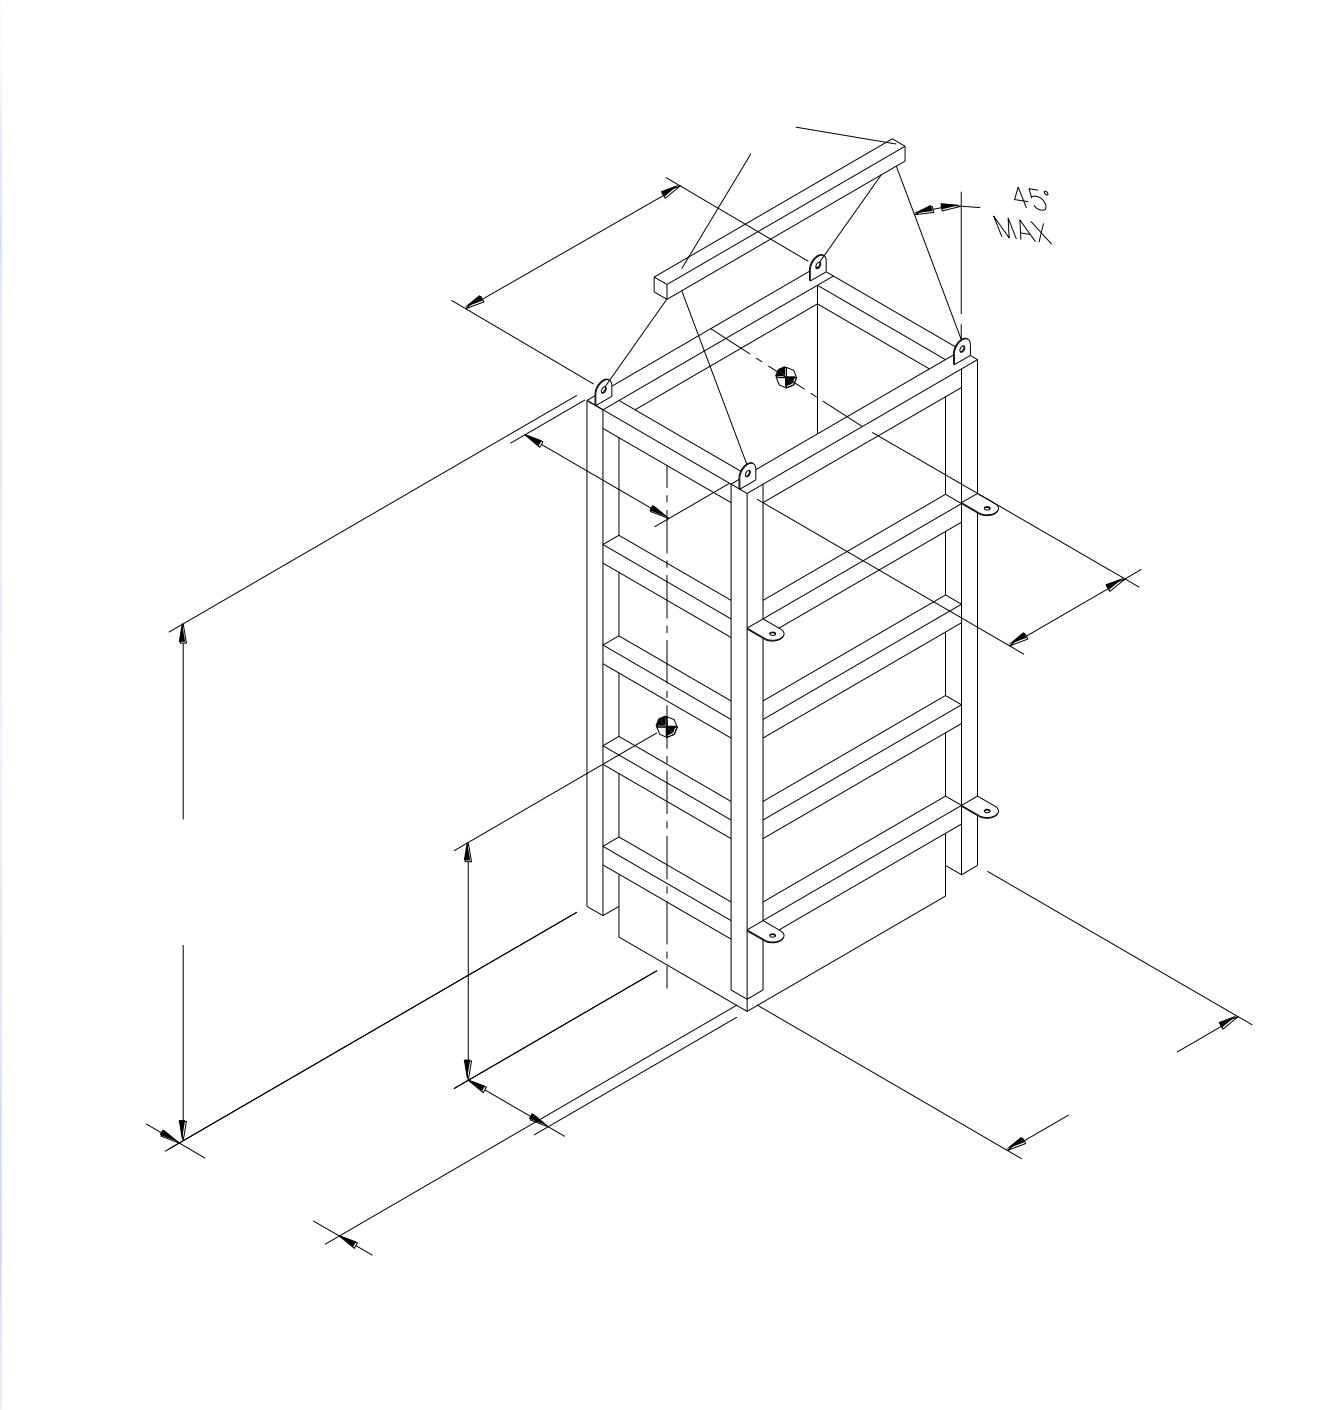

Figure 9: Exhaust Stack Lifting Arrangement (1 spreader beam)

Picture 69: Exhaust Stack Vertical Lifting

Picture 70: Placement of Exhaust Stack

Picture 71: Stack Column Structural Welding

Picture 72: Exhaust Stack Installed

Stack Damper

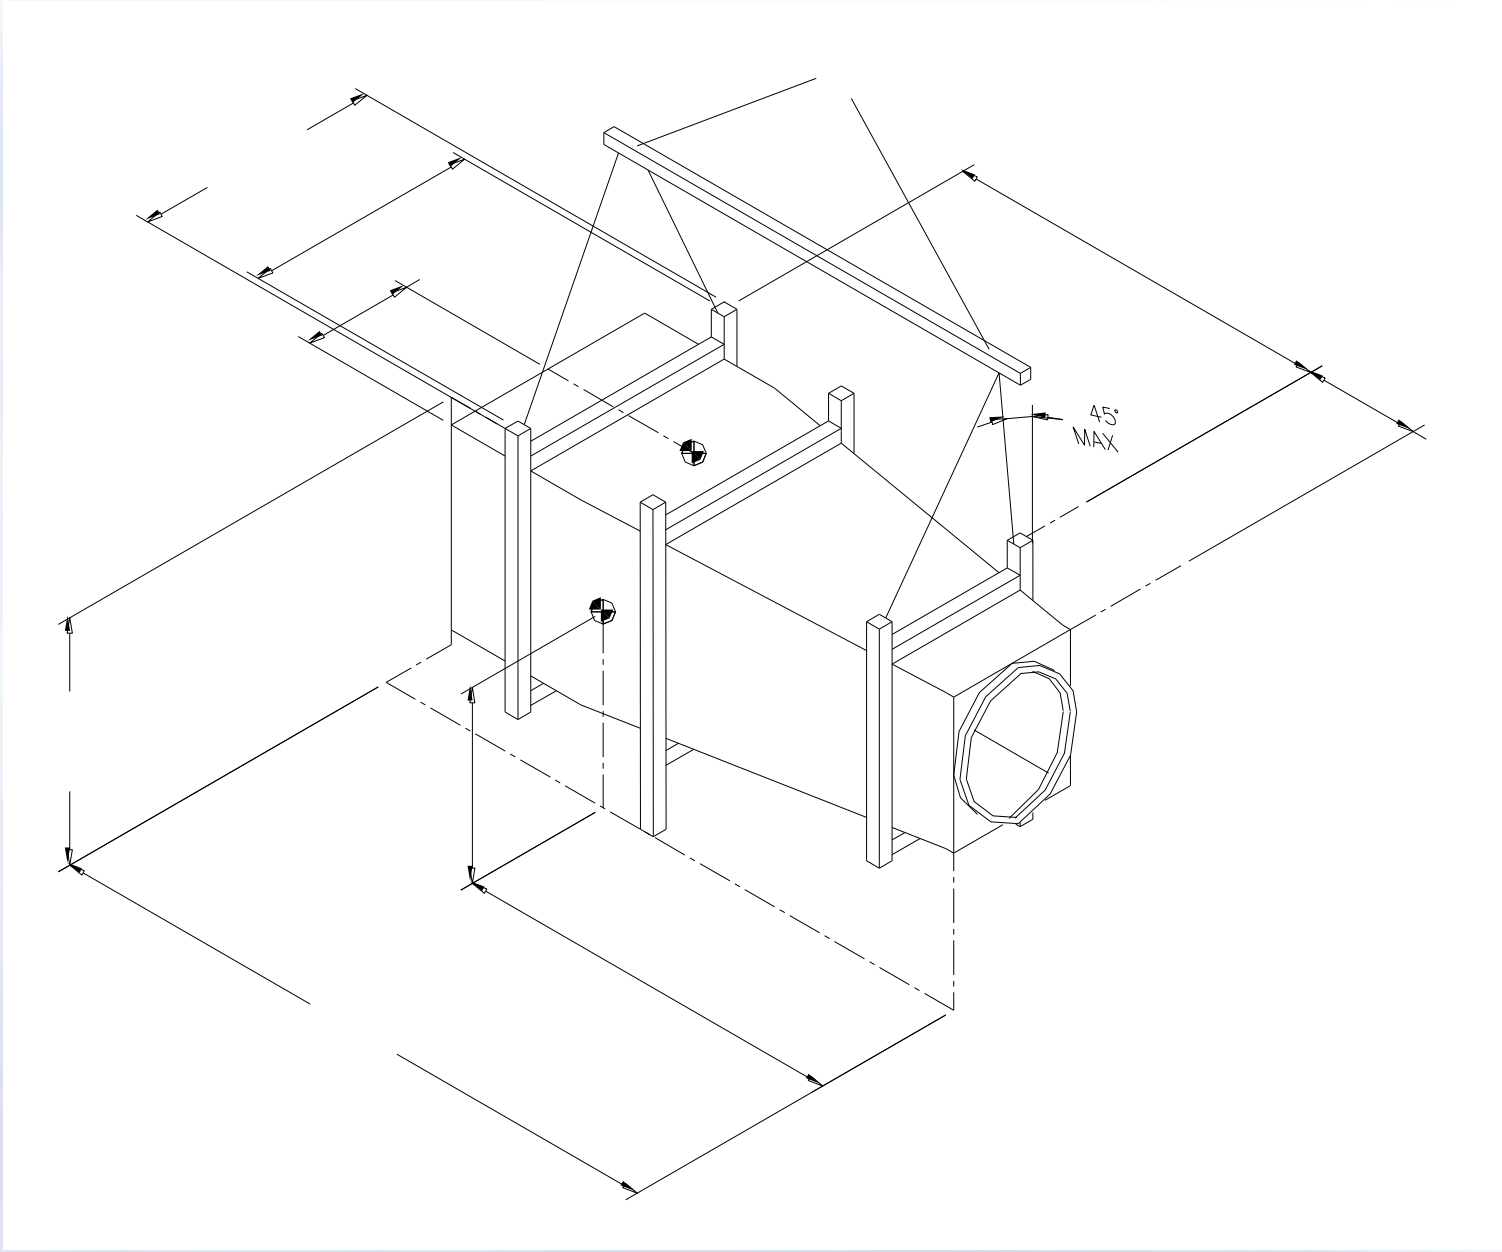
- Stack dampers are required to be installed if an SCR system is supplied with the OTSG.
- There are two main purposes of the stack damper…
    1) Protect the SCR Catalyst from moisture.
    2) Retain heat in the OTSG.
- The stack damper can be installed immediately after the stack is in place and secure.
- The damper is to be secured onto the stack lifting plates using the hardware provided.
- Lifting lugs are provided on the damper frame for lifting and to assist with installation.
- The damper actuator is shipped loose to prevent damage, but should be mounted to the damper prior to lifting it atop the stack.
- Rain skirt liner panels are also shipped loose and are to be bolted into position after the damper is secured in place.
- Once installed, stroke damper open and closed to check for proper operation.

Picture 73: Typical Stack Damper

Picture 74: Stack Damper Lifting Arrangement

Picture 75: Placement of Stack Damper

Inlet Transition Duct Installation



•Place insulation and JAKS inside the inlet plenum for joint between inlet plenum and inlet duct.

• Lift the inlet duct per recommended arrangement.

•Ducting installations are is slip fit connections. While still on the hook of the crane, pull the inlet duct into the inlet plenum opening with come-a-longs.

• Check to ensure all ducts are centered over the base plates in both directions. At the inlet plenum to duct interface, the edge of the duct casing should line up with the plenum bottom horizontal column center-line.

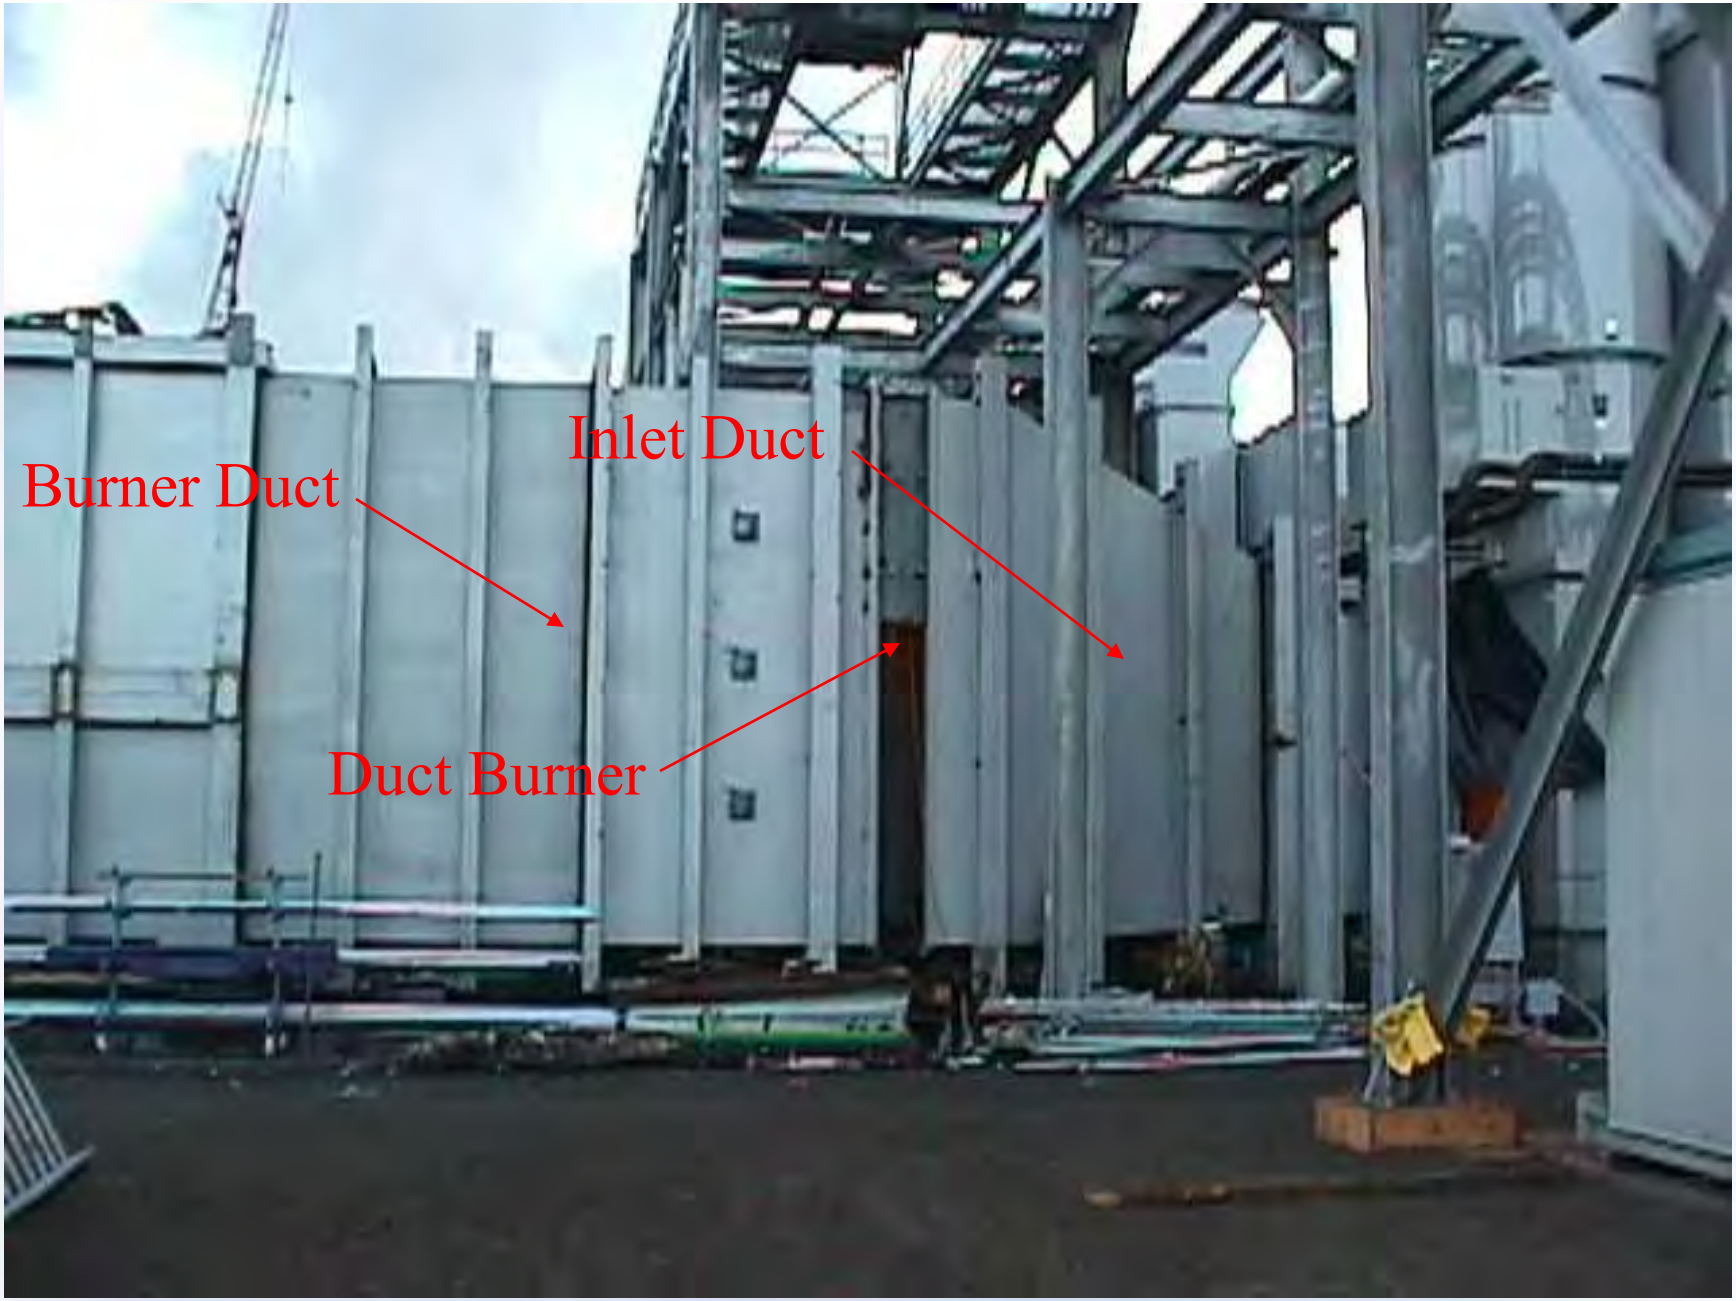
•Check the inlet duct center alignment with the gas turbine centerline and compare distances points on the inlet duct and gas turbine flanges:
(top, bottom, left side & right side).

Inlet Transition Duct Lifting Arrangement (using 1 spreader beam)

Inlet Transition Duct Vertical Lift

Inlet Transition Duct Installation

Inlet Transition Duct Installation



Inlet Duct Design Applications

•Inlet ducting can be design to incorporate various design options. Some of these are as follows…

1. Inlet Transition duct only
2. Inlet duct incorporating duct burner and burner ducting
3. Inlet duct with silencer.
4. Inlet duct with flow screen.
5. Any combination of items 1 & 2 with items 3 & 4.

• If a duct burner is to be installed, the burner assembly and a separate burner ducting will be installed between the inlet duct and the inlet plenum. Burner ducting is to be installed in the same manner as the inlet plenum.

•Flow screens and silencers can be applicable without duct burners. When installed with a duct burner, they are always installed upstream of the burner.

Inlet Ducting with Burner Duct and Duct Burner

Expansion Joint Installation

•Hardware is supplied with the expansion joint installation. Check that all hardware is available.

• Ensure temporary lifting lug for expansion joint is on the top center-line.

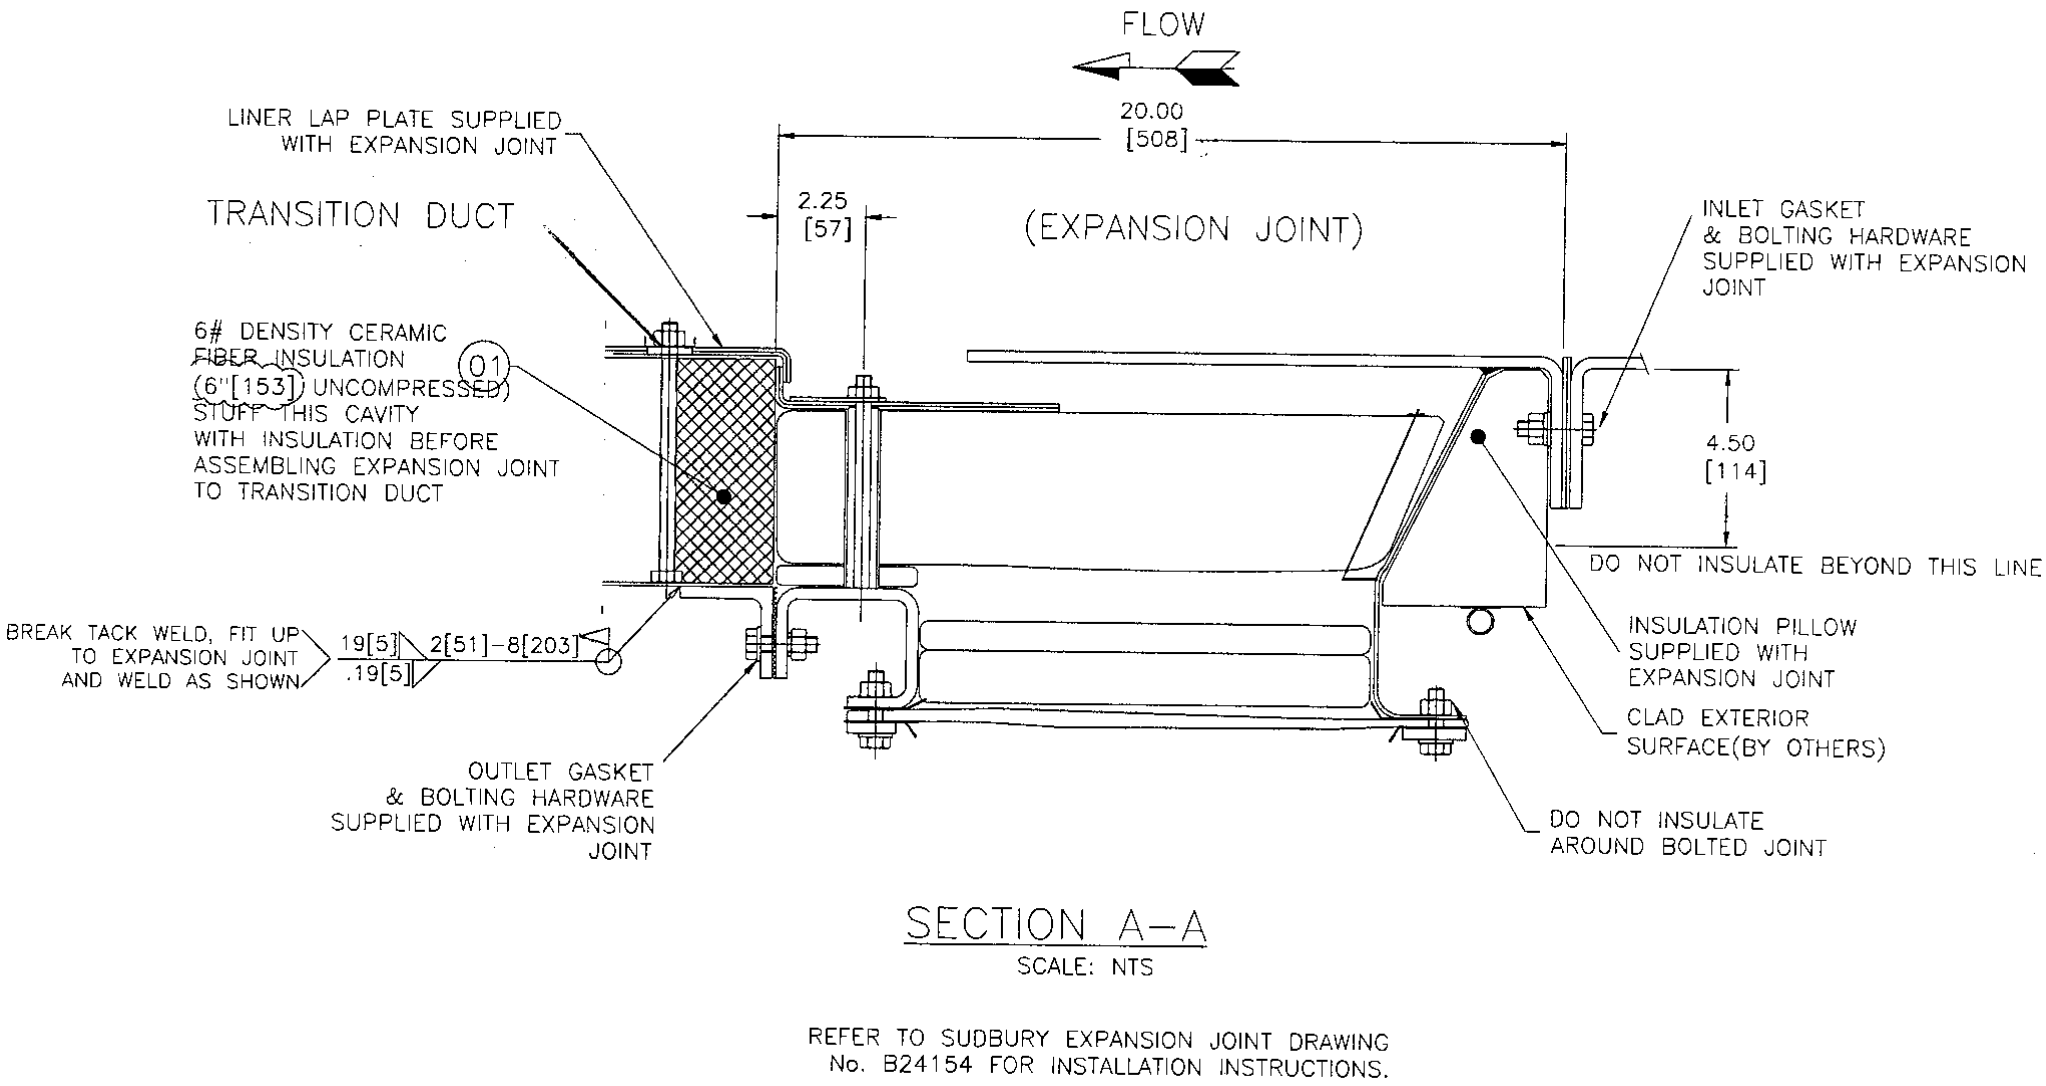
• Apply gasket tape to the both side faces of the expansion joint.

• Lift and place the expansion joint between the GT exhaust flange and the OTSG inlet transition duct flange (ensure correct flow direction).Note: the expansion joint is preset in a compressed position.

• Securely bolt the expansion joint to the GT exhaust flange.

Expansion Joint Installation

• Loosen the preset bars on the expansion joint and allow the joint to expand to the inlet duct flange.



• Securely bolt the expansion joint to the inlet transition duct flange.

• Once flange bolting is entirely completed remove expansion joint preset bars.

• Internally there is a void between the expansion joint and the transition duct insulation. Fill this void with insulation.

• Install closure liner plates (supplied with the expansion joint) that close the gap between the transition duct liner plate and the expansion joint liner plate.

• An insulation pillow is supplied with the expansion joint. This is to be externally installed on the expansion joint beside the inlet flange (Refer to the vendor instructions). Cladding should be installed (by others) over this external insulation pillow.

SECTION A–A

SCALE: NTS

REFER TO SUDBURY EXPANSION JOINT DRAWING No. B24154 FOR INSTALLATION INSTRUCTIONS.

Cross Section - Expansion Joint

Expansion Joint installation

Expansion Joint Preset Bar

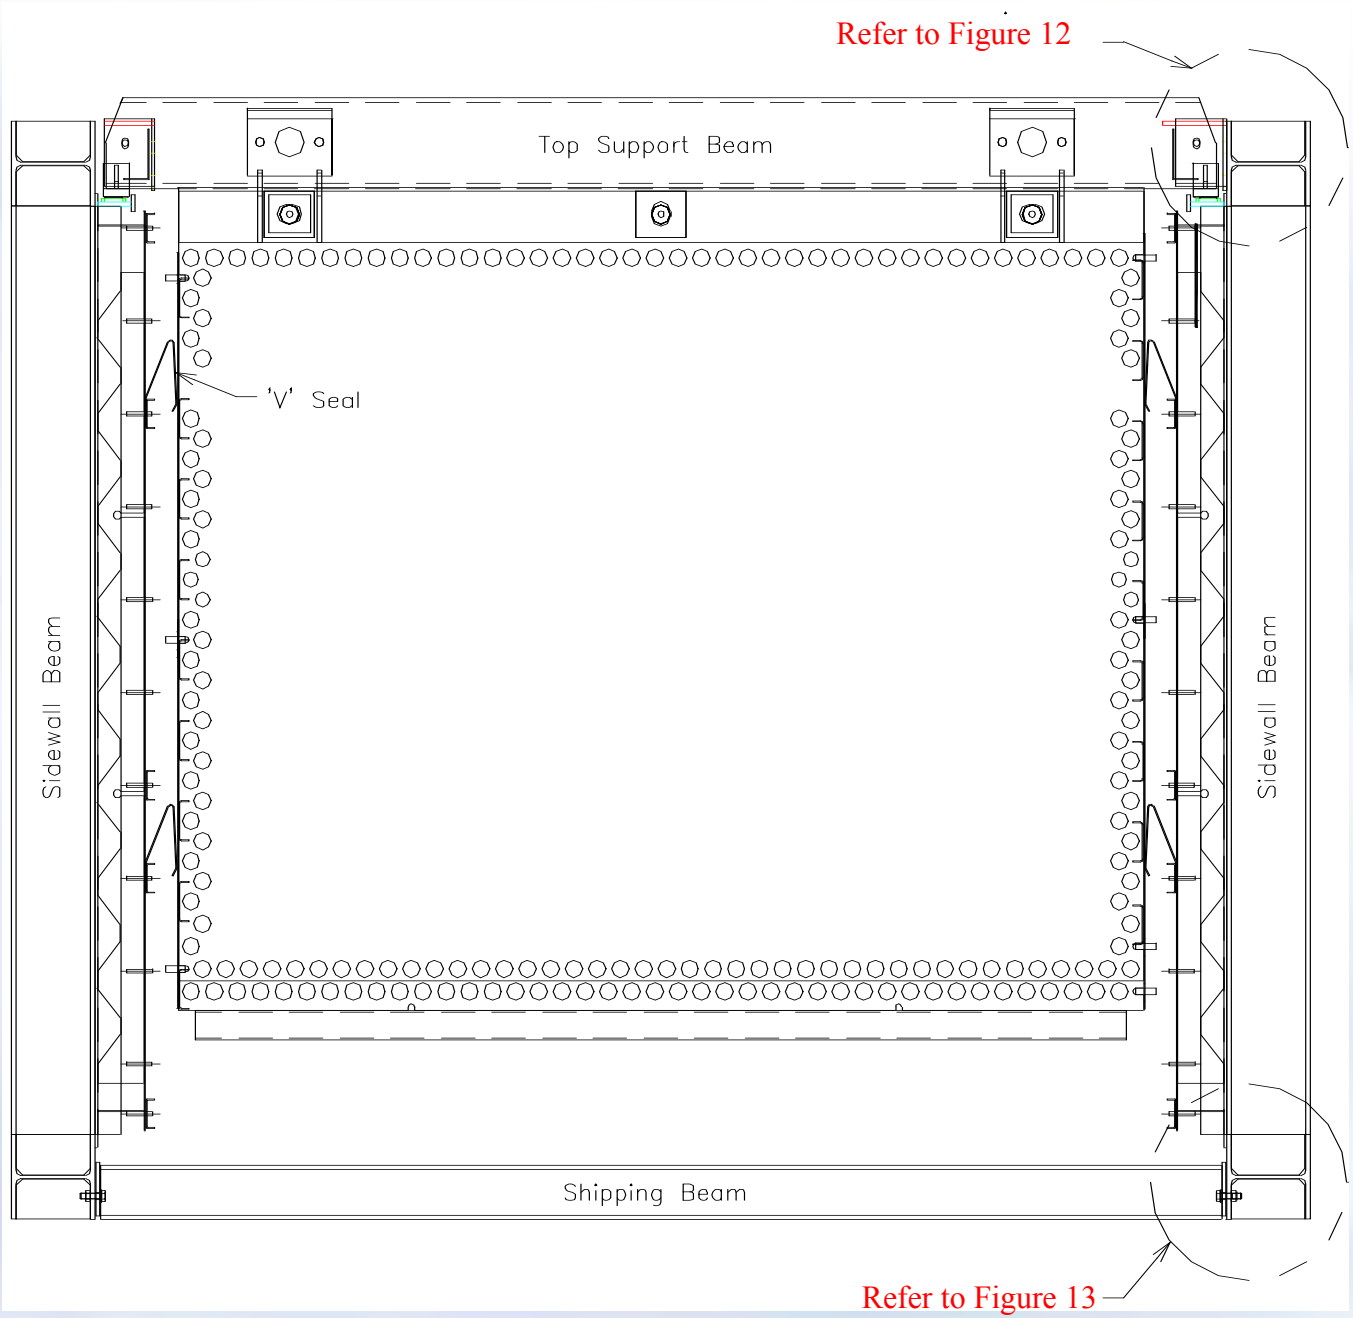
OTSG Module Internal Works

•Extreme care must be taken to prevent any possible damage to the pressure tubing.

•Prior to performing any work on top of any OTSG Module, tubes are to be covered with plywood and fire blankets.

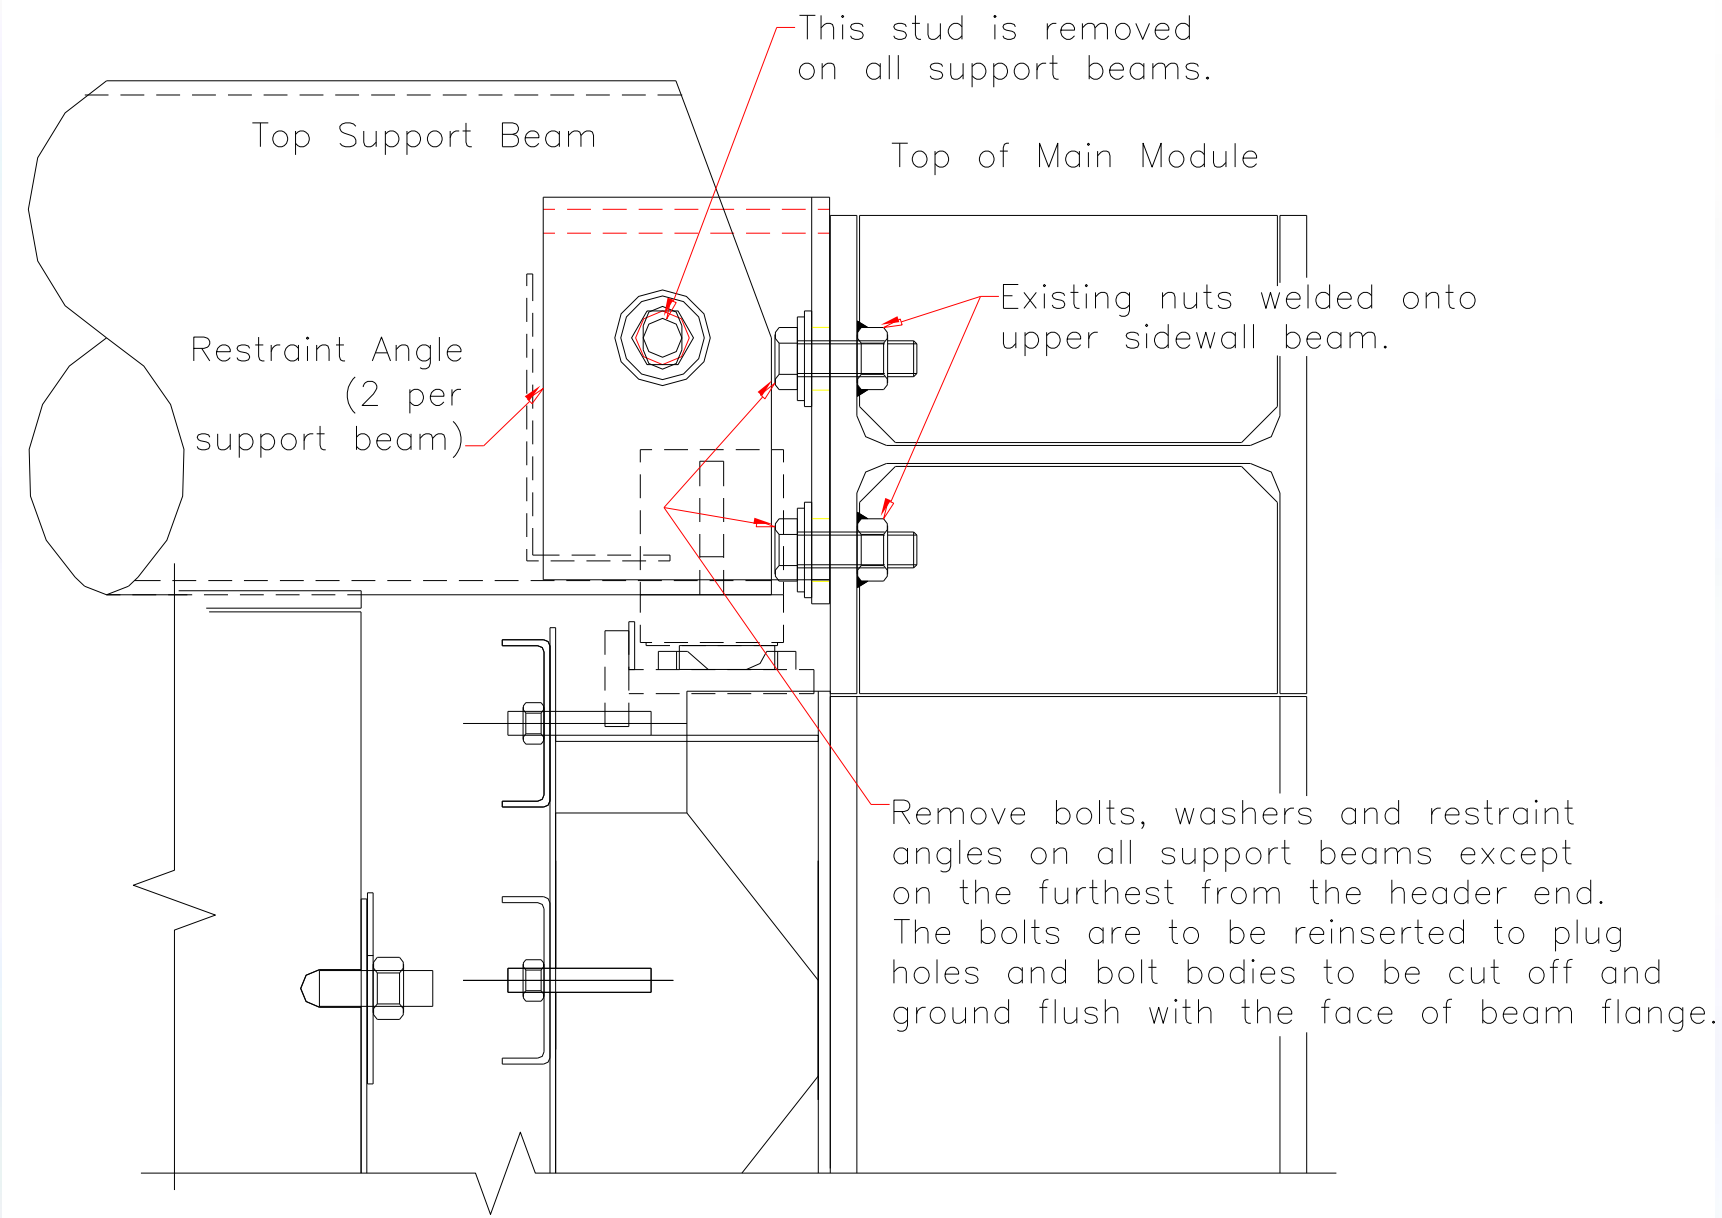
- •Failure to do so could result in warranty invalidation.

•Do not support heavy equipment on the tubes and ensure that loads are evenly spread over multiple tube surfaces.



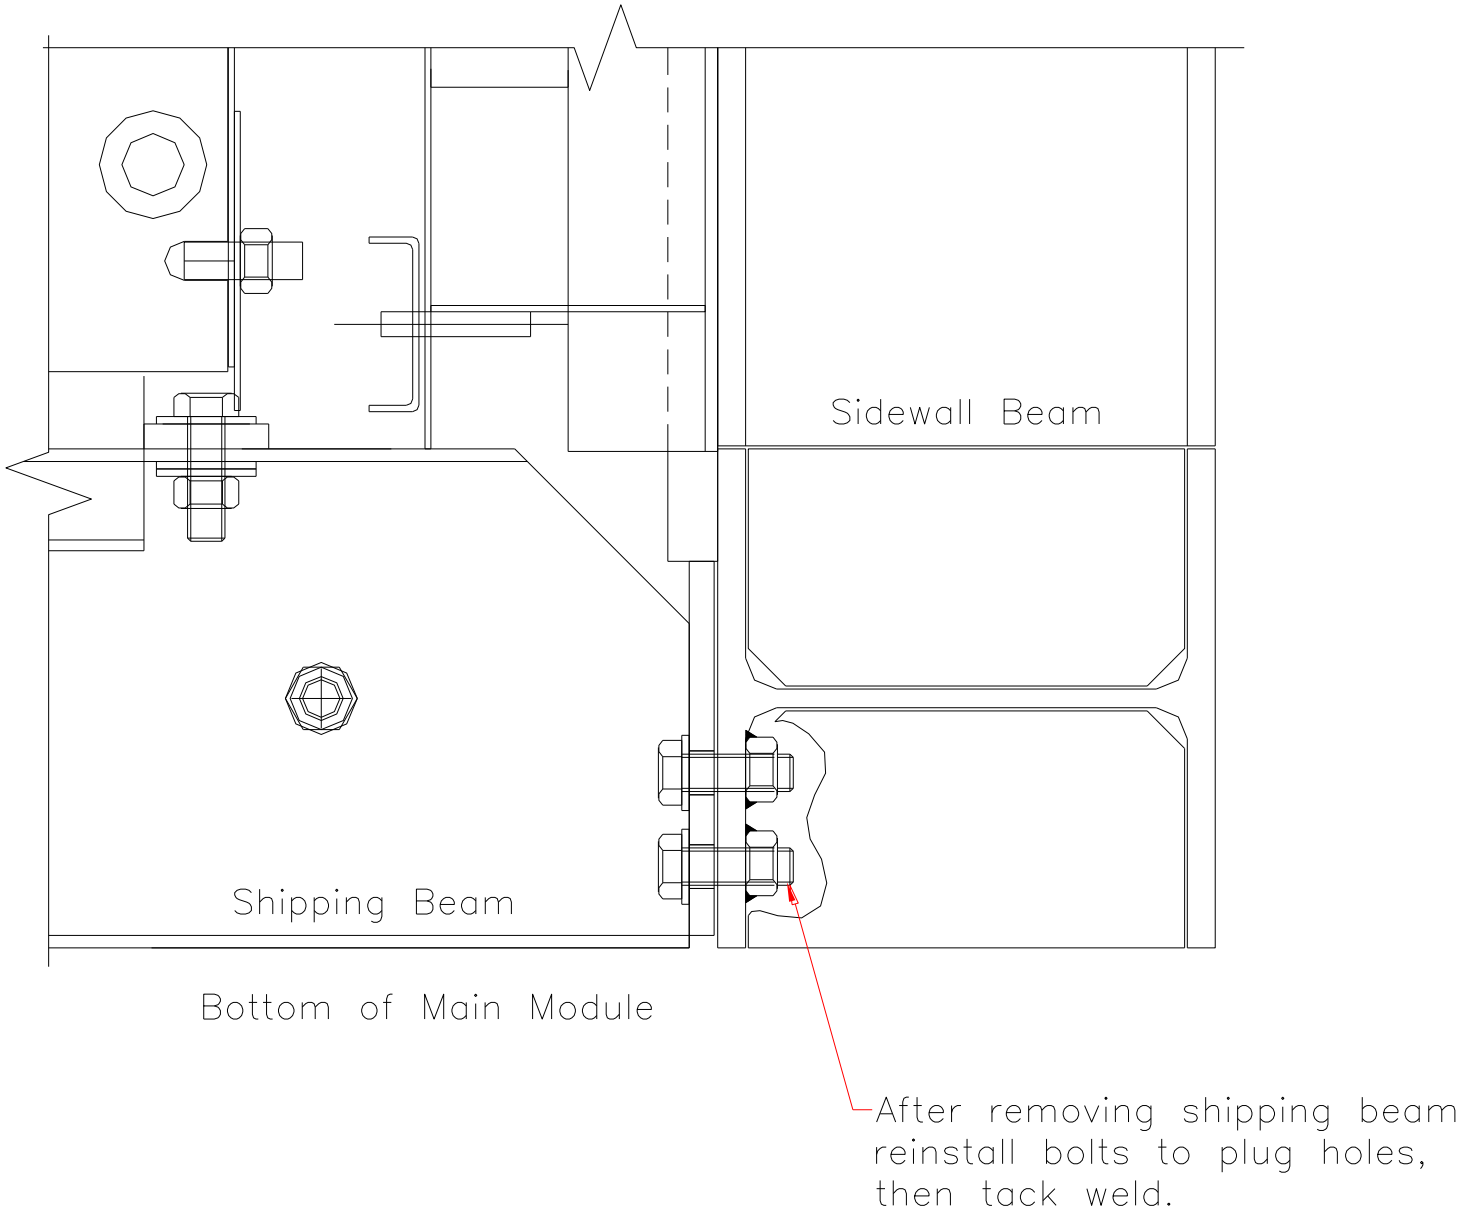
- •Pressure Part Top Support Beam
- •Joints Assembly Kits (JAKS)
- •Restraint Adjustment

Top Support Beams

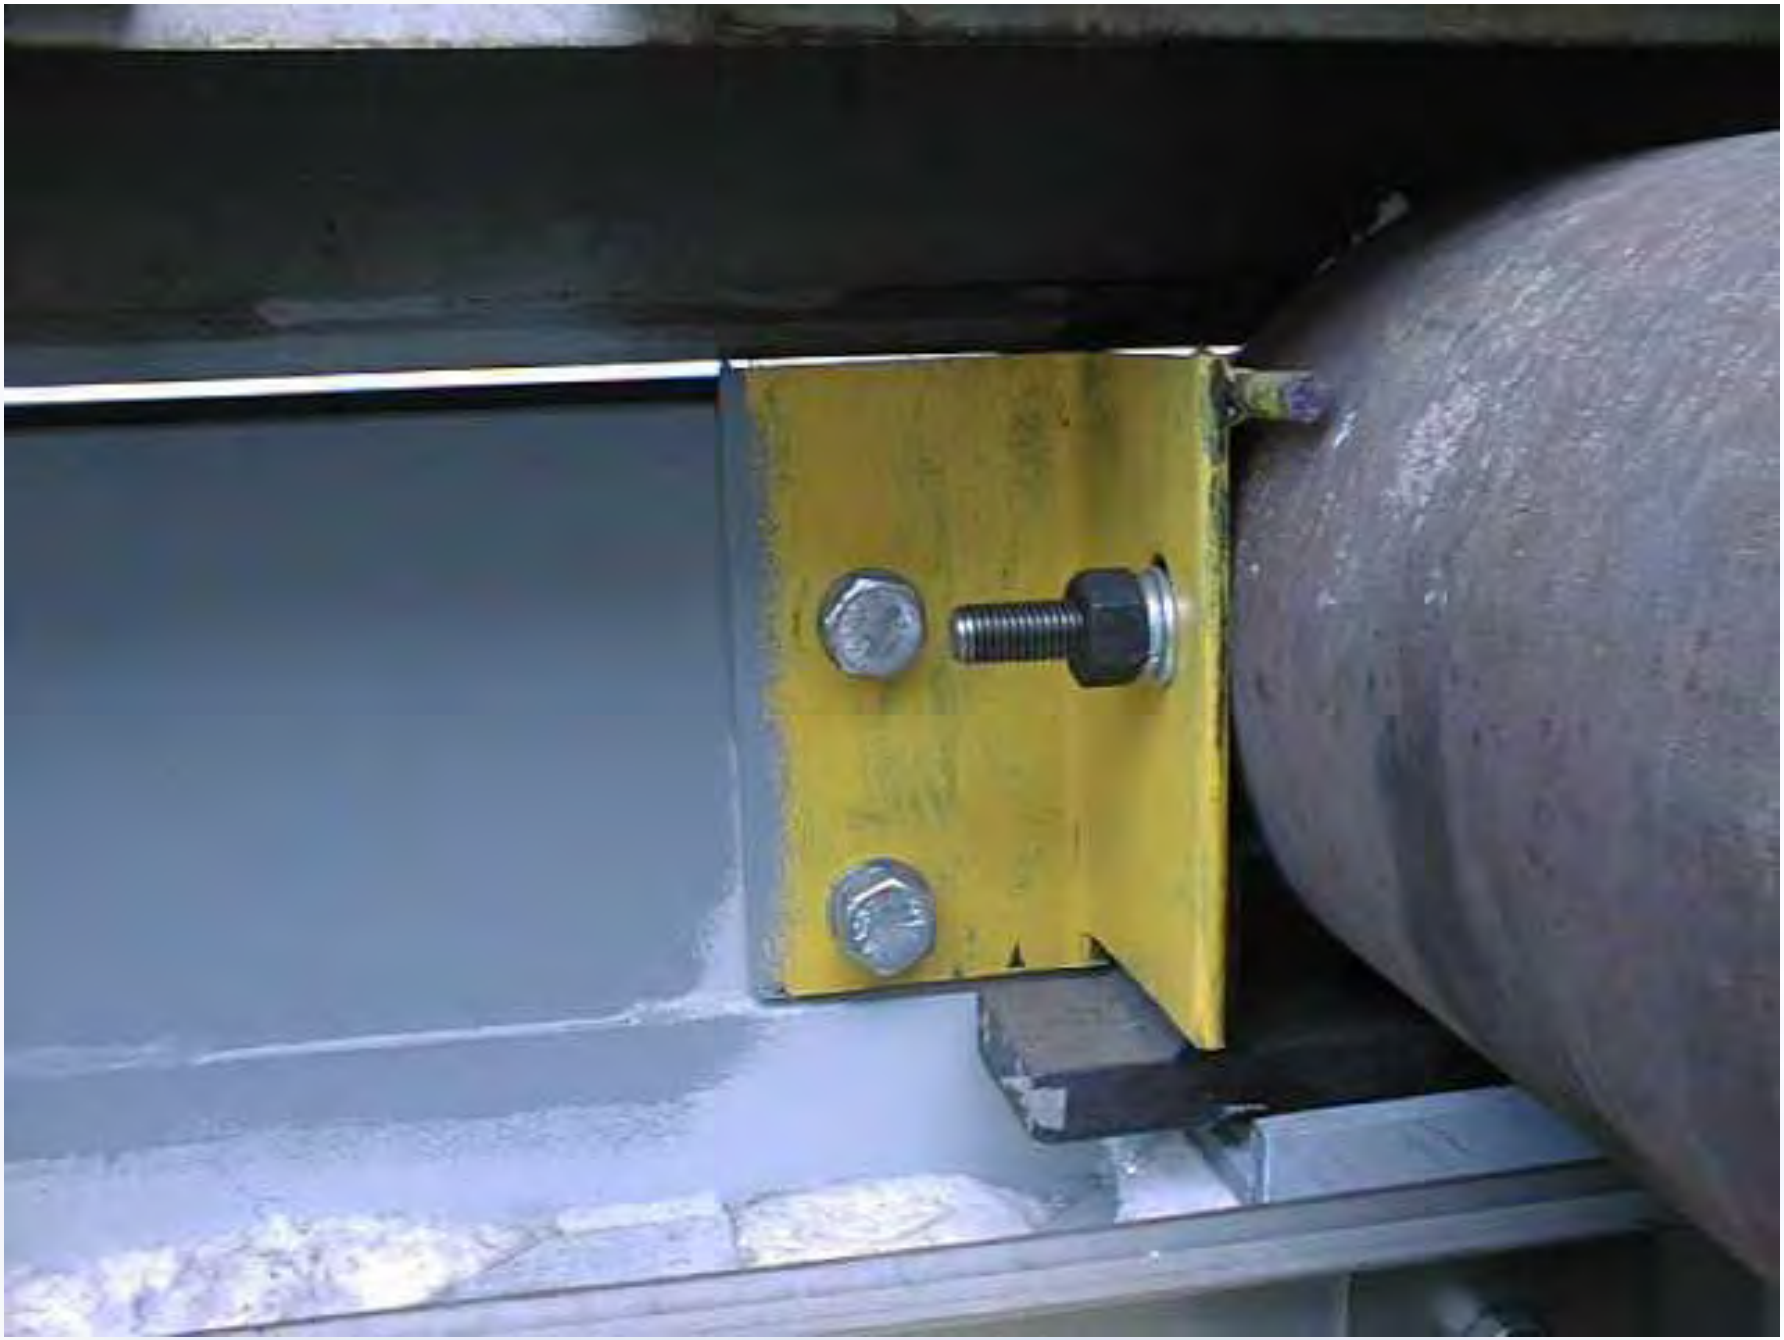


•Remove painted yellow shipping angles from the tubesheet support beams. This will involve removing two bolts that tie into the casing and one stud that attaches into the round support beam.

• On the rear-most support beam (farthest from the header end). Do not remove the angles at this location. Instead, leave in place the bolts tying into and remove the stud that ties into the round support beam.



• At all locations where the shipping angles have been removed, reinsert the bolts into their respective holes, cut heads off with a grinder and seal weld.



Typical Cross Section - Lower Module

Top Support Beam Restraint Hardware Removal

Shipping Beam Removal

Shipping Angle

Top Support Beam & Shipping Angles

Internal Perimeter Joint Welding and Joint Insulation Kits

NOTE: These instructions are typical for all ducting-to-ducting, ducting-to-module and module-to-module joints. JAK – Joint assembly kits

•Remove all remaining shipping beams from the ducting / module and close the bolt-holes at these shipping beam locations by reinstalling the removed bolts and seal welding them into place.

• Seal weld the internal perimeter joint between the two components.

• Remove existing internal liner hardware (channels, nuts, and washers) all around the perimeter on either side of the joint for JAK kit Installations

• Install 3 layers of ceramic fiber insulation into the joint. Ensure insulation ends are tight against one another and that seams are overlapping.

• Install Joint Assembly Kit (JAK) liner panels in correct sequence. Nuts are to be installed “snug” tight, backed off 1/4 turn then tack welded in place.

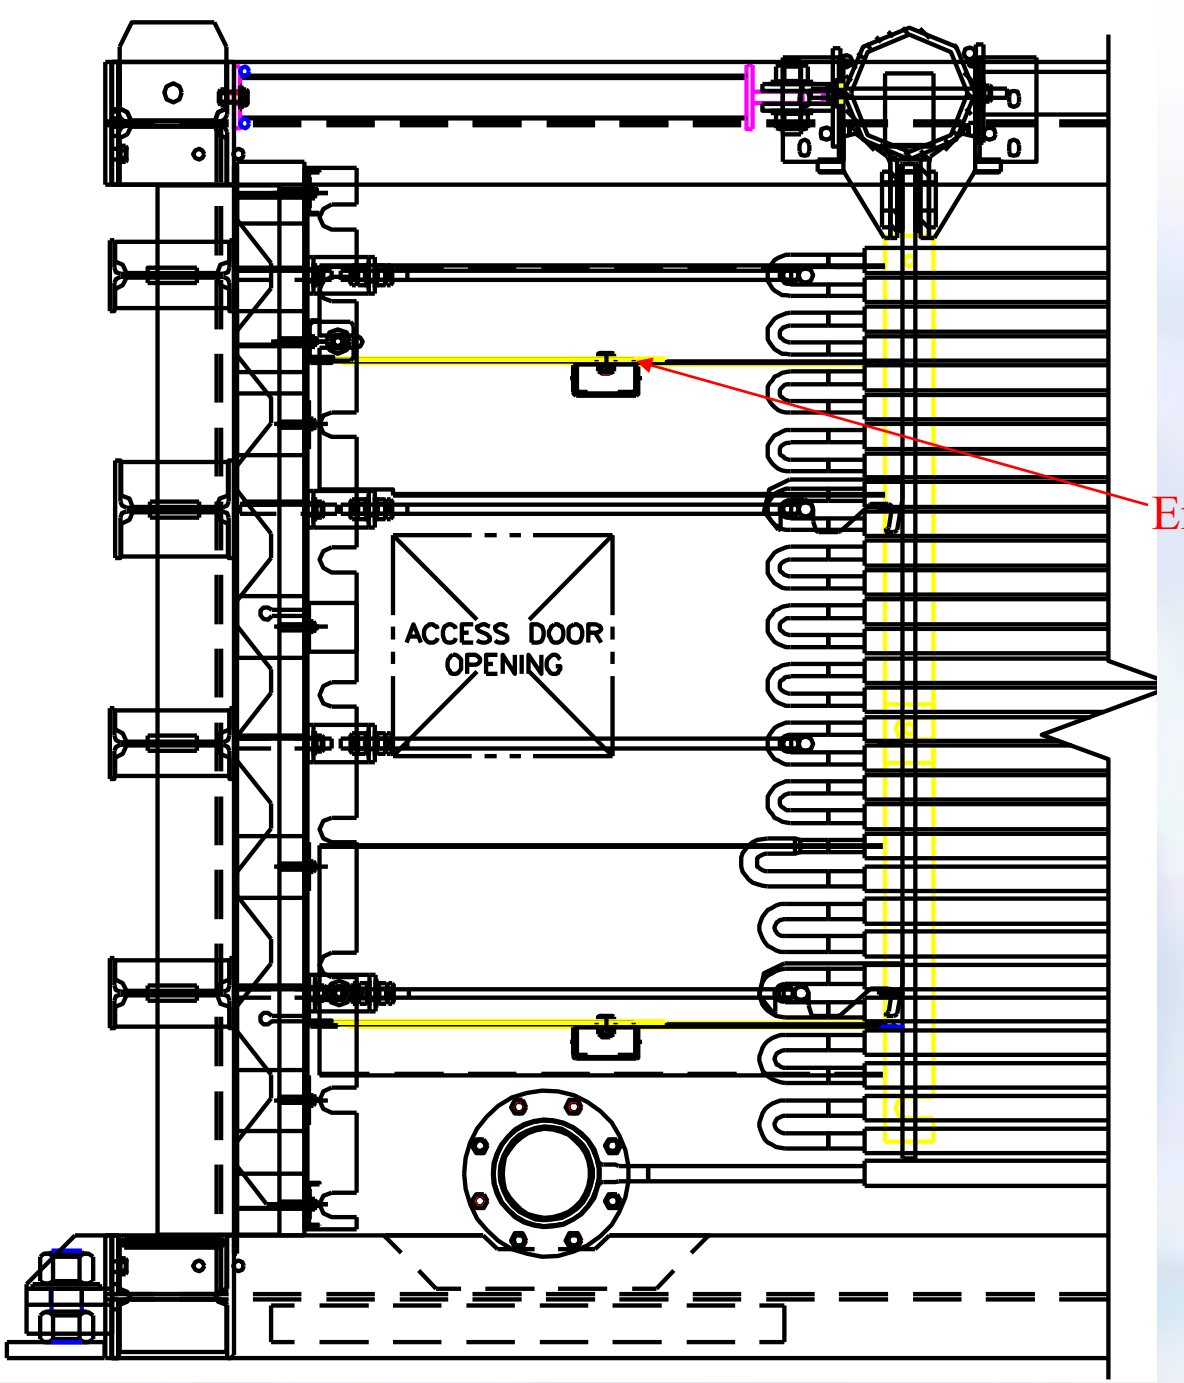
Typical Cross Section - Exhaust Hood & Exhaust Stack

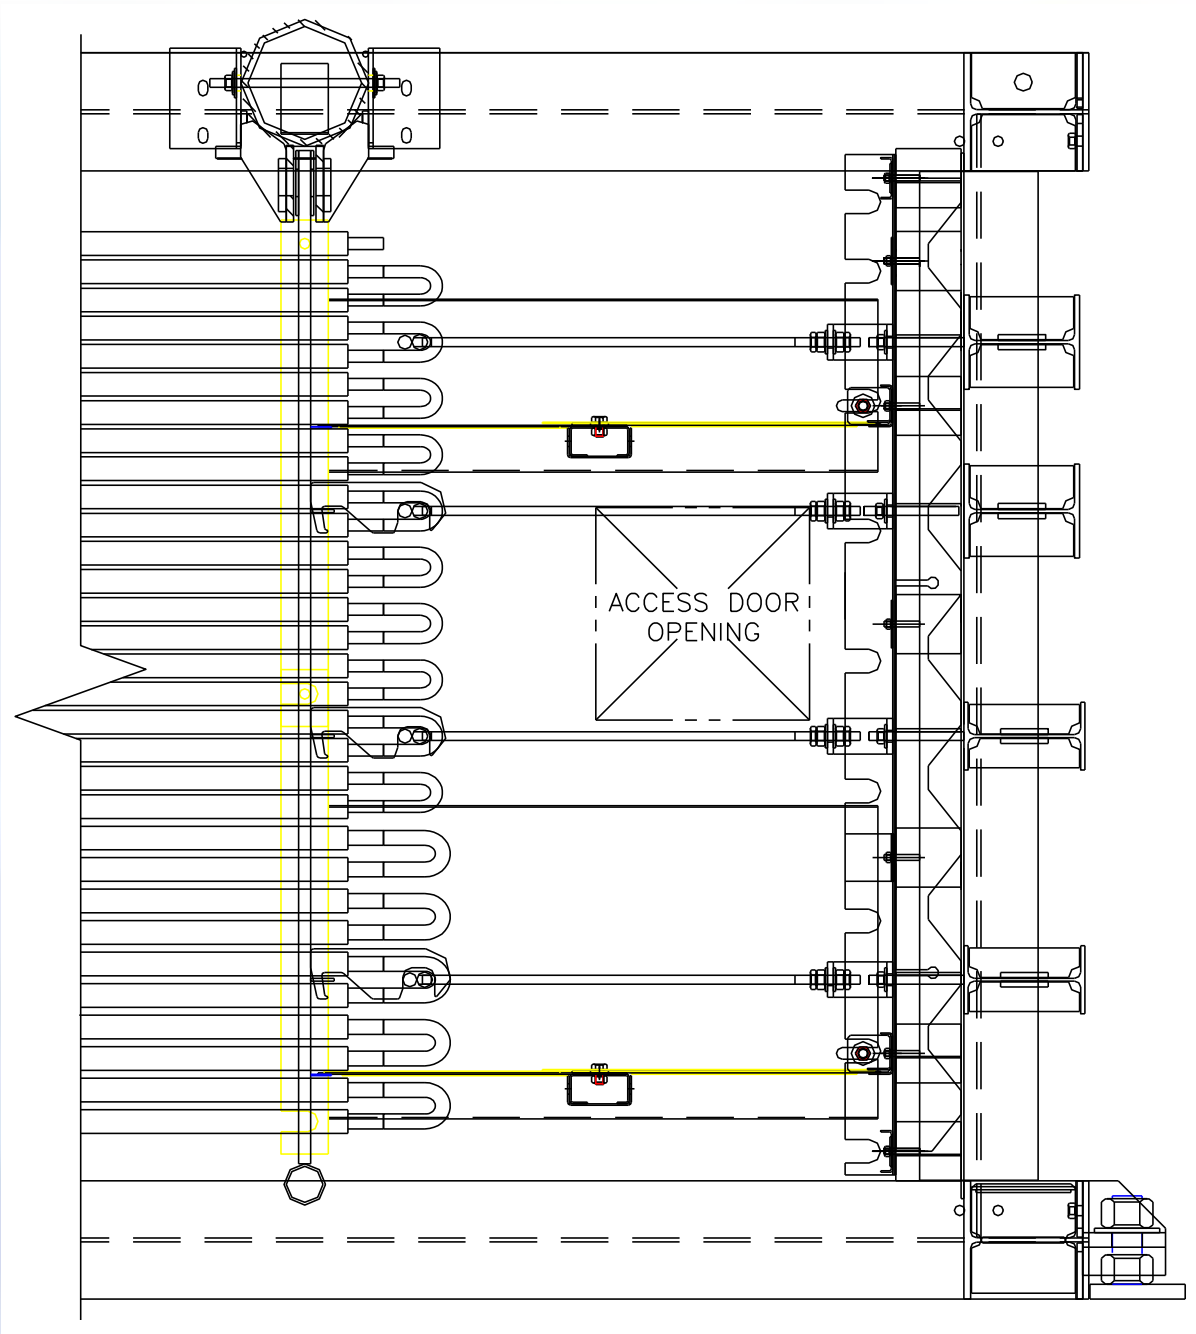
Joint Cross Section - Inlet Plenum & Inlet Duct

Pressure Part Restraint Adjustment



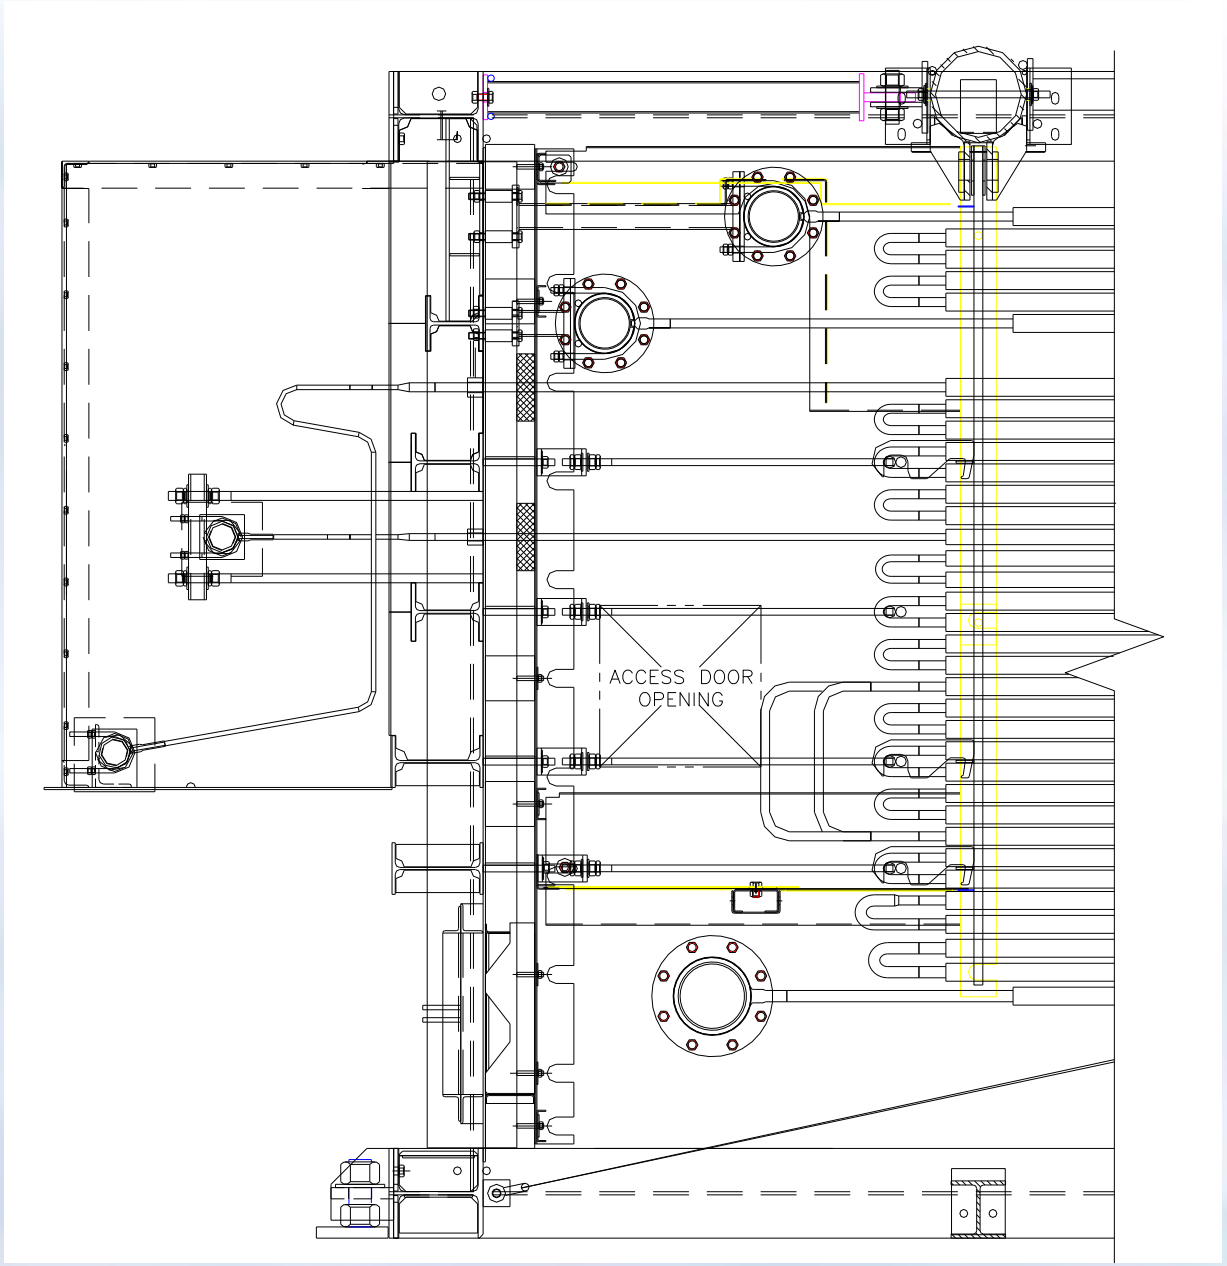
•After internal seal welding is complete and JAKs installed, the OTSG module tube bundles have restraint hardware that require adjustment.

• To protect the tubes during shipping, rubber has been installed on the inside radius of the return bends at all restraint rod levels and must be removed at all levels, both front and rear of each module.

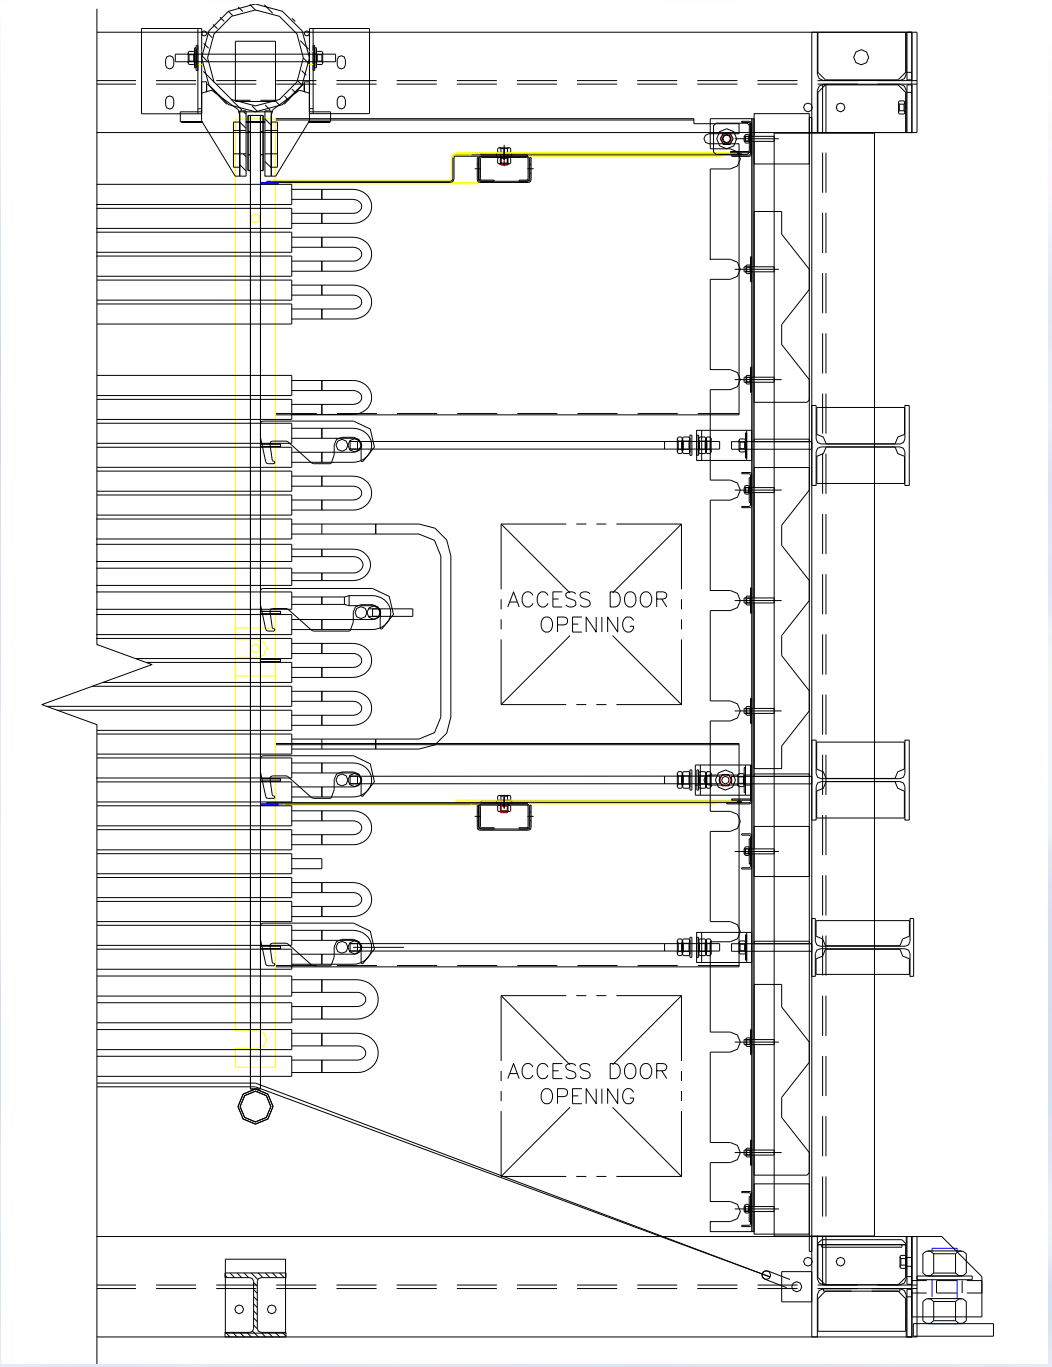


• When the protective rubber is removed, all restraint rods will require adjustment according to the erection instructions.

•It is critical not to over tighten and to maintain the required gaps. Refer to the erection instructions to obtain the required gap for restraint rod adjustment.



• In order to access all levels of restraints, some endseal panels will need to be removed. Ensure all panels are reinstalled immediately after the restraint is adjusted.



Restraint Rods & End Seals; Module Front End

Restraint Rods & End Seals; Module Rear End

Restraint Rods & End Seals; Module Front End

Restraint Rods & End Seals; Module Rear End

Module Cabling Restraint Inserted rubber protection

Typical Restraint System

Platform Steel Installation

•Typically, platform steel is installed after major components are in place.
    •Occasionally in high seismic zones, the platform steel must be installed before the hood and stack are in place.

•Clips are welded to the platform beams and the platforms are support off the OTSG vertical beams and columns.

• Pre-assembly of structural steel columns and beams should commence on the ground.

• Stair stringers, treads and small platform sections should be pre-assembled in the lay-down area to reduce installation time.

• Install grating. In the case of piping/conduit penetrations though grating, the contractor is responsible for cutting the grating and installing any kick plate protection.

Platform Columns & Horizontal Support Members

Platform Structural Members

Platform Steel Installation

Platform Steel Installation

Ladder to Grating Connection Detail

Rail Car Tie Down Lug Removal

The OTSG modules have large shipping lugs attached to the end wall casing to facilitate rail transportation to site.

One, or more, of these shipping lugs may require removal to allow installation of the front platform section. Removal can be done using a torch and the lug can be removed either when the module is on the ground or once it has been installed into position.

Module Shipping Lugs

SRV Vent Silencer Installation

•Ensure that the SRV vent silencer support steel is installed completely and secure.

• Prior to installation confirm measure the distance between holes on the silencer support pads and the support structure.

• Check orientation of the SRV vent silencer against drawing.

SRV Silencer Lift (using 2 cranes)

SRV Silencer Lift (using 2 cranes)

SRV Silencer vertical Lift

SRV Silencer Support

Piping Installation

• Piping installation cannot proceed until the platform steel is in place.

• Check to ensure that piping, valves, supports and hardware are available. Inspect all equipment prior to installation for damage.

• Do not remove protective end caps any piping until necessary.

• Ensure that the safety relief valves hydrostatic test plugs have been installed prior to hydrostatic testing and that all drain connections have been properly piped.

• Check that the SRV vent pipes are secure and check that sufficient clearance exists, between the safety valve discharge elbow and the inside of the vent pipe, to allow for thermal expansion.

• Ensure valves are installed in the correct flow direction. Motorised and pneumatic valves should be checked for proper operation. Operate the valves to ensure the linkages do not bind.

Piping Installation

•Check that pipe orifices and/or flow devices are properly installed.

• Ensure that all flange bolts are tight and that proper gaskets have been installed.

•Check that all drains and vents are free of obstructions and that the lines have been properly supported. Ensure all vent piping has been properly routed and is pointing safely away from access platforms.

• Check all pipe supports. Ensure that guides act only as guides and that any spring hangers are properly set in the "cold" position and shipping blocks removed. Refer to IST piping drawings.

• All temporary supports and bracing, installed for erection, must be removed before OTSG operation. Note: Do not weld temporary supports to steam piping as it will create internal stresses. This is a stress relieved vessel!

• All sampling ports off the OTSG casing and the drain connection on the bottom of the inlet plenum should be capped.

Piping Installation

•All blanking plates used for hydro testing or cleaning should be removed.

• Ensure in-line strainers are installed in the feedwater piping. Strainers will prevent plugging of flow orifices and damage to control valves by foreign matter.

• Ensure all necessary post weld heat treatment and non-destructive examination has been completed as necessary.

• Conduct a successful hydrostatic test as required.

Steam Outlet Piping Assembly

Steam Outlet Piping Assembly Installed

Steam Outlet Piping Installation

Steam Outlet Piping Connection to Header

Vent Stack - U-bolt Connection Detail

Typical Feedwater Piping

“Jumper” Tube Installation

Where the complete OTSG pressure tubing is contained in two or more modules, a connection must be made between these modules to complete the tubing circuitry from the inlet header to the outlet header. This activity is to be done by IST orbital welding technicians using a specialised automatic TIG welding process.

Orbital welding process...

- Prepare ends, on both “jumper” tubes and OTSG module tubes, for welding.
- Fill the inside of the tubing circuit/bundle with argon.
- Fit-up and weld “jumper” tubes to OTSG module tubes.

During this process, the construction contractor will be responsible for providing the following...

- Electrical junction and uninterrupted power source and hook-up service for IST tool crib container and transformer for orbital welding and 110 V power tools.
- Designated lay-down area local to OTSG for IST tool crib container.
- Compressed air.
- Scaffolding, if platform steel and grating is not complete.
- Tarps for scaffold areas at feedwater inlet box, in case of inclement weather.
- Site safety induction of IST personnel prior to commencement of site activities.

(Cont’d)

“Jumper” Tube Installation (con’t)

• Provision of two personnel for assistance with general support labour duties and requirements of IST welding technicians / supervisor.

• Designated lunch, smoking area and toilette facilities.

• Arrangement of any on site permit requirements.

• Supply of ample demineralized water and pressurizing equipment to perform a hydrostatic test of each OTSG circuit once “jumper” tube welding is complete and piping tie-ins are made.

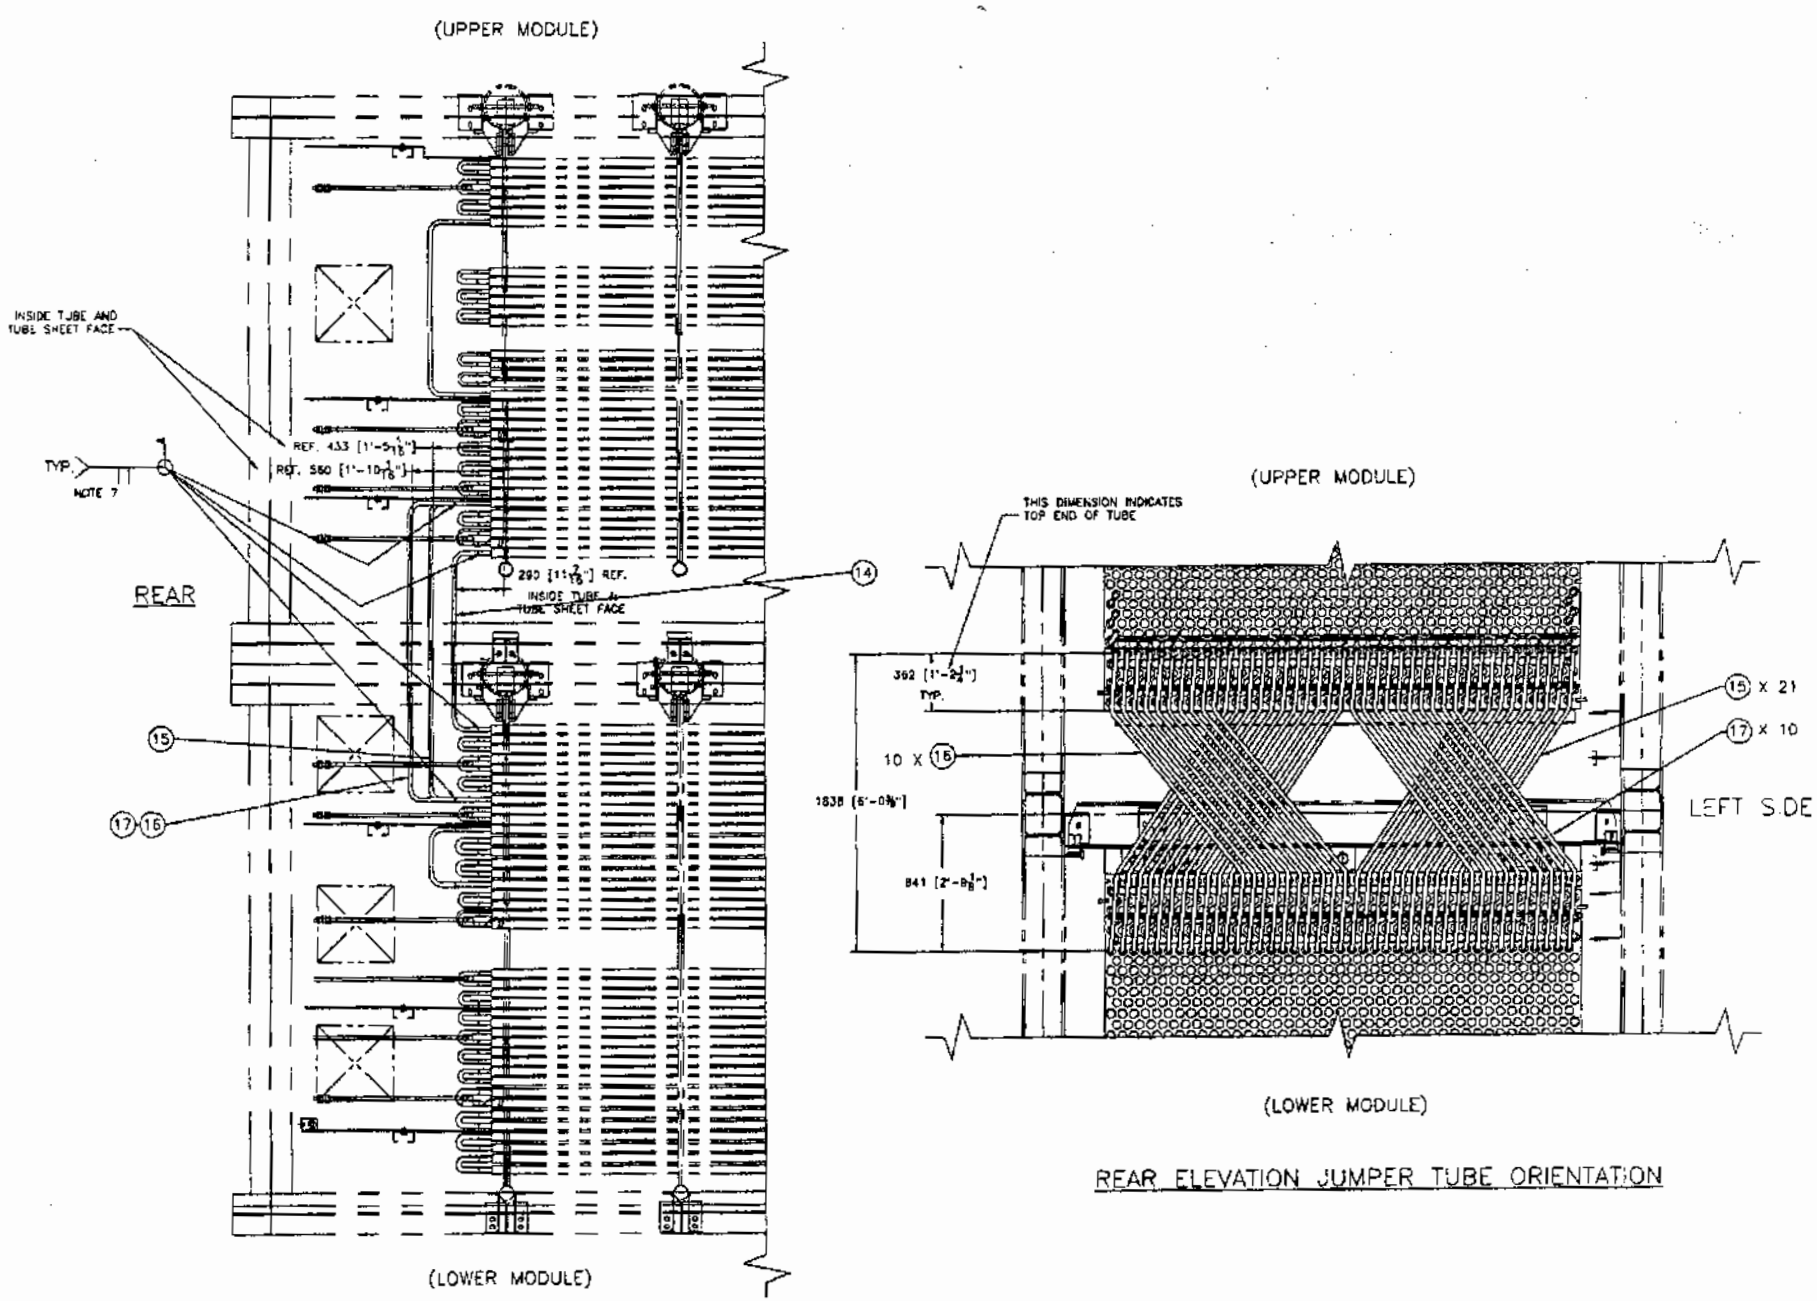


Figure 24: Typical "Jumper" Tube Arrangement

Instrumentation and Thermocouple Installation

- Check that all instrumentation, thermocouples and associated components are available. Inspect for damage.

- During installation ensure that the correct fittings are utilised for the application.

- Check inside all thermowells to ensure that they are void of any obstructions or deformities.

- Ensure that all gas side temperature probes install easily into the connection pipes.

- Ensure that any installed instrumentation does not interfere with platform access or walkways.

- Ensure that tubesheet thermocouples are installed per IST drawing.

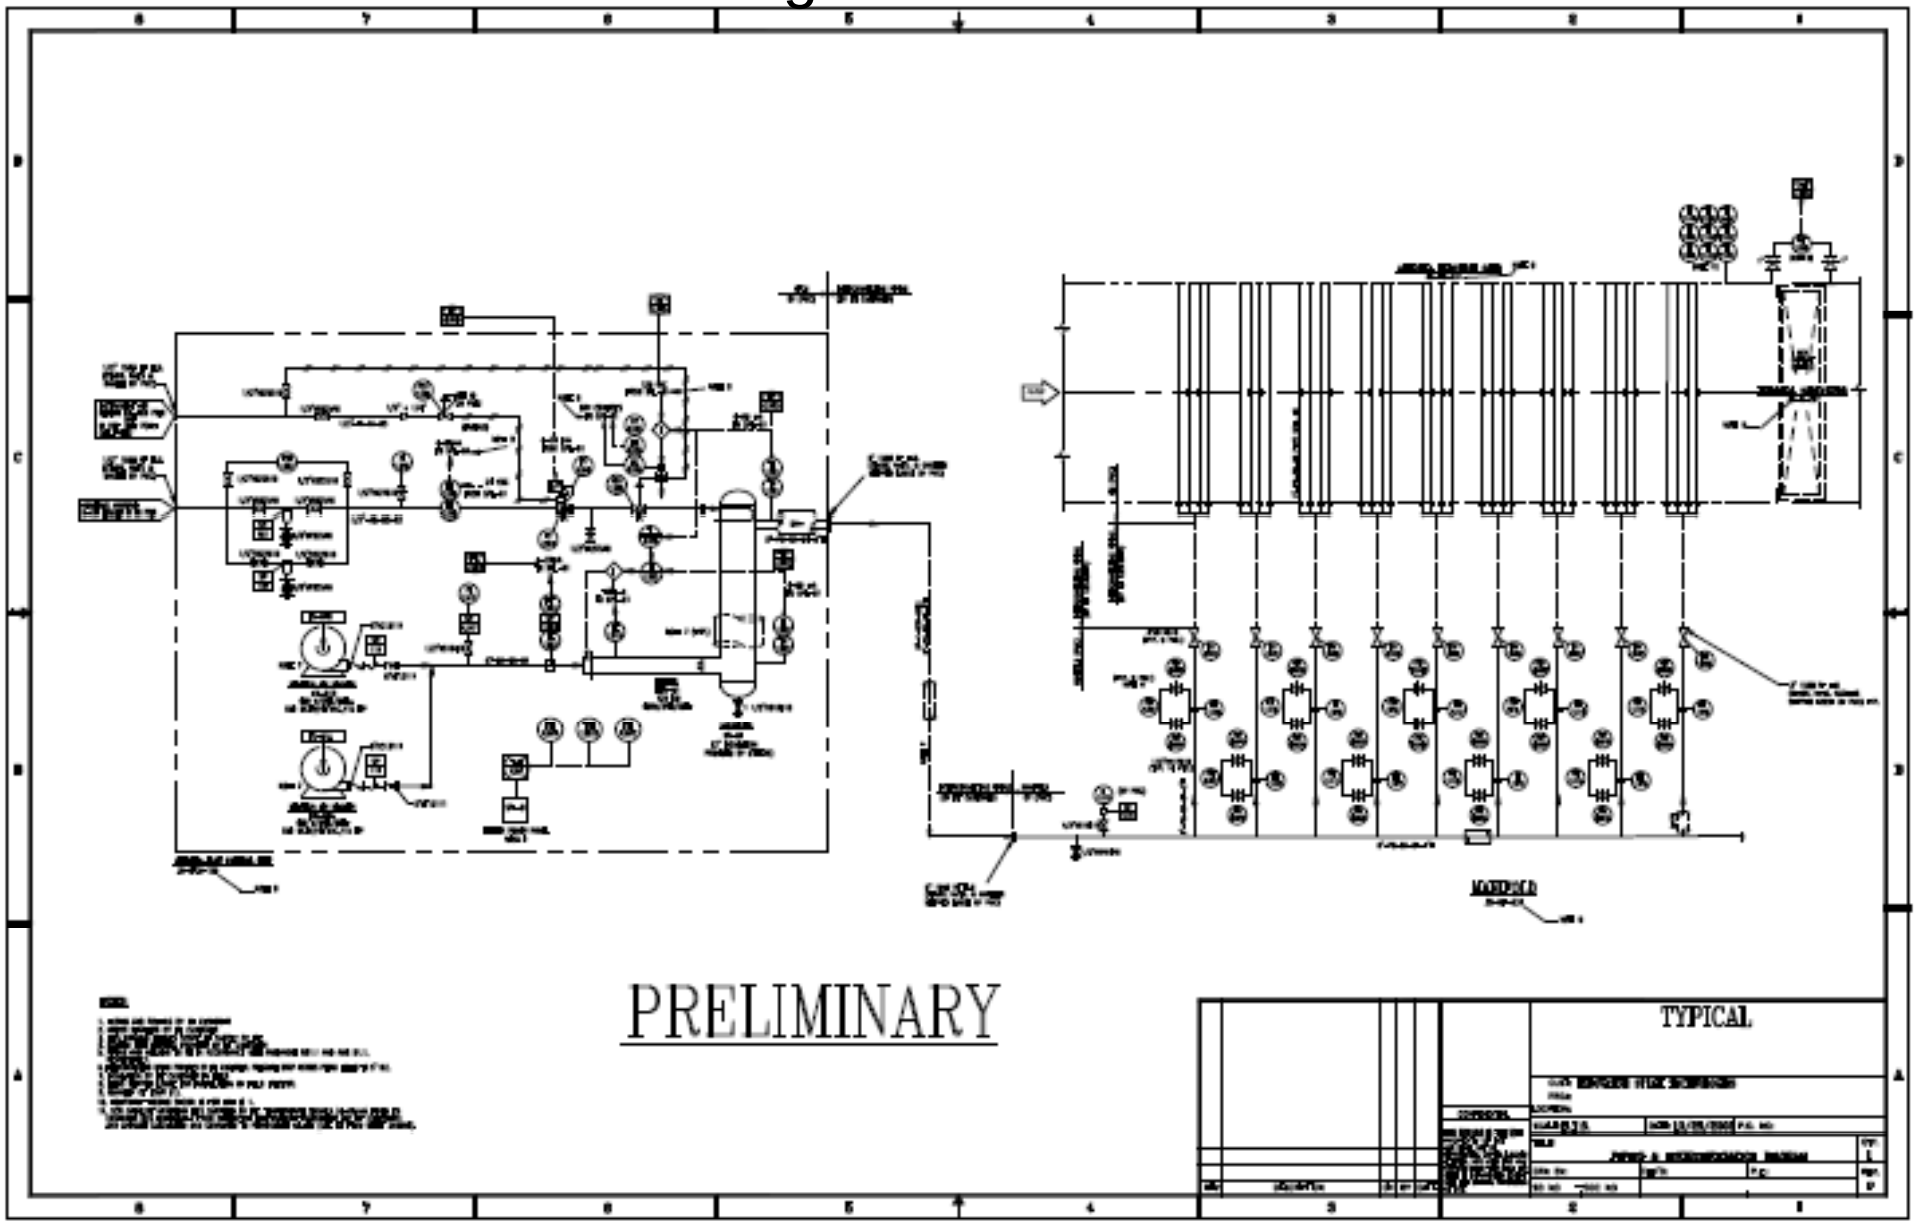
SCR Catalyst Performance



- The Glenarm OTSG has a DNX-629 (GT-301) SCR catalyst integrated. This change allows for the fastest OTSG start and fastest heating of the SCR bed from the cold condition.
- Air dilution is only required in extended/intentional simple cycle operation to cool the catalysts to 850 F max (~108,000 lbs/hr of fresh air).

LEFT SIDE ELEVATION

Preliminary Issue.
Dimensions Subject to Change.

REFERENCE DRAWINGS
FOUNDATION LOADINGS.....11303-0002
BASEPLATE LAYOUT ASSEMBLY.....11303-0003
FEEDWATER & STEAM FLOWSHEET....11303-0004

NOTES:
1. HEADERS LOCATED ON SAME END AS GAS INLET.
2. STEAM OUTLET WILL BE ON THE LEFT WHEN FACING HEADER END OF UNIT.
3. TYP. 12.00[305] CLEARANCE FOR EXTERNAL STIFFENING MUST BE NOTED AND ADHERED TO BY OTHERS.
4. ALL PRIMARY DIMENSIONS & ELEVATIONS ARE IN FEET & INCHES. ALL SECONDARY DIMENSIONS ARE IN mm.
5. IST T.P. DESIGNATES IST TERMINAL POINT.
6. ALL EXTERNAL PIPING WELDS TO BE IN ACCORDANCE WITH ASME B31.1 2007 EDITION.
7. A 28.00[712] SWING CLEARANCE IS REQUIRED AT ALL ACCESS DOORS.
8. STRUCTURAL STEEL DESIGN TO COMPLY WITH IBC 2010, AISC 13TH ED, AND CALIFORNIA BUILDING STANDARDS CODE 2010 EDITION (CCR TITLE 24).
9. PLATFORM GRATINGS TO HAVE FULL EDGE BANDING, INCLUDING CUT-OUTS. GRATING SERRATED TYPE.
10. ALL PLATFORM GRATING AND STAIR TREADS ARE TO BE GALVANIZED.
11. ALL LADDERS AND PLATFORMS TO CONFORM TO US OSHA AND CAL/OSHA STANDARDS (CCR TITLE 8).
12. SEE PIPING ASSEMBLY DRAWINGS FOR TERMINAL POINT DETAILS, MAXIMUM THERMAL DISPLACEMENTS AND ALLOWABLE LOADS ON PIPING.
13. ALL PAINTING TO COMPLY WITH IST STANDARD 11303-0450.

QUANTITIES SHOWN ARE FOR (1) ONE UNIT ONLY.

NOTES:

1. 2.00" [51mm] MINIMUM CLEARANCE FROM EACH SIDE OF SHEAR KEY TO EACH FACE OF PEDESTAL POCKET. CIVIL CONTRACTOR SHALL DETERMINE SHEAR KEY POCKET BASED ON SOLE PLATE DESIGN.
2. TIGHTEN ALL ANCHOR BOLTS WITH FIRST NUT UNTIL THERE IS NO CLEARANCE ABOVE WASHER. THEN LOCK FIRST NUT IN POSITION WITH SECOND NUT ON ALL SUPPORTS EXCEPT FIXED LOCATIONS B6, A1 TO A5 WHERE NUTS ARE TO BE RETIGHTENED AND THEN LOCKED WITH SECOND NUT.
3. BUFFED SIDE OF BASE PLATE TO FACE FABREEKA TEFLON FACE. REMOVE PAPER BACKING BEFORE INSTALLING.
4. BASE PLATES ARE TO BE CENTERED ON SOLE PLATES PRIOR TO BEING WELDED TO COLUMNS BY OTHERS.
5. FOUNDATIONS AND GROUTING SHALL BE SUPPLIED BY OTHERS.
6. DO NOT SCALE DRAWING, WORK WITH DIMENSIONS GIVEN.
7. PRIMARY DIMENSIONS ARE IN FEET & INCHES, SECONDARY DIMENSIONS ARE IN MILLIMETERS.
8. F/S=FARSIDE, N/S=NEARSIDE, U/S=UNDERSIDE, T.O.C.=TOP OF CONCRETE.
9. GRIND PAINT WHERE REQUIRED TO MAKE FIELD WELDS. REPAINT AFTER WELDING PER IST STANDARD #ES-010.
10. ALL STRUCTURAL STEEL WELDING AND INSPECTION SHALL BE ACCORDING TO AWS D1.1 AND APPLICABLE LOCAL CODES.
11. WELD NOT TO EXCEED SPECIFIED LEG DIMENSION LOCAL TO WASHERS TO ENSURE FREE MOVEMENT OF THE WASHER. WELD TO BE GROUND DOWN TO MEET SPECIFIED LEG DIMENSION LOCAL TO WASHERS AS REQUIRED.
12. ALL ANCHOR BOLTS (BY OTHERS) TO BE ASTM A307 OR BETTER. THE CIVIL CONTRACTOR SHALL BE RESPONSIBLE FOR DETERMINING THE FINAL ANCHOR BOLT MATERIAL AND LENGTH BASED ON THE NOMINAL BOLT DIAMETER AND FOUNDATION LOADING PROVIDED.

GENERAL NOTES:

1. ALL PRIMARY DIMENSIONS ARE IN FEET & INCHES, ALL SECONDARY DIMENSIONS ARE IN mm.
   ALL EL. SHOWN ARE PER OTSG DATUM.
2. ALL WORK SHALL BE DONE IN ACCORDANCE WITH THE REQUIREMENTS OF THE LATEST EDITION OF THE AISC AMERICAN OF STEEL CONSTRUCTION, U.S.A. OSHA REGULATIONS ALASKA OSHA REGULATIONS AND ANCE
3. ALL STEEL MATERIALS SHALL CONFORM TO THE FOLLOWING SPECIFICATIONS.
   STRUCTURAL 'S' SHAPES — G40.21M-300W/ASTM A992 GR.50
   HOLLOW STRUCTURAL SECTION (HSS) — G40.21M-350W/ASTM A500 GR.C
   ALL OTHER STRUCTURAL SHAPES AND PLATES — G40.21M-300W/ASTM A572
   BOLTS — ASTM A325
   NO FIELD WELDED CONNECTIONS AND/OR SPLICES (FULL STRENGTH) OF MEMBERS ARE ALLOWED, UNLESS AS SHOWN OR DRAWING OR APPROVED BY SIL.
4. PAINTING & GALVANIZING
   ALL STEEL OTHER THAN GRATING & SCAR TREADS SHALL BE PREPARED AS FOLLOWS.
   SURFACE PREPARATION — COMMERCIAL BLAST CLEANING SSPC-6 OR EQUAL.
   PAINTING — REFER TO SIT SPECIFICATION 09-010
   H.D. GALVANIZING — GRATING & SCAR TREADS ONLY

   DO NOT PAINT 3" AT BOTTOM OF PLATFORM COLUMNS.
5. CONNECTIONS
   ALL FIELD CONNECTIONS SHALL BE WITH 3/4 INCH HIGH STRENGTH BEARING TYPE BOLTS (HOT-DIPPED GALVANIZED) TIGHTENED AND INSPECTED IN ACCORDANCE WITH ASTM A325 UNLESS NOTED OTHERWISE.
   NON-HIGH STRENGTH BOLTS FOR STAIRS, LADDERS ETC. SHALL BE ASTM A307 GRADE A.
   ALL BOLT HOLES ARE 13/16" U.N.O.
6. WELDING: ALL WELDING SHALL BE IN ACCERANCE WITH CSA W59
   ALL WELDS SHALL BE CONTINUOUS UNLESS NOTED OTHERWISE. MINIMUM SIZE OF FILLET WELD TO BE 3/16" OR AS REQUIRED BY MATERIAL THICKNESS OR PARTS JOINTED.
   WELDING MATERIALS CSA# W-H SERIES E48018 OR E7XXX/E80XX LOW HYDROGEN TYPE.
7. GRATING: ALL PLATFORM GRATING SHALL BE SERRATED IRS SERIES TYPE W/S OR APPROVED EQUAL 1 1/4"x3/16" BEARING BARS AT 1 3/16" SPACIAL CENTERS OF GRATING TO BE SWAGED.
   ALL SCAR TREADS GRATING SHALL BE SERRATED IRS SERIES TYPE W/S OR APPROVED EQUAL WITH ABRASIVE TYPE NOSING
   CROSS BARS SHALL BE AT 4" SPACING, LONGITUDINAL BARS ONLY SHALL SPAN SUPPORTING BEAMS
   ABRASIVE NOSING SHALL BE SHOP BOLTED. GRATING HOLD DOWN CLIPS AS PER SIT STANDARD 03-018.
   ALL GRATING PANELS TO BE FULLY BANDED ALL AROUND.
   ALL GRATING TO BE H.D GALVANIZED.
8. HANDRAIL: UNLESS NOTED OTHERWISE, ALL HANDRAILS SHALL BE 1.05"O.D. x 0.15" WALL ASCO SR. C. SHOP WELDED MODULAR UNITS COMBINED WITH RAILS AND BOLTS AND FIELD BOLTED TO STRUCTURAL MEMBERS.
   MAXIMUM SPACING OF POSTS IS 4'-6" O.C.
   TOP OF HAND RAIL FOR PLATFORM TO BE 42" AND CENTERLINE OF MIDRAIL TO BE 24" ABOVE PLATFORM ELEVATION.
   FOR STAIRS TOP OF TOP RAIL TO BE 36" AND CENTERLINE OF MIDRAIL TO BE 18" ABOVE THE SURFACE OF THE TREAD, IN LINE WITH THE FACE OF THE RISER AT THE FORWARD EDGE OF THE TREAD.
9. TOE PLATES: ALL TOE PLATES SHALL BE 4"x1/4" AND EXTEND A MIN. OF 4 1/4" ABOVE GRATING ELEVATION AND BE SHOP WELDED TO HANDRAIL POSTS U.N.O/NOTED OTHERWISE.
10. * DENOTES EXISTING MEMBER OF OTSG.
11. DESIGN LOADS ARE PER SIT SPECIFICATIONS AS FOLLOWS:
    PLATFORM AND WALKWAYS — 100 PSF LIVE LOAD + 20 PSF SERVICE LOAD
    STAIRS — 100 PSF OR 1000 LB CONCENTRATED LIVE LOAD
    STRUCTURAL FRAMEWORK — PIPING LOADS OF 5 KIPS ON MAJOR BEAMS
12. ALL STAIRS AND LADDERS SHALL BE SHOP ASSEMBLED WITH TREADS AND RUNGS INSTALLED. HANDRAILS SHALL BE SHOP INSTALLED ON STRUCTURAL STEEL TO THE FULLEST EXTENT POSSIBLE.
13. NOTE TO ERECTOR:
    FIELD CUT OPENINGS IN GRATING FOR PIPES & OTHER PENETRATIONS OR OTHER OBSTRUCTIONS AS REQ'D. TO SUIT ALL SITE CONDITIONS. FIELD CUT, FIELD FIT & FIELD WELD TOE PLATES & GRATING AS REQ'D. (TYP. ALL GRATING AREAS AT ALL PLATFORM LEVELS). OPENINGS IN GRATING TO BE BANDED.
14. H.D. DENOTES HOOK GRADE BELOW
15. ⟷ DENOTES DIRECTION OF GRATING BEARING BARS
16. U.N.O. = UNLESS NOTED OTHERWISE
17. ERECTOR TO SUPPLY AND INSTALL PIPE PENETRATION TOE PLATES AS REQUIRED.
18. PLATFORM FABRICATION TO MEET SIT SPECIFICATION 03-017.
19. T.O.S. = TOP OF STEEL.
20. T.O.G. = TOP OF PLATFORM GRATING

COLUMN LINE 1
(LOCATED ON INLET PLENUM ONLY)
(MODULES, EXHAUST HOODS, EXHAUST STACK NOT SHOWN FOR CLARITY)
SCALE: 1:32

RIGHT SIDE ELEVATION
SOME COMPONENTS REMOVED FOR CLARITY

NOTES:

1. ALL PRIMARY DIMENSIONS & ELEVATIONS ARE IN FEET & INCHES. ALL SECONDARY [IN BRACKETS] DIMENSIONS ARE IN MILLIMETRES.
2. TACK WELD ALL INTERNAL THREADED CONNECTIONS TO PREVENT NUT FROM TURNING OFF AFTER ASSEMBLY UNLESS OTHERWISE NOTED. (EXCLUDE ALL DOUBLE NUTS)
3. JOINT ASSEMBLY KIT ITEM NO. 09 TO BE PLACED ON LOWER AIC/CO MODULE SUPPORT BEAMS PRIOR TO PLACEMENT OF SCR MODULE.
4. JOINT ASSEMBLY KIT ITEM NO. 10 TO BE PLACED ON SCR MODULE SUPPORT BEAMS PRIOR TO PLACEMENT OF UPPER MODULE.
5. JOINT ASSEMBLY KITS ITEM NO. 11 TO BE PLACED ON OTSG UPPER MODULE TOP SUPPORT BEAMS PRIOR TO HOOD INSTALLATION.
6. JOINT ASSEMBLY KITS ITEM NO. 12 & 13 TO BE PLACED ON LOWER EXHAUST HOOD BAFFLES PRIOR TO PLACEMENT OF UPPER EXHAUST HOOD.
7. JOINT ASSEMBLY KITS ITEM NO. 05, 06, 07 & 08 TO BE PLACED IN INLET PLENUM PRIOR TO PLACEMENT OF BURNER DUCT #1.
8. JOINT ASSEMBLY KITS ITEM NO. 03 & 04 AND EXPANSION JOINT LAP PLATES TO BE PLACED IN INLET TRANSITION DUCT PRIOR TO PLACEMENT OF EXPANSION JOINT.
9. HEX BOLTS (ITEMS #28 & 29) TO BE INSTALLED WITH HEADS ON EXTERIOR OF ERECTION PLATES. BOLTS SHALL BE INSTALLED IN ALL HOLES OF THE CONNECTION AND BROUGHT TO A SNUG-TIGHT CONDITION. SNUG-TIGHT IS DEFINED AS THE TIGHTNESS THAT EXISTS WHEN THE PLIES OF THE JOINT ARE IN FIRM CONTACT. THIS MAY BE ATTAINED BY A FEW IMPACTS OF AN IMPACT WRENCH OR THE FULL EFFORT OF A WORKER USING AN ORDINARY SPUD WRENCH. SNUG TIGHTENING SHALL PROGRESS SYSTEMATICALLY FROM THE MOST RIGID PART OF THE CONNECTION TO THE FREE EDGES AND THEN THE BOLTS OF THE CONNECTION SHALL BE RE-TIGHTENED IN A SIMILAR SYSTEMATIC MANNER AS NECESSARY UNTIL ALL BOLTS ARE SIMULTANEOUSLY SNUG-TIGHT AND THE CONNECTION IS FULLY COMPACTED. FOLLOWING THIS INITIAL OPERATION, ALL BOLTS IN THE CONNECTION SHALL BE TIGHTENED FURTHER BY THE APPLICABLE AMOUNT OF ROTATION (1/3 TURN). DURING THE TIGHTENING OPERATION THERE SHALL BE NO ROTATION OF THE PART NOT TURNED BY THE WRENCH. TIGHTENING SHALL PROGRESS SYSTEMATICALLY FROM THE MOST RIGID PART OF THE JOINT TO ITS FREE EDGES.
10. REMOVE ALL YELLOW PAINTED SHIPPING COMPONENTS PRIOR TO FINAL INSTALLATION. SEE ERECTION INSTRUCTIONS. FOR DETAILS (SHEETS 2 & 3).
11. INSULATION TO BE COMPRESSED TO 5.50" THK.
12. ABBREVIATION JAK = JOINT ASSEMBLY KIT.
13. ALL TUBE WELDS ARE FULL PENETRATION BUTT WELDS IN ACCORDANCE WITH ASME SECTIONS I & IX.
14. MODULE LIFTING AS PER IST ENGINEERING SPEC. ES-024.
15. INSTALL AIG LANCE ASSEMBLIES (ITEM #17) BEFORE ERECTING SCR MODULE, AS A MIN., PLACE THE TWO AIG LANCE SECTIONS IN THE LOWER MODULE FOR LATER INSTALLATION.

QUANTITIES SHOWN ARE FOR (1) ONE UNIT ONLY.

BILL OF MATERIAL AND PARTS LIST

NOTES:

1. INSTALLATION SEQUENCE:
   – REMOVE APPLICABLE CHANNELS AND WASHERS.
   – INSTALL INSULATION AS REQUIRED.
   – PLACE CORNER LINERS (ITEMS #07 & 08) IN CORNERS AT REAR.
   – PLACE LINER PLATES AT REAR END (ITEMS #09).
   – PLACE CORNER LINERS (ITEMS #05 & 06) IN CORNERS AT FRONT.
   – PLACE LINER PLATES AT FRONT END (ITEM #09).
   – PLACE LINER PLATES (ITEMS #01 THRU 04, #09 THRU 14) AS SHOWN AND RESECURE CHANNELS.
   – PLACE HEADER SHIELD (ITEM #15) BELOW HEADER AS SHOWN.
2. UNLESS OTHERWISE SPECIFIED, NUTS ARE TO BE TIGHTENED, SO ALL PANELS OF THE JOINT ARE IN FIRM CONTACT, USING AN ORDINARY WRENCH THEN BACKED OFF 1/4 TURN. (WASHERS MUST BE ABLE TO TURN WHEN HIT ON THE CORNER WITH A HAMMER, USING A NORMAL HAMMER SWING, BUT NOT TURN FREELY). TACK WELD NUT TO BOLT.

NOTE:

83 CU. FT. OF 10# INSULATION REQUIRED FOR UPPER INLET PLENUM TO LOWER MODULET JOINT ASSEMBLY KIT. REFER TO ERECTION DIAGRAM #261027.

NOTES:
1. INSTALLATION SEQUENCE:
   - REMOVE APPLICABLE CHANNELS AND WASHERS.
   - INSTALL INSULATION AS REQUIRED.
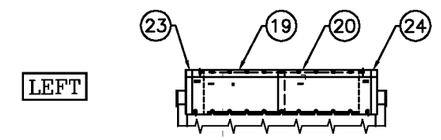
   - PLACE CORNER LINERS (ITEMS #21 & 22) IN CORNERS AT REAR.
   - PLACE LINER PLATES AT REAR ENDS. (ITEMS #19 & 20)
   - PLACE CORNER LINERS (ITEMS #23 & 24) IN CORNERS AT FRONT.
   - PLACE COVER PLATES (ITEM #25 & 28) AROUND TOP SUPPORT RESTRAINT PIPE.
   - PLACE LINER PLATES AT FRONT (ITEM #17 & 18).
   - PLACE COVER PLATES (ITEM #26) AROUND TOP SUPPORT BEAMS.
   - PLACE COVER PLATES (ITEM #27) AROUND TIE RODS.
   - PLACE LINER PLATES (ITEMS #01 THRU 16, 29, 30) AS SHOWN AND RESECURE CHANNELS.
2. UNLESS OTHERWISE SPECIFIED, NUTS ARE TO BE TIGHTENED, SO ALL PANELS OF THE JOINT ARE IN FIRM CONTACT, USING AN ORDINARY WRENCH THEN BACKED OFF 1/4 TURN. (WASHERS MUST BE ABLE TO TURN WHEN HIT ON THE CORNER WITH A HAMMER, USING A NORMAL HAMMER SWING, BUT NOT TURN FREELY). TACK WELD NUT TO BOLT.
3. MATERIAL DESIGNATED ON AN MTR AS A240 S40900 IS ACCEPTABLE PROVIDED THE CHEMISTRY MATCHES THAT OF A240 S40930 INCLUDING THE TITANIUM + COLUMBIUM (NIOBIUM) REQUIREMENT.



NOTE:
121 CU. FT. OF 6# INSULATION REQUIRED FOR UPPER MODULE TO LOWER HOOD JOINT ASSEMBLY KIT. REFER TO ERECTION DIAGRAM #261027.

** 0.5 CU. FT. OF 5# INSULATION REQUIRED FOR AIG PIPING ARRANGEMENT. REFER TO ERECTION DIAGRAM #261027 ITEM 01 FOR SUPPLY.

REFERENCE DRAWINGS

ERECTION DIAGRAM.....261027
PEERLESS MFG. CO. DRAWING.....D202-00055-02

NOTES

1. FILL AIG PIPE SUPPORT SLEEVES LOOSELY WITH INSULATION PRIOR TO INSTALLING AIG PIPING. (DO NOT OVERFILL)
2. UNLESS OTHERWISE SPECIFIED, NUTS ARE TO BE TIGHTENED USING THE FULL EFFORT OF A MAN USING AN ORDINARY WRENCH THEN BACKED OFF 1/4 TURN. (WASHERS MUST BE ABLE TO TURN WHEN HIT ON THE CORNER WITH A HAMMER USING A NORMAL HAMMER SWING BUT NOT TURN FREELY). DEFORM THREADS.
3. PIPING ATTACHMENT WELDS AS PER ASME SECTION IX.
4. REMOVE EXISTING NUTS & WASHERS AT SIDEWALL LOCATIONS, INSERT ITEMS 09, 10, 11 IN ORDER TO UNDERLAP THE EXISTING DIVERTERS RE-ATTACH THE HARDWARE AND FOLLOW NOTE 2 FOR TIGHTENING
5. ITEMS 09, 10, 11 TO BE INSTALLED PRIOR TO AIG PIPING INSERTION

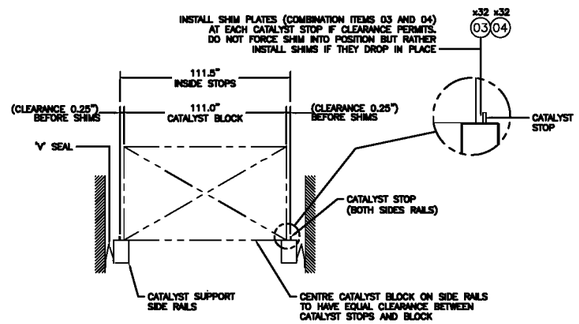
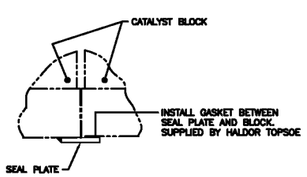
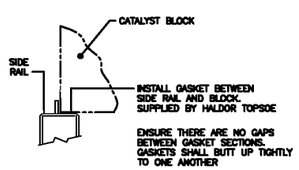
CATALYST CARRIER



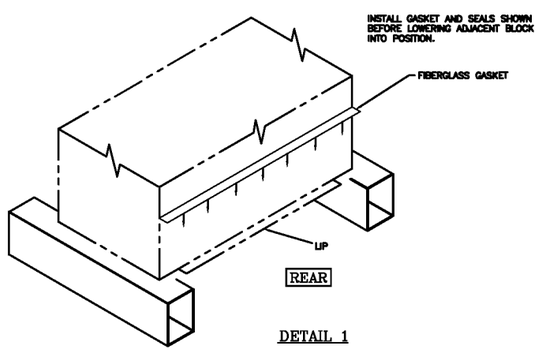
CATALYST BLOCK LOADING SEQUENCE



PREPARATION SEQUENCE



CATALYST BLOCK POSITIONING AND GASKET INSTALLATION



GAP BETWEEN CATALYST BLOCK AND SIDE RAIL STOPS AND SHIM INSTALLATION

VIEW A–A

VIEW B–B

DETAIL 1

CATALYST LOADING PROCEDURE

PREPARATION

1. REMOVE THE GAS SEALING PLATES BETWEEN THE SCR FRAME AND THE REAR WALL INTERNAL LINER.
2. REMOVE THE CATALYST LOADING DOORS LOCATED AT THE REAR END OF THE OTSG.
3. REMOVE THE SCR FRAME REAR CROSS CHANNEL ASSEMBLY.
4. INSTALL THE CART RAILS ACCORDING TO DRAWING 261736 WHICH WILL BE USED TO TRANSPORT THE CATALYST INTO THE UNIT.
5. POSITION THE CATALYST CART ONTO THE CART RAILS.
6. ADD ANY NECESSARY WOOD FOOTING UNDERNEATH THE SCR FRAME TO ALLOW PERSONNEL TO WALK DURING INSTALLATION.

CATALYST INSTALLATION SEQUENCE

1. LIFT THE CATALYST BLOCKS USING THE SUPPLIED LIFTING DEVICES AND PLACE ON THE CARRIER CART. TAKE SPECIAL CARE TO PROPERLY POSITION THE BLOCK ON THE CART AS IT WILL BE DIFFICULT TO MAKE ADJUSTMENTS INSIDE THE UNIT. REMOVE THE LIFTING DEVICE. ENSURE THE BLOCK SEALING LIP FACES TOWARDS THE REAR OF THE UNIT.
2. USING THE HYDRAULIC HANDLE ON THE CART, LIFT THE CART PLATFORM SO THAT THE CATALYST WILL CLEAR THE CATALYST SUPPORT SIDE RAILS.
3. PUSH THE CART/CATALYST BLOCK INTO THE UNIT AND POSITION ON THE FRAME AS INDICATED IN THIS DRAWING. LOWER THE CATALYST ONTO THE FRAME BY RELEASING THE HYDRAULIC PUMP. ENSURE THE SPACE DISTANCE BETWEEN BLOCKS IS MAINTAINED AS INDICATED IN THIS DRAWING.
4. PULL BACK THE CATALYST CARRIER TO THE OUTSIDE PLATFORM TO REPEAT THE PROCESS FOR THE OTHER BLOCKS. REPEAT PROCEDURES 1 TO 4 FOR THE REMAINING BLOCKS.
5. ONCE ALL THE CATALYST HAS BEEN LOADED, REMOVE THE TEMPORARY FOOT PLATES AND REMOVE ALL CART RAILS. REINSTALL THE SCR FRAME END CHANNEL ASSEMBLY, DOORS AND INTERNAL SEAL PLATES. A SPECIAL SCR FRAME CLOSURE ASSEMBLY WILL NEED TO BE INSTALLED. SEE DRAWING 261737.
6. CHECK FOR GAS LEAKAGE AT THE DOOR DURING OPERATION, AND TIGHTEN THE DOOR BOLTS TO REMOVE ANY LEAKAGE. IT MAY BE REQUIRED TO PERFORM A SEAL WELD AROUND THE PERIMETER OF THE DOOR SECTIONS IF A LEAK CANNOT BE STOPPED.

NOTES

1. EACH CATALYST BLOCK (EXCEPT ITEM 02) HAS A SEAL PLATE AT THE BOTTOM EDGE OF THE CATALYST BLOCK FRAME (ONE SIDE ONLY).
2. BLOCKS ARE TO BE INSTALLED WITH THE LIPS FACING THE REAR END (LOADING DOOR OPENING)
3. ENSURE THE BLOCKS ARE INSTALLED IN THE SEQUENCE SHOWN IN THIS DRAWING.

DETAIL 1
GASKET INSTALLATION
SCALE 1 : 8
TYP.

CATALYST FIELD INSTALLATION NOTES:

1. BEGINNING AT THE REAR–LEFT SIDE, APPLY GASKET TO SHORT MEMBERS OF THE FRAME GRID, SLIDING THE CENTER–SLOTTED MATERIAL OVER THE WELD STUDS. AFTER TWO SHORT GRID MEMBERS HAVE BEEN COVERED, CUT AND APPLY GASKET TO ADJOINING CROSS MEMBERS, MAKING SURE THAT GASKETS DO NOT OVERLAP AND NO GAPS ARE LEFT BETWEEN THE GASKETS.
2. AFTER GASKET IS INSTALLED, SLIDE ONE SPACER ITEM 6 OVER EACH STUD.
3. INSTALL CATALYST MODULE BETWEEN SPACERS AND AGAINST GASKET.
4. AFTER TWO ADJOINING CATALYST MODULES ARE INSTALLED, ASSEMBLE ONE CATALYST HOLD DOWN CLIP OVER STUD AND SECURE WITH TWO HEX NUT.
5. FIRST NUT SHOULD BE TORQUED TO 10 ft/lbs FOR PERIMETER STUDS AND 20 ft/lbs FOR INTERIOR STUDS. LOCK WITH SECOND NUT.
8. CATALYST INSTALLATION SHOULD PROCEED PER THE NUMBERED SEQUENCE ABOVE. TO AVOID DAMAGING OR MARRING THE CATALYST FACE, DO NOT STAND ON OR SIT ITEMS ON CATALYST FACE.
7. REFER TO **EMERACHEM** OPERATION AND MAINTENANCE MANUAL FOR CATALYST DETAILS.
8. ITEMS 1 & 2 SUPPLIED BY **EMERACHEM**.
9. REFER TO ABOVE PLAN VIEW FOR TYPICAL TORQUING SEQUENCE. (REDUCED AS SHOWN)
10. IN THE EVENT CATALYST MODULES CANNOT FIT BETWEEN SPACERS (ITEM 6), ERECTOR MAY LEAVE OUT A MINIMUM QUANTITY OF SPACERS (ITEM 6) AND STILL ENSURE A RELATIVELY TIGHT FIT OF MODULES.

NOTE: ITEMS 3 THRU 10 QUANTITIES INCLUDE 10% EXTRA

Performance Guarantees

6.1 Introduction

This Guarantee contains the following:

- Net Plant Performance Guarantee for Combined-Cycle Operation
- Emissions Guarantees
- Noise Guarantees
- Operability Guarantees
- Revision Date: 10 September 2013

6.2 Performance Guarantee for Combined-Cycle Operation (1x160LM)

Operating Point	Fuel	Net Plant Output (kW)	Net Plant Heat Rate (BTU/kWh, HHV)	SCR Ammonia Consumption (lb/hr)	Gas Turbine Demineralized Water Consumption (lb/hr)
Case 1: Evaluation point 1: 67 MW, with Base Loaded Gas Turbine	Natural Gas	67,050	7,904	150	34,756
Case 2: Evaluation Point 2: 33 MW	Natural Gas	--	8,692	--	--

$$\textbf{Net Plant Heat Rate} = \frac{\textbf{Heat Consumption (BTU/h, HHV)}}{\textbf{Net Plant Electric Power Output (kW)}}$$

CONFIDENTIAL INFORMATION

6.2.1 Basis for Combined-Cycle Performance Guarantee

The Combined-Cycle Plant performance guarantees listed above are based on the scope of equipment supply as defined in this specification and the Division of Responsibility, and are stated for the following operating conditions and cycle parameters.

A. Equipment is in a new and clean condition with less than 250 hours of operation. For hours exceeding this value, degradation corrections will be per degradation curve supplied by Contractor. The indicated fired hour exceeds what is specified in Contractor typical test procedure. Hence Contractor reserves the right to establish the cleanliness of the engine and perform corrective action if necessary before testing.

B. Gas turbine operating at stable, base load, steady-state conditions. Base load is defined as the gas turbine operating at maximum output of such unit when the unit is limited by turbine control limiters. The turbine control limiters are as follows:

   T48 = LPT inlet temperature

   T3 = HPC discharge temperature

   PS3 = HPC discharge pressure

   XN25R = HP rotor corrected speed

   Part load heat rate guarantees are based on the as-tested base load power levels.

C. Ambient air dry bulb temperature = 75°F.
   Ambient air relative humidity = 50 %

D. Barometric pressure = 14.3 psia.

E. Natural gas fuel is in compliance with General Electric Gas Fuel Specification MID-TD-000-1.

F. Natural gas composition:

Component	**Molar %**
Methane, CH_4	94.4
Ethane, C_2H_6	2.17
Propane, C_3H_8	0.13
Butane, C_4H_{10}	0.13
Pentane, C_5H_{12}	0.03
Hexane, C_6H_{14}	0.02
Carbon Dioxide, CO_2	1.7
Nitrogen, N_2	1.42
Max Total Sulfur	0.5 grains per 100 scf

Source of gas composition: REQUEST FOR PROPOSAL FOR DESIGN AND FURNISHING OF POWER ISLAND EQUIPMENT FOR THE GLENARM REPOWERING PROJECT, Section 480020, Page 6.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

G. Natural gas lower heating value (LHV) = 20,030 BTU/lb.

H. Natural gas ratio of HHV/LHV = 1.1086

I. City natural gas supplied to the fuel gas terminal point, located at the site boundary, at a pressure of 150 psig and a temperature of 77°F. If pressure reduction is necessary after the terminal point, then the fuel temperature will be measured after the pressure reduction. Any energy consumption associated with fuel preheating, required to maintain a minimum superheat in the fuel, is not included in this guarantee.

J. Natural gas performance is based on operation with a SAC combustion system with gas turbine diluent injection for NOx control. Nominal diluent injection rate per gas turbine is displayed on the guarantee heat balances. Performance guarantees will be subject to correction if it is necessary to increase or decrease diluent injection rate.

K. SPRINT system status = On for case 1, Off for case 2.

L. Gas turbine demineralized water consumption is based only upon diluent injection for NOx control and SPRINT system and does not include non-standard, intermittent, maintenance, testing, water wash, and other unusual operations.

M. Inlet air chiller status = On for case 1 to achieve net plant MW target, Off for case 2.

N. Inlet air heating system status = Off for case 1, On for case 2 to achieve net plant MW target.

O. Fuel gas compressor status = On.

P. Once through steam generator:

High pressure blowdown = 0%.

Inlet temperature to OTSG is uncontrolled.

Q. Ammonia consumption is based only upon SCR within the OTSG and testing shall be conducted on a one-hour average basis.

R. STG inlet valve VWO (valves wide open) will be no more than 95% of mechanical travel capability.

S. The equipment closed loop cooling water temperature is 10 degrees F higher than the condenser cooling water temperature

T. Generator terminal power factor = 0.85, lagging.

U. Generator terminal frequency = 60 Hz.

V. Electrical system losses beyond the high voltage side of the step-up transformer, other than those of the excitation system are not included.

W. Combined-Cycle performance is based on thermal cycle design and piping losses as defined in Contractor heat balances listed below. City allowance for piping and other equipment losses is provided between heat balance state points S1 to S2. The performance test procedure will adjust for losses, which exceed these values.

Case 1	HB # CCA-17604-NG, Revision 0	February 12, 2013
Case 2	HB # CCA-17605-NG, Revision 0	February 12, 2013

X. Tests to determine guaranteed performance shall be conducted in accordance with the mutually agreed upon test procedure.

6.3 Emission Guarantees

6.3.1 Combined-Cycle Emission Guarantees

Pollutant	Compressor Inlet Temperature Range	Gas Turbine Load	Gas Fuel	Emissions Value
NOx Emissions, ppmvd, Ref. 15 % O_2	20°F to 140°F	20 to 100 % of Base Load		2
CO Emissions, ppmvd, Ref. 15 % O_2	20°F to 100°F	20 to 100 % of Base Load		2
	100°F to 140°F	40 to 100 % of Base Load		2
VOC Emissions, ppmvd, Ref. 15 % O_2 as CH4	20°F to 140°F	20 to 100 % of Base Load		2
NH3 Emissions, ppmvd, Ref. 15 % O_2	20°F to 140°F	20 to 100 % of Base Load		5
PM-10, lb/hr	20°F to 140°F	Base Load		4

6.3.2 Emissions Guarantee Conditions

These emissions are based on the following conditions:

Emissions levels are based on control equipment as defined in the General Plant Description of this document.

General

A. Natural gas fuel shall be in compliance with General Electric Gas Fuel Specification MID-TD-000-1 latest revision.
B. Gas turbine diluent injection for NOx control must be operating.
C. Testing and system adjustments are conducted in accordance with GEK-28172,

Standard Field Testing Procedure for Emissions Compliance.

D. Gaseous emissions are typically on a one-hour average basis and particulates are on a three-hour average basis. Gas turbine operating at stable steady-state conditions.

E. Compressor inlet temperature range of 20°F to 140°F.

F. Contractor reserves the right to determine the emission rates on a net basis wherein emissions at the gas turbine inlet are subtracted from the measured exhaust emission rate if required to demonstrate guarantee rate.

G. Mass flow based emissions are reported on a per stack basis.

H. Emissions from sources other than the Gas Turbine and OTSG duct burner are not included.

I. Sulfur emissions are a function of the sulfur present in the incoming air and fuel flows. Since the gas turbine and OTSG have no influence on the sulfur, sulfur based emissions are not guaranteed.

Particulate Matter (PM)

A. PM-10 guarantee is based on a natural gas sulfur content of less than or equal to 0.5 grains/100 SCF.

B. PM-10 emissions include filterable and condensable emissions. The following additional criteria and precautions are required at this particulate guarantee level:

C. Contractor/City must mutually agree on the use of a PM testing firm that meets the specified qualification criteria.

D. PM Testing firm and laboratory must meet qualification criteria specified in GEK-28172.

E. Multiple re-testing (at City's expense) must be allowed, if required.

F. Allowance for background ambient particulate levels must be included.

CONFIDENTIAL INFORMATION

6.4 Noise Guarantees

6.4.1 Near Field Combined Cycle Noise Guarantees

Fuel	**Gas Turbine Load**	**SPL,** dBA
Natural Gas	Base	85 Average

The average sound pressure levels (SPL) (re: 20 micropascals) from the indoor and/or outdoor Contractor equipment defined in the scope of supply, shall not exceed the value stated above, when measured 1 m (3 ft) in the horizontal plane and at an elevation of 1.5 m (5 ft) above the gas turbine operating level, steam turbine operating level (if different), and generator operating level (if different) identified on the General Arrangement drawings. Walkways and/or platforms that are not easily accessible by stairs are excluded from the above guarantee.

Areas inside the steam turbine enclosure that are not considered accessible operator levels (i.e. ground level and mezzanine level) are exempt from the above guarantee.

Near field guarantees apply to areas along a Site specific Source Envelope(s), determined by a line established 1 meter (3 ft.) from the outermost surface of the equipment defined in the proposal scope of supply (including noise abatement equipment). Depending on the site arrangement and relationship of equipment locations, multiple source envelopes may be designated. (See sample figure 4.1 – 1 below)

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

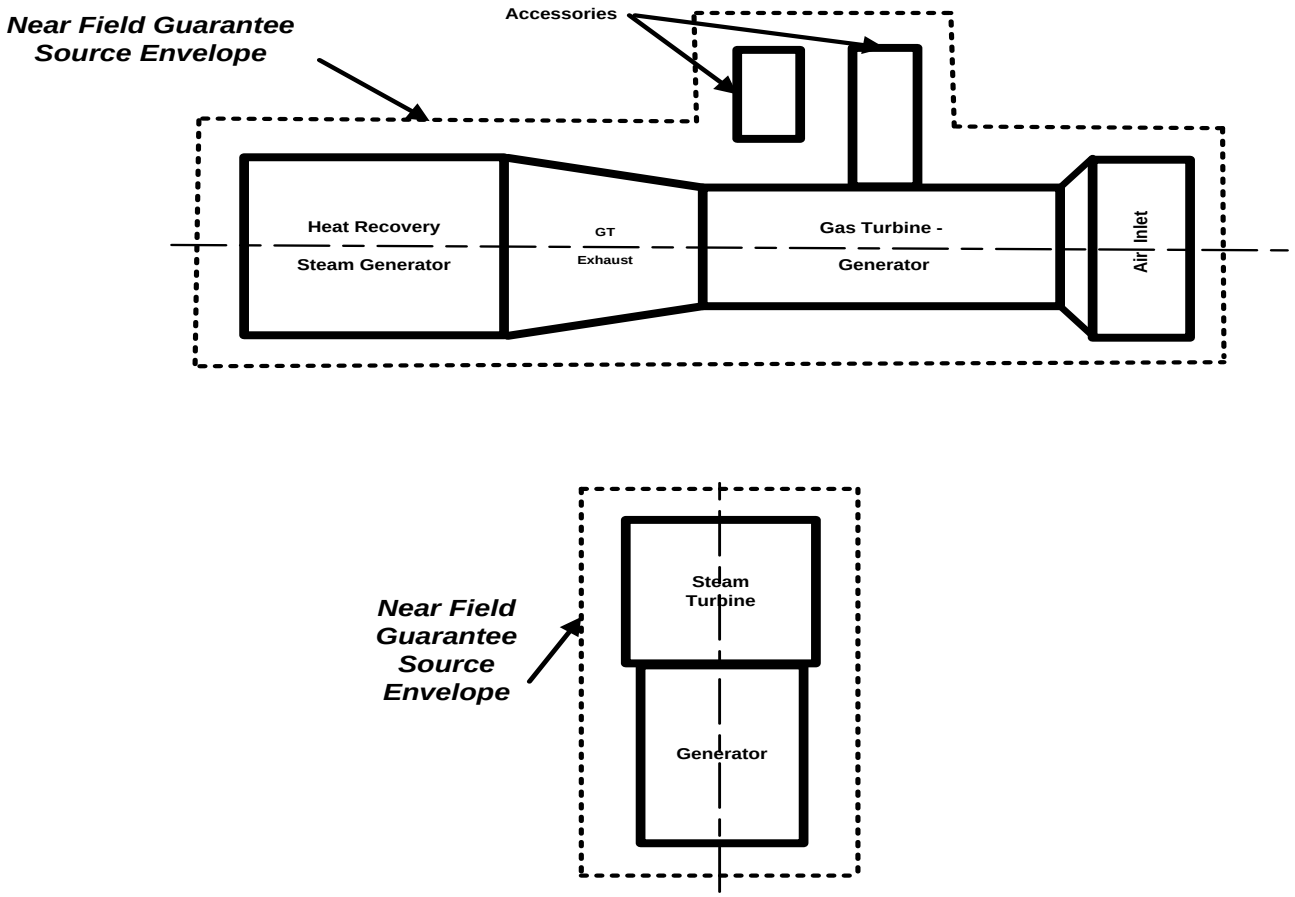

FIGURE 3.1-1- Multi-Shaft

For reference only

6.4.1.1 Basis for Near Field Noise Guarantees

A. The Contractor supplied equipment will be deemed compliant with the acoustic guarantee if the arithmetic average result from measurements taken as described in the conformed specifications, Section 4.2, after background noise corrections have been applied do not exceed the noise limit specified above. For cases where a noise abatement enclosure or wall(s) is included to meet the guaranteed sound pressure level in the near field, all measurements for compliance verification will be taken outside of the noise abatement enclosure or wall(s) in the near field.

B. Testing will be conducted in accordance with a project specific test plan agreed to by both the City and Contractor.

C. Equipment is operated in a new and clean condition when measurements are taken. All access compartments, doors, panels and other temporary openings are fully closed, all silencing hardware is fully installed and all systems designed to be airtight are sealed. Inspection of installation quality will be conducted prior to compliance testing. Identified defects must be corrected prior to compliance testing.

D. Corrections for background noise are to be made according to the conformed specifications, Section 4.7. Background noise is defined in the conformed specifications.

E. Measurements shall be taken as described in the conformed specifications, Section 4.2.

F. Responsibility for measurement and development of the project specific test plan will be stated in the contract.

CONFIDENTIAL INFORMATION

6.4.2 Far Field Combined Cycle Noise Guarantees

6.4.2.1 Contractor Submittal Forms

The southwest corner of the Glenarm Building has been selected as a common reference point within the plant from which the distance to each of the fourteen receptors shown on Exhibit "A" has been determined. The specific site conditions that exist at the fourteen receptor locations shall be considered a valid, inclusive part of the guaranteed noise levels and measurement results. The effects from terrain features, building structure attenuations and reflections, ground absorption and reflections, and other anomalies specific to the existing site conditions at each test site shall be considered a valid part of the test measurements and the Contractor's noise guarantee. Each of these effects are to be included in the guaranteed noise levels and measurement results. No additional corrections shall be permitted to normalize the results to a standardized "flat-world" test site, other than those listed below.

The other site conditions (not listed above) may have a significant effect on the measurement results and shall be corrected with appropriate post-measurement adjustments or avoided during the measurements. These site conditions include the following:

1. existing background noise from the power plant and/or community;
2. large reflective surfaces other than the ground surface that are closer than 50 feet to the measurement microphone at locations C01, C03, C04, C09, C11, C12, and C14;
3. large reflective surfaces other than the ground surface that are closer than 25 feet to the measurement microphone at locations C02, C05, C06, C07, C08, C10, and C13; and
4. atmospheric conditions such as temperature, wind, humidity, inversions layers and temperature lapses.

The above three site conditions shall not be included in the Contractor's guarantee or the measurement results if the effects are considered significant.

All test measurement results shall be rounded up or down to the nearest whole decibel value after all corrections are applied according to the procedures listed in the Conformed Specification. The resulting decibel level after rounding shall be used to determine compliance with the guaranteed noise levels at near-field (in plant) and far-field (community) locations. The guaranteed noise levels are shown on the following Submittal Forms:

NOISE LEVEL GUARANTEES FOR GAS VENTING IMPULSE NOISE DURING START-UP AND SHUTDOWN AT COMMUNITY MEASUREMENT LOCATIONS

Contractor's Equipment Noise Performance Guarantee		
★**Guaranteed Maximum Impulse SPL (LIMP) of Vent Noise at C08:**	45	dBA, re: 20 micropascals
★**Guaranteed Maximum Impulse SPL (LIMP) of Vent Noise at State Street:**	45	dBA, re: 20 micropascals
Exceptions:		

★ **All valid start-up and shutdown vent noise measurements shall be measured individually as a single noise event at two receptor locations: C08 and the center of State Street due south of the Glenarm Building Reference Point. The vent noise shall be measured on a Sound Level Meter using the Impulse response setting and the A-Weighting. A minimum of (2) start-up gas venting impulse noises and (2) shutdown gas venting impulse noises shall be measured. The highest of these shall be reported as the final result for the vent noise performance.**

CONFIDENTIAL INFORMATION

6.4.2.2 Basis for Far Field Noise Guarantees

A. Testing will be conducted in accordance with a project specific test plan agreed to by both the City and Contractor.
B. Equipment is operated in a new and clean condition and all access compartments, doors, panels and other temporary openings are fully closed when measurements are taken. Inspection of installation quality will be conducted prior to compliance testing. Identified defects must be corrected prior to compliance testing.
C. Corrections for background noise are to be made according to the conformed specifications, Section 4.8. Background noise is defined in the conformed specifications.
D. The above far field noise guarantees are valid with the current existing obstacles (buildings, tanks, barriers, etc.) between the power plant and the receivers.
E. Noises of an interim nature such as steam safety relief valves are not included in the above guarantee.
F. Measurements shall be taken as described in the conformed specifications, Sections 4.3, 4.4, and 4.5.
G. Responsibility for measurement and development of the project specific test plan will be stated in the contract.

6.5 Operability Guarantees

6.5.1 Gas Turbine Startup Time Guarantee

Start time is time between initial start command and achievement of base load.

	Minutes
Starting time from GT ready to start to GT Full Speed Full Load (FSFL)	Not to exceed 10, based on the following notes

A. The gas turbine is considered to start up with no allowance for exhaust purge time. If purge credit is lost, a full exhaust purge cycle is required and will add to the total starting time accordingly.
B. At initial start command, the GTG unit shall be ready to start, on turning mode, site utilities available.
C. Generator lube oil pump must be running.
D. Automatic operation of SPRINT is enabled.
E. Full speed full load is defined as the gas turbine operating at maximum output of such unit when the unit is limited by turbine control limiters. It requires a stable grid, defined as +/- 0.12 Hz and +/-5% voltage. The turbine control limiters are as follows:
   T48 = LPT inlet temperature
   T3 = HPC discharge temperature
   PS3 = HPC discharge pressure
   XN25R = HP rotor corrected speed
   Fuel consumption regulator
F. Synchronization time is excluded in the current guarantee figure.
G. Unit must be out of icing condition according to PP-17). This warm-up period is to be excluded from the 10-minute start.
H. Emissions guarantees are not in effect.
I. Problems caused by non-Contractor equipment will negate the testing.

6.5.2 Combined Cycle Operability Guarantees

6.5.2.1 Startup and Shutdown Emissions Guarantees

Type of Event	NOx as NO2, lbs./event	CO, lbs./event
CC Cold Start	28.68	23.61

Shutdown	11.7	9.9

Basis for Startup and Shutdown Emission Guarantees

A. Guaranteed startup emissions values are for a period not to exceed 120 minutes, as described in the Contract, Article 9.

B. Guaranteed shutdown emissions values are for a period not to exceed 60 minutes, as described in the Contract, Article 9.

C. Natural gas fuel shall be in compliance with General Electric Gas Fuel Specification MID-TD-000-1, September 2009

D. Guaranteed mass totals (lbs,) are as measured at the stack.

E. The measurement system for startup and shutdown emissions will be the CONTRACTOR supplied CEMS following calibration. Continuous emissions concentration (ppm) signal from the plant stack CEMS will be converted to emissions mass flow (lb./hr.) using gas turbine control exhaust flow signal and integrated over time from gas turbine firing to gas turbine base load. To obtain mass total (lb.) for the event.

F. Emissions testing will be performed simultaneous with startup time tests. Following plant commissioning as deemed necessary by Contractor, a single test of, startup, and shutdown each will be performed. CEMS data input to the CO and NOx mass flow calculation will be collected and a total lbs. value generated for the startup event. Multiple such trial starts may be performed. A single passed test for each event constitutes meeting the guarantee. In keeping with these requirements, a detailed test procedure will be mutually agreed upon.

G. The SCR, CO catalyst, NH3 injection system and controls have been installed and deemed ready for emissions testing by Contractor. CEMS has been confirmed by Contractor to be functioning per Contractor specification.

H. Prior to testing, the unit will have successfully achieved base load by completing a startup sequence and demonstrated stable operation with the grid.

I. All equipment and controls must be operating normally and all controls are in the automatic mode of operation.

J. Ambient temperature is within the limits specified.

K. All conditions stated within the 10 minute Gas Turbine Startup Guarantee shall apply to the 120 Minute Startup Guarantee.

6.5.2.2 Startup and Shutdown Heat Consumption Guarantees

Type of Event	Heat Consumption (BTU, LHV/HHV)
Startup: 120 minute	No more than 922.02 MMBtu (LHV) and 1023.12 MMBtu (HHV),

period	
Shutdown: 60 minute period	No more than 431.41 MMBtu (LHV) and 478.7 MMBtu (HHV).

Basis for Startup Heat Consumption Guarantees

A. All conditions stated in the Basis for Startup Time Guarantees must be met
B. Guaranteed value is the sum of the below heat consumptions:
   - Heat Consumption is for the gas turbine only
   - Heat Consumption for any other auxiliary equipment such as heaters are not included.

Basis for Shutdown Heat Consumption Guarantees

A. Shutdown shall begin at the initiation of the shutdown sequence, with a GT ramp down to a minimum load point, approximately 20%, over a period of 15 minutes. Then the GT shall resume the standard ramp down schedule to idle and fuel shutoff. The total fuel consumed is the accumulated total for 60 minutes prior to fuel shutoff.

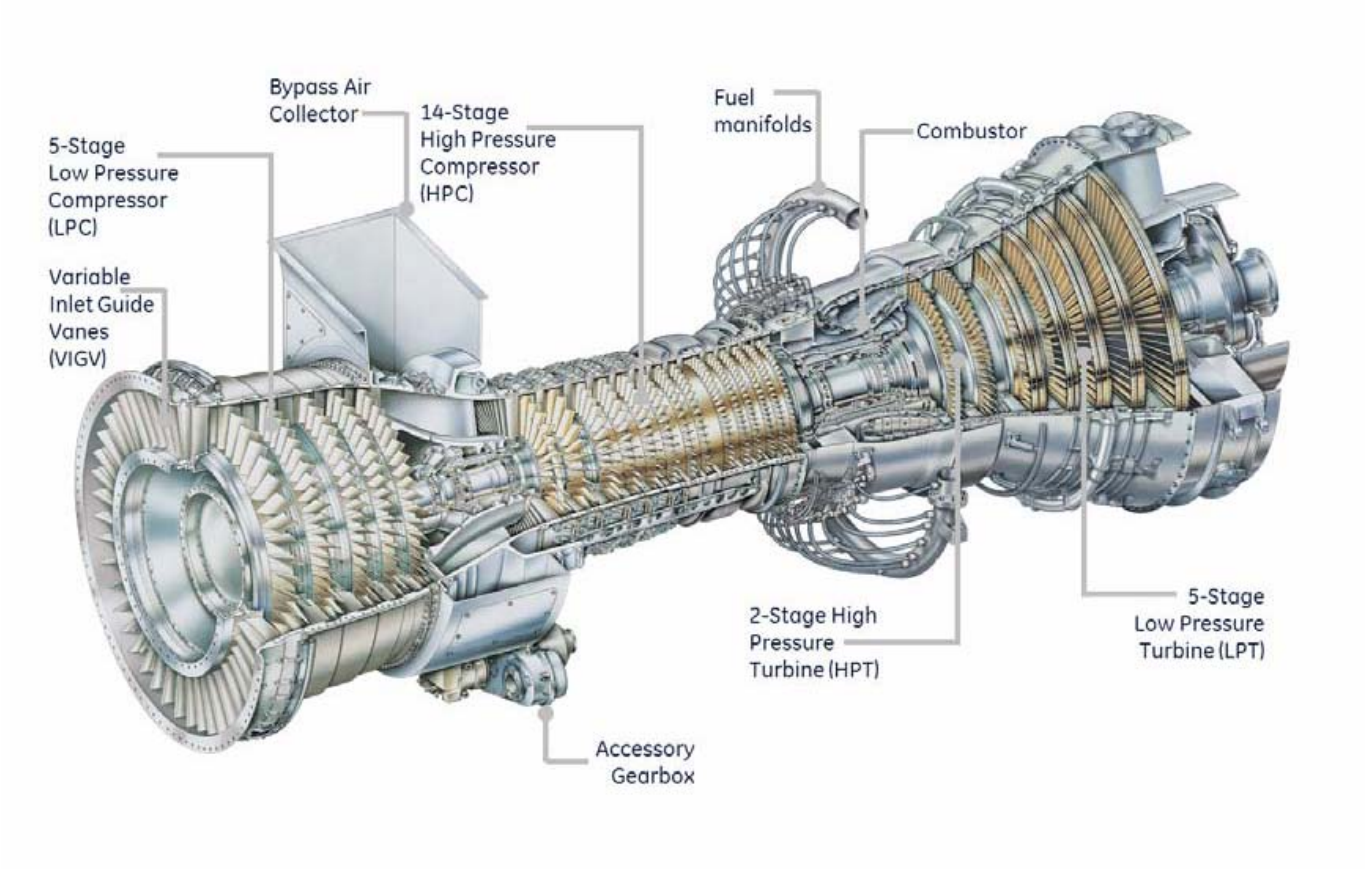
Gas Turbine Generator

Turbine Engine

The latest additions to the LM6000 Product Line are the PG (SAC) and PH (DLE) gas turbines, which are derived from the core of CF6-80C2, GE's high thrust, high efficiency aircraft engine. There are more than 3700 engines in service and many more are on order. They have accumulated more than 178 million hours of operations. The high pressure turbine for PG/PH is derived from the CF6-80E1. The CF6-80E1 has been in service since 1995. Nearly 500 CF6-80E1s are in service and many more are on order. It has logged more than 9 million flight hours, primarily on the A330 fleet. Both LM and aviation engines have a common design and share most major parts. The Low Pressure Turbine, High Pressure Compressor, High Pressure Turbine, and SAC Combustor are virtually identical. This use of flight-proven parts, produced in high volume, contributes to the low initial cost and high operating efficiency of the LM6000.

Additionally, the LM6000 PG and PH remain 94% common with the PC, PD and PF gas turbines, while providing up to 25% more power and an 18% increase in exhaust energy in the same footprint. There are more than 1000 LM6000 engines in operation worldwide with more than 21 million hours of operations.

Major Engine Components:



- 5-stage low-pressure compressor (LPC)
- 14-stage variable geometry high pressure compressor (HPC)
- Single Annular Combustor (SAC) (PG)
- 2-stage air-cooled high pressure turbine (HPT)
- 5-stage low pressure turbine (LPT)
- Accessory Gear Box

The LM6000 has two concentric rotor shafts: The LPC and LPT are assembled on one shaft, forming the Low Pressure Rotor. The HPC and HPT are assembled on the other shaft, forming the High Pressure Rotor.

The LM6000 uses the Low Pressure Turbine (LPT) to power the output shaft. By eliminating the separate power turbine found in many other gas turbines, the LM6000 design simplifies the engine and improves fuel efficiency. The LM6000 gas turbine drives the generator via a flexible dry type coupling connected to the front, or "cold," end of the LPC shaft

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

.

LM6000 Major Engine Components

Turbine Cycle

- Filtered air enters the bellmouth and flows through guide vanes to the LPC
- LPC compresses air by 2.6:1 ratio
- Air flows from LPC through the front frame & bypass air collector to HPC
- Air enters HPC through Inlet Guide Vanes
- The HPC compresses air by 13:1 ratio
- 30 Fuel (SAC) nozzles mix air and fuel
- Air-Fuel mixture is ignited in Annular Combustor
- Hot combustion gases expand through HPT driving the HPC
- Hot combustion gasses expand further through LPT driving the LPC flanged end of the LPC shaft, which drives the reduction gearbox and electric generator
- Exhaust gasses exit engine/package at the exhaust flange

Inlet and VIGV Section

The turbine inlet straightens the air stream and directs it into the Low Pressure Compressor (LPC). Contractor furnishes the LM6000 PG engine with Variable Inlet Guide Vanes (VIGV).

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Low Pressure Compressor

The Low Pressure Compressor (LPC) is a 5-stage axial flow compressor with a 2.6:1 pressure ratio. A horizontally split casing provides access to blades and vanes. Borescope ports permit flow path inspection.

Bypass Air Collector

The LM6000 matches the airflow between the Low Pressure (LP) and High Pressure Compressor (HPC) with 12 hydraulically actuated variable bypass valves mounted in the turbine front frame. During start-up and part-load operation these valves open partially and vent excess air to the bypass air collector. The bypass air collector also supports the accessory gearbox.

High Pressure Compressor

The LM6000 High Pressure Compressor (HPC) is a 14-stage unit. Variable stators in stages 1-5 ensure high efficiency throughout the starting and operating range. The stator geometry of stages 6 through 14 is fixed horizontally. This allows ready access to the stator vanes and rotor blades for inspection or replacement. The pressure ratio of PG/PH increases to 35:1 from 30:1 for a PC engine, allowing for more mass flow through the engine.

Combustion Section

Fuel to the gas turbine will be controlled based on control mode, fuel schedules, and the load condition. For normal start sequence (13 minutes), gradual load changes are preferred with at least 5-minute ramp from idle to maximum power. If a fast start (10 minutes) is required, the load may be ramped from idle to full load in 4 minutes as part of the start sequence provided in operation. Normal load reduction transients should be no faster than 2-3 minutes from maximum power to synchronous idle.

Thirty nozzles feed fuel into the LM6000 annular combustor, providing a uniform heat profile to the High Pressure Turbine (HPT). This produces maximum output with low thermal stress. The swirler-cup dome design produces a lean thoroughly mixed, lean fuel/air mixture in the primary zone of the combustor. This provides cleaner combustion and reduces NO_X. Available nozzle designs allow natural gas, distillate or dual-fuel operation. The nozzles also permit NO_X reduction with water injection (natural gas and distillate fuels). The annular combustor design provides low pressure loss, low exit temperature and extended operating life. A Hastelloy X inner liner resists corrosion and extends combustor life.

High Pressure Turbine

The High Pressure Turbine (HPT) is a 2-stage, air-cooled turbine rotated by the hot gasses exiting the combustor. The HPT powers the High Pressure Compressor (HPC) to supply high-pressure air to the combustor. Turbine disks, blades and stator are air-cooled for efficiency. Air foils are thermal-barrier-coated to improve durability and resist erosion and corrosion.

Low Pressure Turbine

The 5-stage Low Pressure Turbine (LPT) receives the outlet flow from the HPT. The LPT drives the Low Pressure Compressor and the driven load (generator, compressor, etc.) through a shaft concentric to the HPT shaft. Air foils have been optimized to provide improved efficiency.

CONFIDENTIAL INFORMATION

Gas Turbine Support Structures

The LM6000 gas turbine uses three frames to support the LP and HP rotors, the front frame, compressor rear frame and the turbine rear frame. This configuration produces excellent rotor stability and closely controlled blade tip clearance.

Front Frame

The LM6000 front frame is a major engine structure that provides support for the LPC shaft and the forward end of the HPC shaft. The frame also forms an airflow path between the outlet of the LPC and the inlet of the HPC. The front engine mounts attach to the front frame. The front frame contains the engine "A" sump that incorporates the thrust and radial bearings to support the LPC rotor and a radial bearing which supports the forward end of the HPC rotor. Lubrication oil supply and scavenge lines for the "A" sump are routed inside the front frame struts. The accessory gearbox drive shaft is located in the "A" sump and extends out through the strut located at the six o'clock position.
Pads are contained on the frame outer case for mounting of the two High Pressure Compressor inlet temperature sensors.

Compressor Rear Frame

The compressor rear frame (CRF) consists of an outer case, 10 struts and the "B-C" sump housing. The outer case supports the combustor and 30 fuel nozzles. The hub supports both the thrust bearing, the radial bearing and in turn, the mid-section of the HP rotor system. The PG/PH has incorporated an improved CRF based on the design of the existing LMS100 CRF. This provides more operability and performance to increase the output of the PG/PH gas turbine.

Turbine Rear Frame

The turbine rear frame supports the rear engine mount and contains the D-E sump. The 14-strut rear frame guides and straightens the exhaust flow for lower pressure drop and greater efficiency.

Accessory Drive System

The hydraulic starter, lube and scavenge pump, variable geometry hydraulic pump, and other accessories are mounted on and driven by the accessory gearbox. The accessory gearbox is located below the front HPC casing at the six o'clock position on the LPC bleed air collector and is driven by the transfer gearbox through a short horizontal shaft. The transfer gearbox is driven by the high-pressure rotor system. The gearbox is supported from the LPC bleed air collector.

Auxiliary Equipment Module

The base auxiliary equipment module is provided with the unit and integrates several functions and is equipped with enclosure. The following is included as part of the standard auxiliary equipment module:

Auxiliary Module

- Synthetic lube oil system components including: reservoir, duplex oil filter and duplex shell/tube oil-to-coolant heat exchangers
- Electro-hydraulic start system components, including: electric starting motor, variable displacement hydraulic pump, reservoir, air/oil cooler, low pressure return filter, and case drain return filter
- On-line/off-line water wash system, including: reservoir, supply valves, solenoid valves, pump, electric tank heater, in-line water filter, and instrument air filter

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Inlet Air System Single-Stage Design

The air inlet system is designed to protect the gas turbine, generator and equipment compartments from effects of air-borne dirt, contamination and foreign objects. It also provides a pre-engineered, modular design to minimize field assembly and eliminate field welding.

Filtration Specification

The LM6000 pulse filter removes more than 99.9% of all particles 5.0micron and larger by utilizing a single-stage, pulse-cleaned design.

Engine Combustion Air	253,000 scfm / 7,164 m3/min
Turbine Ventilation Air	60,000 scfm / 1,699 m3/min.
Generator Ventilation Air	45,000 scfm / 1,274 m3/min.
Total Typical Air Flow	358,000 scfm / 10,137 m3/min.

Pulse Air Filter (Self Cleaning Legged Housing)

This single-stage self-cleaning filtration system is a well-suited for dry, high dust areas (desert-like conditions) as well as cold weather environment hazards such as blowing snow, hoarfrost and ice fog. Filtration elements are pulsed in banks (rows) to clean the filters. The pulsing is repeated until a predetermined value is reached. Instrument compressed air can be used for the pulsing.

The filter house mounts above the turbine enclosure and is supported with legs. Downward airflow provides filtered air for combustion and ventilation. This compact filter design is easily installed in the field, and it eliminates City supplied ducting. The filter system includes a stainless steel inlet silencer and a ladder and platform for inspection and servicing of the filter. Lighted internal walkways provide generous working room for replacement and maintenance of the filter elements.

Filter House Materials

The filter housing is constructed of 3/16 inch / 4.5 mm steel plate. Protective paint is applied to the exterior and interior carbon steel surfaces.

Floors and drain pans downstream of the inlet air chiller coils are stainless steel to resist corrosion.

Inlet Screens/Weatherhood

The weather hood provides a deflecting surface to prevent driving rain and snow from entering the filter house. In addition, paper, leaves and wind-blown trash are blocked by the inlet screen. This component makes up the exterior face of the filter house and is manufactured from carbon steel. Acoustically lined weather hood is provided to reduce noise emissions.

Pulse Filter

The high-efficiency conical and cylindrical pulse filter elements (provided as a pair) are mounted to a vertically oriented dirty-to-clean air separation sheet (“tube sheet”) within the pulse filter modules. The element media is a low-pressure drop, fully synthetic media specially treated to maximize pulse cleaning performance. The filter elements are designed specifically for gas turbine protection, offering high filtration efficiency (F9 per EN779:2002) and optimal pulse cleaning performance.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Clean Air Plenum

After passing though the filter elements, the filtered air exits the pulse filter modules and enters the clean air plenum. This fabricated structure is the center section of the inlet filter assembly and separates ventilation air from combustion air.

Transition Ducts

Combustion air flows through a transition duct from the clean air plenum to the combustion air inlet silencer. Ventilation air flows through transition ducts to the turbine and generator compartment. 316 Stainless Steel material is provided for wetted surfaces.

Inlet Silencer

The inlet silencer is a low-pressure-drop device located in the combustion air stream before the inlet volute. The silencer attenuates noise from the turbine and helps maintain the unit's low noise level.

Inlet Volute

The inlet volute is stainless steel weldment that directs the combustion air flowing down from the filter and turns it 90 degrees to flow axially into the turbine inlet. Vanes within the volute smooth the airflow and present a balanced air stream to the turbine bellmouth.

Combustion Air Cooling – Chiller Coil

Lowering the combustion air inlet temperature can increase the power output of the LM6000 generator set. When specified, Contractor furnishes high performance inlet air chilling coils as an integral part of the air inlet system. City provides adequate quantities of a chilled water/glycol mixture and interconnecting piping to Contractor furnished chilling coils at the filter house. The same coils can be used for anti-icing.

Package Enclosures

The package is equipped with a generator, a turbine and an auxiliary module enclosure. The unit enclosures are designed for outdoor installation with wind loads up to 150 mph / 240 km/h per ASCE 7-05 and CBC 2010. The enclosures reduces the average near field noise to 85 dB (A) at 3 ft. / 1.0 m from the enclosure and 5 ft. / 1.5m above grade. Each enclosure is provided with access doors and AC lighting.

The turbine enclosure contains an integral overhead bridge crane to facilitate engine removal.

Enclosure walls are a “sandwich” construction filled with insulation blankets of high temperature, sound attenuating material. The inner wall panel is fabricated from perforated 1.21 mm / 18-gauge stainless steel. The outer wall panel is 1.9 mm / 14-gauge cold rolled carbon steel, painted with abrasion resistant, exterior quality epoxy paint.

The turbine and generator enclosure walls are supported by a structural steel framework that can withstand external wind loading and the internal pressure developed by the fire extinguishing system. External door hinges, latches and mounting hardware are stainless steel or chrome plated.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Enclosure Lighting

AC lighting for the interior of the gas turbine and generator enclosures is provided. DC lighting is provided as well in the generator and turbine enclosures.

Enclosure Ventilation System

The ventilation system removes heat from the turbine and generator enclosures and removes combustible gases in the event of a fuel system failure. Both the turbine and generator enclosures are fully ventilated by redundant fans to improve reliability. Ventilation air is filtered to the same quality levels as the gas turbine combustion air.

Turbine Enclosure Ventilation

Ventilation air enters the turbine enclosure around the inlet collector. Dual 125 hp / 93 kW exhaust fans (1 running / 1 standby) create induced-draft airflow of approximately 60,000 scfm / 1,699 m3.

Generator Enclosure Ventilation

Filtered air is forced into the generator enclosure by dual 100 hp / 75 kW forced draft fans (1 running / 1 stand-by) through ducts from the inlet air filter. The 45,000 scfm / 1,270 m3/min. airflow cools the generator and the generator enclosure.

The ventilation fans produce a positive pressure in the generator enclosure, providing additional isolation from the turbine enclosure for gas leak protection purposes. This contributes to classification of the generator enclosure as a non-hazardous area.

Auxiliary Enclosure Ventilation

Ventilation air enters the compartment through two roof mounted forced draft units (1 running/1standby). The unit supplies 3027 ACFM/86 m3/min of ventilation air.

Noise Control

The LM6000 enclosure and air inlet silencer reduce the average near field noise to 85 dB (A) at 3 ft. / 1.0 m from the enclosure and 5 ft / 1.5 m above grade.

Turbine Exhaust

The LM6000 exhausts air is extracted axially through a flange located at the end of the turbine enclosure. This provides low restrictions and a direct path into the heat recovery equipment.

Baseplate

LM6000 generator sets are mounted on rugged I-beam baseplates to simplify shipping and installation.

The basic equipment is supplied with the support structures consisting of a two-piece skid assembly, which is sectioned between the gas turbine and the generator. The full depth, bolted section is designed to provide the full structural properties of the wide flange I-beams. Full depth cross members are utilized to provide a rigid design that meets the requirements of CBC2010 and is therefore suitable for installation in earthquake areas. The baseplate support system is enhanced by the installation of a

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

heavy-duty, welded superstructure which utilizes 6 inch x 6 inch x 3/8 inch wall structural tubing for wall columns and roof beams.

Tapered pins between the baseplates simplify field alignment and temporary lifting (round pin design) trunnions can be installed, providing a convenient structure for transportation.

Fuel System

Gas Fuel System

The gas fuel system contains the following major components. They are mounted in the turbine enclosure, adjacent to the engine.

- Fuel gas strainer
- Fuel gas flow meter
- Instrumentation
- Primary shutoff valve
- Fuel metering valve
- Secondary shutoff valve
- Fuel gas manifold
- Shipped loose manual shut-off valve

Gas Fuel Flow

Gas fuel must be supplied to the package baseplate connection at 725 ± 20 psig for PG (SAC) turbine. Please see Attachment 10 for applicable fuel specification. Lower fuel supply pressure requirements for base load operation may be possible in certain circumstances.

A City supplied pressure regulator, pressure relief valve and Contractor supplied manually operated shut-off valve should be installed in the City fuel supply system outside of main unit.

Pressure and Temperature Monitoring

Pressure transmitters monitor the fuel supply pressure upstream and downstream of the fuel metering valve and forward the data to the fuel control and sequencer system. A platinum, dual element temperature RTD monitors fuel supply temperature and forwards the data to the fuel control and sequencer system.

Fuel Shutoff Valves and Safety Venting

Fuel shutoff valves manage gas flow to the combustor. Solenoid piloted fuel shutoff valves are quick-closure valve assemblies located upstream and downstream of the gas fuel metering valve. These fail-close valves are either fully open to allow fuel flow or fully closed to prevent fuel flow.

During startup, the shutoff valves are opened and fuel flow to the gas manifold is metered by the gas fuel metering valve. During shutdown, when the shutoff valves are closed, a solenoid-operated vent valve opens to vent the fuel supply line between shutoff valves to a safe area.

A gas fuel drain valve opens during certain shutdown conditions to purge the gas manifold and the engine.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Fuel-Metering Valve

The electronically controlled fuel valve provides accurate, non-pulsating fuel flow to the turbine during starting, steady-state operation and dynamic load changes.

Low fuel gas pressure starting is possible, using the electrical output of the LM6000 to power a fuel gas compressor. The LM6000 can start on a minimum 250 psig/1724 kPag fuel gas pressure. At this pressure the LM6000 produces enough electrical power to start a fuel gas compressor. The compressor then builds the fuel gas pressure up for full power output.

This "bootstrap" starting simplifies gas utility requirements and eliminates high electrical "demand charges" for starting the gas compressor motors.

Independent Lube Oil Systems

The LM6000 gas turbine is lubricated with synthetic lube oil (SLO) while a separate mineral lube oil (MLO) system lubricates the generator and gearbox.

Dual shell and tube coolers are used to cool both turbine and generator lube oil. The turbine lube oil system is mounted on the auxiliary module. The generator/gearbox lube oil system is a separate skid. Lube oil piping, fittings and reservoirs are Type 304 stainless steel and valves have stainless steel trim.

Gas Turbine Lube Oil System

The gas turbine lube oil system has two lube oil circuits:

Supply System - Provides filtered, cool oil to the turbine bearings.

Scavenge System - Recovers (scavenges) the lube oil from the bearing drain sumps. It also filters and cools the oil and returns it to the reservoir.

These two circuits cool, lubricate and protect the turbine. The turbine supply system contains the following major components:

- SLO reservoir
- Supply pump
- Supply filter

The scavenge system contains the following major components:

- Scavenge filter/5-element scavenge pump
- Duplex shell and tube water / oil heat exchanger
- Air/oil separator system

Turbine Lube Oil Supply Description

Synthetic lube oil is stored in a 250 gal/946 l capacity stainless steel reservoir mounted on the auxiliary module. The reservoir is fitted with a level gauge, a level transmitter, a filler connection, and a demister/flame arrestor. The reservoir also includes a thermostatically controlled heater and a lube oil temperature transmitter RTD.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

A positive displacement lube oil pump, mounted on the gas turbine accessory drive gearbox, takes suction from the lube oil reservoir. The pump discharge is filtered by a duplex, 6 micron (absolute), full-flow filter located on the auxiliary module. Filter elements can be changed while the turbine is running.

The lube oil supply passes through an anti-siphon check valve and is distributed to the bearing chambers, where oil is sprayed onto each engine bearing.

Pressure transmitters and temperature RTDs monitor lube oil supply with readout, alarm and shutdown at the turbine control panel. Chip detectors in the A and B sumps and in the common scavenge return provide alarms if metal chips are detected in the lube oil. A differential pressure transmitter senses filter differential pressure and warns the operator of dirty filter conditions.

Turbine Lube Oil Scavenge Description

Oil flows through the turbine bearings and accumulates in the bearing sumps. A 5-element scavenge pump is connected to a low point drain in each sump. Whenever the engine is turning the scavenge pump is working to remove oil from the sump drains.

The scavenge pump discharge flows through a 6 micron (absolute) duplex filter, then is cooled by a shell and tube cooler, (1 running / 1 standby) and then returns the oil to the reservoir.

Dual elements RTD on each scavenge line measures temperature, with readout, alarm and shutdown at the turbine control panel. A check valve on the pump discharge prevents siphoning of oil back into the engine during shutdown.

Each bearing sump is vented by the air/oil separator system, consisting of a pre-separator, air-to-oil cooler, and a final separator. Recovered oil drains back to the reservoir to reduce emissions and oil consumption.

Duplex shell and tube coolers (1 running /1 standby) rejects 12,565 Btu/min (13257 kJ/min) from the turbine lube oil circuit. A thermostatic valve regulates the amount of hot oil that bypasses the cooler maintain reservoir oil temperature.

Generator/Gearbox Lube Oil System

The generator/gearbox lubrication system provides approximately 389 gpm/1473 lpm of cooled and filtered mineral oil to the generator/gearbox bearings. The generator/gearbox lube oil reservoir, pumps and duplex filters are located on a separate lube oil module. The lube oil filters may be changed while the unit is operating. Filters have stainless steel plates. Valves are carbon steel bodies with stainless steel trim. The duplex shell and tube coolers serving the generator/gearbox lube oil system are also located on the lube oil module.

The generator/gearbox lube oil system has two lube oil circuits:

Supply System – Provides cool, filtered oil to the generator bearings. The supply system contains the following major components:

- MLO reservoir
- AC pump
- Generator driven mechanical pump

- Four-element jacking oil pump
- Duplex shell and tube heat exchanger
- Duplex filter

Return System - Recovers the lube oil from the bearing drain sumps and returns it to the reservoir.

These two circuits cool, lubricate and protect the generator and gearbox.

Generator/Gearbox Lube Oil Supply Description

A 304 stainless steel reservoir includes a level gauge, a level transmitter, fill connection with strainer and a drain valve. Two heater units turn on at 90 °F (32 °C) falling temperature keeping the oil heated to prevent condensation when the unit is stopped. The lube system has three pumps mounted on the reservoir:

- Main pump: 389 gpm/1473 lpm with a 40 hp/30 kW AC motor
- Standby pump: 389 gpm/1473 lpm with a 40 hp/30 kW AC motor
- Emergency coastdown pump: 165 gpm/625 lpm with a 20 hp/15 kW DC motor

The reservoir assembly includes:

- Duplex 100% filters (6 micron absolute)
- Duplex shell and tube heat exchangers sized to reject 46,475 Btu/min or 49,033 kJ/min
- Oil-mist heat exchanger and motor-driven oil demister
- Accumulators for coastdown and emergency operations

A standby AC pump will provide additional protection in the event the primary AC lube oil pump fails. A standby DC pump will provide coast down protection in the event AC power is lost. The oil flows through the orifice and into the bearings and forms a film that cools and lubricates the journal. Pressure transmitters at the bearing supply header provide low pressure alarm and shutdown signals to the unit control panel. If the supply pressure drops, a low lube oil pressure switch automatically starts the auxiliary lube oil pump. An annunciator alarm indicates that the auxiliary pump is running. If the lube oil pressure falls to a lower level, the turbine generator set shuts down. The primary and auxiliary lube oil pumps can each supply 100% of the generator lube oil requirements.

Each pump is equipped with a pressure relief valve piped to the reservoir. Lube oil pressure at the supply header is controlled by a pressure regulating valve, which bypasses excessive oil flow to the reservoir. The redundant generator/gearbox lube oil filters (6 micron absolute) are mounted on the lube oil module. Filters may be replaced during operation by switching the manual transfer valve. A differential pressure transmitter senses pressure drop across filter to indicate filter cleanliness and provides alarm in case filter requires changing.

Generator/Gearbox Lube Oil Return Description

Each bearing has a gravity drain and sight glass to visually verify oil flow. A dual element RTD is embedded in each generator bearing to measure the actual metal temperature. These RTDs are continuously monitored at the unit control panel and provide alarm and trip signals. The gearbox has a turning gear to rotate the shaft. The gearbox bearing RTDs also provide alarm and trip signals.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

For starting and water wash cycles, the generator rotor is lifted off the bearing seats with a film of high-pressure oil from a small "jacking oil" pump. The oil film reduces bearing friction and helps the rotor "break away" and begin turning.

City Cooling Water Requirements

City provides continuous water or water/glycol solution to the turbine lube oil, generator/gearbox lube oil cooler flange connections and the GLO tank demister at 95°F/ 35°C and a maximum water pressure of 100 psig / 689 kPag.

The turbine lube oil cooling water requirements are 120 gpm/454 lpm with a load rejection of 12,656 Btu/min/13,257 KJ/min. The generator/gearbox lube oil cooler cooling water requirements are 325 gpm/1325 lpm. Total heat rejection for generator/gearbox is approximately 47,012 Btu/min /49,600 kJ/min. The GLO tank demister requires 41 gpm/155 lpm. Total heat rejection is 1377 Btu/min/1452 kJ/min.

Starting System

The LM6000 turbine is started by an electro-hydraulic system, including an electric motor, a pump, a hydraulic starter motor, and other equipment described below. The starter rotates the LM6000 high-pressure compressor shaft for purging, cool down, engine starting and water wash sequences.

The hydraulic start system consists of a hydraulic starting motor / clutch mounted on the turbine accessory gearbox, and the following equipment mounted on the auxiliary module:

- 200 HP / 150 kW electric starting pump motor
- Variable displacement hydraulic pump
- 40 gal. / 151 l hydraulic reservoir
- Air/oil cooler
- Low pressure return filter and case drain return filter

Hydraulic Start System

The hydraulic circuit is a closed loop design with a 40-gallon / 151 l reservoir. The system requires an initial fill of approximately 40 gallons / 151 l of ISO VG 46 premium, anti-wear petroleum-based hydraulic fluid.

During each start cycle a charge-pump portion of the main pump draws fluid from the reservoir to prime the system and supply control oil. Controls modulate the main pump flow from zero to approximately 56 gpm / 212 lpm during the starting cycle. This permits accurate control of gas generator speed for purging, ignition and acceleration. The starter pump increases the hydraulic fluid pressure and delivers the pressurized fluid to the hydraulic starter motor. A portion of the return fluid from the starter motor is routed back to the starter pump. Before reaching the main hydraulic pump on the auxiliary skid, the oil is filtered through a low-pressure, return filter.

Low-pressure hydraulic fluid from the starter motor case is routed off the main skid to the auxiliary skid. On the auxiliary skid, the hydraulic fluid flows through a case drain return filter and an air to oil heat exchanger before returning to the reservoir.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Starting System Operation

To start the gas turbine, the hydraulic motor must:

- Rotate the gas generator to purge the engine
- Accelerate the gas generator to ignition speed
- Continue acceleration to self-sustaining speed

The starter accelerates the gas generator to 2,400 rpm and cranks for 90 seconds in typical simple cycle applications. This forces purging air through the gas turbine and exhaust stack to remove hydrocarbons that may have accumulated during the prior shutdown.

Air-flow during the purge cycle is approximately 7842 scfm / 222 M^3/min. After the purge cycle, Fuel flow is initiated, igniters are actuated, and the turbine starts. Then the starter and the combustion accelerate the gas generator to 4600 rpm where the starter disengages automatically.

The gas generator continues to accelerate until it reaches idle speed. The turbine is now self-sustaining.

Overall start time varies with stack height. The unit with once through steam generator will require a longer purge cycle, typically 15 to 30 minutes. Refer to Contractor's position paper #7 and #8 in for OTSG unit requiring 10 minute start-up.

The typical LM6000 in simple cycle application can reach full power from a cold start in 10 minutes.

Water Wash System

Despite air filtration, gas turbine compressor blades tend to become dirty resulting in decreased compressor performance and lower gas turbine efficiency. Optimal turbine performance is achieved by periodically cleaning compressor stages of the gas turbine. The water wash system provides a mechanism for cleaning the engine compressor during normal operation (online water washing) or when the turbine has been shut down (off-line water washing) in order to recover the compressor efficiency and gas turbine power output. See Attachment 10 for compressor cleaning water/detergent specifications.

Water Wash Equipment

Both on-line and off-line spray nozzles are mounted on the Inlet Air Volute on the main baseplate. The remaining water wash equipment below is mounted on the auxiliary module:

- 100 gallon / 379 l stainless steel reservoir
- Manual water and chemical (detergent) supply valves
- Solenoid valves to sequence water wash and purging
- Motor-driven pressurizing pump
- Electric heater in tank
- In-line water filter

Cleaning Solution Specifications

Cleaning agents (liquid detergent) conforming to Contractor's Specification MID-TD-0000-5 are recommended for washing the gas generator section of the engine. Water and solvents are mixed within the reservoir and sprayed into the turbine inlet. Water is then sprayed in the inlet to rinse the turbine.

A water/anti-freeze mixture must be used for dilution and rinsing in ambient temperatures of 50°F / 10°C, or lower.

Water Quality Standards

Please refer to Contractor's Specification MID-TD-0000-4 in Attachment 10 for the Compressor Cleaning water purity requirements to wash the gas turbine.

Interface Requirements

City supplies a source of water and instrument/compressed air to purge lines at flange connections on auxiliary module. Interconnecting piping and hoses to the permanently mounted turbine spray manifold are provided as part of standard scope of supply.

Fire Protection System

The LM6000 turbine generator set includes controls and sensors to detect fire, unsafe temperatures or explosive atmospheres in the turbine and generator enclosures. The system releases CO_2 if fire is detected.

The package enclosure is designed to reduce the hazard of fire and explosion. A wall separates the turbine and generator enclosures to provide isolation. Ventilation systems, with redundant fans, create a positive pressure in the generator enclosure and a negative pressure in the turbine enclosure. This maintains separation and prevents hydrocarbons entering from the generator enclosure. The turbine and generator enclosures are protected by gas detectors, thermal detectors, optical flame detectors and a CO_2 extinguishing system conforming to NFPA 12.

Gas Detectors

Four explosion proof gas detectors and two explosion proof infrared gas detectors are provided. Three hydrocarbon gas detectors are located in the turbine compartment. Two hydrocarbon gas detectors are located below the turbine, and three gas detectors are located in the turbine enclosure near ventilation exhaust duct. A fourth detector is located in the generator compartment. Two infrared gas detectors are located in the ventilation exhaust duct. If the gas detectors in the turbine or generator compartments sense a gas concentration of 15% LEL, a warning is initiated. If a sensor detects a gas concentration of 25% lower explosion limit, an emergency shutdown is initiated. If an infrared sensor senses a gas concentration of 5% LEL, a warning is initiated. If a sensor detects a gas concentration of 10% LEL, an emergency shutdown is initiated.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Optical Flame Detectors

There are three Optical flame detectors mounted in the turbine enclosure and one mounted in the generator enclosure. A flame indication by a turbine enclosure sensor causes an emergency shutdown and release of CO2.

Thermal Detectors

The turbine enclosure temperature is monitored by two thermal spot detectors, initiating a shutdown at 450°F / 232.2°C. The generator enclosure temperature is monitored by three thermal spot detectors, initiating a shutdown at 225°F / 107.2°C.

In addition to alarm and shutdown functions, the thermal spot detectors provide enclosure temperature signals for the turbine control panel HMI. The spot temperature detectors are bi-metallic and respond to both temperature and rate-of-rise. They trigger a unit shut down and release of the CO_2 when tripped.

Manual System Trip

Three manual trip stations are located on the main enclosure; one on each side near the center of the package, and the third at the exciter end of the generator.

CO2 Extinguishing System

The system components include:

- Main CO_2 storage cylinders
- Reserve CO_2 storage cylinders
- Valves, piping and wiring

The pressurized CO_2 bottles are stored on a rack that includes manifolds, controls, valves and a weigh scale. The reserve cylinders are an “automatic backup,” and are released, if the detectors still indicate a hazard, 90 seconds after release of the main cylinders.

Contractor provides piping within the main enclosure from the pressure connection to the nozzles in the turbine and generator enclosures. Release of the CO_2 is controlled by the fire system control panel or by a manual valve at the unit.

Signals from the equipment-mounted sensors are monitored by solid-state modules in the control panel. The panel-mounted unit includes logic, memory and output functions.

Dedicated Power Supply

A dedicated 24 VDC battery system with charger, to power the fire and gas protection and control system is furnished by BOP contractor per DOR document. This battery system shall conform to NFPA 12 requirements.

Control System

Turbine Control Panel compares the signal from each sensor to alarm and shutdown set points. Any alarm signal sounds an alarm at the control panel and in the turbine enclosure.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Any shutdown signal from a gas detector, optical detector, thermal detector, or manual station closes a contact and causes an emergency shutdown of the unit.

Defective Sensor Protection

Each sensor is connected with closed loop circuitry to verify its readiness. Should the sensor or its wiring become defective, a "fault" condition is indicated on the control panel.

CO2 Release Logic

When a shutdown signal is received the control system turns off the ventilation fans and sounds an alarm horn at the panel and both inside and outside of the turbine enclosure. After a time delay, CO_2 is released into the generator and turbine enclosures.

A CO_2 concentration sufficient to extinguish flames is reached in approximately 30 seconds. If the primary cylinders should fail to discharge within four seconds, the reserve cylinders are discharged. If flames are still detected 90 seconds after the primary CO_2 cylinders have been discharged, the reserve cylinders are discharged.

SPRINT® Power Augmentation

SPRINT® boosts engine performance up to 60.0 MW (ISO conditions) using a spray intercooling design that increases the mass flow by cooling the air during the compression process. The system is based on an atomized water spray injected through spray nozzles placed at two locations, one between the high pressure and low pressure compressors, and the second at inlet bellmouth. Water is atomized using high pressure air taken off of the eighth stage bleed. The water flow rate is metered, using the appropriate engine control schedules and at the inlet bellmouth. Bellmouth and inter-stage portions on SPRINT® alternate operation based on turbine inlet temperature. City supplies demineralized water at flow rates between 14 gpm and 29 gpm (53 lpm to 110 lpm), 25 psig/172 kPag and 100 °F/38 °C to the connection on the unit. Water must meet Contractor's specification MID-TD-0000-3 in Attachment 10.

NOx Control – Water Injection System

The water injection system contains the following major components. All components are mounted on the auxiliary and main skids. Duplex low pressure filter, duplex water injection pump(s), flow transmitter, and flow metering valve. To control the amount of oxides of nitrogen (NOx) emitted by the gas turbine during normal operation, demineralized water is injected into the combustor section of the gas turbine through the water injection manifold. Demineralized water from a City source is pressurized by the selected water injection pump and pumped into the main skid.

Water Filter and Water Injection Pump Equipment

Demineralized water supplied to the auxiliary skid must meet Contractor's quality requirements MID-TD-0000-3 in Attachment 10. The demineralized water is pressurized by the centrifugal water injection pump and the water flows through a duplex water injection filter, where it is filtered to 25 microns. Two identical water injection pumps are provided in the system (primary and standby) for redundant system. If there is a pump failure, the operator, after investigating the cause of the failure to verify the problem is not related to water supply or piping problems, can then select the standby pump from the human

machine interface (HMI) screen. The standby pump becomes the primary pump and the operator can enable the water injection system. Necessary pressure and temperature instrumentation allow remote monitoring of the water injection system on the auxiliary skid. The water injection pumps require a variable speed controller for operation. This is recommended to be placed in close proximity to the Turbine Control panel. One controller is provided per pump.

Main Skid

Water flow enters the main skid piping at an operating pressure of 800-880 psig/5.5-6.1 MPag for gas fuel operation and 955-1100 psig/6.6-7.6 MPag for liquid fuel. An electrically actuated water injection flow-metering valve modulates de-mineralized water flow to the engine manifold and to the water return in response to data received and processed by the control system. Downstream of the metering valve, de-mineralized water flows through a solenoid shutoff valve which opens when the control system commands the water injection system active and closes when the GTG set is stopped or the water injection system is commanded off. A flow transmitter sends a signal to the digital control system providing flow data used to calculate total water use and, in return, calculate the water-to-fuel ratio.

When the system is not in operation, any water in the manifold piping drains from the system through a manifold drain solenoid valve. Pressure in the downstream piping blows any residual water out of the system. The gas fuel purge flow from the engine manifold assists in clearing residual water from the system piping. Necessary pressure and temperature instrumentation allow remote monitoring of the water injection system on the auxiliary and main skids. All piping is stainless steel, and the valves are trimmed with stainless steel.

Winterization to 0°F

This includes, but not limited to the following modifications depending on the level of winterization required:

- Heat tracing and insulation of applicable unit mounted piping
- Enclosing and heating exposed instruments and equipment, as selected by Contractor.
- Winterization enclosures for the auxiliary skid, as selected by Contractor. The enclosures, when required, protect equipment in cold weather and are equipped with hand held fire extinguishers.

Totally Enclosed Water-Air Cooled Generator (TEWAC)

Totally Enclosed Water-Air Cooled Generator (TEWAC), 2-pole generator operating at 13.8 kV, 60 Hz. Generator is capable of handling City power requirement throughout a wide ambient temperature range. The generator includes a brushless excitation system with permanent magnet generator. Neutral and line side cubicles are included. The generator nameplate rating will be based on 0.85 power factor, although performance data and guarantees may be based on another power factor. Rotor removal tools are included.

A closed circuit air system with water/air cooling in place of the filtered air-cooling system is provided. City must supply 618 gpm (2,339 lpm) of treated water, 100 °F (37.8 °C) for cooler, to the generator at above 30 psig up to maximum design pressure of 100 psig (690 kPag). If the cooling water is to be reused, a City supplied circulation water-cooling loop should be sized to reject up to 958 kW, 3,272,000 BTU / Hr.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Gearbox

The Unit is supplied with a gearbox that reduces the turbine shaft speed from 3905 to 3600 RPM for 60 Hz applications.

The gearbox is a double helical parallel shaft speed reduction machine. It has a pinion shaft, a gear shaft, torque limiting device, turning gear, lube oil cooling and lubrication system, and bearing temperature and vibration probes. The pinion shaft is supported by two (2) split sleeve bearings lubricated by a pressurized mineral oil system as well as for gear shaft. The design has combined the requirements from both API 613 and AGMA 6011 and other related AGMA standards. A Safe Set torque limiting device is placed between torque shaft and quill shaft to protect drive train equipment including gas turbine, coupling, and generator. The turning gear for the whole drive train is mounted on the non-drive end of pinion shaft. It provides the power to turn the whole low speed drive train shaft for various purposes, such as starting and motoring.

Gas Vent Line Silencers

Contractor shall design and provide two (2) silencers for gas fuel vent lines (SOV-2006 and SOV-2004) as shown on fuel system F&ID 969260 drawing for installation by others. All vent pipings are for others to furnish and install.

Generator Protection Relays

The package is supplied with redundant microprocessor-based generator protective relay modules, mounted in the TCP. The protective relay system includes functions necessary for protection of the generator. One Beckwith M3425A and one SEL-300G3 multifunction generator protection relays including the comprehensive protection function are provided.

Digital Control System

The package is supplied with a free-standing Turbine Control Panel (TCP) suitable for mounting in an indoor, non-hazardous area. The control system features an integrated turbine control system, vibration monitor, digital meter, digital generator protective relay module and an HMI (human machine interface) display of key discrete and analog data. Alarm and shutdown events are displayed on the HMI automatically. An Ethernet TCP/IP Port is provided to transmit unit conditions (status, pressures, temperature, etc.) to the City's distributed control system. The HMI is a panel mounted or desktop PC located next to the TCP. Power for the control panel shall be provided by a dedicated 24V DC battery system with dual 100% capacity chargers, which are part of BOP contractor scope of supply and installation. The Contractor’s interconnect cable schedule will show a calculation of 100ft of cable and the TCP must be installed within 100 meters of the gas turbine generator package.

Component Testing and Package Test

Every new gas turbine is performance tested under load in a Contractor’s Test Cell, using procedures developed for flight turbine reliability. The generator is tested to IEEE C50.13 standards at its factory of manufacture.

All gas turbine generator sets receive a static test including:

- Switch State (N.O. or N.C., actuation, wiring, and set point)
- Temperature element output and wiring
- Transmitter range, output, and wiring
- Solenoid operation
- Control valve torque motor, excitation, and return signal
- Fire system continuity, and device actuation
- System flushing verification
- Tubing integrity

Drawings, Data and Manuals

Refer to Attachment 11 in the contract.

Training

Refer to Attachment 14 in the contract.

Improvements and Changes

It is understood that the Contractor has the right to make changes in product design and add improvements to products or services at any time without incurring any obligations to install the same on or in connection with the Equipment or Services provided hereunder.

Performance Testing

Contractor will furnish an on-site test representative to be present during the execution of the gas turbine performance test for power output and heat rate. All other performance test personnel, emissions testing, noise testing and other tests are the responsibility of the City.

Remote Monitoring and Diagnostics

During the Equipment Warranty period, Contractor provides a remote monitoring and diagnostic service which includes remote monitoring of key gas turbine generator set parameters by Contractor's technical representatives at one of its remote monitoring centers. City will also have access to the call center (known as Quick Response Center) whereby Contractor's representatives may begin assessing and diagnosing monitored equipment issues over the phone.

City will provide, if requested by Contractor, a high-speed connection to the internet and IT support in the configuration of the Virtual Private Network (VPN) as required for installation and for connection to Contractor's remote monitoring center.

Remote Workstation

Contractor will furnish four Remote Work Stations, Remote Human Machine Interface, ("HMI") for the LM6000 gas turbine package, which shall provide full control of the Gas Turbine Generator Set with the same functions as the local HMI.

The module consists of:

- High Performance Desktop PC System equipped with an Ethernet TCP/IP serial port for communication with the CONTRACTOR Control System (good for communication up to 300').
- Animated graphical displays of the turbine, generator, and auxiliary system analog and digital parameters.
- Historical logging and trending system that can store/display historical data.
- Includes the capability to provide periodic reports
- Provides the capability to start, stop, and control the gas turbine generator system after a manual switch on the Turbine Control Panel is switched to remote control.

Professional Engineering Stamp

California Professional Engineering stamp of foundation, loading drawings, fire system drawings and concentration calculations are provided.

Codes and Standards

Contractor considers the applicable sections of the following US and ISO Codes and Standards to be the most relevant standards for gas turbine equipment. Our designs and procedures are generally compliant with applicable sections of the following:

ANSI A58.1	Minimum Design Loads for Buildings and Other Structures
ANSI B1.1	Unified Inch Screw Threads
ANSI B1.20.1	Pipe Threads
ANSI B16.5	Steel Pipe Flanges and Flanged Fittings
ANSI B16.9	Factory-Made Wrought Steel Butt Welding Fittings
ANSI B16.21	Non-Metallic Flat Gaskets for Pipe Flanges. (Spiral-wound gaskets per API 601 may be used, particularly in turbine compartment piping)
ANSI B31.1	Pressure Piping and Gas Turbine Piping Systems Comply
ANSI B133.2	Basic Gas Turbine
ANSI B133.3	Gas Turbine Auxiliary Equipment
ANSI B133.4	Gas Turbine Controls and Protection Systems
ANSI B133.5	Gas Turbine Electrical Equipment
ANSI B133.8	Gas Turbine Installation Sound Emissions
ANSI/NAFPA 12	Carbon Dioxide Extinguishing Systems
ANSI/NFPA 70 National Electrical Code	
ANSI/IEEE C37.90	Standard for Relays and Relay Systems Associated with Electrical Power Apparatus
ANSI C37.90A/ EEE-472	Guide for Surge Withstand Capability (SWC) Tests
ANSI C50.10	General Requirements for Synchronous Machines
ANSI C50.14	Requirements for Combustion Gas Turbine Driven Cylindrical Rotor Synchronous Generators

ANSI C57.94	American Standard, Guide for Installation and Maintenance of Dry Type Transformers
ANSI C83.16	Relays Associated with Electrical Power Apparatus
ANSI/IEEE 100	IEEE Standard Dictionary of Electrical and Electronic Terms
ANSI/NEMA MG1	Motors and Generators
ANSI/NEMA MG2	Safety Standard for Construction and Guide for Selection, Installation and Use of Electric Motor and Generators
ANSI S1.2	Method for the Physical Measurement of Sound
ANSI S1.4	Method for the Measurement of Sound Pressure Levels
ANSI S1.13	Specification for Sound Level Meters

Once Through Steam Generator

Introduction

The Once Through Steam Generator (OTSG) is designed to match the operating characteristics of the GE gas turbine to provide the optimum performance for the total power plant cycle. The OTSG is designed to be fully integrated into the combined-cycle system and includes required inlet/outlet ductwork, structural supports, piping and accessories.

Significant features of the OTSG are:

- Modular box design provides short installation cycle
- Fast startup and shutdown capability
- Operational flexibility

General Description

The OTSG is a single-pressure level, non-reheat, unfired, forced circulation type steam generator with vertical gas turbine exhaust gas flow through horizontal tube heat transfer sections. The heat transfer sections are configured to obtain optimum exhaust gas energy utilization based on thermo-economic considerations. The typical heat transfer section configuration is shown on the OTSG Flow Diagram in the Mechanical/Fluid Systems Diagrams Attachment 1.

Feedwater flows through the heat transfer sections counter to the exhaust gas flow and is progressively heated, evaporated and superheated as it passes through the unit.

Heat transfer in the OTSG is accomplished through convection in the banks of externally finned tubes. The tube and fin geometry and tube pitch configuration are selected to match the specification and to optimize the performance. The tubes are made of material capable of exposure to high temperatures.

The OTSG casing and ductwork are welded construction, gas tight, and stiffened to withstand internal gas pressure and external loads. The casing and ductwork are insulated and lagged to reduce heat loss and provide personnel protection. The insulation and lagging is applied internally. The insulation and lagging materials, finishes and application methods are selected to meet the environment and the operating parameters of the gas turbine.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Casing and duct work may be insulated internally or externally depending on the final configuration. The insulation is designed to limit surface temperatures as required by the contract. Internal insulation and liners are typically pre-installed at the factory; external insulation and lagging is typically installed in the field. Vents and drains required for the startup and operation of the OTSG are provided. In addition, all steam/water sample and chemical injection connections are provided.

A system of platforms, stairways and ladders is provided for inspection and maintenance access to valves, instrumentation and access doors. Each lane is typically equipped with an access door.

The OTSG will be supplied by Innovative Steam Technology (IST) who have been reviewed and approved by Contractor.

The preliminary combined-cycle water, steam and exhaust gas circuits are shown on the Heat Balance Diagrams contained in Attachment 1.

The water, steam and exhaust gas terminal points, and the typical control and instrumentation device arrangement, are shown on the OTSG Flow Diagram contained in the Mechanical/Fluid Systems Diagrams Attachment 1.

Codes and Regulations

The OTSG proper is designed and fabricated in accordance with the rules of Section I and Section VIII of the ASME Boiler and Pressure Vessel Code.

The OTSG external piping is furnished in accordance with the requirements of ANSI/ASME B31.1, Power Piping and ASME, Section I, Boiler and Pressure Vessel Code.

For purposes of establishing a base, the editions of the ASME and ANSI/ASME at the contract date are utilized. Where actual design of the equipment to the requirements of codes and standards mandated by the date of contract award or thereafter result in a change in the cost of the equipment and/or services provided. The contract price shall be adjusted accordingly.

OTSG Major Components (Typical)

Heat Transfer Sections

Feed water flow through the inlet is counter to the exhaust gas flow, from the inlet to the outlet header through the multi-pass arrangement of finned tubes. The tube sections in the OTSG are such that no discernible distinction is made between economizer, evaporator and superheater.

High Pressure Section

Feed water is piped from the feed water system to the inlet header from which it flows through an arrangement of finned tubes to the outlet header. The flow is counter to the exhaust gas flow. The super heater section raises the steam temperature from saturation to a superheat temperature consistent with the gas turbine exhaust gas conditions and requirements of the steam turbine.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Gas Turbine Exhaust Ductwork System and Stack

An exhaust ductwork system is provided to deliver the gas turbine exhaust gas from the gas turbine through the OTSG.

The exhaust gas stack on an OTSG is typically rectangular and is typically an extension of the ductwork.

A stack damper and silencer are supplied. The ductwork system is designed to minimize pressure drop and distribute the exhaust gas uniformly.

Emission test ports are provided in the stack for emission testing along with associated access and personnel protection, where required.

Selective Catalytic Reduction Catalyst (SCR)

The selective catalytic reduction (SCR) system is designed to reduce nitrogen oxides (NOx) pollution in the gas turbine exhaust gas to a level stated in the "Performance Guarantees" Attachment 6 of this document.

The SCR system is comprised of a NOx catalyst supported within a modular framework. This module, together with inlet and outlet flanges and transitions, becomes an integral portion of the OTSG. It is positioned within a specific temperature range along the gas path in order to support the catalytic reaction involved in the removal of nitrogen oxides from of the exhaust gas. An ammonia injection grid with an aqueous ammonia system is also supplied as part of the SCR system. The grid is located upstream of the catalyst. The control unit, in response to sensors and instrumentation, regulates ammonia dilution and injection. A skid-mounted ammonia flow control unit including two (2) ammonia dilution air fans and motors, ammonia/air mixing chamber, aqueous ammonia evaporation system and dilution air heater is provided as part of the complete system.

The OTSG is capable of operating dry with out and heat transfer upstream of the catalyst. Two dilution air fans are provided. The air dilution system is sized to reduce the dry run temperature entering the OTSG to 800°F which corresponds to the SCR operating temperature.

The SCR Catalyst shall have a design life of five (5) years

Oxidation Catalyst (OC)

The oxidation catalyst (OC) system is designed to reduce carbon monoxide (CO) in the gas turbine exhaust gas to a level stated in the "Performance Guarantees" Attachment 6 of this document.

The oxidation catalyst module shall consist of suitable substrate, washcoat and catalytically active material bonded together.

Catalyst materials shall be shop-fabricated into a removable module that can be easily slipped in or out of the housing.

The CO Catalyst shall have a design life of six (6) years

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Support Structure, Stairways, Ladders and Platforms

The OTSG heat transfer sections, inlet/outlet ductwork systems are supported by a structure designed in accordance with the equipment data, the site conditions and applicable structural codes and standards.

Stairways, ladders and platforms are provided for operation and maintenance access to valves, instrumentation, stack damper motor, and emission test ports. All stairways and platforms are provided with handrails and kick plates. Platform grating and stair treads are typically open, hot dipped galvanized.

Piping

OTSG interconnecting piping is provided to transfer the water and steam between the heat transfer sections and OTSG modules.

Accessories

Instrumentation, controls and valves are provided in accordance with the OTSG Flow Diagram contained in the Mechanical/Fluid Systems Diagrams Attachment 1and in accordance with ASME, Section I, Boiler and Pressure Vessel Code.

The OTSG shall be given a final coat of primer in the shop. Touch up primer shall be shipped with the OTSG to the field for use by the BOP Contractor.

City Inspection

The City has the right to inspect the OTSG and parts thereof during fabrication to verify that the equipment/materials are supplied in accordance with the Scope of Work. A fabrication schedule will be submitted to permit the City to select appropriate times for inspection.

CONFIDENTIAL INFORMATION

Continuous Emissions Monitoring System

Scope

Contractor will provide one (1) CEM / DAHS system to monitor GTG exhaust gas emissions at the inlet to the SCR and at the Exhaust Stack exit. The equipment offered shall measure NOx emissions at the SCR inlet and NOx, CO, NH3 slip, and O2 at the Exhaust Stack Outlet.

The system proposed is a fully extractive sampling system. An 8ft x 10ft x 8ft walk-in shelter is provided to house the system components and is provided with a wall-mounted HVAC unit. The system will also consist of:

- Wall Mounted HVAC for shelter interior climate control
- Fully Extractive Sampling and Conditioning system
- Analyzer equipment to monitor NOx, CO, NH3 slip, and 0_2
- UPS (with 2.5 hour power supply) for PLC & Analyzers
- Multipoint Sample Probe for Stack Mounting (maximum flue gas velocity of 111 ft/sec)
- Single point probe for SCR inlet monitoring
- Field trimmable sample Umbilical Line (estimated length of 300 ft.) 150 ft. per sample point
- Calibration Gas Equipment Assembly
  - Startup / Initial run calibration gases
  - Gas Regulators for daily calibration gases
  - Gas cylinders & cylinder holders
- Data Acquisition & Handling System (DAHS)
  - DAHS Hardware in Control Room
  - DAHS Software /40 CFR Part 60 Configuration for Regulatory Reporting
- SCAQMD System RTU/Chart Recorders
- CEMS Plan, Test Protocols, QA/QC Plan, & Preliminary Monitoring Plan

The additional services are as follows:

- Start-up Technical Assistance: 4 days on site
- Training for Operators:
  - DAHS Operator Training – 1 day
  - Standard CEMS Training - 1 day
- Certification Testing and Support – 2 days

Acoustic enclosure	Pre-engineered steel structure (approximately 45'W x 65'L x 30'H)	STG Enclosure walls, roof, doors and ventilation system is based on meeting the in-plant and community noise level requirements
Instrument Air Compressors	skid-mounted, 2x 100% capacity air compressor	250 scfm 130 psig Outlet Dewpoint -40 deg F
Fuel Gas Compressors	2 x 100% skid mounted fuel gas rotary screw compressor	Min. Inlet pressure: 164.5 psig Outlet pressure: 730 psig Flow: 13 MMSCFD
Inlet Air Chiller	two (2) water cooled centrifugal chillers (2 x 50%)	Target Temp: 54 Deg F Capacity: 1720 tons total Flowrate: 2717 GPM
Electric Auxiliary Boiler	1x100% steam generator for steam seals and condenser sparging	Capacity: 1500 lb/hr Pressure: 150 Psi Electrical rating: 469 kW; 3 phase, 600V
Electric Seal Steam Superheater	1x100%	1,500 lb/hr 150 psi

Equipment Descriptions

Condenser

The unit will be equipped with a steam surface condenser. The condenser will be used to condense the exhaust steam from the steam turbines and deaerate the condensate prior to its use in the system. The condenser is also used to condense the dump steam during by-pass operation. Major components of the condenser include, but are not limited to the following:

- Hotwell sparging system
- Steam bypass dispersion headers internal to condenser
- Tubesheet leak detection trough

Boiler Feed Pump

Two (2) x100% boiler feed pump shall be provided. The feed pump is an electric driven multistage ring section variable speed design. The pump takes suction from the condensate pump and feeds to the HP section of the OTSG.

A multi stage ring section type pump is used for reliability and for easy maintenance. Minimum flow protection is provided by a pneumatic type minimum flow control valve (supplied by PIE Contractor) for each pump.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Condensate Pump

Two (2) x100% condensate pump is supplied to transfer water to the boiler feed pump. A canned type pump is provided.

Minimum flow control is provided by a condensate recirculation flow control valve (supplied by others) located downstream of the gland steam condenser.

Condensate Purification Equipment

The following condensate purification equipment required for the once through steam generator design includes:

- 2x100% full flow precoat type polishers
- Isolation valves
- Instrumentation for monitoring and control
- Base mounting of equipment for easy field installation

Critical Control Valves

Contractor will supply loose the following critical control valves for the power island:

- HP bypass valves (and desuperheating control valves)
- HP feed pump recirc valve

The valves shall be supplied with the proper trim design to ensure proper operation over the full range of operation and shall also be provided with feature necessary to stay within required noise limits.

Acoustic Enclosure

STG Enclosure walls, roof, doors and ventilation system is based on meeting the in-plant and community noise level specified.

- Building frame designed for the applicable codes and local conditions present in Pasadena, California
- Acoustic assemblies consist of a galvanized 24 gauge exterior cladding (standard 1½" deep profile), a custom blended acoustic insulation and a galvanized custom perforated interior liner
- Pre-engineered steel structure: removable walls and roof and personnel access doors with perimeter seals
- Ventilation system design based on a total equipment heat rejection of 110 kW
- Four (4) wall mounted air intakes, Two (2) 5 hp roof ventilators, 8 7kw unit heaters

Instrument Air Compressor

Contractor will provide one (1) skid-mounted, 2x 100% capacity air compressor sufficiently sized for the instrument air requirements for the LM6000 PG GTG package and combined cycle power island equipment. The air compressor system will be a self-contained package including:

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

- a PLC control and indicator panel,
- air dryer,
- coalescing pre-filters,
- particulate after-filters
- air receiver

Instrument Air Compressor System design specification is as follows:

Compressor Type	Rotary screw (Oil free)
Rated Flow, scfm	250
Rated Pressure, psig	130
Air Dryers	Dual Tower Desiccant (Heatless)
Outlet Dewpoint (^{o}F)	-40
Receiver Capacity (gallons)	1060

Fuel Gas Compressor

Contractor will provide a 2 x 100% skid mounted fuel gas rotary screw compressor systems for the LM6000PG combustion turbine. Each of the (2) two skid mounted gas compressor skids will provide the fuel gas flow required for one (1) LM6000 GT. Each of the two (2) gas compressor systems are skid mounted and includes the following equipment:

- One (1) Inlet Suction Scrubber
- Rotary screw type gas compressor
- Electric motor,
- Oil separator
- Duplex Fuel Gas Filter/Coalescer
- Lube oil pump
- Shell & tube cooler for lube oil
- Fuel gas recycle valve
- Fuel gas discharge shell & tube cooler
- PLC control panel
- Isolation valves and appropriate instrumentation
- Sound Attenuation walls to reduce near field noise to $\leq$ 85 dBA.

Gas compressor design basis is as follows:

Parameter	Units	Value
Gas Type		Natural Gas
Fuel gas Inlet pressure (minimum)	psig	164.5
Fuel gas inlet pressure (maximum)	psig	200
Fuel gas Inlet flow	MMSCFD	13

Fuel gas Suction Temperature	^{o}F	77
Fuel Gas Compressor outlet pressure	psig	730

GTG Inlet Air Chilling/Heating

Contractor will provide a packaged modularized inlet air conditioning system that will allow for conditioning of the GT inlet air. The system is designed to operate in the following air conditioning modes:

- GT Inlet Air Chilling
- GT Inlet Air Heating

In the inlet air chilling mode, the turbine inlet combustion air temperature is decreased for the LM6000 PG GTG package to maintain the desired power output during hot day conditions. The package consists of two (2) water cooled centrifugal chillers (2 x 50%) mounted on a heavy structural steel skid with packaged piping, valves, chilled water pumps, MCC's and controls installed and pre-wired. The chiller system will be prefabricated to the maximum extent possible such that field installation consists of setting chiller skids on the customer provided foundations, connecting utility services and control interfaces, and interconnecting chilled water and cooling water piping between modules and cooling coils.

The package is designed to require a single MV power feeder and a single LV power feeder. All MV and LV MCC's, bus connections, and step-down transformers to utility and control voltages are included and pre-wired within the chiller package to minimize field wiring required at the site. All switchgear, starters, and control enclosures are located in the climate controlled "dry room" within the overall package enclosure. A weatherproof insulated enclosure will be provided over the skid to provide weather protection and acoustical attenuation as well as thermal insulation:

The design basis for the GTG Inlet air chilling mode is:

Elevation		751 ft.
Ambient Design Point Dry Bulb Temperature		97 ^{o}F
Ambient Design Point Wet Bulb Temperature		77.34
Target T2 GT inlet air Temperature		54 ^{o}F
Chilling Tonnage		(2 x 860 Tons) 1720 tons total
Chiller Plant Parasitic load		
Fluid	Water/Dynalene HC-10	1,212 kW
	Water/25% Propylene Glycol (PG)	1,264 kW
Condenser Water Flow Rate		2717 GPM
Condenser Water Supply Temperature		85 ^{o}F

***Note:** The above design parameters are estimates and are subject to modifications during the detailed design phase project execution phase.

The chilling system proposed will consist of:

- Two (2) 860 TR Nominal Centrifugal Chillers (4160 V, 60 Hz Motors)
- 3 x 50% Primary fixed speed Chilled Water Pumps
- Allen Bradley PLC Control System
- Structural Steel Base
- Factory Packaged Enclosure painted Ameron PSX700 GE Pearl Grey
- HVAC Unit for module climate control
- Exhaust Fans and Louvers
- Refrigerant Monitoring and ventilation per ASHRAE 15
- Lifting Lugs
- Low Voltage (LV) MCC
- High Voltage (HV) MCC
- Service Monorail for pumps
- Temperature Control Valves

In inlet air heating mode, a shell & tube heat exchanger is provided. The heat exchanger will utilize extraction steam from the Once Through Steam Generator (OTSG) to heat the fluid contained within the chilled water closed loop. The system will utilize the chilled water pumps and temperature control valve to provide the hot water flow to the GTG inlet coils in order to increase the GTG inlet air temperature. The heat exchanger skid for inlet heating will include:

- One (1) Carbon Steel Shell & Tube Heat Exchanger designed and constructed to ASME Sec. 8 Div. 1
- Miscellaneous valves and fittings
- Painted Carbon steel base frame.

The design basis for the GTG Inlet air heating mode is:

<table>
<tr><td colspan="3">Ambient Design Point Dry Bulb Temperature</td><td>32 ^{o}F</td></tr>
<tr><td colspan="3">T2 GT inlet air Temperature</td><td>140 ^{o}F</td></tr>
<tr><td rowspan="6">Heated Fluid Coil data</td><td rowspan="3">Dynalene –HC10</td><td>Coil Entering Fluid Temp</td><td>145 ^{o}F</td></tr>
<tr><td>Coil Leaving Fluid Temp</td><td>128.3 ^{o}F</td></tr>
<tr><td>Fluid Flow rate</td><td>2500 GPM</td></tr>
<tr><td rowspan="3">25% PG</td><td>Coil Entering Fluid Temp</td><td>145 ^{o}F</td></tr>
<tr><td>Coil Leaving Fluid Temp</td><td>128.7 ^{o}F</td></tr>
<tr><td>Fluid Flow rate</td><td>2500 GPM</td></tr>
<tr><td colspan="2" rowspan="3">Heat Exchanger Supply steam properties</td><td>Pressure</td><td>167.7 psia</td></tr>
<tr><td>Temperature</td><td>570 ^{o}F</td></tr>
<tr><td>Mass flow rate</td><td>17.37 kpph</td></tr>
</table>

***Note:** The above design parameters are estimates and are subject to modifications during the detailed design phase project execution phase.

A central *controls system* will be provided for controlling the entire inlet air conditioning system for heating and cooling modes. The system proposed will monitor and control the chiller and all chiller related auxiliary equipment. Operation and monitoring of the system will be provided, locally, through full color graphical touch screen HMI interface mounted in the package which will control gas turbine inlet temperature from operator selection of gas turbine inlet temperature target.

To be supplied by others:

- MV and LV electrical feeds to the module electrical room.
- Cooling Water interconnect piping for chiller condenser heat rejection from plant cooling tower.
- Chilled water Interconnect piping between Chiller Package, Shell & Tube Heat exchanger, and GTG inlet Air Coils.
- Extraction Steam interconnect piping between Inlet heating Shell & Tube heat exchanger skid and OTSG extraction steam header (or designated tie-in point)
- Extraction Steam pressure control valve to condition supply steam from OTSG to the heat exchanger design conditions.
- External electrical and controls wiring
- First fill of Chilled Water Fluid (Dynalene HC-10)

Duplex Fuel Gas Filter Coalescer

Contractor will supply one (1) skid mounted, duplex (2 x 100%) coalescing gas fuel filter skid. The skid will be placed near the gas turbine generator package. Fuel gas piping will consist of carbon steel upstream of the duplex coalescing filter skids, and stainless steel downstream of the skids. The skid will come complete with following design features:

- Vessel to be ASME Section 8 Div. 1 (2001 Edition) designed and code stamped
- Vessel to include separator designed for removal of 99.9% of particles (1 micron or larger)
- Stainless steel piping construction (304)

Instrumentation to include pressure gauges, level gauges, and pressure safety relief valves relief valves

- Isolation manual valves for maintenance purposes

SYSTEM DESCRIPTIONS

Main Steam System

The Main Steam System transfers steam from the Once Through Steam Generator (OTSG) to the steam turbine. The main steam system consists of the high pressure (HP) steam system.

HP steam exits the HP OTSG superheater and is directed to the HP steam header through a stop check valve. The HP steam supply from the OTSG is provided with a bypass valve. The bypass valve is used for turbine startup and during plant upset conditions.

Instrumentation for measurement of pressure, flow, and temperature is provided. Drain valves and drain pots are provided as required to ensure proper removal of condensate from all steam lines during startup, shutdown, and normal operation.

Auxiliary Steam System

The auxiliary steam system is used to provide seal steam for the steam turbine shafts.

During normal operation seal steam is supplied from the HP steam system. During plant startup seal steam is provided by startup seal steam boiler.

The startup seal steam boiler also allows vacuum to be maintained overnight.

Auxiliary and seal steam temperature and pressure control will be provided as required by the final steam turbine design.

Contractor will furnish a packaged type, factory assembles electric auxiliary steam generator.

The boiler will furnish saturated steam for steam turbine seals and sparging. It will include a digital controller with a Modbus link for supervisory plant controls. The vessel shall be constructed in accordance with ASME Boiler Code.

An auxiliary feed pump will be included and would operate in parallel with the condensate pumps to forward condenser water to the auxiliary boiler.

Contractor will furnish an electric seal steam superheater to provide the required steam conditions.

Condensate System

The condensate system condenses the exhaust steam from the steam turbine and transfers the condensate to the boiler feed pump. The condensate system also supplies water for bypass desuperheating, chemical injection, hood spray, etc.

The condensate system consists of the following major components:

- Water Cooled Condenser
- Condensate Pump
- Gland Exhaust Condenser
- Vacuum pumps
- Condensate Purification System

The condenser is used to condense the exhaust steam from the steam turbine. Proper condensate level is maintained automatically by adding makeup water when necessary and dumping excess water when necessary to stay in the proper control range.

Two (2) x100% condensate pumps are provided. The condensate pump transfers condensate from the condenser to the boiler feed pump suction. Minimum flow protection is provided by the use of a minimum flow control valve. This valve also provides minimum flow through the gland exhaust condenser.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Condensate Purification

A pre coat type polisher system is used to supply the OTSG with the proper quality feed water.

The system consists of 2x100% ASME vertical filter vessels, each with a set of filter elements with powdered resin coating. Dissolved solids are captured in the pre coat and suspended solids are retained in the surface of the filter elements. When the filters are at capacity, they are taken off service, backwashed, and a new layer of resin is applied.

The system is controlled by a local PLC. Backwash and recoating are manually initiated by the operator based on system operating parameters. The actual backwash and recoating operations are fully automated.

Additional equipment includes recirculation pump skid, injection pump skid, backwash receiving tank, air receiver, and dewatering bags.

Condenser Air Removal System

The purpose of the condenser air removal system is to create and maintain the condenser vacuum by removing air and non-condensable gases.

Two (2) by 100% liquid ring vacuum pumps are supplied. During hogging both pumps are operated to evacuate the condenser. For vacuum holding operation one pump is in operation and the second pump is in standby.

Cooling is provided through the auxiliary cooling loop system.

Feedwater System

The feedwater system delivers feedwater from the condensate pump discharge to the HP section of the OTSG.

The OTSG is provided with two (2) x100% multi stage ring section type feedwater pumps.

The required minimum flow through each pump is provided by pneumatic minimum flow recirculation control valve.

Feedwater is also used for HP steam desuperheating.

Circulating Cooling Water

Circulating cooling water is provided by two (2) x 100% capacity circulating water pumps located in the cooling tower basin. The circulating cooling water flows from the bottom of the cooling tower to the cooling tower basin. The circulating water pumps discharge into a common header which supplies cooling water to the surface condenser. The circulating water is heated as it passes through the surface condenser. The hot circulating water discharges from the surface condenser and is directed back to the cooling tower.

Three x 50% auxiliary circulating water pumps are provided in the same basin. These pumps supply cooling water to the auxiliary cooling water heat exchangers, the vacuum pumps and the inlet chilling

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

system. Water is returned via the condenser circulating water return line to the cooling tower. This cycle operates independent of the main circulating water pumps to permit simple cycle operation without running the main circulating water pumps.

The evaporative cooling tower is an in-line, multi-cell, counter-flow, mechanically induced draft design. The circulating water is directed to the top of each cell by means of riser pipes and directed to a distribution header from where it is discharged through spray nozzles. The water is cooled by evaporative cooling and sensible cooling as it falls down the tower packing, and comes in contact with cooling air drawn by fans mounted on the top deck of the cooling tower.

The cooling tower blow down is taken downstream of the circulating water pumps. Raw water is used to make up the circulating water losses due to evaporation, drift and blowdown. Raw water header from the plant boundary will be divided to supply make up water to the cooling tower basin and water to other miscellaneous users.

The cooling tower will be supplied to meet the slope requirements of the cooling tower basin, to be designed by the BOP contractor. Any additional fiberglass column length has been accounted for by Contractor as part of this scope of supply.

Sampling and Analysis

The Sampling and Analysis System by BOP Contractor provides a means to monitor the performance of the steam-condensate-feedwater cycle, to monitor the quality of various process fluids and to provide sufficient data to operating personnel for detection of any deviations from control limits so that corrective action can be taken.

Samples are withdrawn from the system and directed to a centrally located sample panel. At the sample panel the steam and water samples are properly conditioned and then directed to the analyzers. Provisions for grab sampling are also provided at the sample panel.

The typical sample points and analyses are as follows:

Sample Point	**Analyses**
Condensate (before polisher)	Conductivity, pH
Condensate (after polisher, before chemical injection)	Conductivity, pH
Boiler Feedwater (condensate after chemical injection)	Conductivity, cation conductivity, pH, O2
HP superheated steam (one point per OTSG)	Cation conductivity, degassed cation conductivity, sodium
Auxiliary Steam	Cation conductivity
LP superheated steam (one point per OTSG)	Cation conductivity
Demineralized Makeup water	Conductivity (in situ)

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Circulating Water	Conductivity, pH

The component cooling water system for the steam turbine and gas turbine is monitored by periodic grab sample.

Final sampling system design (sample points, analyses) depends on the final plant design.

Steam Cycle Drains

The steam cycle drains system is divided into two separate subsystems: vacuum drains and atmospheric drains.

The vacuum drains are directed to a receiver header and then gravity flow back to the condenser hotwell.

The atmospheric drains are directed to a flash tank that is vented to atmosphere. These drains are pumped to the cooling tower basin.

CONFIDENTIAL INFORMATION

Terminal Points

General

This section along with the drawings included in the Drawings / Diagrams Section of this proposal define and locate the limits of supply, terminal points and interface points. Terminal points shown on the drawings take precedence over the information provided in this section. For specific terminal point conditions, refer to the "Design Criteria/Assumptions" Tab.

Terminal Points

Gas Turbine	
All piping, including Fuel Gas, Cooling Water, Demineralized Water, Lube Oil, Compressed Air, Instrument Air, Hydraulic Start Oil	Flanged or threaded connection on Contractor baseplate for turbine generator and accessory skids
Inlet Air-to-Filter	Atmosphere
Turbine Package Ventilation/Cooling Air	Atmosphere
Instruments on Contractor's Baseplate	Terminal box on baseplate
Instrument/ communication wiring in Turbine Control Panel	Terminal in Turbine Control Panel
High Voltage Connections	Bus bar in Contractor's Lineside cubicle
Generator Ground Connections	Contractor's Neutral cubicle
Electric Motors	Terminal box on individual motor
Ladders and Platforms for Air Filter	Ladders and Platforms for Inlet Air Filter maintenance only
DC Power Supply for Control System and Fire and Gas Systems	Terminal in Turbine Control Panel
Inlet Air Chiller chilled water supply and return	Flanged connections at the filter house and the chiller

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Steam Turbine	
Steam	Inlet to main stop valve , , Seal system connections, gland steam return, and Gland condenser inlet,
Condensate	Inlet/outlet to gland seal condenser and LP hood spray connection on casing
Cooling Water	Inlet/outlet to hydraulic coolers , Inlet/outlet to lube oil cooler and inlet /outlet of generator TEWAC cooler
Hydraulic Oil	Inlet/outlet to hydraulic power unit and connections at valves
Lube Oil	Inlet/outlet to lube oil skid and connections at turbine/generator bearing PURCHASER connections
Drains	Connections on stop and admission valves, Connections on turbine casing and Outlet to gland seal condenser
Non-Condensable	Discharge on gland seal exhauster
OTSG	
See M195 in the drawings section for OTSG terminal points	
MECHANICAL BALANCE OF PLANT	
Inlet/Outlet of supplied balance of plant equipment and at drain/vent connections. Refer to flow diagrams in Tab 34 for terminal points	

Electrical, Instrumentation and Controls

Generators	Generator Line Accessory Compartment (GLAC)
Generators	Generator Neutral Accessory Compartment (GNAC)
Data Line for Dedicated On Site Monitoring	A dedicated data line to each TCP is required for the On Site Monitor (OSM) system

Civil / Structural

Foundation Interface	At underside of equipment base

CONFIDENTIAL INFORMATION

Engineering and Design, Drawings and Documentation, and Customer Collaboration

Engineering and Design

General

Engineering design and drafting services will be consistent with Contractor's standard design practices and follow as closely as practical the Owner's specified requirements.

After contract award, a staff of competent discipline engineers will develop the Contractor Engineering work scope defined herein with timeliness and in accordance with the specific requirements of the project.

Product design for the equipment supplied by Contractor, such as the gas turbine, steam turbine, generator, Once Through Steam Generator (OTSG), Continuous Emissions Monitoring System (CEMS) and their related auxiliary components will be provided.

Systems and Thermal Engineering

The following engineering services are provided for the Combined-Cycle Power Plant:

- Definition of the system technical design criteria and requirements, including the plant operating modes, presentation of the performance data, and the plant control requirements.
- Definition of the power cycle and the performance guarantees
- Preparation of performance curves for the expected performance for base load operation including correction data and curves for ambient pressure, ambient temperature and condenser pressure or cooling water temperatures. The curves will provide the necessary corrections to the boundary conditions of Contractor's performance guarantee.
- Preparation of cycle heat balance and performance data for the guarantee points and part-load conditions for the site ambient temperature range.

© 2013 General Electric Company

CONFIDENTIAL INFORMATION

Civil and Structural Engineering

No civil or structural design work is included. However, Contractor will provide foundation interface data for the equipment supplied in terms of loading, anchor bolt location requirements, and embedment and foundation sleeve requirements.

Mechanical Engineering

The following items are considered part of the overall mechanical design work:

- Specification and supply of the following plant equipment as included in the contract scope of supply:
  - Gas Turbine Generator
  - OTSG
  - condensate polisher
  - steam turbine generator (STG)
  - main condenser and air removal equipment
  - boiler feed pumps, condensate pumps and circulating water pumps, air compressor, fuel gas compressor, chiller, electric auxiliary steam equipment and cooling tower.
  - Procurement support for above plant equipment includes preparation of specifications, and review and approval of the equipment vendor drawings and design documentation.
  - Mechanical interface data for the equipment supplied, including outline dimensions, interface locations for supports, piping connections, vent and drain sizes and locations and maintenance clearances.

Electrical Engineering

The following items are considered part of the overall electrical design work:

- Preparation of one–line diagrams for the Contractor supplied equipment illustrating major power equipment and power circuitry. These drawings will indicate the ratings of the major electrical apparatus, as well as identify the instrumentation and protective relaying functions being provided.
- Electrical interface data for Contractor supplied equipment, including location of junction boxes, electrical terminal points, and grounding connections to enable the Owner to complete the electrical design for the plant.
- Specification and supply of the step-up transformer

Controls Engineering

The following items are considered part of the overall controls engineering work:

- GTG, fuel gas compressor and chiller control systems and interface
- Preparation of functional requirements of the OTSG and BOP controlled items in Contractor scope in order for the BOP plant control system designer to furnish control system design. Logic drawings are not included.

© 2013 General Electric Company

- Preparation of the Purchase Specifications, purchasing, review of supplier documents and drawings for:
  - Turbine Bypass Valves
  - Continuous Emissions Monitoring System

The following work is not considered part of the overall Controls Engineering work included in the base scope of supply:

- Logic drawings for control loops in the Contractor scope of supply
- On site or remote Engineering support during commissioning of the DCS.

Units of Measure, Drawing Approval, and Instruction Manuals

- The station installation drawings are prepared in English and/or SI units of measurement based on contractual requirements. As soon as practicable after the work is started a distribution list will be established to dispatch to the Owner drawings, diagrams, and material lists in CD/DVD and on-line formats.
- The Owner's engineer may review the electrical one–line, turbine generator mechanical outlines and flow diagrams for the Contractor supplied equipment before their use is permitted. Errors detected in any drawings submitted will be corrected. A distribution list for dispatching to the Owner's engineer drawings and diagrams in CD/DVD and on-line format will be established as soon as practicable after the design work is started. The above approval will not be cause for waiver of any responsibility for discrepancies and errors made by others, but not detected in the examination.

The approval time–cycle will be per the contract requirements.

- Instruction manuals that describe the modes of equipment operation and the necessary on–site maintenance for all items described herein will be delivered to Contractor's collaboration tool.

Typical Drawings and Documentation

Refer to Attachment 11 – Document Delivery Schedule:

Customer Collaboration

The GE Customer Collaborative Environment is a single portal that provides a **secure platform** for seamless communication and workflow processes that take place between Contractor, its customers, and suppliers worldwide. It is a medium over which all phases of a GE Energy Products project can be executed, from plant conception, through development, design, construction, commissioning, and operation.

Unique and valuable tools that are accessible from the environment help our customers make decisions related to plant design, construction, and operation. Since the collaborative environment is an Internet-based technology, it can be accessed from anywhere in the world, at anytime.

© 2013 General Electric Company

CONFIDENTIAL INFORMATION

Commissioning and Startup

General

The City will be responsible for the plant overall construction, pre-commissioning, commissioning, startup and testing. Contractor will support the commissioning activities with technical personnel; along with one additional advisor (Contractor commissioning advisor) to coordinate with the City the commissioning of the Contractor supplied equipment. The support of the Contractor commissioning advisor is typically based on a firm to schedule plan. Should the time be extended and this support continues to be required by the City a change order will need to be issued.

The project includes for the Contractor scope of supply the technical direction required to perform component and equipment commissioning, startup and testing. Overall plant coordination and scheduling responsibilities remain with City. Contractor will provide input to the overall commissioning schedule for Contractor scope of supply as defined in the contract.

The commissioning, startup and testing of equipment, components, instruments and systems are performed in accordance with the requirements of the equipment manufacturers and their suppliers. Testing methods, procedures and techniques applied are conducted in accordance with Contractor's standard practices and applicable codes and standards as set forth in this contract as interpreted by Contractor.

During the commissioning, startup and testing period, documentation, test and data records are maintained using Contractor standard forms and procedures for Contractor Supplied equipment.

The City will supply qualified and experienced mechanical, electrical, instrumentation technicians and skilled construction crafts support with supervision, to support all phases of the commissioning, startup and testing

Contractor sub-supplier service engineers for checkout, testing, startup and initial operation of equipment, components and systems are arranged and will be scheduled, as required.

After completion of the commissioning, startup and testing Contractor will participate with the City and constructor in a walk down of Contractor supplied equipment and systems. Contract deficient items will be corrected or added to the project punch list for completion.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Scope of Work

Overall plant commissioning, startup and testing is divided into pre-commissioning support, commissioning and startup and testing advisory services. Services provided during these activities include coordinating with the City in preparing testing procedures for Contractor scope of supply. A commissioning advisor will be mobilized to technically supervise and provide coordination to complete the Contractor scope of supply commissioning, startup and functional testing per contract requirements.

Pre-commissioning Support

The Contractor commissioning advisor will provide input to the City's constructor in the field pre-commissioning activities to facilitate an efficient commissioning, startup and testing of Contractor equipment. The commissioning advisor will review necessary prerequisite component and system testing, cleaning, flushing, initial checkout and testing procedures and provide comments.

Contractor will provide recommended system turnover dates for the Contractor supplied equipment to support the planned first fire date.

City will develop pre-commissioning and system cleaning procedures. These procedures will be mutually agreed between the City and Contractor commissioning advisor where these systems interface with Contractor scope of supply.

Commissioning

The City has the overall plant commissioning management responsibility and to lead the commissioning, plant integrated functional testing, operation supervision of the power plant during pre-commissioning, commissioning, and system startup and testing until final acceptance.

Commissioning activities closely follow the construction and pre-commissioning activities and will commence after the system has been turned over from the constructor to the City's commissioning team. Prior to commencing the technical direction of Contractor's scope of supply, Contractor must accept, along with the City's commissioning team, the system turnover packages from construction for Contractor equipment.

The Contractor commissioning advisor will coordinate with the City's commissioning team in implementing the commissioning related administrative activities as it applies to Contractor's scope of supply. Typically the following:

- Attend daily startup meetings
- Give inputs to "Startup Plan of the Day"
- Give inputs to startup "Critical Action Item" list
- Establish "Startup Field Report" program for engineering support of field issues
- Give input to a control room log
- Maintain commissioning startup and testing records for Contractor's scope of supply

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Plant Startup and Testing Services

In addition, the Contractor commissioning advisor will provide technical advice the following typical startup and operational tests to demonstrate Contractor equipment operation and shutdown as defined in the contract. All startup and testing will be done in accordance with Contractor standard procedures and contract requirements:

- Advise on the checkout of Contractor equipment control logic
- Coordinate the Combustion system tuning
- Coordinate the Over speed trip test (if required)
- Coordinate Contract required operation testing to demonstrate Contractor equipment operation
- Coordinate the final turnover documents and coordinate orderly turnover of Contractor supplied equipment to the City's Plant Operations and Maintenance (O&M) personnel

City's Responsibilities

The City Construction and pre-commissioning of all plant equipment and systems, including Contractor scope of supply, in accordance with the design & specification requirements, including but is not limited to the following activities:

- Construction completion in accordance with the design & specifications
- Inspect, lubricate, stroke, adjust/set switches, etc. on manual, motor-operated and control valves and dampers
- Test and calibrate Contractor supplied plant and skid-mounted instrumentation as required. Flow meters (fuel, water and Sprint) must be removed for calibration. Calibration records are to be included in the turnover package.
- Craft labor and supervision, technicians, standard and special tools and services to calibrate, set and injection test all meters and protective relays
- Perform equipment cold alignment checks
- Initial motor uncoupled run-in checks, including vibration, temperature rise, in rush current test and balance (if required)
- Remove, inspect and reinstall orifice plates, flow nozzles and control valve spool pieces
- Ensure adequate supply of demineralized water to accommodate pre-commissioning testing and cleaning
- Hydrostatic testing of piping, vessels, OTSG, etc.
- Ground grid testing
- OTSG & Steam Systems Chemical Cleaning
- Steam systems Cleaning
- System Flushing

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

- Setting and testing of all facility relays based on coordination study. This includes the primary and/or secondary injections to fully function test, calibrate and commissioning all relays associated with the facility.
- Continuity check of the electrical cables and "Cold Loop Checks"
- Megger test and high voltage insulation testing of electrical cables
- Phase and rotation checks for electrical motors
- Conduct pipe hanger surveys and set hangers to cold and hot settings

Lead the system turnover process, including but not limited to system construction & pre commissioning completion, assembling the turnover packages, quality documentation, system walkdowns and obtain Contractor acceptance prior to system turnover to Contractor commissioning for Contractor's scope of supply.

All craft labor, craft labor supervision, technicians, materials, consumables, initial fills, refills and top offs, standard tools, special tools and temporary equipment to perform all commissioning, startup and testing. This support will be required to be scheduled seven (7) days a week with 24 hours a day coverage as required.

Technicians to support electrical, instrument and control Hot Loop checks for all systems.

Storage, testing, treatment and disposal of all facility generated effluents.

Plant Chemistry Program implementation including Chemists, Technicians, Chemicals, Specific Chemical Injection Quantities and Rates, and Analysis Equipment.

Required analysis of gases and fluids including but not limited to demineralized water, fuel oil, fuel gas, lube oil and hydraulic oil.

For the systems where the City designed the Control Software, the City will assign to the site the necessary controls engineers to commission that software and equipment.

Support Contractor with all required Commissioning Reports, Plant Trip and Unplanned Event Reports

Routine equipment maintenance during the commissioning, startup and testing.

Contractor and the City will agree on the appropriate site EHS program, including the specific program to cover the Lock Out/Tag Out (LOTO) procedure. The City will implement the agreed to LOTO program.

All startup consumables, spare parts and materials.

CONFIDENTIAL INFORMATION

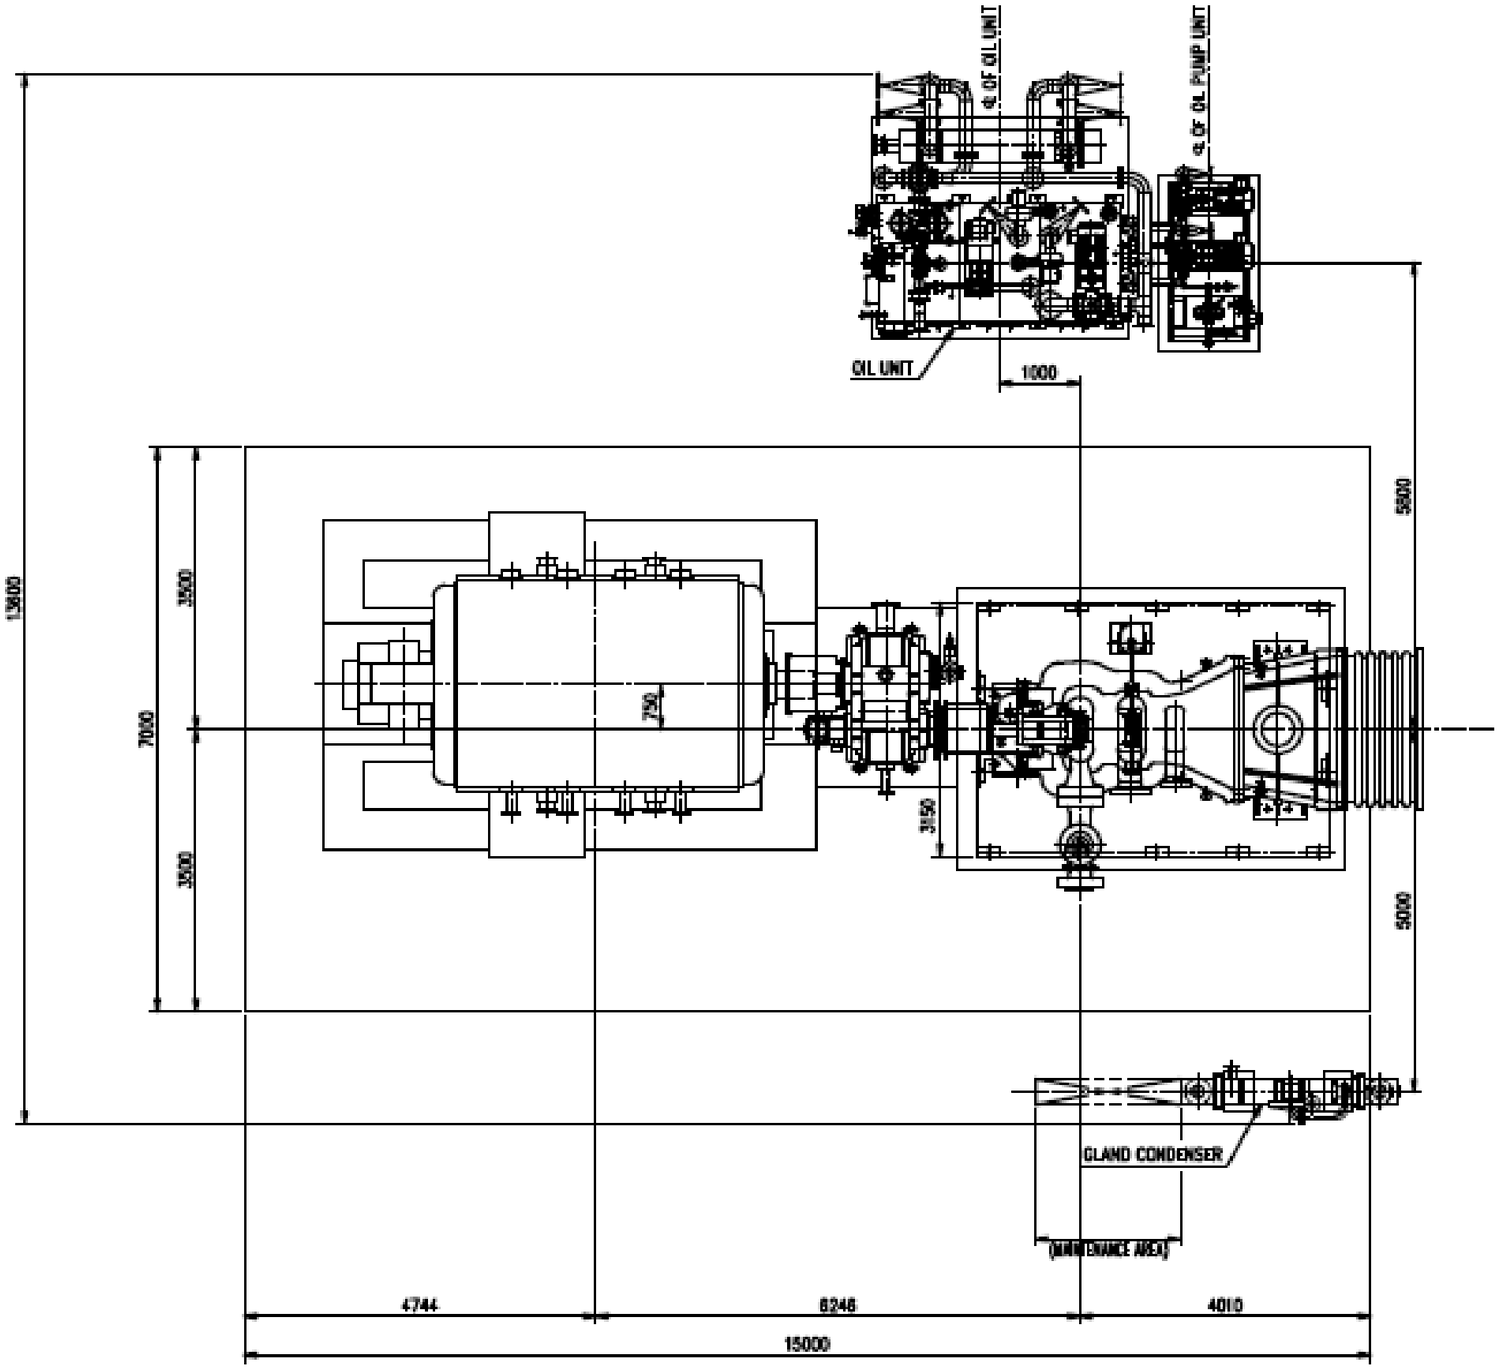
Steam Turbine & Generator Overview

Preferred Supplier: Shin Nippon Machinery Co., Ltd., subsidiary of SUMITOMO

Model: C8-R11-RX

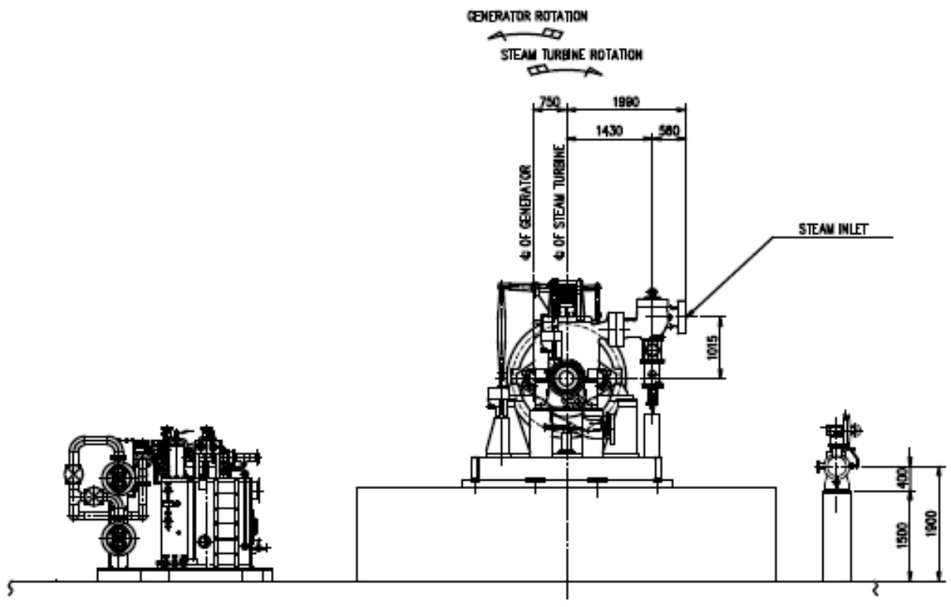
Steam Turbine Manufacturer: Shin Nippon (Mfg. Location – Japan)

Generator: Hyundai Ideal (Mfg. Location – USA)

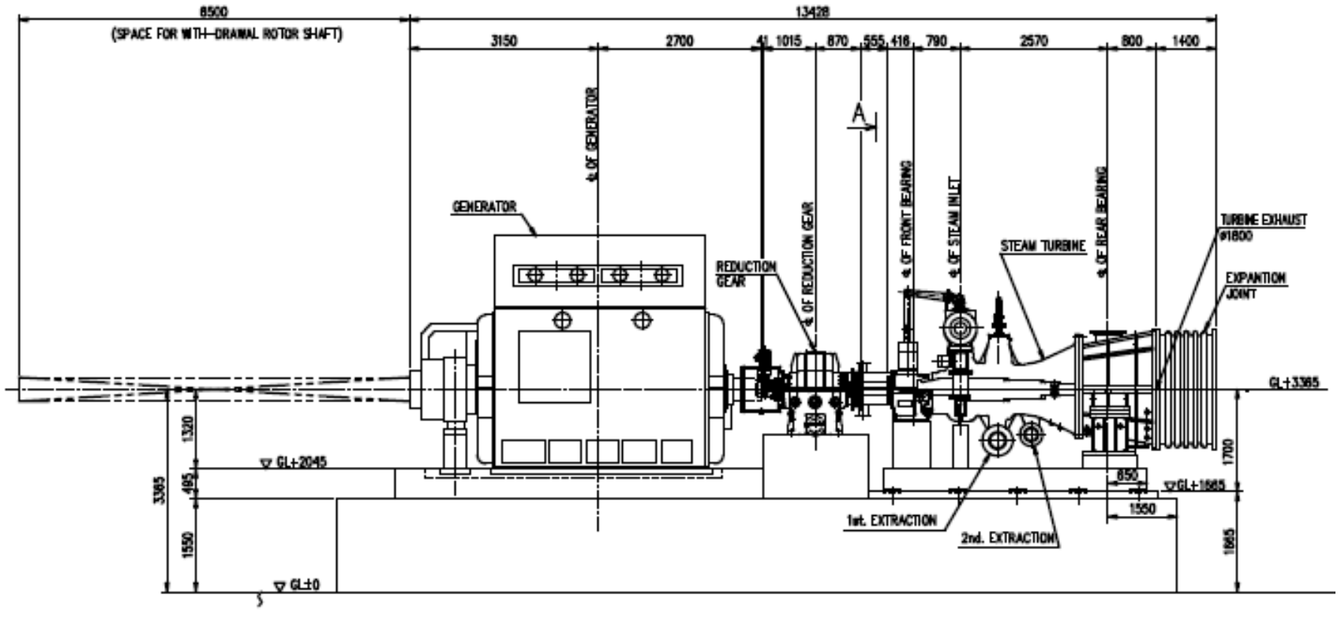


Steam Turbine Design: Horizontal axial flow, impulse, multistage condensing, non-extraction, gear reduction

- Rated output – 15.26MW
- Operating conditions – 6200/1800rpm, inlet press – 373psia, inlet temp – 849F, exh press – 1psia, max flow – 128,040 lbm/hr @ 1psia



Generator Design: TEWAC, Horizontal brushless synchronous generator



- Rated output – 15.26MW
- Operating conditions – 1800rpm, 17,952KVA, 0.85PF, 3Ph-60Hz, 13,800V, WYE conn, continuous duty

Steam Turbine & Generator Overview

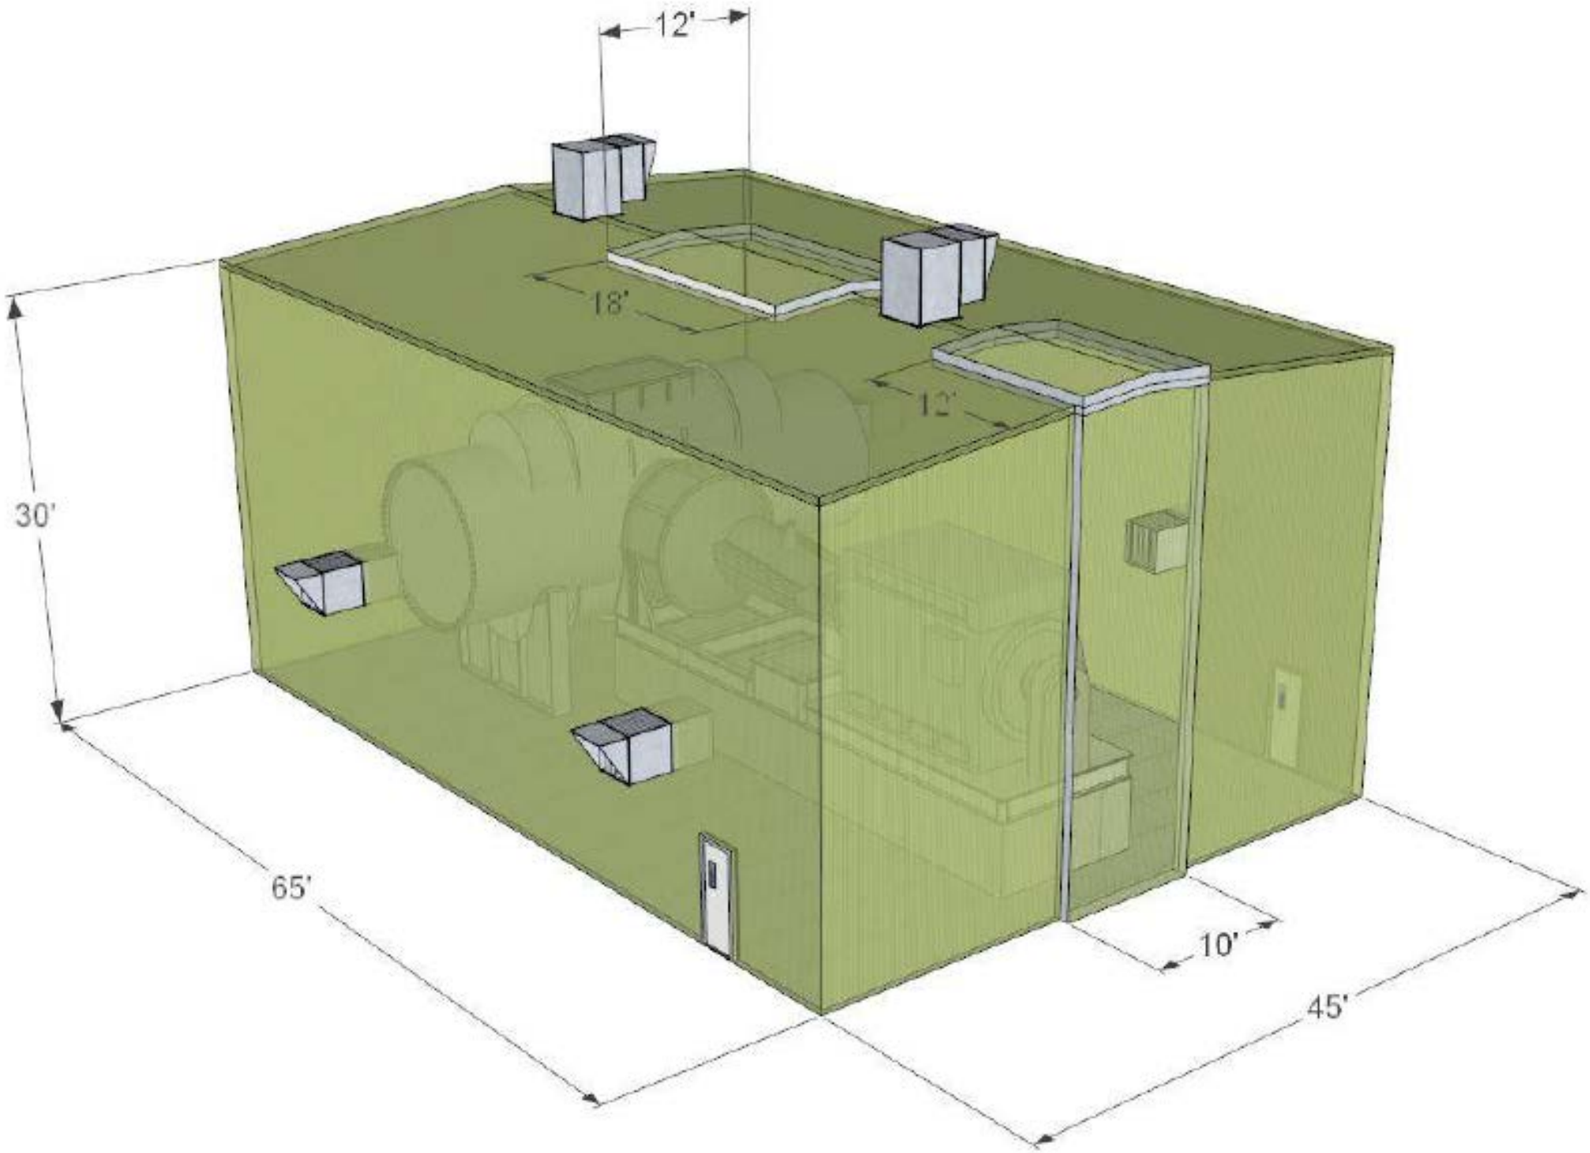
Steam Turbine & Generator Overview

Steam Turbine & Generator Overview

Acoustic Enclosure

Supplier: None Selected

Design: Pre-engineered steel frame construction, roof & walls acoustic panels assys



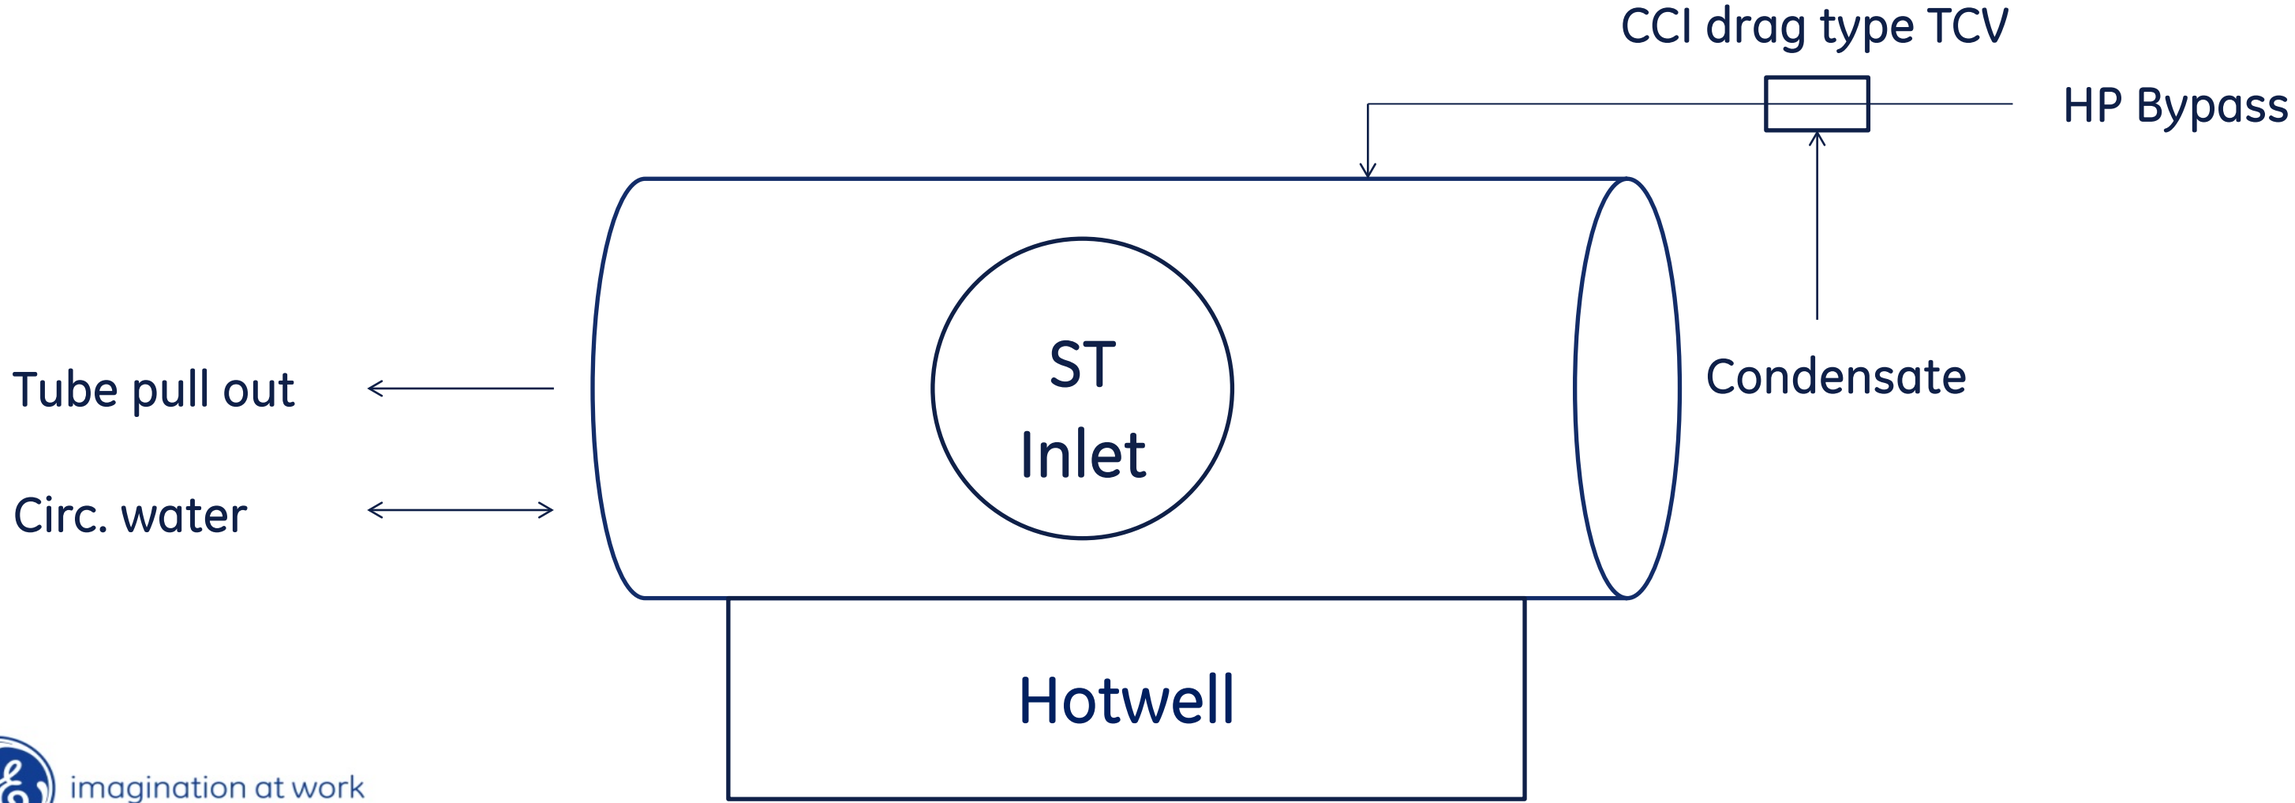
Equipment housed: STG, condenser, gland condenser, vacuum pumps, condensate pumps, aux boiler feed pump, oil & hyd skid

Access: Personnel doors and removable wall and roof panels

Design Consideration: Equipment final layout, maintenance access (i.e. generator rotor removal, condenser tube removal, ST rotor removal), equipment noise emission, escape egress requirements

Comments: FP not included (GE is going to water mist for HD GTs), acoustic enclosure not designed for supporting heavy items such as piping, cable tray, etc.

Acoustic Enclosure Concept



Surface Condenser Overview

Supplier: None Selected

Design: 2-pass, deaerating, 2 x 100% vacuum pumps with silencers, 100% bypass operation

Arrangement: Final arrangement will be available per drawing schedule. Tubes are in horizontal plane and will be accessible through flanged water box. Pullout will be through removable acoustic bldg panel on North side of building

Cooling Tower Overview

Supplier: None Selected

Design: Reinforced composite construction, multi-cell counter flow design, mechanical induce draft, PVC no-fouling fill, drift eliminators

Access: Fan deck accessible by stair tower and caged ladder per OSHA specs

Design Consideration: Design & max ambient wet bulb temp, design & max water inlet/outlet temp, design flow rate, heat duty rejection load, acoustic noise requirements

Arrangement: Final arrangement will be available per drawing schedule. Two cell arrangement is expected.

Comments: Sump basin design and FP not included. Owner has mentioned deluge type FP

Other Mechanical Equipment

Aux Circulating Water Pumps

Supplier: None Selected

Design: Submersible pump, 3 x 50% configuration, automatic failover

Design Consideration: Design & max TDH, design & max flow rate, heat duty rejection load, max. heat rise, acoustic noise requirements

Arrangement: Sump arrangement by BOP contractor

Comments:

Other Mechanical Equipment

Condensate Polisher

Supplier: None Selected

Design: Pre-coat resin back flushable, duel filter vessels, recirculation skid, resin injection skid

Design Consideration: Condensate chemistry including TSS, condensate flow rate, condensate temp

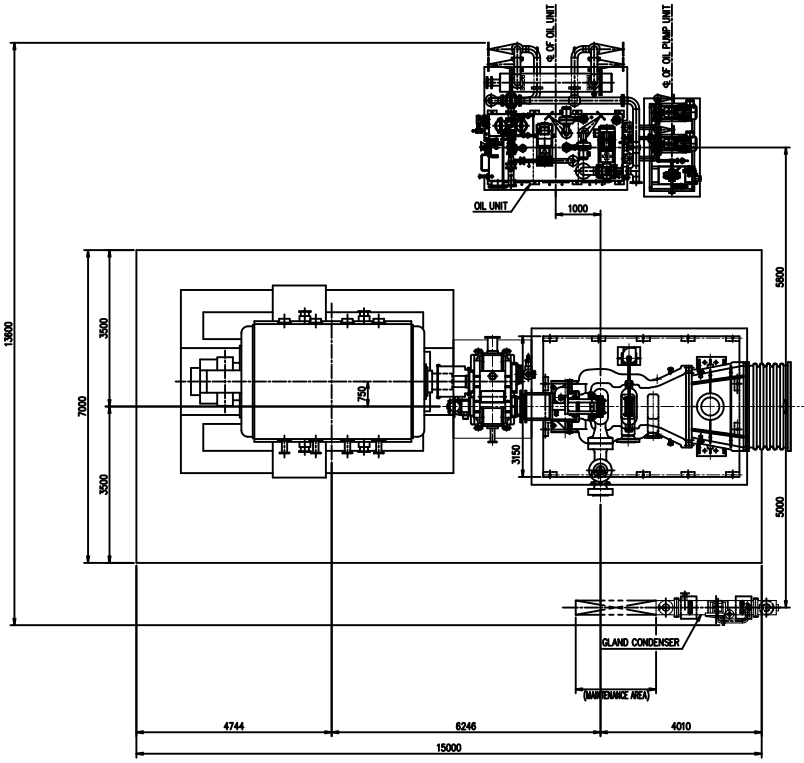
Arrangement: Final arrangement will be available per drawing schedule.

Comments: None

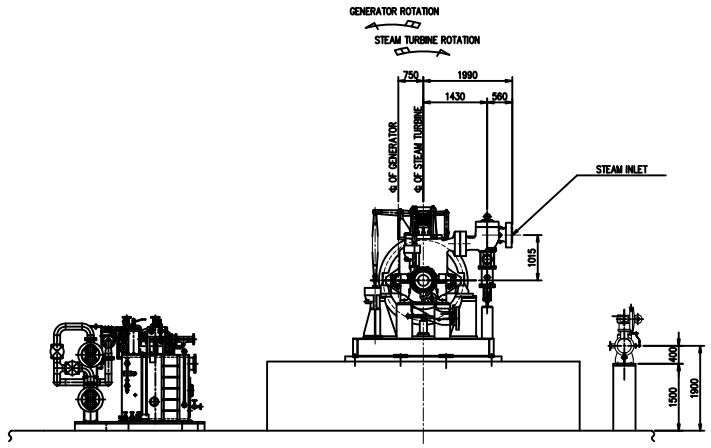
Other Mechanical Equipment

Aux Boiler

Supplier: None Selected

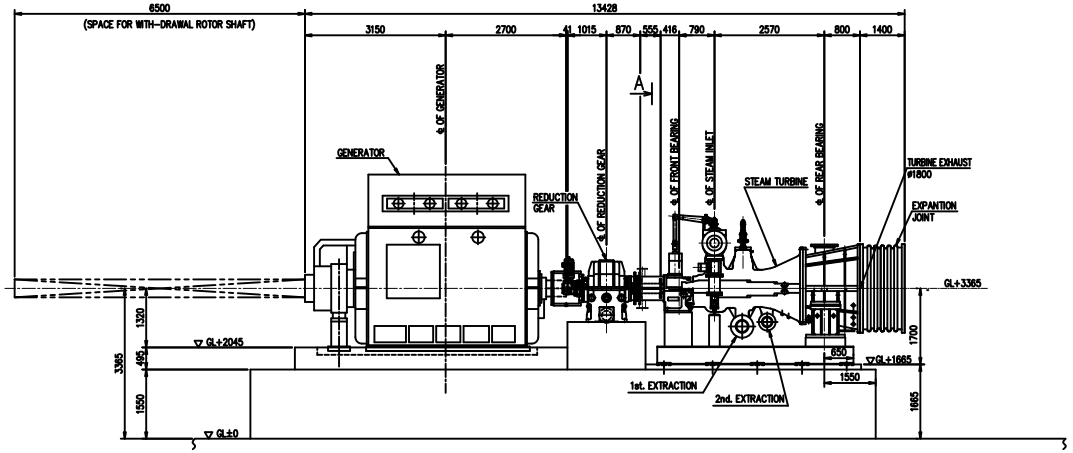


Design: Electric heating element, ASME code vessel



Design Consideration: Operating steam pressure & flow rate

Arrangement: Final arrangement will be available per drawing schedule



Comments: Owner wanted to know what systems are in use when aux boiler is in operation. This depends on operating mode.

Obligations of Site Representatives

Contractor will provide technical advice for the installation and commissioning of the GTG, steam generators, STG, OTSG and the Contractor-supplied Power Island Equipment as stated in the contract. Installation services will include technical advice for the installation of the Contractor supplied equipment, flushing, equipment checkout, and commissioning of mechanical and electrical systems.

The specific personnel required at site for the installation and commissioning of the Contractor supplied equipment is as identified below. The scope of work included in the proposal assumes that the installation and commissioning schedule of the Contractor supplied equipment is not impacted by the installation and commissioning schedules of additional balance of plant equipment and systems that are not provided by Contractor.

Contractor provides the following start-up and commissioning services:

- Site Manager — Responsible for the execution of Contractor on-site services. This person will lead a team consisting of Contractor and vendor technical advisors who will assist in the installation, erection, startup, commissioning and testing of the plant:
  - Coordinate Contractor site activities with the City
  - Assure recommended quality control procedures are applied
  - Coordinate the interface with project home office, manufacturing facilities and suppliers
  - Interface with all suppliers on warranty items
  - Review work for quality
- Materials Coordinator (at Site) - Coordinates shipments, contacts transportation services, produces necessary export/import documents and sets up an inventory control at the site.
- Start-Up/Commissioning Management Advisor (at Site)
- Gas-Turbine-Generator Technical Advisors (at Site)
- Once Through Steam Generator Technical Advisor (at Site)
- Steam-Turbine-Generator Technical Advisor (at Site)
- Condenser Technical Advisor (at Site)
- Cooling Tower Technical Advisor (at Site)
- Pump Technical Advisor (at Site)
- Critical Control Valve Technical Advisor (at Site)
- Condensate Polisher Technical Advisor (at Site)
- CEMS Technical Advisor (at Site)
- GSU Technical Advisor (at Site)
- Chiller Technical Advisor (at Site)

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Contractor has assumed the City will take all necessary precautions, at all times, for the safety of Contractor personnel at site. This will include, but will not be limited to, instruction of the City's safety practices, proper and safe handling of hazardous substances and protection of Contractor personnel from exposure thereto, energization / de-energization of all power systems (electrical, mechanical and hydraulic) using a safe and effective lock-out tag procedure, and conducting periodic safety meetings during construction and start-up.

Contractor may, from time to time, conduct safety audits to insure safe conditions exist and make recommendations to the City concerning the same. If, in Contractor's opinion, the safe execution of Services at site is, or is apt to be, imperiled by local conditions, Contractor may remove some or all of its personnel from the site and/or supervise performances of all or any part of its Services and/or evacuate its personnel and the City will assist in said evacuation. If the Contractor personnel require medical attention, local City facilities will be made available to Contractor personnel for the duration of such needs. If, at site, Contractor encounters toxic substances, hazardous substances or hazardous wastes that require special handling and/or disposal, the City will take whatever precautions are required to eliminate such hazardous conditions. If any such hazardous materials cause an increase in Contractor's cost of or the time required for performance of any part of the work, an equitable adjustment shall be made in the price and schedule. The City will properly dispose of all hazardous materials produced or generated in the course of Contractor's work at site.

The normal workweek will be limited to 60 hours [ten (10) hours per day for six (6) days per week]. Standby time will be billed incremental to the specific hours / durations agreed if technicians are required to be on standby during non-working days. If the Installation and Commissioning schedule dictates longer working hour durations then additional resources can be provided on an incremental daily rate basis. The pricing for these services includes all travel and living expenses and is based on multiple mobilizations.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Test Philosophy

Performance Test Philosophy for Multi-Shaft Combined-Cycle, All-at-Once Installation

General

The performance guarantees for the multi-shaft, combined-cycle system include net plant output and net plant heat rate. The tests to determine compliance with these guarantees will be input/output tests for the entire system using station instrumentation with measurements of additional parameters required to assure that the system is operating at contract conditions, or to enable correction of measured performance to the guarantee basis conditions which are defined in the Performance Guarantees.

The system performance guarantees apply to equipment in new and clean condition. The performance tests must be conducted as soon as possible after the initial startup.

Contractor will prepare a detailed test procedure based on ASME PTC-46, which is submitted to the Owner for mutual agreement a couple of months before the planned date for the tests.

Performance correction curves shall be finalized prior to performance testing. The updated correction curves will be included with the performance test procedure.

An analysis of the test measurement uncertainty will be included with the test procedure.

Tests to demonstrate part load guarantees, if required, will be conducted in accordance with the Combined Cycle Part Load Performance Testing Philosophy (GEK 111095).

Procedure

Contractor provides technical assistance of the test.

The compressor is cleaned in accordance with applicable GE documents and instructions on compressor cleaning and is inspected by the Contractor representative. The Contractor representative will be the sole judge with respect to condition of the gas turbine at the time of testing.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

The system is brought to steady-state test conditions prior to the collection of performance test data. Sufficient data is recorded to determine the system performance and to correct it to performance guarantee basis conditions. The demineralizer will be turned off during the performance test.

If a turbine hall is provided the following comfort conditioned zones will be operated at the upper end of the temperature range while cooling and the lower end while heating. Turbine hall ventilation flow will be reduced to the larger of the following: flow required to achieve the maximum internal turbine hall temperature or flow required to achieve the minimum number of air exchanges per hour. At the conclusion of the performance tests, Contractor will perform calculations to determine performance relative to guarantee and will issue a report covering the entire testing program for submittal to the Owner. GTG testing must be in accordance with "*TYPICAL_LM6000_PC_PG_SAC_SGTGPTM-C-GAS_DkTrns_(012413)_Rev4*" found in Attachment 5.3.

Performance Evaluation

Performance Evaluation at Base Load or Specified % Load

The combined-cycle system performance test is conducted as described above and the measured performance will be corrected to guarantee basis conditions. The corrected performance will be evaluated relative to the performance guarantees as defined below:

1) Combined-Cycle Power

$$kW_{CC} = \left\{ \left[\sum_{i=1}^{n} kW_i \right] + kW_{ST} - kW_{AUX} + kW_{aADJ} \right\} * kW_{ADJ} * kW_D$$

2) Heat Consumption

$$HC_{CC} = \left\{ \left[\sum_{i=1}^{n} HC_i \right] + HC_{aADJ} \right\} * HC_{ADJ}$$

3) Combined-Cycle Heat Rate

$$HR_{CC} = \frac{HC_{CC}}{kW_{CC}} * kW_D * HR_D$$

Where:

Symbol	
n	Number of Gas Turbines and HRSGs in the system.
kW_{CC}	Combined-Cycle Net Plant Output (kW) corrected to guarantee basis conditions.
kW_i	Gas Turbine-Generator Measured Output (kW) during the combined-cycle performance test for each unit.
kW_{ST}	Steam Turbine-Generator Measured Output (kW) during the combined-cycle performance test.
kW_{AUX}	Equipment and BOP Auxiliary Power (kW) measured during the

	combined-cycle performance test.
kW_{aADJ}	Combined-Cycle additive Output adjustment to guarantee basis conditions (Generator power factor, ST backpressure etc.).
kW_{ADJ}	Combined-Cycle multiplicative Output adjustment to guarantee basis conditions (Ambient site conditions, Fuel properties, etc.).
kW_D	Combined Cycle Output Degradation coefficient to account for fired hours above contractually allowable fired hours.
HC_{CC}	Sum of Heat Consumptions adjusted to guarantee conditions, calculated from measured fuel flow and heating value.
HC_i	Heat Consumption calculated from fuel flow and heating value measured during the performance test for each GT/HRSG unit.
HC_{aADJ}	Additive Heat Consumption adjustment to guarantee basis conditions for the system.
HC_{ADJ}	Multiplicative Heat Consumption adjustment to guarantee basis conditions (Ambient site conditions, Fuel properties, etc.) for the system.
HR_{CC}	Combined-Cycle Net Plant Heat Rate corrected to guarantee basis conditions.
HR_D	Combined Cycle Heat Rate Degradation coefficient to account for fired hours above contractually allowable fired hours

The test procedure includes correction factors and curves for test variations such as, but not limited to, ambient temperature, ambient pressure, ambient relative humidity, steam line losses, fuel properties, gas turbine water injection or generator frequency to correct the measured performance data from actual conditions to guarantee basis conditions.

Net output guarantees are satisfied if the corrected and adjusted output (kW_{CC}) surrounded by the test tolerance encompasses the guaranteed output or falls above it. Net heat rate guarantee is satisfied if the corrected and adjusted heat rate (HR_{CC}) surrounded by the test tolerance encompasses the guaranteed heat rate or falls below it.

I. TEST PHILOSOPHY

Testing to demonstrate emission guarantees (if required) will be performed using procedures that are mutually agreed to between GE and the Purchaser. GE engineers and/or technical advisors may be present at the tests for procedural direction. EPA test methods are preferred to demonstrate compliance with GE's emissions guarantees unless otherwise stated in this procedure or the Tab 3 Performance Guarantees. ISO and European Union (EN) methods are also presented herein for comparability to the preferred EPA methods. Other test methods will be considered on a case-by-case basis, as necessary.

II. EMISSION TESTING

A. General

Emission testing identified herein shall be within [GE's] or [Customer's] scope of supply using procedures which are mutually agreed upon. GE and Customer must mutually agree on the use of the testing firm. For Particulate Matter (PM) testing, test process control is critical, and must be performed by a test firm and laboratory meeting the qualification criteria shown in Appendix G. Sampling for inlet concentrations may be required, at the sole discretion of GE, in order to demonstrate compliance with emission guarantees. GE guarantees apply to the net increase of these pollutant emissions above ambient background levels. Re-testing (at purchaser's expense) must be allowed, if required.

The purpose of this GEK is to provide overall guidance for emissions testing methodology; a site-specific test protocol should be developed for each project by [GE] or [Customer] according to contract requirements. Any other test methods than those described herein need to be reviewed and approved by GE for applicability of use.

A Turbine Emissions Performance Test Readiness Checklist (Appendix C) has been attached at the end of this document to provide guidance on pre-test preparations, and should be completed prior to any testing.

B. Testing When Duct Burners Are Present

When testing a unit equipped with duct burners (supplemental firing), testing should be conducted in a manner that differentiates the contribution from the gas turbine and the contribution from the duct burners. For gaseous pollutants, this can sometimes be accomplished by testing simultaneously upstream and downstream of the duct burners. If this type of testing is not possible, testing should be performed with the duct burners off and then repeated with the duct burners on. Further details will be contained in the site-specific test protocol.

C. Nitrogen Oxides Emissions

Before the official compliance testing is begun, the NO_x reduction system (e.g. dry low NO_x (DLN) or water injection) will be adjusted (tuned) to meet performance and emissions criterion. Where water and/or steam injection is used for NO_x abatement, the gas turbine control system will contain a pre-programmed schedule for either water or steam injection. This schedule may be adjusted to achieve an appropriate emission level and minimize the supply requirements. Once the proper injection schedule has been established, it is maintained throughout the testing, and is programmed into the control system.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

1. GE Preferred Method: The NO_x emission testing and related oxygen testing will be in accordance with U.S. EPA Method 20 presented in the Code of Federal Regulations Title 40, Part 60 (40 CFR part 60 Appendix A, 40 CFR part 60 Subparts Da – Standards of Performance for Electric Utility Steam Generating Units applicable to IGCC units, and KKKK – Standards of Performance for Stationary Combustion Turbines, with the following modifications, limitations and additions:

   a) The NO_x instrument will be limited to a chemiluminescent type which meets 40CFR60 Appendix A, Method 7E.

   b) The span of the NOx analyzer will be set for appropriate range of the expected NOx readings.

   c) Oxygen will be sampled simultaneously with all NOx readings since 40 CFR Part 60, Subpart KKKK (and GE's NOx guarantee) requires corrections to 15% O2. Method 20 from 40 CFR Part 60 Appendix A is used for the oxygen analysis.

   d) For diffusion flame combustors using water, steam or nitrogen injection for NOx reduction, GE's standard injection control algorithm instantaneously corrects for ISO reference conditions. An EPA Memorandum to GE dated June 2, 1997 approves the injection control algorithm in lieu of the ISO correction equation under 40 CFR Subpart GG, which applies to existing gas turbines that commenced construction, modification or reconstruction before February 18, 2005.

2. ISO Method: ISO Method 11042, Part 1 is acceptable for testing of gas turbines for NOx, but is not the preferred GE method. This method references ISO Method 10849, which is the automated analysis method for NOx. The main differences of the ISO method with respect to EPA Method 7E are:

   a) ISO 11042 does not include a system bias check.

   b) The ISO drift check is performed over 2 hours while the length of the EPA drift check varies depending on the regulatory requirement.

   c) ISO 11042 span and zero drift allowances are tighter than EPA Method 7E, and are not achievable / realistic for the expected low NOx levels.

   d) ISO 11042 does not include a converter efficiency check.

3. EN Method: EN Method 14792 is acceptable for testing of gas turbines for NO_x, but is not the preferred GE method. When using this method, the following requirements must be followed:

   a) Measurement point selection should adhere to the procedures of EN Method 15259, Sections 8.2 and 8.3.

   b) Upon conclusion of the Direct Calibration Error Test specified in Section 8.4.2.2 of the method a gas containing 40-60% of the NO concentration of the span gas should be directly injected into the analyzer and its response recorded to verify linearity of the instrument. The absolute difference between instrument response to direct injection of the mid-range calibration gas and the certified concentration of the mid-range calibration gas shall be less than or equal to 2% of the certified span gas concentration before proceeding with testing.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

c) When adjusting the analyzer to the span gas response as described in Section 8.4.2.2 the response to the span gas should be recorded and the absolute difference between the instrument response and the certified concentration of the span gas shall be less than +/- 2% of the certified concentration of the span gas.

d) All calibration gases used in conjunction with this method will be certified in accordance with United States EPA Protocol 1 or will have a valid ISO17025 certificate of calibration.

e) Zero and Span checks as outlined in Section 8.4.3 of the method must be performed after every test run.

f) The efficiency of the NO_2 to NO converter shall be demonstrated on-site, prior to conducting any measurements used to determine conformance with performance guarantees.

g) Each test run will use the equation below to determine average gaseous concentrations (not corrected for diluent) obtained during the test.

$$C_{Gas} = \left(C_{Avg} - C_o\right)\frac{C_{MA}}{C_M - C_o}$$

Where:

C_{Gas} = Average effluent gas concentration adjusted for bias and drift.
C_{Avg} = Average unadjusted gas concentration indicated by data recorder for the test run.
C_O = Average of the pre and post –test system response to the low-level (zero) calibration gas.
C_{MA} = Certified concentration of the upscale calibration gas.
C_M = Average of the pre and post -test system response to the upscale calibration gas

GE recommends the use of EPA Method 20 for NO_x testing. If ISO Method 11042 is used, a chemiluminescent-type analyzer must be used, following the span and drift allowances of EPA Method 20 and a system bias check should also be performed according to EPA Method 20; in addition, a stratification test and multi-point sampling (if required by the stratification test results) must be performed in accordance with Method 20.

D. Carbon Monoxide Emissions (If Required)

Sampling for CO is typically the same as sampling for NO_x with the same line feeding the different instruments.

1. GE Preferred Method: EPA Method 10 per 40 CFR Part 60 Appendix A is used, but only the continuous sample method per Section 5.1 is acceptable to GE. A recorder is mandatory, not optional as per 5.3.9, with a span that gives an appropriate range of the guarantee readings.

2. ISO Method: ISO Method 11042, Part 1 also applies to acceptance testing of gas turbines for CO. This method references ISO Method 12039, which is the automated analysis method for CO. The main differences of the ISO method with respect to EPA Method 10 are:

   a) ISO 11042 does not include a system bias check.

   b) ISO 11042 span and zero drift allowances are tighter than EPA Method 10.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

3. EN Method: EN Method 15058 also applies to acceptance testing of gas turbines for CO. The following additional requirements must be followed:

   a) Measurement point selection should adhere to the procedures of EN Method 15259, Sections 8.2 and 8.3.

   b) Upon conclusion of the Direct Calibration Error Test specified in Section 8.4.2.2 of the method a gas containing 40-60% of the nitrogen oxide concentration of the span gas should be directly injected into the analyzer and its response recorded to verify linearity of the instrument. The absolute difference between instrument response to direct injection of the mid-range calibration gas and the certified concentration of the mid-range calibration gas shall be less than or equal to 2% of the certified span gas concentration before proceeding with testing.

   c) When adjusting the analyzer to the span gas response as described in Section 8.4.2.2 the response to the span gas should be recorded and the absolute difference between the instrument response and the certified concentration of the span gas shall be less than +/- 2% of the certified concentration of the span gas.

   d) All calibration gases used in conjunction with this method will be certified in accordance with United States EPA Protocol 1 or will have a valid ISO17025 certificate of calibration.

   e) Zero and Span checks as outlined in Section 8.4.3 of the method must be performed after every test run.

   f) Each test run will use the equation below to determine average gaseous concentrations (not corrected for diluent) obtained during the test.

$$C_{Gas} = \left(C_{Avg} - C_o\right)\frac{C_{MA}}{C_M - C_o}$$

Where:

C_{Gas} =	Average effluent gas concentration adjusted for bias and drift.
C_{Avg} =	Average unadjusted gas concentration indicated by data recorder for the test run.
C_O =	Average of the pre and post –test system response to the low-level (zero) calibration gas.
C_{MA} =	Certified concentration of the upscale calibration gas.
C_M =	Average of the pre and post -test system response to the upscale calibration gas

GE recommends the use of EPA Method 10 for CO testing. If ISO Method 11042 is used the span and drift allowances of EPA Method 6C should be followed and a system bias check should also be performed according to EPA Method 6C.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

E. Unburned Hydrocarbon Emissions (If Required)

1. GE Preferred Method: Sampling and analysis to measure unburned hydrocarbon (UHC) emissions must be done on a wet basis to avoid condensing out the higher hydrocarbons. Moisture determination by EPA Method 4 (or Method 5) is necessary to convert results to a dry basis. Method 25A per 40CFR60 Appendix A is used for unburned hydrocarbons. Results are presented as methane (CH4). This method uses a flame ionization detector (FID) or analyzer. Calibration gases should be methane in an air matrix to avoid synergism effects.

2. ISO Method: ISO Method 11042, Part 1 also includes guidelines for acceptance testing of gas turbines for UHC. This method uses a FID like the EPA method. The main differences of the ISO method with respect to EPA Method 25A are:

   a) ISO 11042 does not include a system bias check.

   b) ISO 11042 span and zero drift allowances are tighter than EPA Method 25A, and are not achievable / realistic for the expected low UHC levels.

   c) The minimum range allowed is 0 to 10 ppm and the measured concentration must be at least 50 percent of the instrument range.

   Expected UHC emissions from most of GE's gas turbine units will be below the threshold for the ISO method, therefore it is not recommended for GE units, where expected UHC concentrations are less than 5 ppm.

3. EN Method: EN Method 12619 applies to acceptance testing of turbines for total organic compounds. The following additional requirements must be followed:

   a) Upon conclusion of the Instrument Adjustment procedure specified in Section 6.1.1 of the method, a gas containing 40%-60% of the concentration of the span gas should be directly injected into the analyzer and its response recorded to verify linearity of the instrument. The absolute difference between instrument response to direct injection of the mid-range calibration gas and the certified concentration of the mid-range calibration gas shall be less than or equal to 2% of the certified span gas concentration before proceeding with testing.

   b) When adjusting the analyzer to the span gas response as described in Section 6.1.1, the response to the span gas should be recorded and the absolute difference between the instrument response and the certified concentration of the span gas shall be less than +/- 2% of the certified concentration of the span gas.

   c) When performing the procedure set forth in Section 6.1.2, the system response to the span gas should be recorded and the absolute difference between the system response and the certified concentration of the span gas shall be less than +/- 5% of the certified concentration of the span gas.

   d) Zero and Span checks as outlined in Section 6.1.2 of the method must be performed before and after every test run. The test run shall be considered invalid if the absolute difference between the pre-test zero gas check and post-test zero gas check is greater than 3% of the certified span gas concentration. Likewise the test run will similarly be invalidated if the absolute difference between the pre-test span gas check and post-test span gas check is greater than 3% of the certified span gas concentration.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

F. Volatile Organic Compound Emissions (If Required)

1. GE Preferred Method: When volatile organic compound (VOC) emissions (non-methane, non-ethane hydrocarbons) are required, U.S. EPA Method 18 per Section 8.2.2 (Direct Interface Sampling and Analysis) should be used. This method requires a gas chromatograph at the site. GE requires calibration of the measurement train at the sampling probe.

2. ISO Method: There are no performance specifications within ISO 11042 for VOC measurement, only suggested procedures; therefore GE recommends the use of EPA Method 18.

3. EN Method: EN Method 13649 applies to acceptance testing of gas turbines for determination of individual gaseous organic compounds. The following additional requirements must be followed:

   a) Performance of EN 13649 should be in conjunction with one of the following total organic compound methods: EPA Method 25A, ISO Method 11042, or EN 12619. Sample duration of EN 13649 tests should not be less than the sample duration of the total organic method that is employed in conjunction with the EN 13649 test.

   b) Proper sample handling and shipping procedures must be followed to ensure that samples do not degrade before they are analyzed.

G. Sulfur Emissions (If Required)

1. GE Preferred Method: Sulfur emissions will be determined by use of fuel flow data and fuel analysis for sulfur content according to ASTM Method D3246 for natural gas firing and ASTM Method D4294 for distillate oil firing.

2. ISO Method: ISO 11042 recommends the use of fuel analysis for determination of sulfur dioxide emissions; therefore it is in accordance with GE's preferred method. The above ASTM Method, or demonstrated ISO equivalent, should be used for sulfur analysis.

H. Particulate Matter Emissions

1. Particulate testing must be performed by a Test Firm, Individual Tester and Laboratory meeting the minimum qualification criteria listed for each in Appendix G of this document.

2. Prior to testing, the tester is required to complete the "Pre-Test – Turbine Emissions Particulate Matter Test Checklist" shown in Appendix D of this document. If any question is answered with "No," the issue must be reviewed as indicated in the Appendix to determine appropriate action.

3. Prior to testing, the tester must review the questions in "Sampling Run – Turbine Emissions Particulate Matter Test Checklist" shown in Appendix E of this document, and be aware of any factor which may require testing to be suspended. After testing is complete, the tester must complete the checklist and review any "No" responses as instructed in the Appendix.

4. After the Laboratory has completed work, the Lab Technician must complete the "Laboratory – Turbine Emissions Particulate Matter Test Checklist" shown in Appendix F of this document. If any response is "No", a full explanation of the issue and subsequent action shall be provided and reviewed with the GE Environmental Engineer.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

5. The following operational conditions should also be met whenever testing for PM:

    a. The combustion turbine must run for a minimum of 300 total-fired hours prior to any PM testing, and must operate at base load for a minimum of 3 to 4 hours prior to any PM test run to achieve steady-state wheelspace temperatures (gas turbine nozzle final stage temperature).

    b. The combustion turbine inlet and exhaust systems must be cleaned and free of any dirt, sand, mud, rust or other contaminants.

    c. Exhaust must be wiped down to prevent metal weepage from stainless steel (400 series) becoming airborne.

    d. Check for wooden spacers left in the HRSG and leaks in the inlet, as applicable.

    e. The area around the turbine is to be treated (e.g. sprayed down with water) to minimize airborne dust.

    f. A compressor wash prior to testing is required.

6. A pre-test checklist that outlines the above operational conditions is attached at the end of this document for use prior to GE emissions testing.

7. The following laboratory conditions should also be met by the lab analyzing the PM samples:

    a. The tolerance for consecutive weights must be reduced from 0.5 mg down to 0.1 mg and weights recorded to the nearest 0.01 mg.

8. Allowance for background ambient particulate levels must be provided, as appropriate. The ambient PM measurement method will be determined on a case-by-case basis, if necessary.

9. Test ports shall be stainless steel and inspected to be clear of any dirt, debris or rust prior to test.

10. Test conditions on the stack must be fully documented and reported, including any activities in the surrounding area that might impact PM levels or introduce contamination (e.g. high winds, high pollen count, wildfires, road grading). Any unusual site conditions may require postponement of testing or addition of extra test runs.

11. Mass emission rates of particulate matter shall be calculated using fuel flow and exhaust flow determined by the EPA Method 19, F-factor method. (See section N.1.a)

12. Filterable Particulate Matter

    a. Preferred method: US EPA Method 5B, described below, is the preferred default method for 60 Hz machines. EN method 13284-1, described below, is the required method for 50 Hz machines, especially those located in the European Union. EPA or ISO methods for 50 Hz machines will be considered on a case-by-case basis.

    b. US EPA Method: Particulate matter (PM) emissions shall be determined in accordance with U.S. EPA Method 5B with traversing per Methods 1 and 2, as contained in 40 CFR 60 Appendix A. The following modifications and limitations on choices within the methods apply.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

c. At least four test runs must be performed (not three as stated by the method). The four runs are to be averaged.

d. Sampling probe internal surfaces must be made of chemically inert and non-catalytic material such as quartz.

e. The filter material shall be glass fiber or quartz.

f. Multiple, pre-assembled sampling train components, such as filters preloaded in filter housings, must be used to reduce field handling of samples, or a clean field recovery area must be provided to mitigate sample contamination.

g. Use of Method 5B requires the probe and filter to be heated to 320 to 345°F (160 to 174°C) and precludes any concern over determination of the sulfuric acid dewpoint. The Method 5B pre- and post-test filter bakes are also conducted at the elevated temperatures indicated previously.

h. Sampling technique shall provide a fairly large exhaust gas sample, with an objective of 125 standard cubic feet (SCF) (3.5 standard cubic meters (SCM)); minimum sample time shall be 3 hours per run.

i. A sample run must be invalidated and repeated if the glass probe liner breaks or any other piece of equipment fails in such a way as to potentially introduce contamination.

j. All recovery brushes shall be Teflon-coated, and in new and clean condition with no signs of wear.

k. Any damage to the sample filter must be noted, if recovering it in the field. Carefully recover as much of the filter as possible and make note of what was unrecoverable.

l. HPLC-grade reagents must be used for all sample collection and recovery.

m. One reagent blank (from the recovery wash bottle into a sample jar) shall be performed after every run.

n. One field blank (assembly of sample train, leak check and all activities up to sampling stack gas, followed by recovery) shall be performed for each unit that is tested.

o. Field train blank results 1.5 times or greater than lab reagent results require additional assessment and written approval by GE Environmental and Acoustic Engineering prior to deeming the results acceptable.

p. Measurement of percent by volume of oxygen and carbon dioxide shall be done using EPA Method 3A in lieu of EPA Method 3.

q. If test equipment is disassembled and reassembled between ports a leak check is required after reassembly prior to continuing testing.

r. Use of Teflon frits is required (in lieu of glass).

s. Impinger water must be weighed and not measured volumetrically.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

13. ISO Method:

    The preferred ISO Method is ISO 12141:2002 with an in-stack filter; the minimum sample time must be 3 hours per run; the sampling points should be determined according to EPA Method 1; and high-purity reagents must be used to avoid contamination.

    ISO Method 11042, Part 1 also applies to acceptance testing of gas turbines for PM with reference to ISO Method 9096, a manual-gravimetric, multi-point sampling procedure. The main differences of the ISO method as compared to EPA Method 5 are:

    a. ISO 9096 covers both in-stack and out-of-stack filter methods.

    b. ISO 11042 calls for 12 to 20 sampling points, whereas the EPA methods specify 8 to 24 sampling points.

    c. ISO 9096 is recommended for concentrations from 20 mg/m^3 to 1000 mg/m^3.

    d. ISO 12141:2002 is similar to ISO 9096, but is recommended for lower PM concentrations in the range of 5 mg/m^3 to 20 mg/m^3.

14. EN Method: The preferred EN Method is EN 13284-1 with an in-stack filter heated and a minimum sample time of 3 hours per run. The following additional requirements must be followed:

    a. Determine the filter tare weight following the procedures of EN 13284-1 Section 7.2, except filters should be baked at 160 ºC +/- 5 ºC for a period of three hours, then cooled in a dessicator for a minimum of 4 hours before weighing.

    b. The portion of the sample system between the tip of the nozzle and filter must be rinsed and recovered after every test run.

    c. After sampling, determine the final filter weight according to the practices established in EN13284-1 Section 7.3 and 7.4 except filters should be baked at 160 ºC +/- 5 ºC for a period of six hours, then cooled in a dessicator for a minimum of two hours prior to initiating the weighing procedure in Section 7.3.

    d. Acetone used in the conduct of EN 13284-1 should exhibit dry residue of less than 8 mg/l.

    e. Measurement point selection should adhere to the procedures of EN Method 15259, Sections 8.2 and 8.3.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

I. Filterable PM10 Emissions (If Required)

PM10 is particulate matter with an aerodynamic diameter less than 10 microns.

Preferred method: GE recommends the use of US EPA methods, described in Section 1 below, for PM10 sampling.

1. US EPA Method: PM10 emissions shall be determined by sampling, analysis and calculation in accordance with U.S. EPA Method 201A for front-half filterable particulate matter and Method 202 for back half condensable particulate matter with traversing per Methods 1 and 2. All methods are as listed in 40 CFR 60, Appendix A except for Method 201A, which is per 40 CFR 51, Appendix M and Method 202, which is as promulgated December 17, 1991 (56 FR 65433). The following modifications and limitations within the methods apply:

   a. At least four test runs must be performed (not three as stated by the method). The four runs are to be averaged.

   b. Sampling probe internal surfaces must be made of chemically inert and non-catalytic material such as quartz.

   c. The filter material shall be glass fiber or quartz.

   d. Multiple, pre-assembled sampling train components, such as filters preloaded in filter housings, must be used to reduce field handling of samples, or a clean recovery area must be provided to mitigate sample contamination.

   e. Sampling technique shall provide a fairly large exhaust gas sample, with an objective of 125 standard cubic feet (SCF) (3.5 standard cubic meters (SCM)); minimum sample time shall be 4 to 6 hours.

   f. A sample run must be invalidated and repeated if the glass probe liner breaks or any other piece of equipment fails in such a way as to potentially introduce contamination.

   g. All recovery brushes shall be Teflon-coated, and in new and clean condition with no signs of wear.

   h. Any damage to the sample filter must be noted, if recovering it in the field. Carefully recover as much of the filter as possible and make note of what was unrecoverable.

   i. HPLC-grade reagents must be used for all sample collection and recovery.

   j. One reagent blank (from the recovery wash bottle into a sample jar) shall be performed after every run.

   k. One field blank (assembly of sample train, leak check and all activities up to sampling stack gas, followed by recovery) shall be performed for each unit that is tested.

   l. Field train blank results 1.5 times or greater than lab reagent results require additional assessment and written approval by GE Environmental and Acoustic Engineering prior to deeming the results acceptable.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

m. Measurement of percent by volume of oxygen and carbon dioxide shall be done using EPA Method 3A in lieu of EPA Method 3.

n. If test equipment is disassembled and reassembled between ports a leak check is required after reassembly prior to continuing testing.

o. Use of Teflon frits is required (in lieu of glass).

p. Impinger water must be weighed and not measured volumetrically.

q. ISO Method: ISO Method 23210:2009 measures PM10 and PM2.5 (filterable particulate only) through a two-stage cascade impactor. GE prefers the use of cyclones rather than impactors, therefore GE recommends the use of EPA Methods as outlined above, if required.

J. Condensable Particulate Matter Emissions (If Required)

1. US EPA Method: Condensable PM emissions shall be determined by sampling, analysis and calculation in accordance with U.S. EPA Method 202 as promulgated on December 17, 1991 (56 FR 65433). The following modifications and limitations within the method apply:

a. At the conclusion of each test run, the sample train must be purged with N2 gas at a rate of 20 liters per minute (lpm) for a period of one hour.

b. HPLC-grade reagents must be used for all sample collection and recovery.

c. One reagent blank (from the recovery wash bottle into a sample jar) shall be performed after every run.

d. One field blank (assembly of sample train, leak check and all activities up to sampling stack gas, followed by recovery) shall be performed for each unit that is tested.

e. Field train blank results 1.5 times or greater than lab reagent results require additional assessment and written approval by GE Environmental and Acoustic Engineering prior to deeming the results acceptable.

f. Method 202 equipment shall be free of stopcock grease.

g. The following laboratory conditions should also be met by the lab analyzing the PM samples:

   a. The tolerance for consecutive weights must be reduced from 0.5 mg down to 0.1 mg and weights recorded to the nearest 0.01 mg.

   b. A 5 ml aliquot should be removed from the inorganic fraction prior to organic extraction and analyzed for sulfate using low-level ion chromatography.

h. The NH4OH titration of the inorganic fraction should be done to neutralize any acid. This helps stabilize the sample and reduces variability

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

K. Opacity (If Required)

1. GE Preferred Method: Opacity shall be measured in accordance with EPA Method 9 from 40 CFR 60, Appendix A. If a continuous opacity monitor is installed in the exhaust stack and has been certified against a reference method (EPA Method 9 or equivalent), the data from this continuous monitor may be used in lieu of Method 9, subject to approval by GE.

2. ISO Method: ISO Method 11042, Part 1 utilizes the Bacharach source test procedure for smoke number determination. There is no direct correlation between percent opacity and measurements based on the Bacharach scale. Therefore, only EPA Method 9 (or a certified continuous opacity monitor) may be utilized to demonstrate compliance with GE's opacity guarantee, if required.

L. Ammonia Slip (If Required)

1. GE Preferred Method: EPA has not yet promulgated a method for measuring ammonia slip. In the interim, GE has established a preference for the use of on-site sampling and analysis plus calculations in accordance with the industry procedure of indophenol absorptiometrics to determine ammonia slip emissions. This procedure requires the use of reactant solutions and a photoelectric spectrophotometer at the plant site. Additional testing details will be incorporated into a site-specific test protocol, as required.

2. ISO Method: ISO method 11042 does not provide performance specifications for ammonia measurement. The standard proposes using chemiluminescent NOx analyzers. A converter is used to oxidize the NH3 to NO, while a second converter reduces NO2 to NO without affecting the NH3; the difference between these two NOx readings is the NH3 concentration. A single analyzer with two converters or two separate analyzers may be used.

   GE recommends the use of the indophenol method for its low detection limit and on-site results. Use of EPA CTM-027 is also acceptable. When using CTM-027, an ion specific electrode will be necessary for on-site results and ion chromatography for the off-site laboratory analysis.

M. Formaldehyde (If Required)

1. GE Preferred Method: If a customer requires formaldehyde testing for their permit, GE recommends that it be measured using California Air Resources Board (CARB) Method 430. This method is a wet-impingement method, and uses dinitrophenylhydrazine (DNPH) as the impinger solution. In order to enhance the method to achieve a detection level of less than 91 parts per billion by volume, dry (ppbvd) at 15% O_2 (the proposed EPA limit in 40 CFR Part 63 – National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines), the following modifications to the method must be followed:

   a. Using typical field blank results, the target sample volume should be approximately 100 liters. At the maximum sampling rate allowed in the method of 0.5 lpm, a run time of 3 hours and 20 minutes is necessary to achieve the minimum aldehyde mass ratio. Sampling rate shall not exceed 0.5 lpm.

   b. Background levels of formaldehyde in the sampling equipment, reagents, and ambient environments are chronic challenges to measuring low parts per billion levels of formaldehyde in the stack. Ambient formaldehyde contamination of the collected sample in the field shall be minimized through appropriate containment and handling of all samples and sampling equipment in clean, formaldehyde-free areas. In some locations, purged glove

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

boxes or similar apparatus may be required. In addition, the sample train must be assembled and recovered in a tented area purged with 99.999% nitrogen.

c. A pre-test leak check, but no post-test leak check (to minimize sample contamination), shall be performed as specified in Section 8.1.4 of the method. A small, fresh activated charcoal tube (such as commercially available tubes used for personal exposure or indoor air sampling) should be temporarily attached to the end of the probe (e.g. with a short length of Teflon tubing) prior to performing leak checks to minimize contamination from ambient air.

d. Other measures to avoid potential field contamination shall include: use a fresh, pre-cleaned polytetrafluoroethylene (PTFE), borosilicate glass, or quartz probe liner for each test run; do not perform a post-test rinse of the sampling probe unless visible condensate is present; do not recycle probe liners in the field.

e. Maintain the sampling probe temperature range between 248 and 273ºF (120 to 134ºC) to avoid condensation of water in the probe, which would necessitate a probe rinse.

f. The laboratory selected to perform the sample analyses shall demonstrate a limit of detection (LOD) capability of less than 0.5 µg of formaldehyde per sample. LOD shall be calculated as specified in CARB Method 430 Section 11.6.

g. Sampling equipment shall include screw-top DNPH impingers that can be fitted with either Teflon-lined screw caps (for storage and shipment) or an impinger stem (for sampling) that have been charged and sealed in the laboratory that will be used for sample analyses. The pre-charged impingers and samples shall be stored and shipped at 4 ºC, using dry ice, until immediately before and after sampling and laboratory analysis.

h. The cleaned sampling equipment is to be sealed in the laboratory and not opened until final train assembly at the sampling location.

i. All handling of wetted sampling equipment is to be performed using polyethylene laboratory gloves to eliminate the potential for aldehydes contamination from the skin. Latex, nitrile, or vinyl gloves shall not be used.

j. To minimize potential contamination, it is advised that the test team members not consume alcohol during the 24 hours prior to sampling and throughout the sampling campaign. Metabolites of alcohol include aldehydes. Alcohol digestion and respiration significantly increases formaldehyde levels in exhaled air, concentrations of 200 ppb and greater have been measured. Aldehydes are also transpired through the skin. Test team members should also refrain from smoking during test activities. If necessary, test team members shall wash their hands with soap and rinse thoroughly with clean water after a smoking break before returning to test activities. Exhaust from vehicles also contains formaldehyde. The sample recovery area should not be in the vicinity of a source of exhaust. Use of aftershave lotion, cologne or perfume should be avoided while testing.

k. Every test shall include at least one sampling train blank (field blank) for each test run, as specified in CARB Method 430 Section 10.1.1. The field blank shall be performed immediately prior to each run. The field blank shall include all of the same components and procedures as a test run, including a leak check as described above in item L.1.c.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

l. The blank-corrected sample value shall be calculated exactly as specified in CARB Method 430 Section 11.10, i.e. based on the concentration of formaldehyde in the liquid samples and blanks (e.g., ug/mL).

m. For maximum accuracy, it is recommended that a sampling train control console that incorporates both a calibrated precision rotameter and a low-flow dry gas meter be used for the tests (e.g., an EPA Method 0030 Volatile Organic Sampling Train control console). A standard Method 5 dry gas meter shall not be used for determining sample volume because the sample flow rate is below the calibrated range of such equipment. Alternatively, a precision rotameter alone may be used provided it is properly instrumented to measure inlet sample gas temperature and pressure and the indicated rate is corrected for actual conditions.

n. The CARB Method 430 reporting protocol of five times the field blank if results are below detection limits should not be used. Stack sample results should be corrected by the field blank average. Applicability of the CARB Method 430 reporting protocol will yield over-reporting values if the stack level is below five times the average field blank (FB) level.

o. ISO Method: There is no known ISO method for measurement of formaldehyde.

N. Certification of Calibration Gases

All gases used in certification of instruments or performance of emissions guarantee demonstrations shall be analyzed and certified in a manner and by a laboratory mutually agreeable to GE and Purchaser. Examples of acceptable certification are:

1. U.S. EPA Standard Methods

   a. U.S. EPA Protocols

   b. U.S. National Bureau of Standards Certification Procedures

   c. ISO Standard Methods (e.g. ISO/TS 14167).

O. Exhaust Gas Flow Determination

1. GE Preferred Method: GE has established preferences for the determination of exhaust flow based on accuracy of the determination. GE recommends the following:

   a. The primary exhaust flow determination shall be by the F-factor method per 40CFR60, Appendix A, Method 19 (as specified in Method 20 for gas turbine emissions). The F-factor constants from Table 19-1 shall be applied in all cases where possible per Paragraph 3.1.

   b. Where available, the compressor inlet airflow signal shall also be used to compute exhaust flow. Exhaust flow on a dry basis is the turbine inlet airflow minus the water vapor plus the fuel flow minus the water formed from the combustion of hydrogen in the fuel. Gas turbine inlet air is measured using the compressor inlet air scroll as a flow element.

a. Flow measurements by Velocity Traverse, per 40 CFR 60, Appendix A, Methods 1 and 2, can result in errors of 25 percent or more in this application, and is not acceptable.

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

b. ISO Method: ISO Method 10780 is similar to EPA Method 1 and 2, using an L and S type pitot tube to determine the velocity and volume flow rate of a gas stream, and is therefore not recommended for the reason cited in N.1.(c) above.

P. Fuel Bound Nitrogen Determination (if required)

1. GE Preferred Method: Prior to emission testing, analyses for fuel bound nitrogen must be determined in accordance with ASTM D4629, which is based on a combustion / chemiluminescence method.

Q. Reporting Preliminary Test Results

The Vendor must use the attached spreadsheets as applicable for reporting preliminary test results prior to test site demobilization or make provisions to complete prior to site demobilization. A more comprehensive set of data will be required for final reporting, to be specified in the project-specific test protocol. Please contact GE for the most recent version of these spreadsheets prior to submittal.

Appendix C.
Turbine Emissions Performance Test Readiness Checklist

Customer:_____ Checklist Completed By:_____ Title:_____
Site:_____ Date:_____
Unit:_____

Please answer all of the following questions and return this form **at least 72 hours prior to the test date.** Questions should be directed to the GE Power Generation Manager of Environmental and Acoustics Engineering.

	SYSTEM / OPERATION	Circle (Y, N, or N/A)			If no, why?	
GAS TURBINE FUEL SYSTEM						
1	Has Mark V or VI fuel flow reading accuracy been checked using ASME Method?	Y	N	N/A		
2	Has gas turbine reached full load on gas fuel firing?	Y	N	N/A		
3	Has running on gas at full load exceeded 10 hours?	Y	N	N/A		
4	Has distillate oil fuel flow divider accuracy been checked across the load range?	Y	N	N/A		
5	Has gas turbine reached full load on oil fuel firing?	Y	N	N/A		
6	Has running on oil at full load exceeded 10 hours?	Y	N	N/A		
7	Has fuel transfer from gas to oil been conducted?	Y	N	N/A		
8	Has more than one transfer been conducted?	Y	N	N/A		
9	Has fuel transfer from oil to gas been conducted?	Y	N	N/A		
10	Has more than one transfer been conducted?	Y	N	N/A		
11	Have purge and check valves been operating properly?	Y	N	N/A		
12	If fuel transfer in either direction has not been smooth, has the system been recalibrated and tested?	Y	N	N/A		
13	**Has a fuel oil sample been taken and tested for fuel bound nitrogen (FBN), sulfur content and ash content? Fuel sample analysis results: FBN:_____ ppm by weight Sulfur:_____ % by weight Ash:_____ %	Y	N	N/A		X1
WATER / STEAM INJECTION SYSTEM						
14	**Is water injection system operating within specification across the load range?	Y	N	N/A		X2
15	Has the flow meter been calibrated?	Y	N	N/A		
16	Is the system set to operate in automatic mode across the load range?	Y	N	N/A		

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

	SYSTEM / OPERATION	Circle (Y, N, or N/A)			If no, why?	
INLET BLEED HEAT						
17	Has inlet bleed heat system been commissioned?	Y	N	N/A		
18	Is the system set to operate in automatic mode?	Y	N	N/A		
CONTROL SYSTEM / INSTRUMENTATION						
19	Have gas fuel flow signals been checked (zero and span)?	Y	N	N/A		
20	Have oil fuel flow signals been checked (zero and span)?	Y	N	N/A		
21	Has humidity sensor accuracy been checked using a psychrometer?	Y	N	N/A		
22	Have bell mouth D.P. sensors been calibrated?	Y	N	N/A		
23	Have the air flow calculations been verified?	Y	N	N/A		
CONTINUOUS EMISSION MONITORS						
24	Has the CEMS system been installed and checked out?	Y	N	N/A		
25	Is the system currently conducting daily calibrations (zero and span)?	Y	N	N/A		
26	Does the CEMS have nearly full bottles of calibration gases?	Y	N	N/A		
HRSG STACK						
27	**Have the proper EPA test port locations been verified?	Y	N	N/A		X3
28	Have the proper CEMS test port locations been verified?	Y	N	N/A		
29	Are the proper walkways, ladders and platforms installed?	Y	N	N/A		
30	Is the stack properly insulated in the areas that personnel will be working or passing?	Y	N	N/A		
31	Is reliable electric power available at test area?	Y	N	N/A		
BYPASS STACK						
32	Is emissions testing of bypass stack required by permit?	Y	N	N/A		
33	**Have the proper EPA test port locations been verified?	Y	N	N/A		X4
34	Have the proper CEMS test port locations been verified?	Y	N	N/A		
35	Are the proper walkways, ladders and platforms installed?	Y	N	N/A		
36	Is the stack properly insulated in the areas that personnel will be working or passing?	Y	N	N/A		
37	Is reliable electric power available at test area?	Y	N	N/A		

© General Electric Company, 2011. GE Proprietary Information. All Rights Reserved.

	SYSTEM / OPERATION	Circle (Y, N, or N/A)			If no, why?	
DUCT BURNER						
38	Does the HRSG have a duct burner (DB)?	Y	N	N/A		
39	Is the DB designed for dual fuel firing?	Y	N	N/A		
40	Is it scheduled to burn natural gas fuel?	Y	N	N/A		
41	Is it scheduled to burn distillate oil fuel?	Y	N	N/A		
42	Has the gas fuel flow meter been calibrated?	Y	N	N/A		
43	Has the oil fuel flow meter been calibrated?	Y	N	N/A		
44	**Has the DB been fully fired on gas fuel?	Y	N	N/A		X5
45	**Has the DB been fully fired on oil fuel?	Y	N	N/A		X6
46	Are air emission monitoring ports located upstream of the DB in the transition duct?	Y	N	N/A		
47	Is black smoke noticeable when firing DB on oil?	Y	N	N/A		
SELECTED CATALYTIC REDUCTION (SCR)						
48	Does the HRSG incorporate an SCR system?	Y	N	N/A		
49	Has the SCR system been checked for proper installation?	Y	N	N/A		
50	**Has the ammonia system been checked out for proper function over the load range?	Y	N	N/A		X7
51	Has the SCR system been operated at full load?	Y	N	N/A		
CARBON MONOXIDE (CO) CATALYST						
52	Does the HRSG incorporate a CO catalyst?	Y	N	N/A		
53	**Has the catalyst system been checked for proper installation?	Y	N	N/A		X8

Pretest - Turbine Emissions Particulate Matter Test Checklist

Customer: _____ Checklist Completed By: _____
Site: _____ Date: _____
Unit: _____

Please answer all of the following questions and return this form via fax or email to _____
prior to testing. Any "no" responses to questions below should be approved in writing by onsite GE personnel, GE's third party observer, or the environmental engineer assigned to the project.

	SYSTEM / OPERATION		Circle		If no, why?
SAMPLING SITE CONDITIONS					
1	Are the test port locations at proper distance from upstream and downstream disturbances? (*To be determined by GE PPS*)	Y	N	N/A	
2	Are the test ports made of stainless steel?	Y	N	N/A	
3	Are the ports free of corrosion and/or residual particulate matter?	Y	N	N/A	
4	Is the area around the stack paved?	Y	N	N/A	
4a	If not paved, has it been sprayed down to reduce fugitive dust?	Y	N	N/A	
5	Is there a clean area near the base of the stack that can be used for sample recovery/equipment preparation?	Y	N	N/A	
SAMPLING EQUIPMENT					
7	Is the sampling equipment in new and clean condition?	Y	N	N/A	
8	Is the sample free of any lubricants or grease that may interfere with the test results?	Y	N	N/A	
9	Have the filters and housings been pre-assembled offsite?	Y	N	N/A	
10	Were HPLC grade reagents brought to site for use with all sample recovery?	Y	N	N/A

Appendix E.
Sampling Run - Turbine Emissions Particulate Matter Test Checklist

Customer: _____ Checklist Completed By: _____
Site: _____ Date: _____
Unit: _____ Run #: _____

Please answer all of the following questions and return this form via fax or email to _____ **within 24 hours of testing**. Any "no" responses to questions below should be approved in writing by onsite GE personnel, GE's third party observer, or the environmental engineer assigned to the project.

	SYSTEM / OPERATION	Circle			If no, why?
AMBIENT CONDITIONS					
1	Are ambient air conditions acceptable for testing? (i.e. no high winds, high dust in area etc.)	Y	N	N/A	
SAMPLING PROCEDURE					
1	If a glass or quartz probe liner was used and broke during testing was the test halted and test run repeated? Please mark N/A if other liner material was used.	Y	N	N/A	
2	If performing Method 202, was the post-test N2 purge performed? It must be done after every run according to the Method 202 procedure.	Y	N	N/A	
3	Was the filter undamaged during removal from the filter holder?	Y	N	N/A	
3a	If damaged, were all pieces recovered?	Y	N	N/A	
QA/QC					
4	Has a reagent blank been taken for each run from the sample recovery equipment used in the field?	Y	N	N/A	
5	Has a field blank been performed (train assembled and leak checked, then recovered)?	Y	N	N/A

Appendix G.
Particulate Matter Test Firm and Laboratory Recommended Qualification Criteria

Test Firm

A) Must have 10 years experience

B) Must have experience on 5 Gas Turbines

C) Must have 2 Customer references

D) Must be ASTM Certified or equivalent as approved by GE

E) Must submit an example test report for review

Individual Test Leader

A) Must have 5 years experience

B) Must have experience on 2 Gas Turbines

C) Must be Source Evaluation Society or ASTM certified or equivalent as approved by GE

D) Must submit an example test report for review

E) Must have received and acknowledged GE training for Particulate Matter testing

Laboratory

A) Must be State Certified (if applicable)

B) Must use a balance with 0.01 mg resolution

C) Must have experience with optional procedures

D) Must have 5 years experience

E) Must have experience with low level ion chromatography

F) Must agree to all GE requirements

G) Must submit an example report with detail for review

Laboratory Technician

A) Must have 1 years experience

SPECIFICATION FOR GAS TURBINE GENERATOR PERFORMANCE TEST MEASUREMENT (SGTGPTM)
LM6000 PC / PG SAC, NATURAL GAS FUEL REV4

I. INTRODUCTION

A Customer's acceptance of a gas turbine power generation facility is usually preceded by proof of compliance with specific performance requirements for the gas turbine generator set(s). GE Power & Water provided a performance guarantee of Output at the generator terminals and Heat Rate that is passed through to the Customer on a gross or unit net basis. In addition, Exhaust Temperature and Energy guarantees may also be provided.

If the Customer plans to use the results of the field test as a basis to determine the fulfillment of contractual requirements, the party responsible for conducting the test will provide the following services:

- Schedule, coordinate, and manage the logistics with respect to the performance test and equipment.
- Provide the final project specific performance test specification (see final paragraph of Section I).
- Validate calibration of pertinent instruments.
- Provide a post-test uncertainty analysis.
- Execute the performance test: data collection, data distribution to parties, fuel sampling, etc.
- Reduce the recorded data in accordance with the manufacturer's site performance data correction procedure.
- Issue a preliminary and final performance test report.

All services are dependent on the scope agreement between all parties. GE Energy may provide on-site support at the Customer's request. Please contact the Project Manager for details.

The test specification outlined below is the GE specification for testing. The Final Agreed Performance Test Specification will be generated by the Testing Entity; all parties will review the specification and iterate until an agreed final version is reached 120 days prior to the performance test date. The specification must be approved by all Parties 120 days before starting the Performance Test. The Final Agreed Performance Test Specification will be a more detailed document containing the GE specification provided here and this additional information:

- Test plan, schedule, and logistics
- Division of responsibility
- Exact instrumentation to be supplied
- Instrument installation
- Source of data collection for all parameters
- Marked up drawings showing installation or if equipment was modified for

installation, one-line and three-line diagrams showing the power meter and auxiliary power measurements
- Planned fuel sample process and laboratory information
- Method for documenting any deviations from the established test plan

This specification is a typical specification only and is for reference and illustrative purposes only. It is not a project specific specification and information contained herein, including numbers, scope, instruments, instrument set-up, etc., are not contractual obligations of GE Power & Water.

II. SCOPE AND PURPOSE

The primary purpose of this test shall be to demonstrate the guaranteed generator electrical output and heat rate for a GE Power & Water Aeroderivative Gas Turbine Generator (GTG). The guarantee power level will be achieved without exceeding specified engine control limits: High-pressure rotor speed, high-pressure compressor discharge pressure and temperature, and low-pressure turbine inlet temperature.

Other tests, such as emissions and noise, are typically identified by the permitting regulatory agency and, therefore, not covered in this document. However, the performance test will be performed while in compliance with NOx and CO emissions guarantees, if applicable. The Customer shall provide GE Power & Water with the emissions testing data during the performance test and the emissions data from the full emissions compliance test. All emissions measurements are in the scope of the Customer and must met the requirements of both parties.

The scopes of responsibilities will be agreed upon by all parties. A general scope of responsibilities is provided below:

- GE Power & Water shall provide a Correction Procedure model for computation of the performance test results. The Testing Entity may create a separate model for validation purposes; however, the GE Power & Water model shall be used as the primary model.
- The Testing Entity will appoint a Test Director who is responsible for supervising all aspects of the test.
- Both the Customer and the Testing Entity will be responsible for recording the data that is being collected.
- The primary results will be computed by the Testing Entity and verified by the Secondary Party.
- Personnel are to be provided by the Customer to assist in logging data and collecting fuel samples.
- One operator representing the Customer will be responsible for operating the unit. The operator may be assisted by a GE Power & Water Controls Technician.
- A site team of Technicians will be utilized for an offline compressor water wash. This procedure is to be conducted no more than three days prior to the performance test

and no less than one day before the performance test. GE Power & Water Technicians may assist.

- In addition to the above, all parties may have observers on the site during the test.
- GE Power & Water Performance Engineers shall establish GTG readiness for performance testing based on preliminary performance data. Preliminary data should be provided 2 weeks prior to the anticipated test date.
- If requested, a GE Power & Water Performance Engineer may provide on-site support to for the performance test.
- The test report shall be issued by the Testing Entity 2 weeks after the fuel samples data is available and all parties shall be allowed a 2 week period for review. If translation is required, the anticipated issue date will be 9 weeks after the fuel samples.
- All test data and reports, including emissions and noise, shall be provided to the GE Power & Water Performance Engineering Team.

III. TEST PROCEDURE

GE Power & Water testing procedures are in general compliance with ASME PTC 22–1997. Comments to ASME PTC 22–1997 are available for review. At GE Power & Water's option, the testing procedure may adapted to meet general compliance with ASME PTC 22-2005 upon providing notice to the customer and making comments to ASME PTC 22–2005 available.

A. Test Setup

The Customer will make a commercially reasonable effort to ensure the test takes place before 200 fired hours have elapsed on each gas turbine engine. Furthermore, the GTG must operate at steady base load and in new and clean condition for 24 cumulative hours prior to commencing the test. If the guarantee includes Exhaust Energy and/or Exhaust Temperature, this requirement of steady state, base load operational hours increases to 72 hours. If the Customer operates the equipment outside of the Seller's specific written operation instructions, GE Power & Water reserves the right to adjust the performance results with an additional degradation factor. GE Power & Water representatives shall determine, in their sole discretion, whether the GTG meets these criteria.

If more than 200 fired hours have elapsed before the test, degradation factors shall be applied.

B. Preparation

An off-line water wash is to be conducted, on each unit at site, no more than 3-days prior to, and no less than 1-day before, the scheduled performance test of initial unit.

Instruments and apparatus used for determinations shall be calibrated in accordance to the National Institute of Standards and Technology. Calibration

certificates for Customer furnished instruments shall be made available for GE Power & Water inspection prior to field-testing. Finally, GE Power & Water furnished instruments to the unit control panel shall be checked and properly adjusted prior to testing. **NOTE:** Additional details of the instrument requirements are provided in *Table 1 –Accuracy of Required Instruments* at the end of this document.

C. Establishing Test Readiness

Prior to initiating the performance test, GE Performance Engineers must establish GTG readiness. Preliminary testing shall be completed and sufficient time shall be allowed to evaluate the preliminary results, review the quantity and quality of data, and implement any agreed upon modifications to increase the test quality. Preliminary data shall be reviewed 2 weeks prior to the anticipated test date. Any adjustments made to the plant equipment or operation after the preliminary evaluation shall be reported to GE Power & Water. Testing shall not be conducted until GE Performance Engineering has released the engine for testing.

D. Conduct of the Test

1. Definition of Test Boundary

The test boundary establishes the equipment to be included in the test. All input and output energy streams must be determined with reference to the point at which they cross the test boundary. The test boundary for this test includes the Gas Turbine Generator, Control Limits, and Package Auxiliary Loads (if applicable – depends on the guarantee basis).

Typical GTG Package Auxiliaries ***(Example for Unit Net Basis Guarantees)***:

- Turbine Enclosure Vent Fan
- Generator/Gearbox Enclosure Vent Fan
- Generator/Gearbox Main Lube Oil Pump
- Generator/Gearbox Air/Oil Separator
- Turbine Air/Oil Separator Heat Exchanger Fan
- Lighting & Low Voltage Distribution System
- SPRINT Water Supply Pump
- Auxiliary Skid Enclosure Vent Fan
- Oil Cooler Fan
- Control House A/C

Each GTG Package Auxiliary Load listed above shall be measured individually at the MCC. Alternatively, if a MCC meter is available, it may be used provided that it measures only the loads specified on the Signed and Stamped Guarantee sheets.

The boundary for the inlet air temperature is established by the guaranteed conditions. If inlet heating/chilling is not used, the ambient temperature shall be the inlet temperature with a measured RH. If an evaporative cooler is used, the inlet air shall be the ambient temperature with an assumed effectiveness of 85% and a measured ambient RH. If inlet chilling/heating is used, the inlet temperature will be downstream of the chiller/heater and an assumed or calculated RH shall be used.

2. **Determination of GTG Steady State Condition**
Test data will be recorded only after the GTG is operated at a steady state base load condition for at least sixty (60) minutes. For the performance test, the GTG will be considered at steady state when variations from the average value (coefficient of variance) of the following parameters do not exceed the listed limits during the test period. The parameters are set for a fifty (50) minute test run. Any other length of test run, and the parameters will be adjusted.
   - Inlet Air Temperature ±4.0°F
   - Barometric Pressure ±0.5%
   - Power Output ±2.0%

3. **Test Duration and Number of Data Sets**
One test point will be conducted over a (50) *fifty-minute period*. A test point is defined as eleven (11) complete sets of manual instrument readings recorded at (5) *five-minute intervals* and all automated data shall be in thirty (30) second intervals.

4. **Data Collection Methodology**
Data collection methodology will be as follows:
   - The Test Director shall be provided to observe and support all aspects of the test.
   - If requested and agreed, one GE Power & Water Test Engineer may be provided to support all aspects of the test.
   - Personnel shall be provided by the Customer to collect fuel samples.
   - GE Power & Water and the Customer shall be responsible for recording the data that is being collected.
   - Manually collected data: The Customer shall collect back-up data manually where necessary: HMI screen shots, control system watch window screen shots.
   - Automated data collection: An automated data acquisition system shall be the preferred method of data collection.
   - Data sampling frequency: For automated data, a sampling rate of thirty (30) seconds shall be used. For manual data, a sampling rate of five (5) minutes shall be used.

   The Customer and a GE Power & Water representative will sign all data sheets at the completion of the test. All parties shall be provided with copies of all data sheets. The Testing Entity will retain the originals for use in preparing the official test report.

5. **Gas Fuel Analysis and Sampling**
The Owner will arrange for sampling and analysis of fuel. Analysis of fuel shall give composition of the natural gas in mole % (per ASTM D-1945), HHV, LHV and specific gravity (per ASTM D-3588). See Appendix IV for analysis methods.

   Three (3) fuel samples will be collected during the performance test. First sample is

taken at the beginning of the test, the second sample approximately 25 minutes into the test, and the third sample at the conclusion of the test. Sample bottles are to be marked with the time, data, unit/sample number, and fuel temperature at time of test.

Two (2) of the three (3) samples are to be sealed, labeled and sent off for analysis by the Customer. The third sample is to be held at the site until analyzed samples are reviewed and deemed acceptable by GE Power & Water and Customer. Appendix IV of the Correction Procedure (to be provided) will provide additional information on fuel sampling and analysis methods.

IV. INSTRUMENTS REQUIRED

Table 1 gives a general list of the test equipment, recommended accuracies, and parties responsible for supplying such equipment to conduct the performance test.

A. Generator Power Output

Generator output shall be measured by a precision 3-phase wattmeter with accuracy less than ±0.2%

GE Power & Water furnished current transformers are certified to ±0.3% accuracy. If more accurate CTs are required, the Customer will assume the scope of providing the instruments. Potential transformers shall be provided by the Customer. GE Power & Water recommends accuracy of to ±0.3% or better. A total KW monitoring system uncertainty of ±0.5% is attainable with this calibrated system.

If applicable, each GTG Package Auxiliary Load listed above shall be measured individually at the MCC. Alternatively, if a MCC meter is available, it may be used provided that it measures only the loads specified on the Signed and Stamped Guarantee sheets. GTG Package Auxiliary Loads are only applicable to unit net basis guarantees. Auxiliary loads shall be measured with accuracy of ±5.0% or better. A power factor of 0.85 is assumed unless measured. The GT power factor is not equivalent to the power factor of the auxiliary loads.

B. Fuel Heat Input - Gaseous Fuels

GE Power & Water Single Annular Combustor (SAC) packages use a flow meter rated at 1%, but capable of being calibrated in the range of 0.5% to 0.8%. If the Customer wishes to reduce the uncertainty below 0.8%, they shall design and construct a permanent flow meter capable of providing fuel flow with accuracy of 0.5% or better. If a further reduction in uncertainty is desired, the Customer shall design and construct a permanent flow meter capable of providing compensated fuel flow on a mass basis with uncertainty of ±0.5% or less. Compensation shall be calculated in accordance with AGA8.

The GTG SAC package includes fuel pressure and temperature sensors; however, if a secondary meter is installed, the Customer shall provide these instruments. The fuel temperature sensor and fuel pressure sensor shall be installed in close proximity to the fuel flow meter so the data collected is a representation of the fuel state at the meter. Pressure at the fuel gas meter is to be measured with a pressure transducer having ±0.25% accuracy. Temperature at the fuel gas meter is to be measured an accuracy of ±1°F. Compressibility of the fuel will be determined using the performance test fuel analysis and AGA8 calculations.

C. Engine Inlet Air Conditions

The ambient dry-bulb temperature is a primary measurement if the guarantee was created without inlet conditioning or if the guarantee was created with an evaporative cooler in service. The ambient dry bulb temperature shall be measured with at least eight (8) RTDs placed in the filter house with at least four (4) RTDs placed in each side of the filter house. The RTDs shall be placed in a location prior to inlet coils (if applicable) that allows for sufficient flow over the RTDs and installed in a manner that quantifies and minimized the spatial variation. The sensors shall be away from direct exposure to radiation and sunlight. The sensors shall be installed away from areas with flow disturbances. The individual sensor accuracy shall be ±0.26°F and the overall measurement uncertainty including spatial variation shall be ±1°F. Additional sensors may be required to reduce the overall measurement uncertainty. If the ambient dry bulb temperature is a secondary measurement, the instrumentation may be reduced and alternative schemes will be evaluated.

If the guarantee was created with inlet chilling or heating, the compressor inlet temperature (T2) will become the inlet temperature, a primary measurement, and shall be measured using eight (8) RTDs with four (4) RTDs placed in each side of the filter house. If any coil/pad/flow interference is included in the filter house hardware, , the RTDs shall be placed after this equipment and away from any flow disturbances to allow for a compressor inlet temperature reading. The RTDs shall be placed in a location that allows for sufficient flow over the RTDs and installed in a manner that quantifies and minimized the spatial variation. The overall measurement uncertainty including spatial variation shall be ±1°F. Additional sensors may be required to reduce the overall measurement uncertainty. If the unit is not inlet conditioned, the T2 measurement will be secondary and will be obtained by the dual thermocouple provided with the GE Power & Water package instrumentation. Expected uncertainty using the dual thermocouple is dependent on the package.

For both ambient and compressor inlet temperatures, the delta between the min and max sensor in one side of the filter house should be limited to 5°F. The delta between the bulk temperatures of the filter house sides shall be limited to 5°F. Any items causing the deltas, such as hot air streams from other processes shall be eliminated if possible or mitigated to the best extent.

The relative humidity shall be measured using at least two (2) digital relative humidity

sensors with one (1) sensor in each side of the filter house in the same location as the ambient air RTDs. A total accuracy of ±2% is expected. If the guarantee was created with inlet chilling or heating, the RH at station 2 (compressor inlet) is required for correction. Due to the environment at this station, direct measurement is not practical; therefore, the station 2 RH will be assumed or calculated. The assumed value of RH will be determined per an APP run using the ambient dry bulb temperature, the ambient RH, and the station 2 temperature.

Barometric pressure at the test site shall be measured with a barometer accurate to ±0.075%. Two sensors are recommended, but only one is required. Barometric pressure shall be measured as close as practical to the engine centerline.

Engine inlet total pressure loss shall be measured with a differential pressure transmitter with one line installed on the calibration valve of the P0 pressure transmitter and the other open to atmosphere. A total accuracy of ±0.25 inches of water is assumed. If GE Power & Water supplies the inlet air system, the inlet air system will be inspected. If GE Power & Water finds the air inlet system in a suitable condition, the engine inlet total pressure loss will be collected for reference information only and this value will be secondary - no correction for inlet total pressure loss will be made. If the inlet system is not in a suitable condition, GE Power & Water shall chose to either request the system be restored or will apply a correction for inlet pressure loss.

D. Engine Exhaust Static Pressure

For the exhaust static pressure loss measurement, a pressure transmitter shall be utilized if a connection port is made available. The Customer is responsible for supplying test port connections (static pressure taps) or ports for static pressure probes (pancake probes) for exhaust loss measurement. GE does not provide test ports between the turbine exhaust and exhaust stack, SCR, or boiler. Multiple ports are recommended to provide redundant measurements and also provide for troubleshooting. GE Power & Water recommends providing four equally spaced ports along the circumference of the duct. The Test Director may at that time choose to utilize all four ports either through a manifold/single pressure transducer or through multiple transducers.

Engine exhaust static pressure shall be measured at the discharge of the engine exhaust collector upstream of any heat recovery, catalytic converter or sound attenuation equipment. The instrument accuracy shall be ±0.25 inches of water or better and enough ports/instruments shall be provided to achieve a maximum uncertainty of 10%.

Exhaust pressure loss can be a difficult measurement to obtain accurately due to the flow conditions downstream of the GT exhaust. If an accurate measurement cannot be obtained, the parties will decide on an alternative plan. Exhaust pressure loss shall be measured at the discharge of the engine exhaust collector upstream of any heat recovery, catalytic converter or sound attenuation equipment.

If GE Power & Water supplies the exhaust system of the package, the exhaust air system will be inspected. If GE Power & Water finds the air exhaust system in a suitable condition, the engine exhaust pressure loss will be collected for reference information only, and no correction will be made for exhaust pressure loss.

E. NOX Water Injection

NOx water injection flow is measured via a Flow Technology turbine flow meter. The water temperature at the flow meter is measured with an RTD. The accuracy of the measurement and readout is ±0.5% for water flow.

F. Exhaust Temperature **(if Applicable)**

GE Power & Water recommends that the gas turbine exhaust temperature shall be measured using a grid of temperature sensors (rakes) located in the exhaust plenum of the gas turbine as close to the turbine/exhaust duct (HRSG, SCR, or stack inlet) interface point as possible. The duct surface of the exhaust shall be insulated to mitigate heat losses. The grid shall consist of at least 24 temperature sensors, spaced to measure equal area sections of the exhaust duct such that the maximum uncertainty of the measured exhaust temperature is ± 10.0 °F or better. This total uncertainty shall include contributions from the thermocouple wire (if applicable) and the processing equipment (if applicable). Individual sensor accuracy shall be ±0.5°F or better. Due to the non-uniform nature of exhaust flow, GE Power & Water recommends thermocouple rakes with at least 24 thermocouples. The TCs should be read individually and not ganged together. The measurement location should be away from any bends, transitions, or other flow disturbances. Each sensor shall be installed at least 8 inches from the wall of the duct to avoid boundary layer effects on the flow. The Customer is responsible for providing the available ports. The Testing Entity is responsible for providing the temporary test instrumentation and ensuring that the arrangement results in a total measurement uncertainty of ± 10.0 °F or better. If ports are provided downstream of the engine exhaust flange, GE Power & Water reserves the right to adjust the exhaust temperature measurement by the estimated temperature decay. If enough ports and instrumentation is not provided to obtain the desired measurement uncertainty, GE Power & Water reserves the right to adjust the exhaust temperature measurement and exhaust energy calculation with a commercial tolerance to account for the inadequate measurement. The commercial tolerance will be calculated based on the delta in uncertainty from the required ±10°F. A Test Deviation Letter will be provided to document the deviation from the proposed test specification. All uncertainty calculations must include the contribution due to spatial variation of the proposed measurement method.

The responsibility of exhaust temperature measurement is not in GE scope. Exhaust temperature measurements are required even if the guarantee only consists of exhaust energy.

G. Engine Exhaust Energy **(if Applicable)**

A proposed methodology outlining the calculation of exhaust gas energy will be provided in Section VII.C of the Correction Procedure. This methodology is based on an energy balance. Exhaust energy cannot be computed if the exhaust temperature is not measured. Since exhaust energy is heavily dependent on the exhaust temperature measurement, GE Power & Water reserves the right to adjust the exhaust energy calculation with a commercial tolerance if the exhaust temperature is inadequately measured. The commercial tolerance will be calculated based on the delta in uncertainty from the required exhaust temperature uncertainty of ±10°F. All uncertainty calculations must include the contribution due to spatial variation of the proposed measurement method. A Test Deviation Letter will be provided to document the deviation from the proposed test specification.

H. Emissions Measurements

The Customer shall make provisions to measure emissions in a method that is agreed to by all parties. If a CEMS is the proposed measurement device, the CEMS shall have gone through a certification process. The Customer shall provide information on making corrections for calibration and drift. GE Power & Water recommends using a qualified third party test entity with temporary instrumentation that will test for emissions in accordance to the methods established on the Stamped and Signed Guarantee Sheet. The only emissions measurements required during the performance test are NOx and CO.

V. ENGINE LIMIT ASSESSMENT

The following Unit Control Limit Parameters are to be recorded during the performance test for engine limit assessment:

- High Pressure Rotor speed, XN25
- Low Pressure Rotor Speed, XNSD
- Compressor Discharge Pressure, PS3
- Compressor Discharge Temperature, T3
- Low Pressure Turbine Inlet Temperature, T48

VI. TEST EXECUTION

The Test Director has the overall responsibility for starting and stopping test, for directing plant operation and the test personnel, and for all other aspects of the test execution. However, the Test Director may not deviate from the test plan without prior mutual agreement by all parties to the test.

A. Unit Operating Conditions

1. **Permissible Mode of Unit Control:**
   All Unit components will be operating within the respective manufacturer's specified continuous operating limits at base load. Test data will be recorded only when GTG is at base load and at a control limit (T3, PS3, T48, N25, N25R), and all test instrumentation are functioning satisfactory and in steady state condition for at least 30 minutes prior to testing. Please Note: If unit is in XNSD control, MW Limit Control, and/or Maximum or Minimum Fuel Control, then the performance test will not be conducted unless the GTG is in XNSD control due to the Max MW Limit Control Schedule or if the unit is in XNSD control due to a GE Performance Test Engineer approving a MW cutback to balance plant emissions or performance. Customers and or third party Test Entities may not make this decision without the written authorization of GE Power & Water.

2. **Operating Status of GTG Inlet Conditioning**
   Inlet conditioning shall match the stamped and signed guaranteed performance sheets. If an evaporative cooler was used in the guarantee, the performance test will not take place until the evaporative effectiveness is at least 85%. If applicable, the inlet chiller/heating system including all components shall be online, fully functional, and at steady state for the performance test. The chiller/heater must be capable to provide the capacity as stated on the Stamped and Signed Guarantee Sheet.

3. **Operating Status of GTG Package Auxiliary Loads:**
   The test should be conducted with normal auxiliary package service loads in operation. Unit service loads associated with Balance of Plant, emergency equipment, construction or any other operation, which is not normal day-to-day operation, are to be excluded from the test.

4. **Emissions:**
   Combustion Mapping must be completed prior to the performance test to insure the GTG meets the guarantee emission requirements. The performance test will not be conducted if emissions are in excess of the guaranteed limits. During the performance test, NOx water injection is to be used to maintain a NOx emission rate at the guaranteed value. The Customer shall make provisions to measure emissions in a method that is agreed to by all parties. The Customer shall provide all emissions test data to GE Power & Water.

5. **Applicable Operating Range for the Correction Procedure:**
   To reduce the effect of corrections, every effort within practicality shall be made to reduce the delta between the test conditions and guarantee conditions. For the performance test runs, allowable ranges from the guarantee point are provided in in this Section and in Section VII. Outside of these ranges, a Test Deviation will need to be signed and/or the correction procedure model will

require a revision. The correction model provided is not valid outside of this established range.

*EXAMPLE Table - Allowable ranges are project specific.

PARAMETERS	MIN	MAX

B. Permissible Deviations during Test Runs

1. **Typical Performance Test Restart Situation:**
   Any deviation outside of the Steady State Limits established in Section III.D.2 will require a restart of the performance test until the Steady State criteria are met.

2. **Allowable Deviation from Guarantee Conditions**
   To reduce the effect of corrections, every effort within practicality shall be made to reduce the delta between the test conditions and guarantee conditions. See Section VI.A.5 for the operating condition range.

2. **Typical Performance Test Abort Situation:**
   - NOx water must be online during the performance test. If NOx water injection goes offline during the performance test, then the test will be aborted.
   - The unit must be at base load with all systems operating (SPRINT, Inlet Heater if needed, Gas compressors if needed, etc...). If any of these systems go offline during the performance test, the test will be aborted.
   - If the unit trips offline for any reason, then the test will be aborted.
   - Unit goes into Maximum or Minimum Fuel Control.
   - NOX and/or CO emissions are in excess of the guaranteed limits (if applicable).

The performance test will be restarted as soon as the problem leading up to the abort situation is rectified.

VII. EVALUATION OF TEST RESULTS

The Gas Turbine Generators are designed and guaranteed to produce a certain output with a certain heat rate for a given set of ambient and operating conditions. As the ambient conditions deviate from the design values, the actual performance of the GTG changes. The ambient conditions at the time of testing are likely to be different from the values stated in the basis of guarantee. To account for these deviations from design ambient conditions, site-specific correction will be applied to the raw data to derive equivalent design condition results.

To reduce the effect of corrections, every effort within practicality shall be made to reduce the delta between the test conditions and guarantee conditions. For the performance test runs, the applicable range of operating conditions is listed in Section VI.A.5. Outside of these ranges, a test deviation will need to be signed and/or the correction procedure model will require a revision.

A. Guarantee Basis Site Conditions

The guarantee basis conditions are included on the GE Power & Water Stamped and Signed Guarantee Sheets, which are included in Appendix I.

B. Methodology for Data Reduction

The gas turbine generators are designed to produce a certain output with a certain heat rate for a given set of ambient and operating conditions. As the ambient conditions deviate from the guarantee basis values, the measured performance of the GTG changes. To account for the deviations from basis condition of the guarantee, a GE Power & Water Deck Transfer Correction Procedure has been compiled.

The Deck Transfer Correction Procedure uses the Application for Package Performance Systems cycle deck (APPS) to model gross output and heat rate at the performance test day conditions and also to provide the gross power and heat rate at the basis conditions of the guarantee.

From these performance runs, an overall correction for power and heat rate will be respectively determined and applied to the measured output and heat rate. In the Correction Procedure, an example of the Deck Transfer Methodology will be outlined in Appendix II.A and the APPS performance runs will be included in Appendix II.B.

****Gross Corrected Power = Measured Power at GT Generator Terminals Corrected for the Parameters Noted in Appendix II.**

****Gross Corrected Heat Rate = Calculated Heat Rate Corrected for the Parameters Noted in Appendix II.**

Corrected Exhaust Temperature = Measured Exhaust Temperature Corrected for the Parameters Noted in Appendix II

Corrected Exhaust Energy = Calculated Exhaust Energy (Energy Balance Method) Corrected for the Parameters Noted in Appendix II

** unit net basis guarantees will be adjusted by the measured package auxiliary loads.

Collected Performance Data (EXAMPLE)	
Barometric Pressure, psia	
Ambient Dry Bulb, °F	
Ambient Wet Bulb, °F	
Ambient Relative Humidity, %	
Compressor Inlet Temperature, °F	
Inlet Loss, inH2O, (No Correction taken as this is in GE Power & Water Scope of Supply)	
Exhaust Loss, inH2O,	
FF	Fuel Flow, scfm
FLHV	Fuel Lower Heating Value, Btu/scf
Measured Gross Power, Calculated Heat Rate, and Measured Package Auxiliary Loads	
MGPOW	Measured Gross Power, kW @ Generator Terminals
PwrFac	Power Factor
Cal_GHR	Calculated Gross Heat Rate, Btu/kW-hr = FF * FLHV / MGPOW
Deck Transfer Correction Methodology	
A	Modeled Power Output, APPS Deck Transfer Run (Case 100) @ **Guarantee Basis Conditions, kW**
B	Modeled Power Output, APPS Deck Transfer Run (Case 101) @ **Test Day Conditions, kW**
C	Modeled Heat Rate, APPS Deck Transfer Run (Case100) @ **Guarantee Basis Conditions, Btu/kW-hr**
D	Modeled Heat Rate, APPS Deck Transfer Run (Case 101) @ **Test Day Conditions, Btu/kW-hr**
Correction Factors	
CF_GP	Deck Transfer Correction Factor for Gross Power = B / A
CF_GHR	Deck Transfer Correction Factor for Gross Heat Rate = D / C
Gross Power and Heat Rate Correction Calculations	
CGO	Corrected Gross Ouput, kW = MGPOW / CF_GP
OM	**Output Margin, %**
CorrGHR, LHV	Corrected Gross Heat Rate, Btu/kW-hr (LHV) = Cal_GHR / CF_GHR
HRM	**Heat Rate Margin, %**

C. Method and Criteria for Evaluation of Test Results with Regard to Guaranteed Performance

The Test Director and GE Power & Water will independently evaluate test data once test fuel analyses are received. Test data correction is performed in accordance with General Electric "Gas Turbine Site Performance Test and Correction Procedure", GE Power & Water document #SSPCP2500-A. This document is the site specific correction procedure, which is provided 120 days prior to the anticipated test date.

Each measured test parameter's tolerance is defined as twice the estimated standard deviation (2-sigma). The uncertainty in the compliance parameter resulting from this tolerance is calculated for each measured test parameter. These uncertainties are then combined by root-sum-square analysis to obtain the total uncertainty for that compliance parameter. *Table 2* illustrates typical uncertainty calculations.

Applied tolerances are a commercial item and shall be discussed in the contract terms and conditions. From a technical perspective, measurement uncertainty shall not be applied to the corrected results and/ or performance correction calculations. Uncertainty shall be used prior to the test to measure the quality of test. If the uncertainty is not acceptable, the parties shall work on modifying the instrumentation to reduce the uncertainty. For exhaust temperature measurements, if enough ports and instrumentation is not provided to obtain the desired measurement uncertainty, GE Power & Water reserves the right to adjust the exhaust temperature measurement and exhaust energy calculation with a commercial tolerance to account for the inadequate measurement.

A full test report should be issued two weeks after the fuel analysis has been received. If translation is required, the anticipated issue date will be 9 weeks after the fuel samples.

D. Exhaust Energy Calculation Procedure **(Example, if Applicable)**

An energy balance around the GTG shall determine exhaust gas energy. Below is an outlined methodology, but details will be provided with the Correction Procedure. The ASME PTC-22 (2005) calculation method may only be used if the exhaust energy is guaranteed with reference to the T2 temperature; the PTC methodology utilizes the NASA Glenn coefficients, which do not work at a zero absolute temperature (ref 0°R).

The diagram below illustrates an energy balance around the GTG:

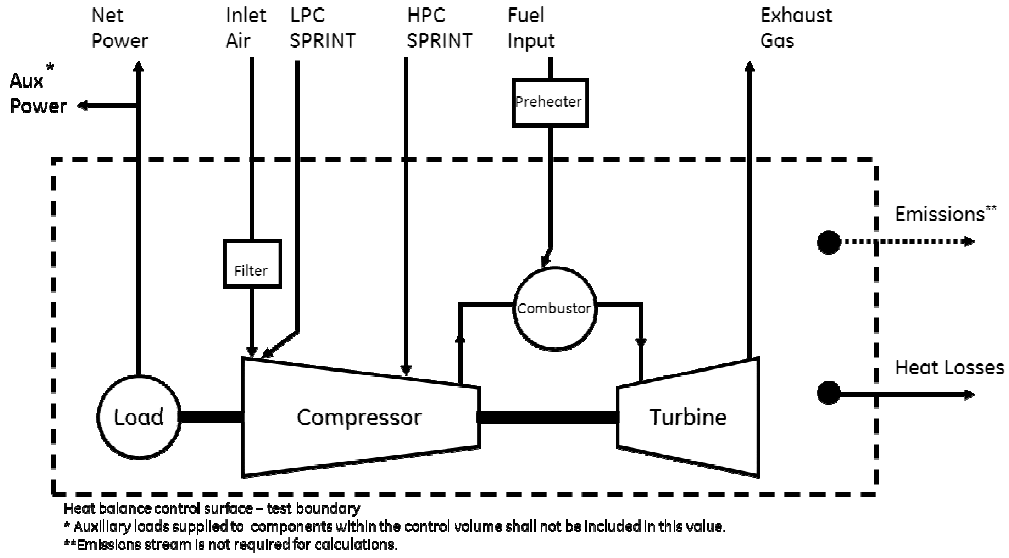

Figure 1: Control Envelope for Heat Balance Calculations (EXAMPLE)

A GTG energy balance results in the following equation:

Input Energy = Output Energy

$Q_{air} + Q_{fuel} + Q_{wtr\ inj} = Q_{kw} + Q_{loss} + Q_{exh} + Q_{gear\ loss}$

Or

$$Q_{exh} = Q_{air} + Q_{fuel} + Q_{wtr\ inj} - Q_{kw} - Q_{loss} - Q_{gear\ loss}$$

Setting the reference temperature T_{ref} equal to the inlet air temperature eliminates the Q_{air} term in the energy balance equation. This requires guaranteed exhaust energy to be referenced to T2. The exhaust energy guarantee is shown on the Stamped and Signed Guarantee Sheet. If this is the case, the equation reduced to the following:

$$Q_{exh} = Q_{fuel} + Q_{wtr\ inj} - Q_{kw} - Q_{loss} - Q_{gear\ loss}$$

Where:

Q_{air} (MMBtu/hr) = *Inlet Air Input Energy (zero for T2 referenced energies)*
= $m_{air} * (h_{air} - h_{air,ref}) / 1E6$

Q_{fuel} (MMBtu/hr) = *Fuel Gas Input Energy*
= $m_{fuel} * [LHV + (h_{fuel,temp} - h_{air,ref})] / 1E6$

$Q_{wtr\ inj}$ (MMBtu/hr) = *Water Injection (SPRINT and NOX Water as Separate Terms)*
= $m_{wtr\ inj} * [h_{inj}(P_{inj},T_{inj}) - H_{v,sat}(T_{ref})] / 1E6$

Q_{kw} (MMBtu/hr) = *Gas Turbine Power Output Energy*
= $PWR * (3412.14163\ Btu / kWh) / 1E6$

Q_{loss} (MMBtu/hr) = *Gas Turbine Heat Losses*
= $L_{gen} + L_{misc}$

$Q_{gear\ loss}$ (MMBtu/hr) = *Gear Box Loss*
= $GB_{loss} * (3412.12163\ Btu/ kWh) /1E6 * 0.85$

Where:

T_{ref}	=	reference temperature
m_{air}	=	inlet air mass flow rate (lb/hr)
h_{air}	=	inlet air enthalpy at measured temperature (Btu/lb)
$h_{air,ref}$	=	inlet air enthalpy at T_{ref} (Btu/lb)
m_{fuel}	=	fuel gas mass flow rate (lb/hr)
LHV	=	fuel gas lower heating value (Btu/lb)
$m_{wtr\ inj}$	=	water injection mass flow rate (klb/hr)
$h_{v,sat}(T_{ref})$	=	saturated vapor enthalpy (Btu/lb) at T_{ref}
$h_{inj}(P_{inj}. T_{inj})$	=	injection enthalpy (Btu/lb at measured P (P_{inj}) and T (T_{inj})
PWR	=	gas turbine power output net of excitation power (kW)
L_{gen}	=	Generator Losses (MMBtu/hr)
L_{misc}	=	Miscellaneous Losses (MMBtu/hr)
GBL_{loss}	=	Gearbox Losses (kW)

The Generator and Miscellaneous losses are determined from GE design data for the gas turbine. For an LM-6000 gas turbine the design losses are:

L_{gen} = [(100 – η_{gen}) /100] * PWR / 100 * 3412.14 Btu/kWh / 1E6

(η_{gen} is the generator efficiency determined from the generator curve which contains margin. To eliminate the margin, a 1.011 factor will be applied to the APPS data.) (To eliminate design margin, gearbox loss data in APPS will be decreased by a factor of 0.85)

L_{misc}^{*} = m_{air} * Losses

In order to determine L_{misc}, a value for the air flow to the turbine (m_{air}) needs to be determined (Flow losses are estimated based on a preliminary analysis from GE Power & Water Performance Engineering). A mass balance around the gas turbine results in the following equation:

m_{exh} = $m_{air} + m_{fuel} + m_{wtr\ inj}$

Exhaust flow will be determined by using the APPS model and if necessary by performing a mass balance by solving the energy balance equation for the exhaust gas flow rate:

$$m = \frac{Q_{exh} - Q_{kw} - Q_{loss} - Q_{gear}}{(h_{exh} - h_{exh,ref}) / 1000}$$

The exhaust gas enthalpies h_{exh} and $h_{exh,ref}$ are determined from the measured exhaust and selected reference temperatures, respectively, and the calculated exhaust gas molar composition. The exhaust gas molar composition is determined using combustion reaction stoichiometry (or APPS), the measured values for fuel gas composition, fuel gas flow rate, and water injection flow rate, and an initial guess for air flow rate. The exhaust enthalpy is then calculated using GE established thermodynamic data.

The energy balance may require iterative calculations depending on the inlet air flow estimate. GE Power & Water may employ data reconciliation methods on the energy balance.

The 1997 ASME Steam Tables shall be used for the properties of water and steam. In all energy calculations the International Table BTU is the BTU to be used, with a conversion factor of 1 BTU = 1,055.056 Joules.

Since the unit will operate at baseload during the performance test, bleed flows should be near zero. Bleed flows were not included in the provided example. Any bleed flow must be accounted for when calculating the energy and mass balances.

Table 1: Accuracy of Required Instruments (Proposed)

Instruments	Customer	GE Package	Testing Entity	Recommended [2]
Recording wattmeter			X	±0.20%
Potential transformers	X			±0.30%
Current transformers		X[3]		±0.30%
Primary fuel gas meter		X[5]		±1.0%
Fuel gas sampling device	X			Lab
Fuel gas pressure sensor		X[5]		±0.25%
Fuel gas temperature sensor		X[5]		±1.0°F
Engine inlet temperature (x8)			X[1]	±1.0°F
Barometric pressure transmitter			X	±0.075%
GT thermocouple system		X[1]		±2.0°F [4]
Ambient air RTDs (x8)			X[1]	±1.0°F
Inlet loss pressure transmitter			X	±0.25in. H2O
Relative humidity sensor (x2)			X	±2.0%
Exhaust loss pressure transmitter			X	±0.25in. H2O
Exhaust temperature (x24)			X[2]	±10°F
SPRINT water flow meter		X		±0.75%
Auxiliary power meter	X			±5.0%
Water Injection				
NOX water flow meter			X	±1.0%
NOX water temperature			X	±2.0°F
NOX/CO emissions	X			±1.5%

(1) See Section IV.C for details. The primary inlet temperature measurement is determined by the basis of guarantee conditions. All other measurements of air temperature are then considered secondary and the accuracy of instrumentation becomes less critical.

(2) Recommendations are for instrument accuracy except for exhaust temperature, and inlet temperature where the recommendation is for overall measurement uncertainty. Sensor accuracy for these temperatures shall be ±0.26°F for inlet temperature and ±0.50°F for exhaust temperature. Overall measurement uncertainty must be evaluated for all parameters. Additional sensors may be required to reduce the overall measurement uncertainty of a parameter.

(3) Provided that the Customer is accepting of the accuracy level. If a more accurate device(s) are required, the Customer shall assume the scope of providing the CTs.

(4) LM6000 PC accuracy is ±2.0°F. LM6000PG accuracy is ±6.4°F.

(5) See section IV.B for more details.

Table 2: Instrument Uncertainty (Example)

Pre Test Uncertainty of Corrected Gross Power Turbine Acceptance Test

Measured Parameter	Units	Average	Instrument Uncertainty B_I	Spatial Uncertainty B_s	Systematic Uncertainty B_C	Random Uncertainty** S_x	Total Uncertainty of Measured Parameter U_{95i}	Sensitivity θ_i ($\Delta R/\Delta P$)	Individual Uncertainty of Result (θ_i * U_{95i})

2. CULTURAL RESOURCES						
Mitigation Measure CULT-1: Archaeological Resources Treatment. If archaeological resources are encountered during project implementation, an archaeologist meeting the Secretary of the Interior's Professional Qualification Standards (the	City of Pasadena Planning Division (Zoning Administrator)	During grading and excavation, in the event that archaeological resources are encountered, Applicant to notify Planning Division and retain a qualified	If notified by Applicant of the presence of archaeological resources during construction, Planning Division to verify Applicant retention of qualified archaeologist for			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
"archaeologist") shall be immediately notified and retained by the applicant and approved by the City to oversee and carry out these mitigation measures. The archaeologist shall coordinate with the applicant as to the immediate treatment of the find until a proper site visit and evaluation is made by the archaeologist. The archaeologist shall be allowed to temporarily divert or redirect grading or excavation activities in the vicinity in order to make an evaluation of the find and determine appropriate treatment. Treatment will include the goals of preservation where practicable and public interpretation of historic and archaeological resources. All cultural resources recovered shall be documented on California Department of Parks and Recreation Site Forms to be filed with the CHRIS-SCCIC. The archaeologist shall prepare a final report about the find to be filed with Project Applicant, the City, and the CHRIS-SCCIC, as required by the California Office of Historic Preservation. The report shall include documentation and interpretation of resources recovered. Interpretation will include full evaluation of the eligibility with respect to the National and California Register and CEQA. The report shall also include all specialists' reports as appendices. The Lead Agency shall designate repositories in the event that significant resources are recovered. The archaeologist shall also determine the need for archaeological and Native American monitoring for any ground-disturbing activities thereafter. If warranted, the archaeologist will develop a monitoring program in coordination with a Native American		archaeologist to implement this mitigation measure.	implementation of this mitigation measure. Following project grading and excavation and prior to project construction, Planning Division to review and approve final report submitted by Applicant or qualified archaeologist.			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
representative (if there is potential to encounter prehistoric or Native American resources), the applicant, and the City. The monitoring program will also include a treatment plan for any additional resources encountered and a final report on findings.						
Retain and notify an archaeologist meeting the Secretary of the Interior's Professional Qualification Standards to oversee and carry out these mitigation measures if archaeological resources are encountered during project implementation	***Approval of archeologist required by Planning Division prior to start of grading activities***	***Prior to start of grading activities***	***During construction***			
Mitigation Measure CULT-2: Paleontological Resources Treatment. A qualified paleontologist shall attend a pre-grade meeting and develop a paleontological monitoring program to cover excavations in the event they occur into the older Quaternary Alluvium. A qualified paleontologist is defined as a paleontologist meeting the criteria established by the Society for Vertebrate Paleontology. If excavation into Quaternary deposits occurs, monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If it is determined that excavation will not encounter Quaternary deposits, no further measures need be taken. The frequency of monitoring inspections shall be based on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. If a fossil is found, the paleontologist shall be allowed to temporarily divert or	City of Pasadena Planning Division (Zoning Administrator)	During grading and excavation, in the event that paleontological resources are encountered, Applicant to notify Planning Division and retain a qualified paleontologist to implement this mitigation measure.	If notified by Applicant of the presence of paleontological resources during grading and excavation, Planning Division to confirm Applicant retention of qualified paleontologist for implementation of this mitigation measure. Following project grading and excavation and prior to project construction, Planning Division to confirm receipt of final report from Applicant or qualified paleontologist.			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation and, if necessary, salvage. At the paleontologist's discretion and to reduce any construction delay, the grading and excavation contractor shall assist in removing rock samples for initial processing. Any fossils encountered and recovered shall be prepared to the point of identification and catalogued before they are donated to their final repository. Any fossils collected shall be donated to a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County. Accompanying notes, maps, and photographs shall also be filed at the repository. If fossils are found following completion of the above tasks, the paleontologist shall prepare a report summarizing the results of the monitoring and salvaging efforts, the methodology used in these efforts, as well as a description of the fossils collected and their significance. The report shall be submitted by the applicant to the lead agency, the Natural History Museum of Los Angeles County, and representatives of other appropriate or concerned agencies to signify the satisfactory completion of the project and required mitigation measures.						
Retain a qualified paleontologist to attend a pre-grade meeting and develop a paleontological monitoring program to cover excavations in the event they occur into the older Quaternary Alluvium	***Update in monthly reports to Planning Case Manager***	***During grading and excavation***	***Following project grading and excavation and prior to project construction, Planning Division to confirm receipt of final report from Applicant or qualified paleontologist.***			
Mitigation Measure CULT-3: **Human Remains Treatment.**	City of Pasadena Planning Division (Zoning	During grading and excavation, in the event	If notified by Applicant of the presence of human			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
If human remains are encountered unexpectedly during construction excavations and grading activities, State Health and Safety Code Section 7050.5 requires that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98. If the remains are determined to be of Native American descent, the coroner has 24 hours to notify the Native American Heritage Commission (NAHC). The NAHC shall then identify the person(s) thought to be the Most Likely Descendent of the deceased Native American, who shall then help determine what course of action shall be taken in dealing with the remains. The applicant shall then under take additional steps as necessary in accordance with *CEQA Guidelines* Section 15064.5(e). Preservation of the remains in place or project design alternatives shall be considered as possible courses of action by the applicant, the City, and the Most Likely Descendent.	Administrator)	that human remains are encountered, Applicant to notify Planning Division and initiate consultation the NAHC and follow that agency's recommended course of action to implement this mitigation measure.	remains during grading and excavation, Planning Division to confirm Applicant consultation with the NAHC for implementation of this mitigation measure. Following project grading and excavation and prior to project construction, Planning Division to confirm Applicant has completed the NAHC's recommended course of action.			
Contact coroner and NAHC representative if human remains are unexpectedly uncovered. Undertake additional steps in accordance with CEQA protocols.	***Update in monthly reports to Planning Case Manager***	***During grading and excavation***	***Following project grading and excavation and prior to project construction***			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
3. HAZARDS AND HAZARDOUS MATERIALS						
Mitigation Measure HAZ-1: Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs), as indicated in the Phase II Environmental Site Assessment, shall be excavated and disposed of off-site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above-mentioned locations is planned for off-site disposal, then the excavated soil shall be stockpiled and a WET test shall be made on stockpile soil samples to determine the soluble lead concentration of the stockpiled soil for soil disposal purposes.	City of Pasadena Fire Department	During grading and excavation, Applicant to implement this mitigation measure.	Prior to the commencement of construction, Building and Safety Division to verify Applicant compliance with this mitigation measure.			
Excavate and dispose of lead contaminated soil off-site in accordance with WET testing protocols	***Update in weekly reports to Fire Department***	***During grading and excavation***	***Prior to start of construction activities***			
Mitigation Measure HAZ-2: If the soil at the vicinity of the locations (as identified in the Phase II Environmental Site Assessment) where TRPH concentrations exceed 1,000 ppm is planned for off-site disposal, then the excavated soil shall be stockpiled and analytically tested for TPH and VOCs using EPA Method 8015 M and 8260B or per soil disposal facility requirements.	City of Pasadena Fire Department	During grading and excavation, Applicant to implement this mitigation measure.	Prior to the commencement of construction, Building and Safety Division to verify Applicant compliance with this mitigation measure.			
Excavate and dispose of TRPH contaminated soil off-site in accordance with EPA Method 8015 M and 8260B or per soil disposal facility requirements	***Update in weekly reports to Fire Department***	***During grading and excavation***	***Prior to the commencement of construction***			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
Mitigation Measure HAZ-3: During project design development and prior to initiation of excavation and grading activities, PWP shall retain a qualified environmental consultant to prepare a soils management plan that shall be submitted to the City of Pasadena Fire Department for review and approval. The soils management plan shall be implemented during excavation and grading activities on the project site to ensure that any contaminated soils are properly disposed of offsite. The plan shall include, but not necessarily be limited to the following: • A qualified environmental consultant shall be present as necessary during excavation or grading activities to monitor compliance with the soils management plan and to actively monitor the soils and excavations for evidence of contamination. • Any soil encountered during excavation or grading activities that appears to have been affected by hydrocarbons or any other contamination shall be evaluated, based upon appropriate laboratory analysis, by a qualified environmental consultant prior to offsite disposal at a licensed facility. • Soils in the southwestern corner of the site near Boring Location GP32 and where TRPH concentrations exceed 1,000 ppm, as identified in the Limited Phase II ESA, shall be segregated and analyzed prior to offsite disposal. This may require over-excavation in these area and further analysis of this soil to determine the extent of soil contamination.	City of Pasadena Fire Department	During project design development and prior to excavation and grading, Applicant to retain qualified consultant to prepare soils management plan and submit plan to Building and Safety Division for approval. During grading and excavation, Applicant to implement approved soils management plan. Upon completion of grading and excavation, Applicant to notify Building and Safety Division of completion of implementation of soils management plan.	Prior to the commencement of grading and excavation, Building and Safety Division to review and approve soils management plan. Following grading and excavation and prior to construction, Building and Safety Division to verify completion of implementation of soils management plan.			

Mitigation Measure	Monitoring or Enforcement Agency	Timeframes for Mitigation Implementation & Enforcement		Verification of Compliance		
		Applicant Implementation	Agency Enforcement	Initial	Date	Remarks
• All identified contaminated soils shall be properly handled and transported to an appropriately licensed disposal facility.						
Retain qualified consultant to prepare soils management plan	***Submit to Building and Safety Division***	***During project design development and prior to excavation and grading***	***Prior to the commencement of grading and excavation***			
Implement soils management plan	***Update in weekly reports to Fire Department***	***During excavation and grading***	***During excavation and grading***

Facility ID: 800168
Revision #: 26
Date: August 15, 2013

FACILITY PERMIT TO OPERATE

PASADENA CITY, DWP
72 E GLENARM ST
PASADENA, CA 91105

NOTICE

IN ACCORDANCE WITH RULE 206, THIS PERMIT TO OPERATE OR A COPY THEREOF MUST BE KEPT AT THE LOCATION FOR WHICH IT IS ISSUED.

THIS PERMIT DOES NOT AUTHORIZE THE EMISSION OF AIR CONTAMINANTS IN EXCESS OF THOSE ALLOWED BY DIVISION 26 OF THE HEALTH AND SAFETY CODE OF THE STATE OF CALIFORNIA OR THE RULES OF THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT. THIS PERMIT SHALL NOT BE CONSTRUED AS PERMISSION TO VIOLATE EXISTING LAWS, ORDINANCES, REGULATIONS OR STATUTES OF ANY OTHER FEDERAL, STATE OR LOCAL GOVERNMENTAL AGENCIES.

Barry R. Wallerstein, D. Env.
EXECUTIVE OFFICER

By
Mohsen Nazemi, P.E.
Deputy Executive Officer
Engineering & Compliance

FACILITY PERMIT TO OPERATE

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

FACILITY CONDITIONS

F9.1 Except for open abrasive blasting operations, the operator shall not discharge into the atmosphere from any single source of emissions whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is:

(a) As dark or darker in shade as that designated No.1 on the Ringelmann Chart, as published by the United States Bureau of Mines; or

(b) Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in subparagraph (a) of this condition.

[**RULE 401, 3-2-1984;** RULE 401, 11-9-2001]

F14.1 The operator shall not use fuel oil containing sulfur compounds in excess of 0.05 percent by weight.

The 0.05 percent sulfur limit shall not apply to existing supplies of any liquid fuel in storage as of October 1, 1993 until such supply is exhausted.

[**RULE 431.2, 5-4-1990;** RULE 431.2, 9-15-2000]

F14.2 The operator shall not purchase fuel oil containing sulfur compounds in excess of 15 ppm by weight as supplied by the supplier.

This condition shall become effective on or after June 1, 2004.

[**RULE 431.2, 5-4-1990;** RULE 431.2, 9-15-2000]

F16.1 The operator shall keep records, in a manner approved by the District, for the following parameter(s) or item(s):

purchase records of fuel oil and sulfur content of the fuel

[**RULE 3004(a)(4)-Periodic Monitoring, 12-12-1997**]

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

F18.1 Acid Rain SO2 Allowance Allocation for affected units are as follows:

Device ID	Boiler ID	Contaminant	Tons in any year
13	Broadway Unit No. B-1	SO2	126
14	Broadway Unit No. B-2	SO2	163
15	Broadway Unit No. B-3	SO2	74

a). The allowance allocation(s) shall apply to calendar years 2000 through 2009.

b). The number of allowances allocated to Phase II affected units by U.S. EPA may change in a 1998 revision to 40CFR73 Tables 2,3, and 4. In addition, the number of allowances actually held by an affected source in a unit account may differ from the number allocated by U.S. EPA. Neither of the aforementioned conditions necessitate a revision to the unit SO2 allowance allocations identified in this permit (see 40 CFR 72.84)

[**40CFR 73 Subpart B, 1-11-1993**]

F24.1 Accidental release prevention requirements of Section 112(r)(7):

a). The operator shall comply with the accidental release prevention requirements pursuant to 40 CFR Part 68 and shall submit to the Executive Officer, as a part of an annual compliance certification, a statement that certifies compliance with all of the requirements of 40 CFR Part 68, including the registration and submission of a risk management plan (RMP).

b). The operator shall submit any additional relevant information requested by the Executive Officer or designated agency.

[**40CFR 68 - Accidental Release Prevention, 5-24-1996**]

F52.1 This facility is subject to the applicable requirements of the following rules or regulation(s):

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

The facility shall submit a detailed retirement plan for the permanent shutdown of Boiler B-3 (Device 15), describing in detail the steps and schedule that will be taken to render Boiler B-3 inoperable.

The retirement plan must be submitted to AQMD within 60 days of permit issuance. AQMD shall notify PDWP whether the plan is approvable. If AQMD notifies PDWP that the plan is not approvable, PDWP shall submit a revised plan addressing AQMD's concerns within 30 days.

PDWP shall not commence any construction of equipment for the repower project before the retirement plan for permanent shut down of Boiler B-3 is approved in writing by AQMD.

PDWP shall provide AQMD with a notarized statement that Boiler B-3 is permanently shut down and that any re-start or operation of the unit shall require a new Permit to Construct and be subject to all requirements of nonattainment new source review and the prevention of significant deterioration program.

The notarized statement shall be submitted within 30 days following the permanent shutdown of Boiler B-3.

PDWP shall notify AQMD 30 days prior to the implementation of the approved retirement plan for permanent shut down of Boiler B-3.

PDWP shall cease operation of Boiler B-3 (Device 15) within 90 calendar days of the first fire of turbine GT-5.

[RULE 1304(a)-Modeling and Offset Exemption, 6-14-1996]

DEVICE CONDITIONS

A. Emission Limits

A63.3 The operator shall limit emissions from this equipment as follows:

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

CONTAMINANT	EMISSIONS LIMIT
CO	Less than or equal to 5,873 LBS IN ANY ONE MONTH
PM10	Less than or equal to 3,010 LBS IN ANY ONE MONTH
VOC	Less than or equal to 1,436 LBS IN ANY ONE MONTH
SOX	Less than or equal to 588 LBS IN ANY ONE MONTH

The above limits apply after the equipment is commissioned.

The operator shall calculate the monthly emission limit(s) by using calendar monthly fuel use data and the following emission factors: VOC: 3.48 lbs/mmscf, PM10: 7.30 lbs/mmscf, SOx: 1.43 lbs/mmscf.

The operator shall calculate the emission limit(s) for CO after the CO CEMS certification based upon readings from the AQMD certified CEMS. In the event the CO CEMS is not operating or the emissions exceed the valid upper range of the analyzer, the emissions shall be calculated by using monthly fuel use data and the following factors: normal operation: 14.25 lbs/mmscf.

[RULE 1303(b)(2)-Offset, 5-10-1996; RULE 1303(b)(2)-Offset, 12-6-2002]

[Devices subject to this condition : D56]

A99.8 The 42.83 LBS/MMSCF NOX emission limit(s) shall only apply during the interim reporting period during initial turbine commissioning to report RECLAIM emissions.

[RULE 2012, 5-6-2005]

[Devices subject to this condition : D56]

A99.9 The 18.79 LBS/MMSCF NOX emission limit(s) shall only apply during the interim reporting period after initial turbine commissioning to report RECLAIM emissions.

[RULE 2012, 5-6-2005]

[Devices subject to this condition : D56]

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

A99.10 The 2.0 PPM NOX emission limit(s) shall not apply during turbine commissioning, start-up, shutdown, Water Injection and Intercooler Tuning (WIIT), and Ammonia Injection Grid Tuning (AIGT) periods. Start-up time shall not exceed 120 minutes for each start-up. Shutdown periods shall not exceed 60 minutes for each shutdown. The turbine shall be limited to a maximum of 5 start-ups per day, 155 start-ups per month, and 750 start-ups per year.

For the purposes of this condition, the beginning of start-up occurs at initial fire in the combustor of the combustion turbine through the full operation of the steam turbine generator. If during start-up, the process is aborted the process will count as one start-up.

For the purposes of this condition, shutdown shall be defined as the period of time from initiation of the shutdown sequence to cessation of firing.

For the purposes of this condition, WIIT shall be defined as the tuning of the gas turbine water injection and intercooler system. WIIT shall not exceed 12 hours. The operator shall limit the duration of WIIT to no more than 12 hours in any one month and 24 hours in any one year.

For the purposes of this condition, AIGT shall be defined as optimizing and re-balancing of the NH3 grid or catalyst modules, and the retuning of the turbine control systems. AIGT shall not exceed 10 hours. The operator shall limit the duration of AIGT to no more than 10 hours in any one year.

The commissioning period shall not exceed 204 hours.

[RULE 1703(a)(2) - PSD-BACT, 10-7-1988; RULE 2005, 6-3-2011]

[Devices subject to this condition : D56]

A99.11 The 2.0 PPM CO emission limit(s) shall not apply during turbine commissioning, start-up, shutdown, Water Injection and Intercooler Tuning (WIIT), and Ammonia Injection Grid Tuning (AIGT) periods. Start-up time shall not exceed 120 minutes for each start-up. Shutdown periods shall not exceed 60 minutes for each shutdown. The turbine shall be limited to a maximum of 5 start-ups per day, 155 start-ups per month, and 750 start-ups per year.

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

For the purposes of this condition, the beginning of start-up occurs at initial fire in the combustor of the combustion turbine through the full operation of the steam turbine generator. If during start-up, the process is aborted the process will count as one start-up

For the purposes of this condition, shutdown shall be defined as the period of time from initiation of the shutdown sequence to cessation of firing.

For the purposes of this condition, WIIT shall be defined as the tuning of the gas turbine water injection and intercooler system. WIIT shall not exceed 12 hours. The operator shall limit the duration of WIIT to no more than 12 hours in any one month and 24 hours in any one year.

For the purposes of this condition, AIGT shall be defined as shall be defined as optimizing and re-balancing of the NH3 grid or catalyst modules, and the retuning of the turbine control systems. AIGT shall not exceed 10 hours. The operator shall limit the duration of AIGT to no more than 10 hours in any one year.

The commissioning period shall not exceed 204 hours.

[RULE 1303(a)(1)-BACT, 5-10-1996; RULE 1303(a)(1)-BACT, 12-6-2002; **RULE 1703(a)(2) - PSD-BACT, 10-7-1988]**

[Devices subject to this condition : D56]

A195.8 The 2.0 PPMV NOX emission limit(s) is averaged over 60 minutes at 15 percent O2, dry.

[RULE 1703(a)(2) - PSD-BACT, 10-7-1988; RULE 2005, 6-3-2011]

[Devices subject to this condition : D56]

A195.9 The 2.0 PPMV CO emission limit(s) is averaged over 60 minutes at 15 percent O2, dry.

[RULE 1303(a)(1)-BACT, 5-10-1996; RULE 1303(a)(1)-BACT, 12-6-2002; **RULE 1703(a)(2) - PSD-BACT, 10-7-1988]**

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

[Devices subject to this condition : D56]

A195.10 The 2.0 PPMV VOC emission limit(s) is averaged over 60 minutes at 15 percent O2, dry.

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002]

[Devices subject to this condition : D56]

A195.11 The 5.0 PPMV NH3 emission limit(s) is averaged over 60 minutes at 15 percent O2, dry.

The operator shall calculate and continuously record the NH3 slip concentration using the following: NH3 (ppmv) = [a-b*c/1EE+06]*1EE+06/b, where: a = NH3 injection rate (lbs/hr)/17(lb/lb-mol), b = dry exhaust gas flow rate (scf/hr)/385.3 scf/lb-mol), c = change in measured NOx across the SCR (ppmvd at 15% O2).

The operator shall install and maintain a NOx analyzer to measure the SCR inlet NOx ppmv accurate to plus or minus 5 percent calibrated at least once every twelve months.

The NOx analyzer shall be installed and operated within 90 days of initial start-up.

The operator shall use the above described method or another alternative method approved by the Executive Officer.

The ammonia slip calculation procedures described above shall not be used for compliance determination or emission information without corroborative data using an approved reference method for the determination of ammonia.

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002]

[Devices subject to this condition : C67]

A327.1 For the purpose of determining compliance with District Rule 475, combustion contaminant emissions may exceed the concentration limit or the mass emission limit listed, but not both limits at the same time.

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

[**RULE 475, 10-8-1976**; RULE 475, 8-7-1978]

[Devices subject to this condition : D56]

A433.1 The operator shall comply at all times with the 2.0 ppm 1-hour BACT limit for NOx, except as defined in condition A99.10 and for the following scenarios:

Operating Scenario	Maximum Limit	Operational Limit
Start-up	28.68 lb	The mass emission limit shall be determined for start-up using CEMS minute by minute emission data. It shall be calculated to 120 minutes from the commencement of initial fire in the combustor
Shutdown	11.78 lb	The mass emission limit shall be determined for shutdown using CEMS minute by minute emission data. It shall be calculated to 60 minutes counted back from the cessation of firing

Records of minute by minute start-up and shutdown data shall be maintained and made available to the Executive Officer upon request.

[**RULE 2005, 6-3-2011**]

[Devices subject to this condition : D56]

A433.2 The operator shall comply at all times with the 2.0 ppm 1-hour BACT limit for CO, except as defined in condition A99.11 and for the following scenarios:

Operating Scenario	Maximum Limit	Operational Limit

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

Start-up	23.61 lb	The mass emission limit shall be determined for start-up using CEMS minute by minute emission data. It shall be calculated to 120 minutes from the commencement of initial fire in the combustor
Shutdown	9.90 lb	The mass emission limit shall be determined for shutdown using CEMS minute by minute emission data. It shall be calculated to 60 minutes counted back from the cessation of firing

Records of minute by minute start-up and shutdown data shall be maintained and made available to the Executive Officer upon request.

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002; **RULE 1703(a)(2) - PSD-BACT, 10-7-1988**]

[Devices subject to this condition : D56]

D. Monitoring/Testing Requirements

D12.9 The operator shall install and maintain a(n) temperature gauge to accurately indicate the temperature in the exhaust at the inlet to the SCR reactor.

The operator shall also install and maintain a device to continuously record the parameter being measured.

The measuring device or gauge shall be accurate to within plus or minus 5 percent. It shall be calibrated once every 12 months.

The temperature shall be between 600 degrees F and 900 degrees F.

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

[RULE 2005, 6-3-2011]

[Devices subject to this condition : C67]

D12.10 The operator shall install and maintain a(n) pressure gauge to accurately indicate the differential pressure across the SCR catalyst bed in inches of water column.

The operator shall also install and maintain a device to continuously record the parameter being measured.

The measuring device or gauge shall be accurate to within plus or minus 5 percent. It shall be calibrated once every 12 months.

The differential pressure shall less than 6.5 inches of water column.

[RULE 2005, 6-3-2011]

[Devices subject to this condition : C67]

D12.13 The operator shall install and maintain a(n) flow meter to accurately indicate the flow rate of the total hourly throughput of injected ammonia (NH3).

The operator shall also install and maintain a device to continuously record the parameter being measured.

The measuring device or gauge shall be accurate to within plus or minus 5 percent. It shall be calibrated once every 12 months.

The ammonia injection rate shall be between 84 and 107 lbs/hr.

[RULE 2005, 6-3-2011]

[Devices subject to this condition : C67]

D29.6 The operator shall conduct source test(s) for the pollutant(s) identified below.

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

Pollutant(s) to be tested	Required Test Method(s)	Averaging Time	Test Location
NOX emissions	District method 100.1	1 hour	Outlet of the SCR serving this equipment
CO emissions	District method 100.1	1 hour	Outlet of the SCR serving this equipment
SOX emissions	AQMD Laboratory Method 307-91	Not Applicable	Fuel Sample
VOC emissions	District Method 25.3	1 hour	Outlet of the SCR serving this equipment
PM10 emissions	Approved District method	District-approved averaging time	Outlet of the SCR serving this equipment
PM2.5	Approved District method	District-approved averaging time	Outlet of the SCR serving this equipment
NH3 emissions	District method 207.1 and 5.3 or EPA method 17	1 hour	Outlet of the SCR serving this equipment

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

The test shall be conducted after AQMD approval of the source test protocol, but no later than 180 days after initial start-up. The AQMD shall be notified of the date and time of the test at least 10 days prior to the test.

The test shall be conducted to determine the oxygen levels in the exhaust. In addition, the tests shall measure the fuel flow rate (CFH), the flue gas flow rate. The combined gas turbine and steam turbine generating output in MW shall also be recorded if applicable.

The test shall be conducted in accordance with AQMD approved test protocol. The protocol shall be submitted to the AQMD engineer no later than 90 days before the proposed test date and shall be approved by the AQMD before the test commences. The test protocol shall include the proposed operating conditions of the turbine during the tests, the identity of the testing lab, a statement from the testing lab certifying that it meets the criteria of Rule 304, and a description of all sampling and analytical procedures.

For natural gas fired turbines only, an alternative to AQMD Method 25.3 for the purpose of demonstrating compliance with BACT as determined by CARB and AQMD, may be the following:

a) Triplicate stack gas samples are extracted directly into Summa canisters, maintaining a final canister pressure between 400-500 mm Hg absolute,

b) Pressurization of the Summa canisters is done with zero gas analyzed/certified to containing less than 0.05 ppmv total hydrocarbons as carbon, and

c) Analysis of Summa canisters is per unmodified EPA Method TO-12 (with preconcentration) or the canister analysis portion of AQMD Method 25.3 with a minimum detection limit of 0.3 ppmvC or less and reported to two significant figures, and

c) Analysis of Summa canisters is per unmodified EPA Method TO-12 (with preconcentration) or the canister analysis portion of AQMD Method 25.3 with a minimum detection limit of 0.3 ppmvC or less and reported to two significant figures, and

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

The use of this alternative method for VOC compliance determination does not mean that it is more accurate than unmodified AQMD Method 25.3, nor does it mean that it may be used in lieu of AQMD Method 25.3 without prior approval, except for the determination of compliance with the BACT level of 2.0 ppmv VOC calculated as carbon set by CARB for natural gas fired turbines. The test results shall be reported with two significant digits.

The test shall be conducted when this equipment is operating at loads of 100, 75 and 50 percent of maximum load for NOx, CO, VOC, and ammonia tests. The PM10 and PM2.5 tests shall be conducted when this equipment is operating at 100 percent of maximum load.

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002; **RULE 1303(b)(2)-Offset, 5-10-1996;** RULE 1303(b)(2)-Offset, 12-6-2002; **RULE 1703(a)(2) - PSD-BACT, 10-7-1988; RULE 2005, 6-3-2011**]

[Devices subject to this condition : D56]

D29.7 The operator shall conduct source test(s) for the pollutant(s) identified below.

Pollutant(s) to be tested	Required Test Method(s)	Averaging Time	Test Location
NH3 emissions	District method 207.1 and 5.3 or EPA method 17	1 hour	Outlet of the SCR serving this equipment

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

The test shall be conducted and the results submitted to the District within 45 days after the test date. The AQMD shall be notified of the date and time of the test at least 7 days prior to the test.

The test shall be conducted at least quarterly during the first twelve months of operation and at least annually thereafter. The NOx concentration, as determined by the CEMS, shall be simultaneously recorded during the ammonia slip test. If the CEMS is inoperable, a test shall be conducted to determine the NOx emissions using District Method 100.1 measured over a 60 minute averaging time period.

The test shall be conducted to demonstrate compliance with the Rule 1303 BACT concentration limit.

If the turbine is not in operation during one quarter, then no testing is required during that quarter.

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002]

[Devices subject to this condition : D56]

D29.8 The operator shall conduct source test(s) for the pollutant(s) identified below.

Pollutant(s) to be tested	Required Test Method(s)	Averaging Time	Test Location
SOX emissions	AQMD Laboratory Method 307-91	Not Applicable	Fuel Sample
VOC emissions	District Method 25.3	1 hour	Outlet of the SCR serving this equipment
PM10 emissions	Approved District method	District-approved averaging time	Outlet of the SCR serving this equipment
PM2.5	Approved District method	District-approved averaging time	Outlet of the SCR serving this equipment

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

The test(s) shall be conducted at least once every three years.

The test shall be conducted and the results submitted to the District within 60 days after the test date. The AQMD shall be notified of the date and time of the test at least 10 days prior to the test.

The test shall be conducted when the gas turbine is operating at 100 percent of maximum heat input.

For natural gas fired turbines only, an alternative to AQMD Method 25.3 for the purpose of demonstrating compliance with BACT as determined by CARB and AQMD, may be the following:

a) Triplicate stack gas samples are extracted directly into Summa canisters, maintaining a final canister pressure between 400-500 mm Hg absolute,

b) Pressurization of the Summa canisters is done with zero gas analyzed/certified to containing less than 0.05 ppmv total hydrocarbons as carbon, and

c) Analysis of Summa canisters is per unmodified EPA Method TO-12 (with preconcentration) or the canister analysis portion of AQMD Method 25.3 with a minimum detection limit of 0.3 ppmvC or less and reported to two significant figures, and

d) The temperature of the Summa canisters when extracting samples for analysis is not to be below 70 degrees Fahrenheit.

The use of this alternative method for VOC compliance determination does not mean that it is more accurate than unmodified AQMD Method 25.3, nor does it mean that it may be used in lieu of AQMD Method 25.3 without prior approval, except for the determination of compliance with the BACT level of 2.0 ppmv VOC calculated as carbon set by CARB for natural gas fired turbines. The test results shall be reported with two significant digits.

The test shall be conducted to demonstrate compliance with the Rule 1303 concentration and/or monthly emission limit.

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002; **RULE 1303(b)(2)-Offset, 5-10-1996;** RULE 1303(b)(2)-Offset, 12-6-2002]

[Devices subject to this condition : D56]

D82.4 The operator shall install and maintain a CEMS to measure the following parameters:

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

CO concentration in ppmv

Concentrations shall be corrected to 15 percent oxygen on a dry basis.

The CEMS shall be installed to measure CO concentrations over a 15 minute averaging time period.

The CEMS shall be installed no later than 90 days after initial start-up of the turbine, and in accordance with an approved AQMD Rule 218 CEMS plan application. The operator shall not install the CEMS prior to receiving initial approval from AQMD. Within two weeks of the turbine start-up, the operator shall provide written notification to the District of the exact date of start-up.

The CEMS will convert the actual CO concentrations to mass emission rates (lbs/hr) and record the hourly emission rates on a continuous basis.

CO Emission Rate, lbs/hr = K*Cco*Fd[20.9% - %O2 d)][(Qg * HHV)/106], where

K = 7.267 *10-8 (lb/scf)/ppm

Cco = Average of four consecutive 15 min. ave. CO concentration, ppm

Fd = 8710 dscf/MMBTU natural gas

%O2 d = Hourly ave. % by vol. O2 dry, corresponding to Cco

Qg = Fuel gas usage during the hour, scf/hr

HHV = Gross high heating value of fuel gas, BTU/scf

[RULE 1703(a)(2) - PSD-BACT, 10-7-1988; RULE 218, 5-14-1999]

[Devices subject to this condition : D56]

D82.5 The operator shall install and maintain a CEMS to measure the following parameters:

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

NOX concentration in ppmv

Concentrations shall be corrected to 15 percent oxygen on a dry basis.

The CEMS shall be installed and operated no later than 90 days after initial start-up of the turbine, and in accordance with an approved AQMD REG XX CEMS plan application. The operator shall not install the CEMS prior to receiving initial approval from AQMD. Within two weeks of the turbine start-up, the operator shall provide written notification to the District of the exact date of start-up.

Rule 2012 provisional RATA testing shall be completed and submitted to the AQMD within 90 days of the conclusion of the turbine commissioning period. During the interim period between the initial start-up and provisional certification date of the CEMS, the operator shall comply with the monitoring requirements of Rule 2012(h)(2) and 2012(h)(3).

[RULE 1703(a)(2) - PSD-BACT, 10-7-1988; RULE 2005, 6-3-2011; RULE 2012, 5-6-2005]

[Devices subject to this condition : D56]

E. Equipment Operation/Construction Requirements

E179.3 For the purpose of the following condition number(s), continuously record shall be defined as recording at least once every hour and shall be calculated upon the average of the continuous monitoring for that hour.

Condition Number D 12- 9

Condition Number D 12-11

[RULE 2005, 6-3-2011]

[Devices subject to this condition : C67]

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

E179.4 For the purpose of the following condition number(s), continuously record shall be defined as recording at least once every hour and shall be calculated based upon the average of the continuous monitoring for that month.

Condition Number D 12-10

[RULE 2005, 6-3-2011]

[Devices subject to this condition : C67]

E179.6 For the purpose of the following condition number(s), continuously record shall be defined as recording at least once every hour and shall be calculated upon the average of the continuous monitoring for that hour.

Condition Number D 12- 9

Condition Number D 12-13

[RULE 2005, 6-3-2011]

[Devices subject to this condition : C67]

E193.2 The operator shall restrict the operation of this equipment according to the following specifications:

In accordance with all air quality mitigation measures stipulated in the final Environmental Impact Report (EIR), State Clearing House #2011091056.

[CA PRC CEQA, 11-23-1970]

[Devices subject to this condition : D56, C67]

E193.3 The operator shall upon completion of construction, operate and maintain this equipment according to the following specifications:

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

The operator shall record the total net power generated in a calendar month in megawatt-hours.

The operator shall calculate and record greenhouse gas emissions of each calendar month using the following formula:

GHG = 59.187 * FF

Where, GHG is the greenhouse gas emissions in tons of CO2E and FF is the monthly fuel usage in millions standard cubic feet.

The GHG emissions from this equipment shall not exceed 280,502 tons per year. The average GHG emissions shall not exceed 1050 pounds per net megawatt-hours. The operator shall calculate and record the GHG emissions in tons per year and pounds per net megawatt-hours on a 12 month rolling average with a new monthly period starting at the beginning of each month.

The operator shall maintain records in a manner approved by the District to demonstrate compliance with this condition. The records shall be made available to AQMD upon request.

[RULE 1714, 11-5-2010]

[Devices subject to this condition : D56]

H. Applicable Rules

H23.5 This equipment is subject to the applicable requirements of the following rules or regulations:

Contaminant	Rule	Rule/Subpart
NOX	40CFR60, SUBPART	KKKK
SOX	40CFR60, SUBPART	KKKK

[40CFR 60 Subpart KKKK, 7-6-2006]

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

[Devices subject to this condition : D56]

I. Administrative

I297.1 This equipment shall not be operated unless the facility holds 56397 pounds of NOx RTCs in its allocation account to offset the annual emissions increase for the first year of operation. RTCs held to satisfy this condition may be transferred only after one year from the initial start of operation. If the hold amount is partially satisfied by holding RTCs that expire midway through the hold period, those RTCs may be transferred upon their respective expiration dates. This hold amount is in addition to any other amount of RTCs required to be held under other condition(s) stated in this permit.

[**RULE 2005, 6-3-2011**]

[Devices subject to this condition : D56]

K. Record Keeping/Reporting

K40.3 The operator shall provide to the District a source test report in accordance with the following specifications:

FACILITY PERMIT TO OPERATE
PASADENA CITY, DWP

SECTION H: PERMIT TO CONSTRUCT AND TEMPORARY PERMIT TO OPERATE

The operator shall comply with the terms and conditions set forth below:

Source test results shall be submitted to the District no later than 90 days after the source test was conducted.

Emission data shall be expressed in terms of concentration (ppmv) corrected to 15 percent oxygen (dry basis), mass rate (lb/hr), and lb/MM cubic feet. In addition, solid PM emissions, if required to be tested, shall also be reported in terms of grains per DSCF and lbs/MMBtu.

All exhaust flow rate shall be expressed in terms of dry standard cubic feet per minute (DSCFM) and dry actual cubic feet per minute (DACFM).

All moisture concentration shall be expressed in terms of percent corrected to 15 percent oxygen.

Source test results shall also include the oxygen levels in the exhaust, fuel flow rate (CFH), heating content of the fuel, the flue gas temperature, and the generator power output (MW) under which the test was conducted.

[**RULE 1303(a)(1)-BACT, 5-10-1996;** RULE 1303(a)(1)-BACT, 12-6-2002; **RULE 1303(b)(2)-Offset, 5-10-1996;** RULE 1303(b)(2)-Offset, 12-6-2002; **RULE 1703(a)(2) - PSD-BACT, 10-7-1988; RULE 2005, 6-3-2011**]

[Devices subject to this condition : D56]

K67.7 The operator shall keep records, in a manner approved by the District, for the following parameter(s) or item(s):

Natural gas fuel use during the commissioning period.

[RULE 2012, 5-6-2005]

Pasadena, CA 91105

SUBJECT: Title V Facility Significant Permit Revision (Facility ID: 800168)

Dear Ms. Currie:

Please find attached the Title Page, Table of Contents, and Section H of your Title V Facility Permit. The sections reflect the approval of the combined cycle generating system requested in your Title V Revision Application No. 538118.

This permit revision includes the Permit to Construct for the GE LM6000 SPRINT PG gas turbine and SCR. The EPA received a copy of the draft Section H of the Title V Facility Permit and engineering evaluation on May 2, 2013. The EPA concluded the review period on June 17, 2013 with no comments. The Public Notice was published on May 6, 2013 and mailed to addresses within a quarter mile of the facility on May 10, 2013. Blair High School and Westridge High School distributed the notices to their students on May 13, 2013. The 30 day public comment period ended on June 13, 2013 with no comments.

Equipment	Application No.	Permit Type
GE LM6000 SPRINT PG Gas Turbine, 56.1 MW	538115	PC
SCR/CO Catalyst	538120	PC

Please review the attached sections carefully. Insert the enclosed sections into your Title V Facility Permit and discard the earlier versions. Questions concerning changes to your permit should be directed to Mr. Marcel Saulis at (909) 396-3093.

Sincerely,

Mohsen Nazemi, P.E.
Deputy Executive Officer

RECEIPT OF YOUR NOTICE OF INTENT

The State Water Resources Control Board (State Water Board) has received and processed your NOTICE OF INTENT TO COMPLY WITH THE TERMS OF THE GENERAL PERMIT TO DISCHARGE STORM WATER ASSOCIATED WITH CONSTRUCTION ACTIVITY. Accordingly, you are required to comply with the permit requirements.

Your WDID identification number is: **4 19S319995.** Please use this number in any future communications regarding this permit.

SITE DESCRIPTION

OWNER:	CITY OF PASADENA WTR AND POWER
DEVELOPER:	
COUNTY:	LOS ANGELES
SITE ADDRESS:	43 E STATE ST PASADENA, CA 91105
COMMENCEMENT DATE:	1/27/03
EST. COMPLETION DATE:	6/30/03

When construction is complete or ownership has been transferred, dischargers are required to notify the Regional Water Board by submitting a Notice of Termination (NOT). All State and local requirements must be met in accordance with Special Provision No. 7 of the General Permit. Enclosed is a NOT for your future use. If you do not notify the State Water Board that construction activity has been completed you will continue to be invoiced for the annual fee each January.

Please contact your Regional Water Board at (213) 576-6600 if you have any questions regarding permit requirements. To obtain storm water related information and forms, please visit the storm water web page at www.swrcb.ca.gov/stormwtr/index.html.

Sincerely,

Storm Water Section

Does the erosion/sediment control plan address construction activities such as infrastructure and structures? ☐ YES ☐ NO

Name of local agency: _____ Phone: ( ) -

B. Is this project or any part thereof, subject to conditions imposed under a CWA Section 404 permit of 401 Water Quality Certification? ☐ YES ☒ NO

If yes, provide details: _____

/II. RECEIVING WATER INFORMATION

A. Does the storm water runoff from the construction site discharge to (Check all that apply):

1. ☒ Indirectly to waters of the U.S.
2. ☒ Storm drain system - Enter owner's name: CITY OF PASADENA
3. ☐ Directly to waters of U.S. (e.g. , river, lake, creek, stream, bay, ocean, etc.)

B. Name of receiving water: (river, lake, creek, stream, bay, ocean): SAN PASQUAL CREEK

III. IMPLEMENTATION OF NPDES PERMIT REQUIREMENTS

A. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) (check one)

☐ A SWPPP has been prepared for this facility and is available for review: Date Prepared: ___/___/___ Date Amended: ___/___/___

☒ A SWPPP will be prepared and ready for review by (enter date): 01/27/03

☒ A tentative schedule has been included in the SWPPP for activities such as grading, street construction, home construction, etc.

B. MONITORING PROGRAM

☐ A monitoring and maintenance schedule has been developed that includes inspection of the construction BMPs before anticipated storm events and after actual storm events and is available for review.

If checked above: A qualified person has been assigned responsibility for pre-storm and post-storm BMP inspections to identify effectiveness and necessary repairs or design changes ☒ YES ☐ NO

Name: ALVIN BOYD Phone: (626) 744 -6564

C. PERMIT COMPLIANCE RESPONSIBILITY

A qualified person has been assigned responsibility to ensure full compliance with the Permit, and to implement all elements of the Storm Water Pollution Prevention Plan including:

1. Preparing an annual compliance evaluation ☒ YES ☐ NO

Name: ALVIN BOYD Phone: (626) 744 - 6564

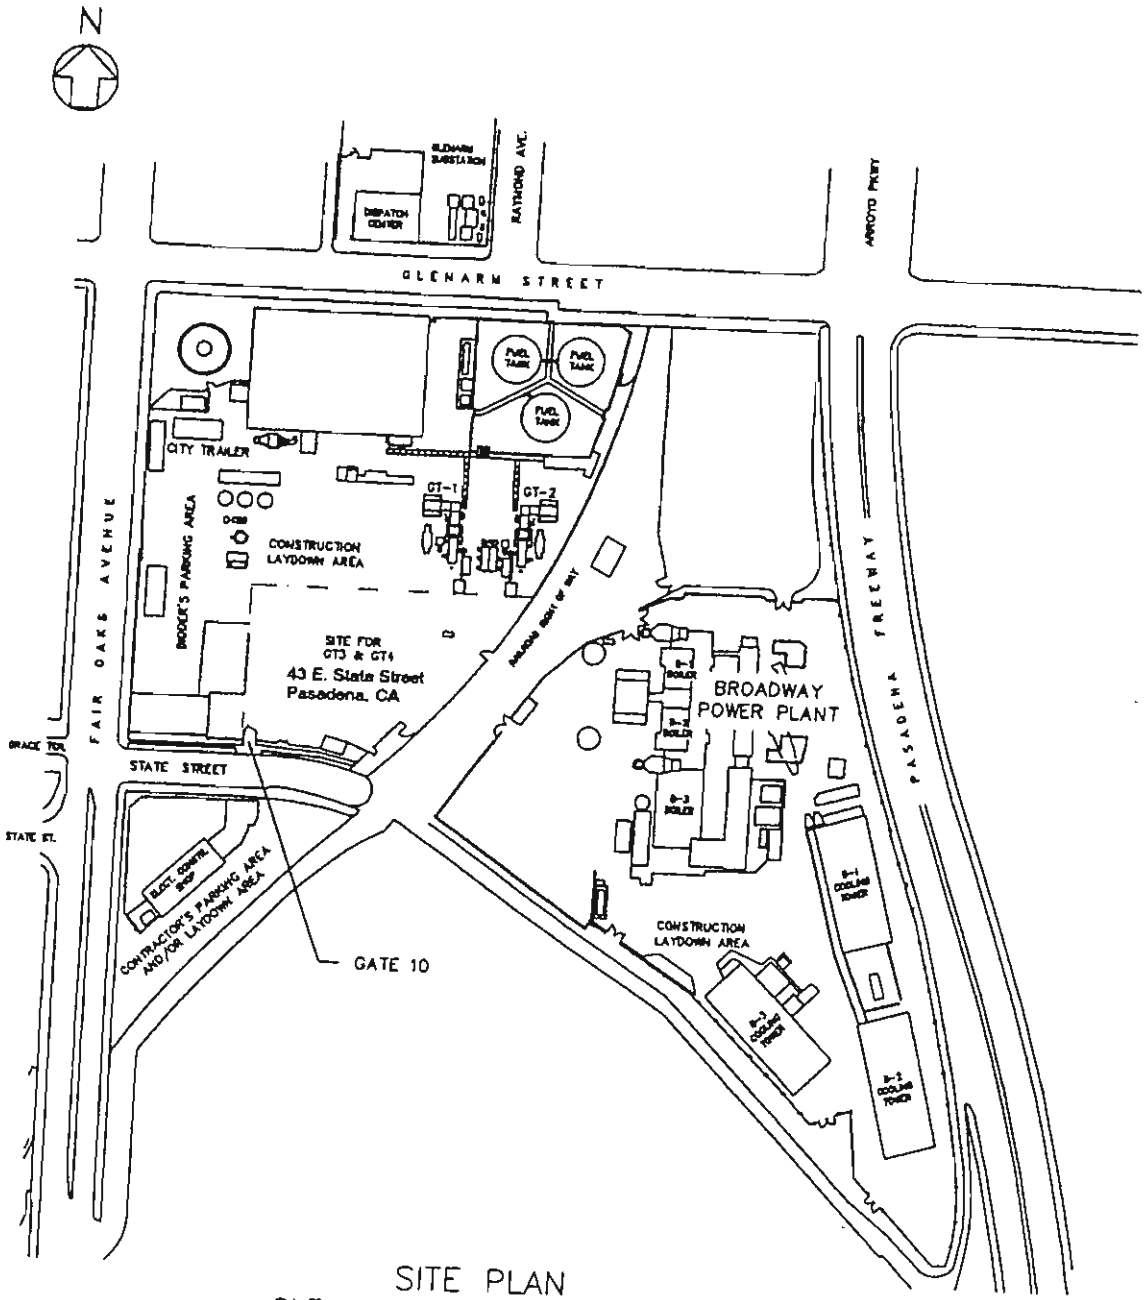
2. Eliminating all unauthorized discharges ☒ YES ☐ NO

. VICINITY MAP AND FEE (must show site location in relation to nearest named streets, intersections, etc.)

ave you included a vicinity map with this submittal? ☒ YES ☐ NO

ave you included payment of the annual fee with this submittal? ☒ YES ☐ NO

CERTIFICATIONS



certify under penalty of law that this document and all attachments were prepared under my direction and supervision in accordance with system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the erson or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false formation, including the possibility of fine or imprisonment. In addition, I certify that the provisions of the permit, including the velopment and implementation of a Storm Water Pollution Prevention Plan and a Monitoring Program Plan will be complied with."

General Construction Activity Storm Water Permit Ongoing Requirements

The ongoing requirements of this permit are as follow:

1. Continued compliance with general permit provisions must be adhered to. This includes, by reference, this Storm Water Pollution Prevention Plan (SWPPP) and the Best Management Practices (BMPs).
2. Periodic monitoring of the site, inspection, and documentation must be conducted (Section B: Monitoring Program). No sampling of storm water is required.
3. Training of all personnel responsible for implementing this program (Section A: Storm Water Pollution Prevention Plan) must be conducted.
4. An annual certification that the project is in compliance with permit and SWPPP (Certification, Appendix C: General Construction Activity Storm Water Permit) must be made to State Water Resources Control Board (SWRCB) on July 1, 2003, and every year thereafter until Notice of Termination is filed.
5. A copy of the SWPPP, monitoring documentation, and acknowledgment by the Regional Water Quality Control Board (RWQCB) must be available at the construction site during construction activity.
6. A Notice to Terminate must be submitted to the RWQCB when construction activity has ceased and post-construction requirements have been met (Appendix F: Notice of Termination Information).
7. All records related to this permit and plan must be retained for at least 3 years from when the record was created.
8. The contents of this SWPPP and the sections of any other plans that it incorporates are enforceable by the EPA or other designated authority.

Compliance Certification

A statement certifying that the Pasadena Power Plant Upgrade construction activity is in compliance with the requirements of this general permit and its Storm Water Pollution Prevention Plan (SWPPP) at this site must be made to the California State Water Resource Control Board annually, beginning July 1, 2003, and every year thereafter until a Notice of Termination is filed with the Board. The certification must be made based on inspections conducted as part of Section B: Monitoring Program.

> "I certify under penalty of law that the construction activity at this Pasadena Power Plant Upgrade construction site is in compliance with the requirements of this general permit and its Storm Water Pollution Prevention Plan (SWPPP), to the best of my knowledge, based on my inquiry of the persons responsible for managing the site, or those persons directly responsible for gathering the monitoring program information. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

Section A: Storm Water Pollution Prevention Plan

City of Pasadena, Department of Water and Power (PWP)
Pasadena Power Plant Upgrade Project
NPDES General Permit No. CAS000002

1.0 Introduction

The Pasadena Power Plant Upgrade Project is located at 45 East Glenarm Street, in Pasadena, California (Figure 1, Vicinity Map). This project involves the installation of two GE LM 6000 Gas Turbine Generator Sets, GT-3 and GT-4 (furnished by the city of Pasadena) along with the construction of a water treatment plant and installation of auxiliary equipment. The furnishing, installation, inspection, and testing of all materials and components required to provide a complete functioning simple cycle gas turbine facility for the City of Pasadena, Department of Water and Power will be completed.

The Pasadena Power Plant Upgrade Project consists of two construction areas (Figure 2, Location Map). The construction area located on the west side of Railroad Street is the Glenarm Construction Site, and the construction area located on the east side of Railroad Street is the Broadway Construction Site. This Storm Water Pollution Prevention Plan (SWPPP) covers both the Glenarm and Broadway Sites.

1.1 Site Activities

1. Soil excavation
2. Soil backfilling
3. Soil grading
4. Concrete foundation and slab construction
5. Pipefitting and welding
6. Electrical wire, cable, and conduit installation
7. Skid-mounted equipment setting and alignment
8. Structural steel erection
9. Painting
10. Asphalt paving
11. Pipeline Installation
12. Above-ground storage tank installation

2.0 Objectives

This SWPPP has been developed for and will be implemented to address the specific circumstances at the Pasadena Power Plant Upgrade construction site. This SWPPP is certified in accordance with the signatory requirements of Section C, Standard Provision for Construction Activities, of the General Permit and the certification found at the end of this document. The City of Pasadena, Department of Water and Power (PWP) is the entity applying for this permit and responsible for ensuring permit compliance. PWP will hold all contractors and subcontractors in this permit or otherwise affiliated with the construction project

responsible for fully implementing the conditions of this permit. This SWPPP meets the following objectives:

A. Identification of pollutant sources, including sources of sediment, that may affect the quality of storm water discharges associated with construction activity (storm water discharges) from the construction site.

B. Identification of non-storm water discharges.

C. Identification, construction, implementation in accordance with a time schedule, and maintaining of Best Management Practices (BMPs) to reduce or eliminate pollutants in storm water discharges and authorized non-storm water discharges from the construction site during construction.

D. Development of a maintenance schedule for BMPs that are installed during construction that are designed to reduce or eliminate pollutants after construction is completed (post-construction BMPs).

This report is organized into two sections. Section A is the SWPPP and Section B is the Monitoring Program. The report includes the following appendices:

Appendix A: Notice of Intent and Application Package Contents
Appendix B: Construction Activity Schedule
Appendix C: Annual Certification
Appendix D: Best Management Practices
Appendix E: General Construction Activity Storm Water Permit
Appendix F: Copy of Notice of Termination Application Form

3.0 Implementation Schedule

Construction activity will begin January 13, 2003. This SWPPP has been developed prior to the start of soil-disturbing activity and will be implemented concurrent with the commencement of soil-disturbing activities.

4.0 Availability

This SWPPP will be kept at the construction site during construction activity and available during working hours, commencing with the initial construction activity and ending with termination of coverage under the Notice of Termination.

5.0 Required Changes

A. PWP will amend the SWPPP whenever there is a change in construction or operations that may affect the discharge of pollutants to surface waters, ground waters, or a separate municipal storm sewer system. The SWPPP will also be amended if it does not meet any condition of the General Permit or has not achieved the general objective of reducing pollutants in storm water discharges. The SWPPP will be amended in a timely manner, but not more than 14 calendar days after the Regional Water Quality Control Board (RWQCB) determines that the SWPPP is in violation of any requirements of the General Permit.

B. The SWPPP will also be amended if the RWQCB or local agency with the concurrence of the RWQCB requires the SWPPP to be amended.

6.0 Source Identification

This section includes project information and pollutant source identification combined with an itemization of those BMPs specifically chosen to control the pollutants listed.

6.1 Pollutant Source and BMP Identification

This subsection describes potential sources that are likely to add pollutants to storm water discharges or that may result in non-storm water discharges from the construction site. Table 1 below lists the sources of potential pollutants and the pollutants of concern, and Table 2 lists the BMPs for each pollutant source. Detailed BMP fact sheets are included in Appendix D.

Table 1
Source Identification

Material/Equipment Storage, Fueling and Maintenance Areas	Dry Decontamination of oil, greases, fuel, and sediment from equipment
Equipment Decontamination Area	Dry Decontamination of oil, greases, fuel, and sediment from equipment
Soil Storage Area	Sediment
Loading/Unloading Operations	Material spills
Vehicle Entrance/Exits	Sediments
Disposal Areas and Construction Wastes	General Trash Disposal (Dumpsters)

Table 2
BMPs for Source Identification

Equipment Decontamination	Materials will be captured and disposed of.
Soil Storage Area	Store in designated areas, cover, and install silt fence, hay bales, visqueen, and fiberglass if required.
Material/Equipment Storage, Fueling and Maintenance Areas	Store in designated areas, with cover and containment, ensure spill equipment is readily available.
Loading/Unloading Operations	Position loading areas away from drainage patterns, build temporary berms around loading operations, ensure spill cleanup equipment is readily available.
Disposal Areas and Construction Wastes	In designated waste collection areas dispose in accordance with regulatory requirements.

6.1.1 Drainage Patterns and Slopes Anticipated After Grading Activities are Completed

The drainage patterns and slopes anticipated after construction and grading activities are completed will be generally the same as before construction. The site will be regraded to the existing conditions as near practical. Additional storm drain catch basins will be installed in the interior of the facility to reduce sheet flow leaving the property.

6.1.2 Onsite Drainage Patterns

The storm water drainage patterns are shown on the Location Map (Figure 2, Location Map). Storm water drainage from the Glenarm construction area flows naturally from the northwest

to the southeast. This pattern will be maintained during construction activities. Storm water drainage from the Broadway construction area flows in a westerly direction towards existing storm drains and catch basins as shown on Figure 2. Storm water run-on will be diverted from the construction areas by grading, diking, or berming of the site perimeters. Run-off from the construction areas will be diverted through silt fences, hay bales, and fiberglass barriers for sediment control. In areas where continuous grading activities occur, the storm drain catch basins will be sealed off with sand bags and in some areas, with sand bags and hay bales.

6.1.3 Control of Exposure to Contaminated Soil or Toxic Materials

Excavated soil at the site may contain elevated concentrations of lead and petroleum hydrocarbons in the diesel and heavy fuel oil range. BMPs that will be implemented to minimize the exposure of storm water to contaminated soil or toxic materials in the soil excavation and storage areas are as follows:

Train personnel to recognize contaminated soil, excavate, and directly load the soil into trucks for shipment and proper disposal through a licensed transportation and disposal service.

If construction personnel encounter unexpected potentially contaminated soil, the soil will be excavated, stockpiled, covered, characterized and profiled, and then disposed of properly.

All contaminated soil will be removed from the construction sites prior to the contractor construction effort.

6.1.4 Areas Designated for Storage

Storage of soil or waste

Waste will be stored in designated areas as shown on Figure 2. Clean backfill soil will be stored in stockpiles on site. Visqueen will be placed underneath and atop of the clean stockpiles as a barrier to prevent topsoil drainage.

All excavated contaminated soil will be directly loaded into trucks for shipment and disposed of properly through a licensed transportation and disposal service.

If construction personnel encounter unexpected potentially contaminated soil, the soil will be excavated, stockpiled, covered, characterized and profiled, and then disposed of properly. Should stockpiles of contaminated soil be established on site, the piles will be protected with coverings and berms placed around their perimeters.

Vehicle/Equipment storage, cleaning, and maintenance

BMPs for storage and service of vehicles and equipment at the construction site are included in Appendix D.

Construction material loading, unloading, and access areas

Construction material loading, unloading, and access areas will be situated near the construction site to avoid accidental material spills from entering the storm drainage system. Spill clean-up materials will be available in the immediate vicinity of the construction area. Materials being off-loaded will be checked for leaks prior to moving onto the construction site.

6.1.5 BMPs for Control of Discharges from Waste Handling and Disposal

A selected onsite waste collection area will be designated at both the Glenarm and Broadway Construction Sites. Trash dumpsters will be placed at each site. Waste collection will be arranged prior to the overflow of waste containers. Spills of waste materials will be cleaned up immediately, and spill materials will be in the immediate vicinity of the waste disposal area. Construction wastes will be collected, removed, and disposed of only at authorized disposal areas.

6.1.6 Post-construction BMPs

Post-construction BMPs are discussed in Section 10, Post-construction Storm Water Management.

6.2 Additional Information

6.2.1 Pollutant Sources and BMPs not Identified on Site Map

All potential pollutant sources have been identified in Table 1 above and listed in Table 3 at the end of Section B. Pre-construction control practices to reduce sediment and other pollutants into the storm water will include engineering analysis of the construction activities to determine ways to minimize the amount of disturbed soil and determine if a site plan can be developed so that minimal grading occurs.

6.2.2 Inventory of Materials Used and Activities Performed with Potential to Pollute

An inventory of materials that will be stored on the site is included in Table 3 located at the end of Section B. All of these materials are included in the categories of potential pollutant sources. BMPs for preventing these materials from polluting storm water are included in Appendix D. All materials will be stored in accordance with their labels, and state, local, and federal law.

6.2.3 Construction Site Surface Area Specifications

The size of the construction site surface area is approximately 3.4 acres. The percentage of the site that is impervious prior to construction is approximately 95%. The percentage of the site that is impervious post-construction is approximately 92%.

6.2.4 Copy of the NOI

A copy of the NOI is included in Appendix A and the original will be mailed to the Storm Water Permit Unit of the State Water Resources Control Board in the Water Quality Division.

6.2.5 Construction Activity Schedule

As required by this permit, the SWPPP includes a construction activity schedule in Appendix B.

6.2.6 Qualified Personnel

The following table lists the individuals responsible for the implementation of the SWPPP.

Responsibility	Name	Telephone
Inspections (Environmental Inspector)	Gurcharran Bawa	626/744-6562
Legal contact (responsible for overall construction project)	Joe Awad	626/744-4019 626/744-6258
Contact responsible for the implementation of all of the SWPPP	Gurcharran Bawa	626/744-6562

7.0 Erosion Control

The BMPs and control practices for erosion control are provided in Appendix D. All BMPs will be implemented upon initiation of construction activities as required.

In general, the erosion control methods consist of:

1. General environmental protection measures such as use of designated area and flagging of the site.
2. Sediment barriers including hay bales, silt fences, fiberglass, and sand bags.

The location map illustrates the construction perimeter for soil disturbance at the Glenarm and Broadway construction sites.

7.1 BMPs to Reduce Wind Erosion at All Times

Wind erosion control will be achieved through the application of water and an encapsulant that binds the surface of the soil particles together.

8.0 Sediment Control

The BMPs that will be implemented to prevent a net increase of sediment load in storm water discharges are described in Section 7 and fact sheets are included in Appendix D.

Deliveries and traffic will attempt to be scheduled at times when personnel are available to clean up if it is required.

9.0 Non-storm Water Management

Potential non-storm water discharges for the construction site may include the following:

- Potable water sources
- Uncontaminated water from dust control and general housekeeping practices

To the greatest extent practical, these discharges will be eliminated.

10.0 Post-construction Storm Water Management

This permit requires that descriptions of the BMPs used to reduce pollutants in storm water discharge after all construction phases have been completed at the site are addressed. Operation and maintenance of control practices after construction is completed are also required to be addressed, including short- and long-term funding sources and the responsible

party. In addition, to be able to file a Notice of Termination (NOT), the permittee must satisfy the following:

- Uniform vegetative cover of 70 percent
- Use of equivalent stabilization measures

Prior to construction of the new gas turbines, the site was concrete and asphalt paved. Therefore, post-construction controls will consist of regrading and paving the area to its original contours to the extent practical.

Revegetation will not be necessary, unless determined by the appropriate resource agency. PWP will be responsible for the funding of the regrading. Post-construction BMPs will be implemented in accordance with the Los Angeles County Standard Urban Storm Water Mitigation Plan (SUSMP) for the site.

11.0 Maintenance, Inspection, and Repair

For the duration of the project, inspections of the storm water controls and the effectiveness of the controls will be performed before and after storm events and once each 24 hours during extended storm events. Additional equipment and materials will be available onsite for rapid response to failures and emergencies. The name and telephone number of the person responsible for the inspections are provided in Section 6.2.6. The environmental inspector will designate personnel responsible for assisting in emergency situations. An inspection form will be filled out for each inspection and is filed in this plan. A blank inspection form is available at the end of this document.

12.0 Training

PWP will perform training to ensure the successful implementation of this SWPPP and permit compliance. Documentation of the training must be maintained. Prior to the beginning of construction, PWP will hold training to explain the requirements of this SWPPP and permit, and will conduct short refreshers during the construction activities on storm water pollution prevention.

At the initial training, all persons onsite who will have responsibility to act in accordance with this permit will be provided training. Persons directly responsible for ensuring that the permit is complied with, inspectors, and those installing the erosion control devices will receive detailed training on their responsibilities. Persons responsible for acting in accordance with the permit will be given a thorough overview of how storm water pollution will be prevented at this construction site. New personnel that require storm water training after the start of construction will be provided training within a reasonable amount of time, either by being provided the SWPPP to review, perform a review with another qualified personnel, or receive training in a subsequent training session. Documentation that new personnel were trained must be maintained.

Documentation of the training will consist of a dated training roster with signature, and a brief outline of what was covered during the training. "Refresher" training will be documented on a sheet with the date of the training and a brief statement of what was discussed. All documentation will be filed with this plan.

13.0 List of Contractors/Subcontractors

INSERT LIST OF CONTRACTOR/SUBCONTRACTOR NAMES, TELEPHONE NUMBERS, ADDRESSES, AND SPECIFIC AREAS OF RESPONSIBILITY, PRIOR TO BEGINNING CONSTRUCTION AND BRINGING THIS PLAN ONSITE.

14.0 Public Access

This SWPPP shall be provided, upon request, to the RWQCB and is available to the public, under Section 308(b) of the Clean Water Act.

15.0 Preparer Certification

This SWPPP and each of its amendments are signed by the discharger or his/her representative and include the date of the initial preparation and the date of each amendment. The SWPPP certification and amendments are included as part of this document.

Section B: Monitoring Program and Reporting Requirements

City of Pasadena, Department of Water and Power (PWP)
Pasadena Power Plant Upgrade Project
NPDES General Permit No. CAS000002

1.0 Required Changes

PWP understands that the RWQCB may require them to perform additional site inspections, submit reports and certifications, or perform sampling and analysis.

2.0 Implementation

The requirements of this section will be implemented at commencement of construction activity. PWP will be responsible for implementing these requirements until construction activity is completed and the site is stabilized.

3.0 Site Inspections

Qualified inspectors will conduct inspections of the construction site prior to anticipated storm events, during extended storm events, and after actual storm events to identify areas contributing to a discharge of storm water associated with construction activity. The names and contact numbers of the personnel are listed in Section 6.2.6. During extended storm events, inspections will be conducted during each 24-hour period. Inspections will be recorded on the inspection form provided at the end of this document. Completed inspections will be documented and filed with this document.

4.0 Compliance Certification

A certification made by PWP will be submitted to the RWQCB stating that the construction activity is in compliance with the requirements of the General Permit and the SWPPP. The certification will be made by July 1 of each year. A certification form is provided at the end of this document. Completed copies of certification forms will be filed with this document.

5.0 Noncompliance Reporting

PWP will make the necessary notification if a noncompliance event occurs, as described in the General Permit.

6.0 Monitoring Records

PWP will retain records of all inspections, compliance certifications, and noncompliance reports for at least 3 years from the date generated. While the construction is ongoing, the records will be on file with this document at the construction site. When construction is complete and the permit terminated, records will be on file at the PWP office located at 45 East Glenarm Street, Pasadena, California.

Table 3
Inventory of Potential Materials to be Used Onsite
The following list includes materials that may be used during construction activities at the site.

Material	Use and Disposal
Diesel (#2) Fuel	Diesel fuel will be spent in the powering of equipment, temporary pumps, and other engines.
Ethylene Glycol	Ethylene glycol (antifreeze) will be contained within vehicle and equipment engines.
Gasoline	Gasoline fuel will be spent in the powering of equipment, temporary pumps, and other engines.
Hydraulic fluid	Hydraulic fluid will be contained within vehicle and equipment engines.
Lubricants (motor oil, grease)	Motor oil will be contained within vehicle and equipment engines. Waste motor oil will be sent to licensed facilities for recycling. Grease and other lubricants will be spent.
Sulfuric Acid	Sulfuric acid is found in batteries located in construction equipment and vehicles. Spent batteries will be sent to licensed facilities for recycling or disposal.
Liquid Ammonia	Liquid ammonia may be contained on-site during the installation of the new ammonia tank located on the Broadway Construction Site.

Storm Water Pollution Prevention Plan Inspection Checklist

Site Location:_____

Inspection Date (Day/month/year): _____

Estimate of Beginning of Storm (Date/time): _____

Estimate of Duration of Storm (Date/time): _____

Estimate of Time Elapsed since Previous Storm (Days/hours): _____

Approximate Amount of Rainfall (Inches): _____

List All BMPs in Place (e.g., Silt Fence)	Was BMP Adequate?	If No, What Will Be Corrected?	Date Corrected

NOTE: INSPECTION AND REPAIR OF BMPs SHOULD ONLY BE CONDUCTED UNDER SAFE CONDITIONS, WHERE IT IS POSSIBLE TO ACCESS THESE DEVICES SAFELY IN INCLEMENT WEATHER. IF IT IS NOT POSSIBLE TO ACCESS SAFELY DURING A STORM, LIST A VISUAL INSPECTION OF STORM WATER AT OUTFALL, DISCHARGE POINT, OR DOWNSTREAM.

APPENDIX D

Best Management Practices

BMP: Vehicle and Equipment Maintenance

Description

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment maintenance by running a "dry site." This involves using off-site facilities, performing work in designated areas only, providing cover for materials stored outside, checking for leaks and spills, containing and cleaning up spills immediately, and training employees and subcontractors.

Approach

- Keep vehicles and equipment clean, don't allow excessive build-up of oil and grease.
- Use off-site repair shops as much as possible. Maintaining vehicles and equipment outdoors or in areas where vehicle or equipment fluids may spill or leak onto the ground can pollute stormwater. If you maintain a large number of vehicles or pieces of equipment, consider using an offsite repair shop. These businesses are better equipped to handle vehicle fluids and spills properly.
- Performing this work off-site can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and runoff of spills.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Regularly inspect on-site vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment on site.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic, and transmission fluids.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.

Requirements

Costs (Capital, O&M)

- All of the above are low cost measures.

Maintenance

- Keep ample supplies of spill cleanup materials on-site.
- Inspect maintenance areas on a regular schedule.

Limitations

- Sending vehicles/equipment off-site should be done in conjunction with BMP C/PS8 (Stabilized Construction Entrance).

Additional Information - Vehicle and Equipment Maintenance

Outdoor vehicle or equipment maintenance is a potentially significant source of storm water pollution. Activities that can contaminate storm water include engine repair and service, particularly changing or replacement of fluids, and outdoor equipment storage and parking (dripping engines).

Listed below is further information if you must perform vehicle or equipment maintenance on-site.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, 1, 1, 1-trichloroethane, or methylene chloride. Many of these parts cleaners are harmful and must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents (1, 1, 1 -trichloroethane, methylene chloride, etc.) with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check list of active ingredients to see whether it contains chlorinated solvents. The "chlor" term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling/Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous and non-hazardous wastes separate, do not mix used oil and solvents, and keep chlorinated solvents (like 1,1,1-trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.

Oil filters disposed of in trash cans or dumpsters can leak oil and contaminate storm water. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before

disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Do not bury used tires.

BMP: Vehicle and Equipment Cleaning

Description

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment cleaning by using off-site facilities, washing in designated areas only, eliminating discharges to the storm drain by infiltrating or recycling the wash water and training employees and subcontractors.

Approach

- Use off-site commercial washing businesses as much as possible. Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water.
- If you wash a large number of vehicles or pieces of equipment, consider conducting this work at an off-site commercial business. These businesses are better equipped to handle and dispose of the wash waters properly. Performing this work off-site can also be economical by eliminating the need for a separate washing operation at your site.
- If washing must occur on-site, use designated, bermed wash areas to prevent wash water contact with storm water, creeks, rivers, and other water bodies. The wash area can be sloped for wash water collection and subsequent infiltration into the ground.
- Use as little water as possible to avoid having to install erosion and sediment controls for the wash area.
- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning on-site. Steam cleaning can generate significant pollutant concentrations leading to potential storm water and groundwater contamination.

Requirements

Costs (Capital, O&M)

- All of the above are low cost measures.

Maintenance

- Minimal; some berm repair maybe necessary.

Limitations

- Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades.
- Sending vehicles/equipment off-site should be done in conjunction with PS7 (Stabilized Construction Entrance).

BMP: Vehicle and Equipment Fueling

Description

Prevent fuel spills and leaks, and reduce their impacts to storm water by using off-site facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors.

Approach

- Use off-site fueling stations as much as possible. Fueling vehicles and equipment outdoors or in areas where fuel may spill/leak onto the ground can pollute storm water. If you fuel a large number of vehicles or pieces of equipment, consider using an off-site fueling station. These businesses are better equipped to handle fuel and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate fueling area at your site.
- If fueling must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Discourage "topping-off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/leaks.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Carry out all Federal and State requirements regarding stationary above ground storage tanks.
- Do not use mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and perhaps small forklifts, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.

Requirements

Costs (Capital, O&M)

- All of the above measures are low cost, except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.

Maintenance

- Keep ample supplies of spill cleanup materials on-site.
- Inspect fueling areas and storage tanks on a regular schedule.

Limitations

- Sending vehicles/equipment off-site should be done in conjunction with PS7 (Stabilized Construction Entrance).

BMP: Contaminated Soil Management

Description

Prevent or reduce the discharge of pollutants to storm water from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

Approach

Contaminated soils may occur on your site for several reasons including:

- Past site uses and activities,
- Detected or undetected spills and leaks, and
- Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline-forming elements.

The following steps will help reduce storm water pollution from contaminated soil:

- Conduct thorough site planning including pre-construction geologic surveys.
- Look for contaminated soil as evidenced by discoloration, odors, or differences in soil properties.
- Seal bedrock fractures with grout or bentonite to reduce seepage from excavation.
- Prevent leaks and spills to the maximum extent practicable. Contaminated soil can be expensive to treat and/or dispose of properly. However, addressing the problem before building construction is much less expensive than after the buildings are in place.
- Test suspected soils at a certified laboratory.
- If the soil is contaminated, work with the local regulatory agencies to develop options for treatment and/or disposal.

Requirements

Costs (Capital, O&M)

- Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil can be quite expensive.

Maintenance

- Inspect excavated areas daily for signs of contaminated soil.

- Implement Spill Prevention and Control to prevent leaks and spills as much as possible.

Limitations

- Contaminated soils that cannot be treated on-site must be disposed of off-site by a licensed hazardous waste hauler.
- The presence of contaminated soil may indicate contaminated water as well.

BMP: Hazardous Waste Management

Description

Prevent or reduce the discharge of pollutants to storm water from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

Approach

Many of the chemicals used on-site can be hazardous materials which become hazardous waste upon disposal. These wastes may include:

- Paints and solvents,
- Petroleum products such as oils, fuels, and grease,
- Fertilizers, herbicides and pesticides,
- Acids for cleaning masonry,
- Soil stabilization additives such as calcium carbonate,
- Asphalt products, and
- Concrete curing compounds.

In addition, sites with existing structures may contain wastes which must be disposed of in accordance with Federal, State, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints,
- Asbestos, and
- PCBs (particularly in older transformers).

The following steps will help reduce storm water pollution from hazardous wastes:

Material Use

- Use all of the product before disposing of the container.
- Do not remove the original product label, it contains important safety and disposal information.
- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Overapplication is expensive and environmentally harmful. Till fertilizers and lime into soil rather than hydroseeding. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with Federal and State regulations.

Waste Recycling/Disposal

- Select a designated waste collection area on-site.
- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place hazardous waste containers in secondary containment.
- Do not mix wastes, this can cause chemical reactions, make recycling impossible, and complicate disposal.
- Recycle any useful material such as used oil.
- Make sure that toxic liquid wastes (used oils, solvents, paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.

Training

- Train employees and subcontractors in proper hazardous waste management.
- Warning signs should be placed in areas recently treated with chemicals.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- If a container does spill, clean up immediately.

Requirements

Costs (Capital, O&M)

- All of the above are low cost measures.

Maintenance

- Inspect hazardous waste receptacles and area regularly.
- Arrange for regular hazardous waste collection.

Limitations

- Hazardous waste that cannot be re-used or recycled must be disposed of by a licensed hazardous waste hauler.

BMP: Solid Waste Management

Description

Prevent or reduce the discharge of pollutants to storm water from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Approach

Solid waste is one of the major pollutants resulting from construction. Construction debris includes:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction,
- Packaging materials including wood, paper and plastic,
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, masonry products, and
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes.

The following steps will help keep a site clean and reduce storm water pollution:

- Select a designated waste collection area on-site.
- When possible, locate containers in a covered area.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it's windy.
- Collect site trash daily.
- Erosion and sediment control devices tend to collect litter. Remove this solid waste promptly.
- Salvage or recycle any useful material.
- Make sure that toxic liquid wastes (used oils, solvents, paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.

- If a container does spill, clean up immediately.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.
- Train employees and subcontractors in proper solid waste management.

Requirements

Costs (Capital, O&M)

- All of the above are low cost measures.

Maintenance

- Collect site trash daily.
- Inspect construction waste area regularly.
- Arrange for regular waste collection.

Limitations

- There are no major limitations to this best management practice.

BMP: Spill Prevention and Control

Description

Prevent or reduce the discharge of pollutants to storm water from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, Material Delivery and Storage and Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this appendix.

Approach

The following steps will help reduce the storm water impacts of leaks and spills:

General Measures

- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.

Cleanup

- Clean up leaks and spills immediately.
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and an absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Sweep up or excavate the material and dispose of properly. See the waste management BMPs in this chapter for specific information.

Reporting

- Report spills to local agencies, such as the Fire Department; they can assist in the cleanup.
- Federal regulations require that any oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).

Use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- If maintenance must occur on-site, use a designated area, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Regularly inspect on-site vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment on site.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under pacing equipment when not in use.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.
- Oil filters disposed of in trash cans or dumpsters; can leak oil and contaminate storm water. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Discourage "topping-off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/leaks.

Requirements

Costs (Capital, O & M)

- Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil or water can be quite expensive.

Maintenance

- Keep ample supplies of spill control and cleanup materials on-site, near storage, unloading, and maintenance areas.
- Update your spill cleanup materials as changes occur in the types of chemicals on site.

Limitations

- If necessary, use a private spill cleanup company.

BMP: Material Use

Description

Prevent or reduce the discharge of pollutants to storm water from material use by using alternative products, minimizing hazardous material use on-site, and training employees and subcontractors.

Approach

The following materials are commonly used on construction sites:

- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Use of these materials on-site can pose the following risks:

- Storm water contamination,
- Injury to workers or visitors,
- Groundwater contamination, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Use less hazardous, alternative materials as much as possible.
- Use as few hazardous materials on-site as possible.
- Limit material usage to designated areas only.
- Follow manufacturer's instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- For pesticides in particular, personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Do-not over apply fertilizers, herbicides, and pesticides. Prepare only the amount needed.
- Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Till fertilizers and lime into the soil rather than hydroseeding.

Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains.

- Train employees and subcontractors in proper material use.

Requirements

Costs (Capital, O & M)

- All of the above are low cost measures.

Maintenance

- Maintenance of this best management practice is minimal.

Limitations

- Alternative materials may not be available, suitable, or effective in every case.

BMP: Material Delivery and Storage

Description

Prevent or reduce the discharge of pollutants to storm water from material delivery and storage by minimizing the storage of hazardous materials on-site, storing materials in a designated area, installing secondary containment, conducting regular inspection, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see Material Use, or Spill Prevention and Control. For information on wastes, see the waste management BMPs in this appendix.

Approach

The following materials are commonly stored on construction sites:

- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Storage of these materials on-site can pose the following risks:

- Storm water contamination,
- Injury to workers or visitors,
- Groundwater contamination, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Designate an area of the construction site for material delivery and storage.
  - Place near the construction entrance, away from waterways
  - Avoid transport near drainage paths or waterways
  - Surround with earth berms (see DRI, Earth, Dika)
  - Place in an area which will used to stabilize any residential materials
- Storage of reactive, ignitible, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.

- Keep an accurate, up-to-date inventory in your SWPPP of the materials delivered and stored on site.
- Keep your inventory down. Store only the amount you need, for only as long as you need it.
- Store as few hazardous materials on-site as possible.
- Handle hazardous materials as infrequently as possible.
- Designate a secure material storage area away from drainage courses and near the site entrance.
- Whenever possible, store materials in a covered area with secondary containment such as an earthen dike, horse trough, or even kid's wading pool for non-reactive materials such as detergents, oil, grease and paints. Small amounts of material may be secondarily contained in "bus boy" trays or concrete mixing trays.
- Do not store chemicals, drums, or bagged materials directly on the ground. Place these items in secondary containment.
- If drums must be kept in an uncovered area, store them at a slight angle to reduce ponding of rainwater in the lids and to reduce corrosion.
- Try to keep chemicals in their original containers, and keep them well labeled.
- Train employees and subcontractors.
- Employees trained in emergency spill cleanup procedures should be present when dangerous materials or liquid chemicals are unloaded.

Requirements

Cost (Capital, O & M)

- All of the above are low cost measures.

Maintenance

- Keep the designated storage area clean and well organized.
- Conduct routine weekly inspections and check for external corrosion of material containers.
- Keep an ample supply of spill cleanup materials near the Storage area.

Limitations

- Storage sheds often must meet building and fire code requirements.

BMP: Employee/Subcontractor Training

Description

Employee/subcontractor training, like maintenance or equipment, is not so much a best management practice as it is a method by which to implement BMPs. This fact sheet highlights the importance of training and of integrating the elements of employee/subcontractor training from the individual source controls into a comprehensive training program as part of a company's Storm Water Pollution Prevention Plan (SWPPP). It includes the overall objectives and approach for assuring employee/subcontractor training in storm water pollution prevention.

Objectives

Employee/subcontractor training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water,
- Identify solutions (BMPs),
- Promote employee-subcontractor ownership of the problems and the solutions, and
- Integrate employee/subcontractor feedback into training and BMP implementation.

Approach

- Integrate training regarding storm water quality management with existing training programs that may be required for your business by other regulations such as: the Illness and Injury Prevention Program (11PP) (SB 198) (California Code of Regulations Title 8, Section 3203), the Hazardous Waste Operations and Emergency Response (HAZWOPER) standard (29 CFR 1910.120), the Spill Prevention Control and Countermeasure (SPCC) Plan (40 CFR 112), and the Hazardous Materials Management Plan (Business Plan) (California Health and Safety Code, Section 6.95).
- Businesses, particularly smaller ones that may not be regulated by Federal, State, or local regulations should develop a training program to reduce their potential to pollute storm water.
- Train employee/subcontractors in proper and consistent methods for disposal.
- Consider posting the quick reference table around the job site or in the on-site office trailer to reinforce training.
- Train employee/subcontractors in standard operating procedures and spill cleanup techniques described in the BMP fact sheets. Employee/subcontractors trained in spill

containment and cleanup should be present during the loading/unloading and handling of materials.

- Personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Proper education of off-site contractors is often overlooked. The conscientious efforts of well trained employee/subcontractors can be lost by unknowing off-site contractors, so make sure they are well informed about what they are expected to do on-site.

BMP: Scheduling

Description

Sequencing the construction project to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project. Use of other, more costly yet less effective, erosion and sedimentation controls, may often be reduced through proper construction sequencing.

Approach

- Project design considerations: Design project to integrate into existing land contours. Significant regrading of a site will require more costly erosion and sedimentation control measures and may require that on-site drainage facilities be installed.
- Incorporate existing, natural areas: Inventory and evaluate the existing site terrain and vegetation. Disturbance of highly erosive natural areas (e.g., steep, unstable slope areas, watercourses) should be minimized, while protecting other areas may enhance site aesthetics. Construction should not disturb these areas (see ESC2).
- Avoid rainy periods: Schedule major grading operations during dry months. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means (see ESC 10 to 24) or to install temporary sediment trapping devices (see ESC 50 to 56).
- Practice erosion and sediment control year round: Erosion may be caused during dry seasons by "freak" rainfall, wind and vehicle tracking. Therefore, keep the site stabilized year-round, and retain wet season sediment trapping devices.
- Minimize soil exposed at one time! Schedule projects to disturb only small portions of the site at any one time. Complete grading as soon as possible. Immediately stabilize the disturbed portion before grading the next portion. Practice staged seeding--revegetate cut and fill slopes as the work progresses.
- Trenching: Close and stabilize open trenches as soon as possible. Sequence trenching projects so that most open portions of the trench are closed before new trenching is begun.

Requirements

Cost

Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost-effectiveness of scheduling techniques should be compared with the other, less effective erosion and sedimentation controls to achieve a cost-effective balance.

Limitations

There are no significant limitations to the use of this BMP.

BMP: Silt Fence

General Description

A silt fence is a temporary sediment barrier consisting of filter fabric stretched across and attached to supporting posts, entrenched, and, depending upon the strength of the fabric used, supported with wire fence. Silt fences trap sediment in two ways: (1) by intercepting and detaining small amounts of sediment from disturbed areas during construction operations in order to promote sediment from behind the fence: and (2) by decreasing the velocity of flows up to 0.5 cfs in swales.

Silt fences may be used for perimeter control, placed upstream of the point(s) of discharge of runoff from a site, but before the flow becomes concentrated. They may also be used as interior controls below disturbed areas where runoff may occur in the form of sheet and rill erosion, and perpendicular to minor swales or ditch lines for up to one acre contributing drainage areas. Silt fences are not intended for use in detaining concentrated flows, and are only applicable for sheet or overland flows.

Suitable Applications

- Along the perimeter of the site
- Along streams and channels
- Across swales with small catchments
- Below the toe of a cleared slope
- Around temporary spoil areas
- Below other small cleared areas

Installation/Application

Planning:

Silt fences are preferable to straw barriers in many cases. Laboratory work at the Virginia Highway and Transportation research Council has shown that silt fences can trap a much higher percentage of suspended sediments than can straw bales. While the failure rate of silt fences is lower than that of straw barriers, there are many instances where silt fences have been improperly installed. The following installation methods can improve performance and should be followed:

- Construct along a level contour.
- Silt fences should remain in place until the disturbed area is permanently stabilized.
- Provide sufficient room for sediment removal equipment between the silt fences and toes of slopes or other obstructions.

- Turn the ends of the filter fence uphill to prevent stormwater from flowing around the fence.
- Leave an undisturbed or stabilized area immediately downslope from the fence.
- Do not place in live steams or intermittently flowing channels.

Design:

Limit the upstream drainage area to 1 acre or less when used alone or in combination-with-sediment basin in a larger site..

Limit the maximum slope perpendicular to the fence line, should be 1:1.

Limit the maximum sheet or overland flow path length to any point along the fence to 100 feet.

Limit the concentrated flows reaching the fence to 0.5

Selection of a filter fabric is based on soil conditions at the construction site (which affect the equivalent opening size (EOS) fabric specification) and characteristics of the support fence (which affect the choice of tensile strength). The designer shall specify a filter fabric that retains the soils found on the construction site yet will have openings large enough to permit drainage and prevent clogging. The following criteria is recommended for selection for the equivalent opening size:

a. If 50 percent or less of the soil, by weight, will pass the U.S. Standard Sieve No. 200, select the EOS to retain 85 percent of the soil. The EOS should not be finer than EOS 70.

b. For all other soil types, the EOS should be no larger than the openings in the U.S. Standard Sieve No. 70 (0.0083 in. [0.21 mm.]) except where direct discharge to a stream, lake or wetland will occur, then the EOS shall be no larger than Standard Sieve No. 100.

To reduce the chance of clogging, it is preferable to specify a fabric with openings as large as allowed by the criteria. No fabric should be specified with an EOS smaller than U. S. Standard Sieve No. 100 (0.0059 in. (0. 15 mm)). If 85 percent or more of a soil, by weight, passes through the openings in a No. 200 sieve (0.0029 in. (0.074 mm)), filter fabric shall not be used. Most of the particles in such a soil would not be retained if the EOS was too large, and they would clog the fabric quickly if the EOS was small enough to capture the soil.

The fence should be supported by a wire mesh if the fabric selected does not have sufficient strength and bursting strength characteristics for the planned application (as recommended by the fabric manufacturer). Filter fabric material shall contain ultraviolet ray inhibitors and stabilizers to provide a minimum of six months of expected usable construction life at a temperature range of 0°F to 120°F.

Installation Guidelines:

Filter fences are to be constructed on a level contour. Sufficient area should exist behind the fence for ponding to occur without flooding or overtopping the fence.

a. Posts should be spaced a maximum of 6 feet apart and driven securely into the ground a minimum of 30 inches.

b. A trench should be excavated approximately 8 inches wide and 12 inches deep along the line of posts and upslope from the barrier.

c. When standard strength filter fabric is used, a wire mesh support fence should be fastened securely to the upslope side of the posts using heavy-duty wire staples at least 1 inch long, tie wires or hog rings. The wire should extend into the trench a minimum of 4 inches.

d. The standard strength filter fabric should be stapled or wired to the fence, and 20 inches of the fabric should extend into the trench. When extra-strength filter fabric and closer post spacing are used, the wire mesh support fence may be eliminated and filter fabric stapled or wired directly to the posts.

e. The filter fabric should be purchased in a continuous, cut to the length of the barrier to avoid use of joints. When joints are necessary, filter cloth should be spliced together only at a support post, with a minimum 6 inch overlap, and both ends securely fastened to the post.

f. The trench should be backfield with 3/4-inch minimum diameter washed gravel or compacted native material.

Requirements

Maintenance

- Inspect monthly during dry periods and immediately after each rainfall. Repair as necessary. Sediment must be removed when it reaches approximately one third the height of the fence, especially if heavy rains are expected.
- Filter fences should not be removed until the upslope area has been permanently stabilized.

Limitations

- Filter fences will create a temporary sedimentation pond on the upstream side of the fence which may cause temporary flooding. Fences not constructed on a level contour will be overtopped by concentrated flow resulting in failure of the filter fence.
- Filter fences are not practical where large flows of water are involved, hence the need to restrict their use to drainage areas of one acre or less, and flow rates of less than 0.5 cfs.
- Problems may arise from incorrect selection of pore size and/or improper installation.
- Do not allow water depth to exceed 1.5 feet at any point.
- Improperly installed fences are subject to failure from undercutting, overlapping, or collapsing.

BMP: Straw Bale Barriers

General Definition

A straw bale barrier consists of a series of secured anchored bales placed to intercept sediment-laden runoff from small drainage areas of disturbed soil. The barrier ponds runoff and allow sediment to settle. Straw bale dikes should not be used for extended periods of time because they tend to rot and fall apart.

The straw bale dike is used where there are no concentrations of water in a channel or drainage way, and where erosion would occur from sheet flow. These barriers are typically constructed, below disturbed areas subject to sheet flow of runoff to intercept and detain sediment.

Suitable Applications

- Along the perimeter of the site
- Along streams and channels
- Across swales, with small catchments
- Around temporary spoil areas
- Below other small, cleared areas

Installation/Application Criteria

Straw bale barriers should be used for drainage areas no more than 1/4 acre per 100 feet of barrier length in any size, with no more than 100 ft upstream of any port along the barrier. The barrier should be placed along a level contour no greater than 2:1. When installed and maintained according to the guidelines on this fact sheet, straw bale dikes remove approximately 67% of the sediment transported in construction site runoff. This optimum efficiency can only be achieved through careful maintenance with special attention to replacing rotted or broken bales. Barrier should be constructed on a level contour to prevent concentration of flow against a small portion of the barrier.

An effective straw bale barrier should be installed in the following manner:

1. Bales should be placed on the contour and in a row with ends tightly abutting the adjacent bales.
2. Leave area for runoff to pond upstream of the barrier by locating barrier away from the toe of the slopes. This also provides access for maintenance.
3. Each bale should be embedded in the soil a minimum of (4) inches and placed so the bindings are horizontal. Bindings placed on soil will soon disintegrate and cause the barrier to fail.

4. Bales should be securely anchored in place be either two stakes or re-bars driven through the bale. The first stake in each bale shall be driven toward the previously laid bale at an angle to force the bale together. Stakes should be driven flush with the bale.
5. Remove when it has served its usefulness so as not to block or impede storm flow or drainage.

Requirements

Costs

- Straw bale typically cost about $4 per lineal foot

Maintenance

- Inspect weekly and after each rain
- Replace bales which have decomposed or whose bindings have broken
- Remove sediment -behind the barrier when it-reaches-a depth of 6 inches

Limitations

- Straw bale dikes are not to be used for extended periods of time because they tend to rot and fall apart.
- Suitable only for sheet flow on slopes of 2% or flatter.
- Not appropriate for large drainage areas, limit to one acre or less.
- Straw bales lose their effectiveness rapidly due to rotting, thus constant maintenance is required.
- Not recommended for concentrated flow, channel flow, and live streams.
- Bale bindings of jute or cotton not recommended.
- Straw bale barriers have not been as effective as expected due to improper use. These barriers have been placed in streams and drainage ways where runoff volumes and velocities have caused the barriers to wash out. In addition, failure to stake and entrench the straw bale has allowed undercutting and end flow.

BMP: Sand Bag Barrier

General Definition

Stacking sandbags along a level contour creates a barrier which detains sediment-laden water, ponding water upstream of the barrier and promoting sedimentation.

Suitable Applications

Sandbag berms may be used during construction activities in stream beds and utility construction in channels, temporary channel crossing for construction equipment, etc. Sandbag berms may also be installed parallel to roadway construction. Sandbag berms may also be used to create temporary sediment traps, retention basins and in place of straw bales or silt fences. Examples of applications include:

- Check dams across stream channels
- Barrier for utility trenches or other construction in a stream channel
- Temporary channel crossing
- Barrier on a slope in place of straw bales or silt fences
- Direct or divert flow
- Create temporary sediment basin or retention basin
- Near the toe of slopes
- At construction perimeter

Advantages

- Provides a semi-permeable barrier in potentially wet areas
- More permanent than silt fences or straw bales
- Allows for easy relocation on site to meet changing needs during construction

Installation/Application

Sandbag berms are appropriate to use when construction of check dams or sumps in a stream is undesirable. The sandbag berms can provide the same function as a check dam without disturbing the stream or vegetation. The sandbag berm will also allow a small sediment retention area to be created prior to construction of final detention basins. For installation of a sandbag berm, the following criteria should be observed:

- Drainage Area - Up to -five (5) acres
- Height of Berm - 18 inches minimum height, measured from the top of the existing ground at the upslope toe to the toe of the barrier
- Width of Berm - 48 inches minimum width measured at the bottom of the barrier; 18 inches at the top

- Sandbag Size – length: 24 to 30 inches, width: 16 to 18 inches, and thickness: 6 to 8 inches. Weight: 90 to 125 pounds.
- Sandbag Material - Polypropylene, polyethylene or polyamide woven fabric, minimum unit weight four (4) ounces per square yard, mullen burst strength exceeding 300 psi and ultraviolet stability exceeding 70 percent. Use of burlap is discouraged since it rots and deteriorates easily.
- Grade of Sand - Coarse sand, gravel.
- Runoff water shall flow over the tops of the sandbags or through four (4) inch polyvinyl chloride.

Requirements

Maintenance

- Inspect after each rain
- Reshape or replace damaged sandbags immediately
- Remove sediment when it reaches six inches in depth

Limitations

- Sandbags are more expensive than other barriers, but also more durable
- Burlap should not be used for sandbags

BMP: Stabilized Construction Entrance

General Description

The construction entrance practice is a stabilized pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right-of-way, street, alley, sidewalk or parking area.

Suitable Applications

- All points of construction ingress and egress
- Unpaved areas where sediment tracking occurs from site onto paved roads

Installation/Application Criteria

- Construct on level ground where possible
- Stones should be 2-3 inches
- Minimum depth of stones should be 8 inches or as recommended by soils engineer
- Length should be 50-foot minimum, and width should be 15-foot minimum
- Provide ample turning radii as part of entrance

Requirements

Cost

- Ranges from $750 to $1200 depending upon region and availability of material

Maintenance

- Inspect monthly and after each rainfall
- Replace gravel material when surface voids are visible
- Remove all sediment deposited on paved roadways within 24 hours
- Remove gravel and filter fabric at completion of construction

Limitations

The stabilized construction entrance plan should be reviewed as part of the project traffic control plan.

- Construct on level ground.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

- Requires periodic top dressing with additional stones
- Should be used in conjunction with Wash Rack BMP, if appropriate
- Should be used in conjunction with street sweeping on adjacent public right-of-way

Additional Information - Stabilized Construction Entrance

A stabilized pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right-of-way, street, alley, sidewalk or parking area. The purpose of a stabilized construction entrance is to reduce or eliminate the tracking of sediment onto public rights-of-way or streets. Reducing trackout of sediments and other pollutants onto paved roads helps prevent deposition of sediments into local storm drains and production of airborne dust.

Where traffic will be entering or leaving, a stabilized construction entrance should be used at all points of construction ingress and egress. NPDES permits require that appropriate measures be implemented to prevent track out of sediments onto paved roadways, which is a significant source of sediments derived from mud and dirt carryout from the unpaved roads and construction sites.

Stabilized construction entrances are not very effective in removing sediment from equipment leaving a construction site. Efficiency is greatly increased when a washing rack is included as part of a stabilized construction entrance. The entrance should be built on level ground. Advantages of the Stabilized Construction Entrance is that it does remove some sediment from equipment and serves to channel construction traffic in and out of the site at specified locations.

Design & sizing considerations include the aggregate for stabilized construction entrance aprons shell be 2 to 3 inches in sized, washed, well-grades gravel or crushed rock. The minimum apron dimensions will be 15 feet by 50 feet and 8 inches deep for one-way ingress/egress traffic.

Entrance must be properly graded to prevent runoff from leaving the construction site. When wash areas are provided, washing shall be done on an area stabilized with crushed stone which drains into a properly constructed sediment trap or basin (pond). Sediment barriers shall be provided to prevent sediments from entering into the stormwater sewer system, ditch, or waterway.

BMP: Dust Controls

General Description

Dust control measures are used to stabilize soil from wind erosion, and reduce dust generated by construction activities. Dust which settles on surfaces both on-site and off-site may be washed by storm water into waterways.

California's Mediterranean climate, with short wet seasons and long, hot, dry seasons, allows the soils to thoroughly dry out. During these dry seasons, construction activities are at their peak, and disturbance and exposed areas are increasingly subject to wind erosion, sediment tracking and dust generated by construction equipment.

Dust control, as a BMP, is a practice that is already in place for many construction activities. Los Angeles, the North Coast and Sacramento, among others have enacted dust control ordinances for construction activities that cause dust to be transported beyond the construction property line. Recently, the State Air Resources Control Board has, under the authority of the Clean Air Act, started to address air quality in relation to inhalable particulate matter less than 10 microns (PM-10). Ninety percent of the SC particles are considered to be dust. Existing dust control regulations by local agencies, municipal departments, public works department, and/or public health departments are in place in some regions within California. For jurisdictions that have no formal dust control regulations and/or standards, Section 10, 17 and 18 of Caltrans' Standard Specifications provide detailed provisions for dust control practices.

Many local agencies require dust control in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. The following are measures that local agencies may have already implemented as requirements for dust control form contractors:

- Construction & Grading Permits: Require provisions for dust control plans;
- Opacity Emission Limits: Enforce compliance with California air pollution control laws;
- Increase overall enforcement activities: Priority given to cases involving citizen complaints;
- Maintain Field Application Records: Require records of dust control measures from contractor;
- Stormwater Pollution Prevention Plan: (SWPPP): Integrate dust control measures into SWPPP.

Dust Control Practices

Dust control BMP's generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel or asphalt surfacing, temporary gravel

construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control, applications. Permanent or temporary vegetation and mulching, and sand fences can be employed for areas of occasional or no construction traffic. Preventive measures would include minimizing surface areas to be disturbed.

Many of the reasonably available control measures for controlling dust from construction sites can also be implemented as BMPs for storm water pollution prevention. Those BMPs include:

- Pave, vegetate, or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads,
- Provide covers for haul trucks transporting materials that contribute to dust,
- Provide for wet suppression or chemical stabilization of exposed soils,
- Provide for rapid clean-up of sediments deposited on paved roads,
- Furnish stabilized construction road entrances and vehicle wash down areas,
- Stabilize unpaved haul roads, parking and staging areas,
- Reduce speed and trips on unpaved roads,
- Implement dust control measures for material stockpiles,
- Prevent drainage of sediment laden storm water onto paved surfaces,
- Stabilize abandoned construction sites using vegetation or chemical stabilization methods, and
- Limit the amount of areas disturbed by clearing and earth moving operations by scheduling these activities in phases.

For the chemical stabilization, there are many products available as dust palliatives for chemically stabilizing gravel roadways and stockpiles.

Suitable Applications

- Clearing and grading activities
- Construction vehicle traffic on unpaved roads
- Drilling and blasting activities
- Sediment tracking onto paved roads
- Soil and debris storage piles
- Batch drop from front end loaders
- Areas with unstabilized soil

Installation/Application Criteria

- Schedule construction activities to minimize the area where, and time period when soils are exposed
- Quickly stabilize exposed soils using vegetation, mulching, spray-on adhesives, calcium chloride, sprinkling , and stone/gravel layering
- Identify and stabilize key access points prior to commencement of construction
- Minimizing the impact of dust by anticipating the direction of prevailing winds
- Direct most construction traffic to stabilized roadways within the project site

Requirements

Cost

- Reference Caltrans Cost Schedule for regional cost ranges.

Maintenance

- Most dust control measures require frequent, often daily, attention.

Limitations

- Oil treated subgrades should not be used because the oil may migrate into drainageways and/or seep into the soil.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration, and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- Asphalt, as a mulch tack or chemical mulch, requires a 24 hour curing time to avoid adherence to equipment, worker shoes, etc. Application should be limited because asphalt surfacing may eventually migrate into the drainage system.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.

BMP: Oil / Water Separators

General Description

Oil/water separators are baffled chambers designed to remove petroleum compounds and greases from storm water. Oil/water separators also remove floatable debris and settled solids (sediment). These separators will mainly be used in the following activities:

- Aircraft/Vehicle/Equipment Fueling
- Aircraft/Vehicle/Equipment Washing
- Fuel/Chemical Storage
- Installing, Cleaning, and Maintaining Oil/Water Separators

Approach

Design of New Facilities and Existing Facility Upgrades:

Oil/water separators are typically used in areas where the concentrations of petroleum hydrocarbons, floatables, or sediment may be abnormally high and source control techniques are not very effective. There are two types of oil/water separators: the American Petroleum Institute (API) separator and the coalescing plate separator (CPS). Design, sizing, and placement of oil/water separators is dependent on several factors including: tributary area, type of activity, pollutant type and concentration, and water temperature. General sizing guidelines for API separators include the following:

- Horizontal velocity: 3 feet per minute.
- Depth of 3 to 8 feet.
- Depth-to-width ratio of 0.3 to 0.5.
- Width of 6 to 16 feet.
- Baffle height-to-depth ratios of 0.85 for top baffles and 0.15 for bottom baffles.

CPS separator sizing is more complex. Sizing calculations require the inclusion of information such as packing plate surface areas and plate angles. CPS separators can, due to their packed plate design, remove the same quantities of oils and greases while occupying less space than API separators.

Contingency Response

- Maintain adequate supplies of spill response equipment and materials in accessible locations near areas where spills may be likely to occur.

Inspection and Training

- Provide the appropriate level of employee training in the following areas: spill response and prevention, storm water pollution prevention education (see SC-10 for storm water pollution education approaches), right-to-know awareness training, and hazardous materials management.

- Perform and document in a log book all inspections and maintenance operations.
- Develop a written operating, sampling, and reporting procedure under local storm water authority guidelines. Train appropriate employees to implement these procedures.

Requirements

Costs (Capital, O&M)

- Capital and O&M Costs increase as the tributary area increases.

Maintenance

- Separators must be inspected and cleaned frequently of accumulated oil, grease, floating debris and sediments to be effective storm water quality controls.
- Oil absorbent pads are to be replaced as needed but will always be replaced prior to the wet season.
- The effluent shutoff valve will be closed during cleaning operations.
- Any standing water removed during the cleaning operation must be disposed of in accordance with federal, state, and local requirements.
- Any standing water removed during the cleaning operation must be replaced with clean water to prevent oil carry-over through the outlet.

Limitations

- Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades.
- Sending vehicles/equipment off-site should be done in conjunction with PS7 (Stabilized Construction Entrance).

Fitzgerald, Maggie/SCO

FCEMeetingAgenda 1-21-03.doc

** High Priority **

Hi everyone,

This is to inform you that the next Fish Contamination Education Task Force meeting will be held on January 21, 2003 from 1 pm to 4 pm at the NOAA Damage Assessment Center in downtown Long Beach. Attached you will find the agenda along with directions. The meeting facility is small but it is able to accommodate phone conferencing, so if anyone is unable to attend in person, you can participate by calling in. The information for doing so is provided at the bottom of the attached agenda.

If you have any questions or problems opening the attachments, please contact me via phone or email.

Thank you,

Guillermo Jaimes
Health Education Program Assistant
CA Department of Health Services
320 W. 4th St., Suite 560
Los Angeles, CA 90013
Phone: (213) 576-6634
Fax: (213) 620-2586
email: gjaimes@rb4.swrcb.ca.gov

Agenda for the
Southern California
Fish Contamination Outreach and Education Committee
Task Force Meeting

January 21, 2003
1 p.m. – 4 p.m.

NOAA MSRP conference room
501 W. Ocean Blvd. #4470
Long Beach, CA 90802

Meeting topics

1. Introduction of new CBOs (Gina)
2. Discussion of Project (Gina)
3. EPA Palos Verdes Shelf Public Outreach and Education Contract Status (EPA)
2. EPA/NOAA MSRP fish in ocean laboratory analysis status (EPA/MSRP)
3. EPA RI/FS related activities (EPA)
4. Message status (Gina)
5. Logo (Kellie)

Phone conferencing

If you would like to participate in this meeting via phone, please call

Toll free (877) 804-2050

The pass code is 250838

Updated 01/10/03

BMP: OIL / WATER SEPERATORS

DESCRIPTION

Oil/water separators are baffled chambers designed to remove petroleum compounds and greases from storm water. Oil/water separators also remove floatable debris and settled solids (sediment). These separators will mainly be used in the following activities:

- Aircraft/Vehicle/ Equipment Fueling
- Aircraft/Vehicle/ Equipment Washing
- Fuel/Chemical Storage
- Installing, Cleaning, and Maintaining Oil/Water Separators

APPROACH

The key approaches are to frequently inspect and clean separators and to replace absorbent pads as needed

Design of New Facilities and Existing Facility Upgrades:
Oil/water separators are typically used in areas where the concentrations of petroleum hydrocarbons, floatables, or sediment may be abnormally high and source control techniques are not very effective. There are two types of oil/water separators: the American Petroleum Institute (API) separator and the coalescing plate separator (CPS). Design, sizing, and placement of oil/water separators is dependent on several factors including: tributary area, type of activity, pollutant type and concentration, and water temperature. General sizing guidelines for API separators include the following:

- Horizontal velocity: 3 feet per minute.
- Depth of 3 to 8 feet.
- Depth-to-width ratio of 0.3 to 0.5.
- Width of 6 to 16 feet.
- Baffle height-to-depth ratios of 0.85 for top baffles and 0.15 for bottom baffles.

CPS separator sizing is more complex. Sizing calculations require the inclusion of information such as packing plate surface areas and plate angles. CPS separators can, due to their packed plate design, remove the same quantities of oils and greases while occupying less space than API separators.

Existing Facility Activities:

Operational Considerations:

- Separators must be inspected and cleaned frequently of accumulated oil, grease, floating debris and sediments to be effective storm water quality controls.
- Oil absorbent pads are to be replaced as needed but will always be replaced prior to the wet season.
- The effluent shutoff valve will be closed during cleaning operations.
- Any standing water removed during the cleaning operation must be disposed of in accordance with federal, state, and local requirements.
- Any standing water removed during the cleaning operation must be replaced with clean water to prevent oil carry-over through the outlet.

Contingency Response

- Maintain adequate supplies of spill response equipment and materials in accessible locations near areas where spills may be likely to occur.

Inspection and Training

- Provide the appropriate level of employee training in the following areas: spill response and prevention, storm water pollution prevention education (see SC-10 for storm water pollution education approaches), right-to-know awareness training, and hazardous materials management.
- Perform and document in a log book all inspections and maintenance operations.
- Develop a written operating, sampling, and reporting procedure under local storm water authority guidelines. Train appropriate employees to implement these procedures.

REQUIREMENTS

Capital and O&M Costs increase as the tributary area increases.

LIMITATIONS

Oil/water separator installations should be designed and installed by experienced individuals. Little data on the characteristics of petroleum hydrocarbons in storm water leads to considerable uncertainty about separator performance.

Gray Davis
Governor

To: STORM WATER DISCHARGER

SUBJECT: CHECKLIST FOR SUBMITTING A NOTICE OF INTENT

In order for the State Water Resources Control Board to expeditiously process your Notice of Intent (NOI), the following items must be submitted:

1._____ NOI with all applicable sections filled out and signed by the owner/operator;

2._____ Check made out to the "State Water Resources Control Board" with the appropriate fee; and

- County Fees: $250.00 or $500.00
- Dairy Farms: $2000.00

3._____ Site map displaying the layout of premises (see NOI instructions) (Vicinity Map)
DO NOT SEND BLUEPRINTS

Please return the above items to the address below. If you have any questions regarding this matter, please contact us at (916) 657-0757.

FOR
WATER QUALITY ORDER 99-08-DWQ

STATE WATER RESOURCES CONTROL BOARD (SWRCB)
901 P STREET, SACRAMENTO, CALIFORNIA 95814

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR
STORM WATER DISCHARGES ASSOCIATED WITH
CONSTRUCTION ACTIVITY (GENERAL PERMIT)

BACKGROUND

In 1972, the Federal Water Pollution Control Act (also referred to as the Clean Water Act [CWA]) was amended to provide that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with an NPDES permit. The 1987 amendments to the CWA added Section 402(p) which establishes a framework for regulating municipal and industrial storm water discharges under the NPDES Program. On November 16, 1990, the U.S. Environmental Protection Agency (USEPA) published final regulations that establish storm water permit application requirements for specified categories of industries. The regulations provide that discharges of storm water to waters of the United States from construction projects that encompass five (5) or more acres of soil disturbance are effectively prohibited unless the discharge is in compliance with an NPDES Permit.

While federal regulations allow two permitting options for storm water discharges (individual permits and General Permits), the SWRCB has elected to adopt only one statewide General Permit at this time that will apply to all storm water discharges associated with construction activity, except from those on Tribal Lands, in the Lake Tahoe Hydrologic Unit, and those performed by the California Department of Transportation (Caltrans). Construction on Tribal Lands is regulated by an USEPA permit, the Lahontan Regional Water Control Board adopted a separate NPDES permit for the Lake Tahoe Hydrologic Unit, and the SWRCB adopted a separate NPDES permit for Caltrans projects. This General Permit requires all dischargers where construction activity disturbs five acres or more to:

1. Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting storm water and with the intent of keeping all products of erosion from moving off site into receiving waters.

2. Eliminate or reduce nonstorm water discharges to storm sewer systems and other waters of the nation.

3. Perform inspections of all BMPs.

This General Permit shall be implemented and enforced by the nine California Regional Water Quality Control Boards (RWQCBs).

The General Permit accompanying this fact sheet regulates storm water runoff from construction sites. Regulating many storm water discharges under one permit will greatly reduce the otherwise overwhelming administrative burden associated with permitting individual storm water discharges. Dischargers shall submit a Notice of Intent (NOI) to obtain coverage under this General Permit. It is expected that as the storm water program develops, the RWQCBs may issue General Permits or individual permits containing more specific permit provisions. When this occurs, those dischargers will no longer be regulated by this General Permit.

TYPES OF CONSTRUCTION ACTIVITY COVERED BY THIS GENERAL PERMIT

Construction activity subject to this General Permit includes clearing, grading, disturbances to the ground such as stockpiling, or excavation that results in soil disturbances of at least five acres of total land area. Construction activity that results in soil disturbances of less than five acres is subject to this General Permit if the construction activity is part of a larger common plan of development that encompasses five or more acres of soil disturbance or if there is significant water quality impairment resulting from the activity. Construction activity does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility, nor does it include emergency construction activities required to protect public health and safety. Dischargers should confirm with the local RWQCB whether or not a particular routine maintenance activity is subject to this General Permit.

A construction project which includes a dredge and/or fill discharge to any jurisdictional surface water (e.g., wetland, channel, pond, or marine water) will also need a CWA Section 404 permit from the U.S. Army Corps of Engineers and a CWA Section 401 Water Quality Certification from the RWQCB/SWRCB. Storm water discharges from dredge spoil placement which occurs outside of Corps jurisdiction (upland sites) and are part of construction activity which disturbs five or more acres of land are covered by this general permit. Proponents of construction projects which disturb five or more acres of land within the jurisdictional boundaries of a CWA Section 404 permit should contact the local RWQCB to determine the applicability of this permit to the project.

NOTIFICATION REQUIREMENTS

It is the responsibility of the landowner to obtain coverage under this General Permit prior to commencement of construction activities. To obtain coverage, the landowner must file an NOI with a vicinity map and the appropriate fee with the SWRCB. In addition, coverage under this permit shall not occur until the applicant develops an adequate SWPPP for the project. Section A of the General Permit outlines the required contents of a SWPPP. For proposed construction activity on easements or on nearby property by agreement or permission, the entity responsible for the construction activity shall file an NOI and filing fee and shall be responsible for development of the SWPPP, all of which must occur prior to commencement of construction activities.

A separate NOI shall be submitted to the SWRCB for each construction site. Owners of new construction shall file an NOI prior to the commencement of construction. Owners of an ongoing construction site that is covered under the previous General Construction Permit (WQ Order No.92-08-DWQ) (1) shall continue to implement their existing SWPPP and monitoring program and (2) shall implement any necessary revisions to their SWPPP in a timely manner but in no case later than 90-calender days from adoption of this General Permit in accordance with Section A of this General Permit.

The NOI requirements of the General Permit are intended to establish a mechanism which can be used to clearly identify the responsible parties, locations, and scope of operations of dischargers covered by the General Permit and to document the discharger's knowledge of the requirements for a SWPPP.

The NOI must be sent to the following address:

State Water Resources Control Board
Division of Water Quality
Storm Water Permit Unit
P.O. Box 1977
Sacramento, CA 95812-1977

The current annual fee for this General Permit is either $500 or $250 depending on the location of the project.

When construction is complete or ownership has been transferred, dischargers shall file a Notice of Termination with the RWQCB certifying that all State and local requirements have been met in accordance with Special Provisions for Construction Activity, C.7, of the General Permit.

Dischargers who fail to obtain coverage under this General Permit for storm water discharges to surface waters will be in violation of the CWA and the California Water Code.

CONSTRUCTION ACTIVITY NOT COVERED BY THIS GENERAL PERMIT

This General Permit does not apply to storm water discharges from (1) those areas on Tribal Lands; (2) the Lake Tahoe Hydrologic Unit; (3) construction by municipal entities with a population under 100,000[1]; (4) construction under five acres, unless part of a larger common plan of development or sale; (5) projects covered by an individual NPDES Permit for storm water discharges associated with construction activity; and (6) landfill construction that is subject to the general industrial permit.

Storm water discharges in the Lake Tahoe Hydrologic Unit are regulated by a separate permit(s) adopted by the California Regional Water Quality Control Board, Lahontan Region (LRWQCB).

[1] These construction activities are addressed by USEPA under the Phase II regulations. Construction activities conducted by municipalities with a population less than 100,000 may be required to apply for a permit under the Phase II regulations by August 7, 2001. (CFR Section 122.26(g)(l)(ii)).(40 CFR Part 122.26(g)(l)(ii))

USEPA regulates storm water discharges on Tribal Lands. Permit applications for storm water discharges that will be conducted in the Lake Tahoe Hydrologic Unit must be submitted directly to the LRWQCB.

DESCRIPTION OF GENERAL PERMIT CONDITIONS

The following is a brief description of the major provisions of the General Permit and the basis for the General Permit.

Prohibitions

This General Permit authorizes the discharge of storm water to surface waters from construction activities that result in the disturbance of five or more acres of land. It prohibits the discharge of materials other than storm water and authorized storm water discharges and all discharges which contain a hazardous substance in excess of reportable quantities established at 40 Code of Federal Regulations (CFR) 117.3 or 40 CFR 302.4 unless a separate NPDES Permit has been issued to regulate those discharges. In addition, this General Permit contains provisions that uphold discharge prohibitions contained in water quality control plans, as implemented through the nine RWQCBs.

Effluent Limitations

Permits for storm water discharges associated with construction activity shall meet all applicable provisions of Sections 301 and 402 of the CWA. These provisions require controls of pollutant discharges that utilize best available technology economically achievable (BAT) and best conventional pollutant control technology (BCT) to reduce pollutants and any more stringent controls necessary to meet water quality standards.

It is not feasible at this time for the SWRCB to establish numeric effluent limitations. The reasons why it is not feasible to establish numeric effluent limitations are discussed in detail in SWRCB Order Nos. WQ 91-03 and WQ 91-04. Therefore, the effluent limitations contained in this General Permit are narrative and include the requirement to implement appropriate BMPs. The BMPs shall primarily emphasize source controls such as erosion control and pollution prevention methods. The discharger shall also install structural controls, as necessary, such as sediment control which will constitute BAT and BCT and will achieve compliance with water quality standards. The narrative effluent limitations constitute compliance with the requirements of the CWA.

Elimination or reduction of nonstorm water discharges is a major goal of this General Permit. Nonstorm water discharges include a wide variety of sources, including improper dumping, spills, or leakage from storage tanks or transfer areas. Nonstorm water discharges may contribute a significant pollutant load to receiving waters. Measures to control spills, leakage, and dumping and to prevent illicit connections during construction shall be addressed through structural as well as non-structural BMPs.

This General Permit prohibits the discharge of materials other than storm water and authorized nonstorm water discharges. It is recognized that certain nonstorm water discharges may be necessary for the completion of construction projects. Such discharges include, but are not limited to irrigation of vegetative erosion control measures, pipe flushing and testing, street cleaning, and dewatering. Such discharges are allowed by this General Permit provided they are not relied upon to clean up failed or inadequate construction or post-construction BMPs designed to keep materials onsite. These authorized nonstorm water discharges shall (1) be infeasible to eliminate, (2) comply with BMPs as described in the SWPPP, and (3) not cause or contribute to a violation of water quality standards. Additionally, these discharges may be required to be permitted by the local RWQCB (e.g., some RWQCBs have adopted General Permits for dewatering discharges). This General Permit is performance-based to the extent that it prohibits the discharge of storm water that causes or threatens to cause pollution, contamination, or nuisance; but it also allows the owner/developer to determine the most economical, effective, and possibly innovative BMPs.

The requirements of this General Permit are intended to be implemented on a year-round basis, not just during the part of the year when there is a high probability of a precipitation event which results in storm water runoff. The permit should be implemented at the appropriate level and in a proactive manner during all seasons while construction is ongoing.

Weather and storm predictions or weather information concerning the 10-year, 6-hour storm event and mean annual rainfall can be obtained by calling the Western Regional Climate Center at 702- 677-3106 or via the internet at www.wrcc.dri.edu/precip.html and/or www.wrcc.dri.edu/pcpnfreq.html. Other rainfall information is available at www.cdec.water.ca.gov.

Receiving Water Limitations Language

The receiving water limitations language is fundamentally different from the language adopted in the SWRCB General Industrial Activities Storm Water Permit on April 17, 1997. Construction related activities which cause or contribute to an exceedance of water quality standards must be corrected immediately and cannot wait for the RWQCB to approve a plan of action to correct. The dynamic nature of construction activity allows the discharger the ability to more quickly identify and correct the source of the exceedances. Therefore, the owner is required to take immediate corrective action and to provide a report to the appropriate RWQCB within 14-calendar days of the violation describing the corrective action.

Storm Water Pollution Prevention Plan (SWPPP)

This General Permit requires development and implementation of a SWPPP. This document emphasizes the use of appropriately selected, correctly installed and maintained pollution reduction BMPs. This approach provides the flexibility necessary to establish BMPs which can effectively address source control of pollutants during changing construction activities.

All dischargers shall prepare and implement a SWPPP prior to disturbing a site. The SWPPP must be implemented at the appropriate level to protect water quality at all times throughout the life of the project. Nonstorm water BMPs must be implemented year round. The SWPPP shall remain on the site while the site is under construction, commencing with the initial mobilization and ending with the termination of coverage under the permit.

The SWPPP has two major objectives: (1) to help identify the sources of sediment and other pollutants that affect the quality of storm water discharges and (2) to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in storm water as well as nonstorm water discharges. The SWPPP shall include BMPs which address source control and, if necessary, shall also include BMPs which address pollutant control.

Required elements of a SWPPP include: (1) site description addressing the elements and characteristics specific to the site, (2) descriptions of BMPs for erosion and sediment controls, (3) BMPs for construction waste handling and disposal, (4) implementation of approved local plans, (5) proposed post-construction controls, including description of local post-construction erosion and sediment control requirements, and (6) nonstorm water management.

To ensure that the preparation, implementation, and oversight of the SWPPP is sufficient for effective pollution prevention, individuals responsible for creating, revising, overseeing, and implementing the SWPPP should participate in applicable training programs and document such training in the SWPPP.

SWPPPs are reports that are available to the public under Section 308(b) of the CWA and will be made available by the RWQCB upon request.

Monitoring Program

Another major feature of the General Permit is the development and implementation of a monitoring program. All dischargers are required to conduct inspections of the construction site prior to anticipated storm events and after actual storm events. During extended storm events, inspections must be made during each 24-hour period. The goals of these inspections are (1) to identify areas contributing to a storm water discharge; (2) to evaluate whether measures to reduce pollutant loadings identified in the SWPPP are adequate and properly installed and functioning in accordance with the terms of the General Permit; and (3) whether additional control practices or corrective maintenance activities are needed. Equipment, materials, and workers must be available for rapid response to failures and emergencies. All corrective maintenance to BMPs shall be performed as soon as possible, depending upon worker safety.

Each discharger shall certify annually that the construction activities are in compliance with the requirements of this General Permit. Dischargers who cannot certify annual compliance shall notify the appropriate RWQCB. A well-developed monitoring program will provide a good method for checking the effectiveness of the SWPPP.

Retention of Records

The discharger is required to retain records of all monitoring information, copies of all reports required by this General Permit, and records of all data used to complete the NOI for all construction activities to be covered by the General Permit for a period of at least three years from the date generated. This period may be extended by request of the SWRCB and/or RWQCB. With the exception of reporting noncompliance to the appropriate RWQCB, dischargers are not required to submit the records, except upon specific request by the RWQCB.

STATE WATER RESOURCES CONTROL BOARD (SWRCB)
ORDER NO. 99 - 08 - DWQ
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT NO. CAS000002

WASTE DISCHARGE REQUIREMENTS (WDRS) FOR DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION ACTIVITY

The State Water Resources Control Board finds that:

1. Federal regulations for controlling pollutants in storm water runoff discharges were promulgated by the U.S. Environmental Protection Agency (USEPA) on November 16, 1990 (40 Code of Federal Regulations (CFR) Parts 122, 123, and 124). The regulations require discharges of storm water to surface waters associated with construction activity including clearing, grading, and excavation activities (except operations that result in disturbance of less than five acres of total land area and which are not part of a larger common plan of development or sale)[1] to obtain an NPDES permit and to implement Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to reduce or eliminate storm water pollution.

2. This General Permit regulates pollutants in discharges of storm water associated with construction activity (storm water discharges) to surface waters, except from those areas on Tribal Lands; Lake Tahoe Hydrologic Unit; construction projects which disturb less than five acres, unless part of a larger common plan of development or sale; and storm water discharges which are determined ineligible for coverage under this General Permit by the California Regional Water Quality Control Boards (RWQCBs). Attachment 1 contains addresses and telephone numbers of each RWQCB office.

3. This General Permit does not preempt or supersede the authority of local storm water management agencies to prohibit, restrict, or control storm water discharges to separate storm sewer systems or other watercourses within their jurisdiction, as allowed by State and Federal law.

///
///
///

---

[1] *Construction activities under five acres are not covered by this permit. Construction activities with less than five acres of disturbance are required to apply for a permit under Phase II regulations by August 7, 2001. (CFR Section 122.26(g)(l)(ii).)*

4. To obtain authorization for proposed storm water discharges to surface waters, pursuant to this General Permit, the landowner (discharger) must submit a Notice of Intent (NOI) with a vicinity map and the appropriate fee to the SWRCB prior to commencement of construction activities. In addition, coverage under this General Permit shall not occur until the applicant develops a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of Section A of this permit for the project. For proposed construction activity conducted on easements or on nearby property by agreement or permission, or by an owner or lessee of a mineral estate (oil, gas, geothermal, aggregate, precious metals, and/or industrial minerals) entitled to conduct the activities, the entity responsible for the construction activity must submit the NOI and filing fee and shall be responsible for development of the SWPPP.

5. If an individual NPDES Permit is issued to a discharger otherwise subject to this General Permit or if an alternative General Permit is subsequently adopted which covers storm water discharges regulated by this General Permit, the applicability of this General Permit to such discharges is automatically terminated on the effective date of the individual permit or the date of approval for coverage under the subsequent General Permit.

6. This action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (Public Resources Code Section 21100, et seq.) in accordance with section 13389 of the California Water Code.

7. The SWRCB adopted the California Ocean Plan, and the RWQCBs have adopted and the SWRCB has approved Water Quality Control Plans (Basin Plans). Dischargers regulated by this General Permit must comply with the water quality standards in these Basin Plans and subsequent amendments thereto.

8. The SWRCB finds storm water discharges associated with construction activity to be a potential significant sources of pollutants. Furthermore, the SWRCB finds that storm water discharges associated with construction activities have the reasonable potential to cause or contribute to an excursion above water quality standards for sediment in the water bodies listed in Attachment 3 to this permit.

9. It is not feasible at this time to establish numeric effluent limitations for pollutants in storm water discharges from construction activities. Instead, the provisions of this General Permit require implementation of Best Management Practices (BMPs) to control and abate the discharge of pollutants in storm water discharges.

10. Discharges of non-storm water may be necessary for the completion of certain construction projects. Such discharges include, but are not limited to: irrigation of vegetative erosion control measures, pipe flushing and testing, street cleaning, and dewatering. Such discharges are authorized by this General Permit as long as they (a) do comply with Section A.9 of this General Permit, (b) do not cause or contribute to violation of any water quality standard, (c) do not violate any other provision of this General Permit, (d) do not require a non-storm water permit as issued by some RWQCBs,

and (e) are not prohibited by a Basin Plan. If a non-storm water discharge is subject to a separate permit adopted by a RWQCB, the discharge must additionally be authorized by the RWQCB permit.

11. Following adoption of this General Permit, the RWQCBs shall enforce the provisions herein including the monitoring and reporting requirements.

12. Following public notice in accordance with State and Federal laws and regulations, the SWRCB in a public meeting on June 8, 1998, heard and considered all comments. The SWRCB has prepared written responses to all significant comments.

13. This Order is an NPDES permit in compliance with section 402 of the Clean Water Act (CWA) and shall take effect upon adoption by the SWRCB provided the Regional Administrator of the USEPA has no objection. If the USEPA Regional Administrator objects to its issuance, the General Permit shall not become effective until such objection is withdrawn.

14. This General Permit does not authorize discharges of fill or dredged material regulated by the U.S. Army Corps of Engineers under CWA section 404 and does not constitute a waiver of water quality certification under CWA section 401.

IT IS HEREBY ORDERED that all dischargers who file an NOI indicating their intention to be regulated under the provisions of this General Permit shall comply with the following:

A. DISCHARGE PROHIBITIONS:

1. Authorization pursuant to this General Permit does not constitute an exemption to applicable discharge prohibitions prescribed in Basin Plans, as implemented by the nine RWQCBs.

2. Discharges of material other than storm water which are not otherwise authorized by an NPDES permit to a separate storm sewer system (MS4) or waters of the nation are prohibited, except as allowed in Special Provisions for Construction Activity, C.3.

3. Storm water discharges shall not cause or threaten to cause pollution, contamination, or nuisance.

4. Storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of a reportable quantity listed in 40 CFR Part 117 and/or 40 CFR Part 302.

B. RECEIVING WATER LIMITATIONS:

1. Storm water discharges and authorized nonstorm water discharges to any surface or ground water shall not adversely impact human health or the environment.

2. The SWPPP developed for the construction activity covered by this General Permit shall be designed and implemented such that storm water discharges and authorized nonstorm water discharges shall not cause or contribute to an exceedance of any applicable water quality standards contained in a Statewide Water Quality Control Plan and/or the applicable RWQCB's Basin Plan.

3. Should it be determined by the discharger, SWRCB, or RWQCB that storm water discharges and/or authorized nonstorm water discharges are causing or contributing to an exceedance of an applicable water quality standard, the discharger shall:

   a. Implement corrective measures immediately following discovery that water quality standards were exceeded, followed by notification to the RWQCB by telephone as soon as possible but no later than 48 hours after the discharge has been discovered. This notification shall be followed by a report within 14-calender days to the appropriate RWQCB, unless otherwise directed by the RWQCB, describing (1) the nature and cause of the water quality standard exceedance; (2) the BMPs currently being implemented; (3) any additional BMPs which will be implemented to prevent or reduce pollutants that are causing or contributing to the exceedance of water quality standards; and (4) any maintenance or repair of BMPs. This report shall include an implementation schedule for corrective actions and shall describe the actions taken to reduce the pollutants causing or contributing to the exceedance.

   b. The discharger shall revise its SWPPP and monitoring program immediately after the report to the RWQCB to incorporate the additional BMPs that have been and will be implemented, the implementation schedule, and any additional monitoring needed.

   c. Nothing in this section shall prevent the appropriate RWQCB from enforcing any provisions of this General Permit while the discharger prepares and implements the above report.

C. SPECIAL PROVISIONS FOR CONSTRUCTION ACTIVITY:

1. All dischargers shall file an NOI and pay the appropriate fee for construction activities conducted at each site as required by Attachment 2: Notice of Intent--General Instructions.

2. All dischargers shall develop and implement a SWPPP in accordance with Section A: Storm Water Pollution Prevention Plan. The discharger shall implement controls to reduce pollutants in storm water discharges from their construction sites to the BAT/BCT performance standard.

3. Discharges of non-storm water are authorized only where they do not cause or contribute to a violation of any water quality standard and are controlled through implementation of appropriate BMPs for elimination or reduction of pollutants. Implementation of appropriate BMPs is a condition for authorization of non-storm water discharges. Non-storm water discharges and the BMPs appropriate for their control must be described in the SWPPP. Wherever feasible, alternatives which do not result in discharge of nonstorm water shall be implemented in accordance with Section A.9. of the SWPPP requirements.

4. All dischargers shall develop and implement a monitoring program and reporting plan in accordance with Section B: Monitoring Program and Reporting Requirements.

5. All dischargers shall comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies regarding discharges of storm water to separate storm sewer systems or other watercourses under their jurisdiction, including applicable requirements in municipal storm water management programs developed to comply with NPDES permits issued by the RWQCBs to local agencies.

6. All dischargers shall comply with the standard provisions and reporting requirements contained in Section C: Standard Provisions.

7. The discharger may terminate coverage for a portion of the project under this General Permit when ownership of a portion of this project has been transferred or when a phase within this multi-phase project has been completed. When ownership has transferred, the discharger must submit to its RWQCB a Change of Information Form (COI) Attachment 4 with revised site map and the name, address and telephone number of the new owner(s). Upon transfer of title, the discharger should notify the new owner(s) of the need to obtain coverage under this General Permit. The new owner must comply with provisions of Sections A. 2. (c) and
B. 2. (b) of this General Permit. To terminate coverage for a portion of the project when a phase has been completed, the discharger must submit to its RWQCB a COI with a revised map that identifies the newly delineated site.

8. The discharger may terminate coverage under this General Permit for a complete project by submitting to its RWQCB a Notice of Termination Form (NOT), and the post-construction BMPs plan according to Section A.10 of this General

Permit. Note that a construction project is considered complete only when all portions of the site have been transferred to a new owner; or the following conditions have been met:

a. There is no potential for construction related storm water pollution,

b. All elements of the SWPPP have been completed,

c. Construction materials and waste have been disposed of properly,

d. The site is in compliance with all local storm water management requirements, and

e. A post-construction storm water management plan is in place as described in the site's SWPPP.

9. This General Permit expires five years from the date of adoption.

D. REGIONAL WATER QUALITY CONTROL BOARD (RWQCB) AUTHORITIES:

1. RWQCBs shall:

a. Implement the provisions of this General Permit. Implementation of this General Permit may include, but is not limited to requesting the submittal of SWPPPS, reviewing SWPPPs, reviewing monitoring reports, conducting compliance inspections, and taking enforcement actions.

b. Issue permits as they deem appropriate to individual dischargers, categories of dischargers, or dischargers in a geographic area. Upon issuance of such permits by a RWQCB, the affected dischargers shall no longer be regulated by this General Permit.

2. RWQCBs may require, on a case-by-case basis, the inclusion of an analysis of potential downstream impacts on receiving waterways due to the permitted construction.

3. RWQCBs may provide information to dischargers on the development and implementation of SWPPPs and monitoring programs and may require revisions to SWPPPs and monitoring programs.

4. RWQCBs may require dischargers to retain records for more than three years.

5. RWQCBs may require additional monitoring and reporting program requirements including sampling and analysis of discharges to water bodies listed in

Attachment 3 to this permit. Additional requirements imposed by the RWQCB should be consistent with the overall monitoring effort in the receiving waters.

6. RWQCBs may issue individual NPDES permits for those construction activities found to be ineligible for coverage under this permit.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on August 19, 1999.

Administrative Assistant to the Board

SECTION A: STORM WATER POLLUTION PREVENTION PLAN

1. Objectives

A Storm Water Pollution Prevention Plan (SWPPP) shall be developed and implemented to address the specific circumstances for each construction site covered by this General Permit. The SWPPP shall be certified in accordance with the signatory requirements of section C, Standard Provision for Construction Activities (9). The SWPPP shall be developed and amended or revised, when necessary, to meet the following objectives:

a. Identify all pollutant sources including sources of sediment that may affect the quality of storm water discharges associated with construction activity (storm water discharges) from the construction site, and

b. Identify non-storm water discharges, and

c Identify, construct, implement in accordance with a time schedule, and maintain Best Management Practices (BMPs) to reduce or eliminate pollutants in storm water discharges and authorized nonstorm water discharges from the construction site during construction, and

d Develop a maintenance schedule for BMPs installed during construction designed to reduce or eliminate pollutants after construction is completed (post-construction BMPs).

2. Implementation Schedule

a. For construction activity commencing on or after adoption of this General Permit, the SWPPP shall be developed prior to the start of soil-disturbing activity in accordance with this Section and shall be implemented concurrently with commencement of soil-disturbing activities.

b. Existing permittees engaging in construction activities covered under the terms of the previous General Construction Permit SWPPP (WQ Order No.92-08-DWQ) shall continue to implement their existing SWPPP and shall implement any necessary revisions to their SWPPP in accordance with this Section of the General Permit in a timely manner, but in no case more than 90-calender days from the date of adoption of this General Permit.

c. For ongoing construction activity involving a change of ownership of property, the new owner shall review the existing SWPPP and amend if necessary, or develop a new SWPPP within 45-calender days.

3. Availability

The SWPPP shall remain on the construction site while the site is under construction during working hours, commencing with the initial construction activity and ending with termination of coverage under the General Permit.

4. Required Changes

a. The discharger shall amend the SWPPP whenever there is a change in construction or operations which may affect the discharge of pollutants to surface waters, ground waters, or a municipal separate storm sewer system (MS4). The SWPPP shall also be amended if the discharger violates any condition of this General Permit or has not achieved the general objective of reducing or eliminating pollutants in storm water discharges. If the RWQCB determines that the discharger is in violation of this General Permit, the SWPPP shall be amended and implemented in a timely manner, but in no case more than 14-calendar days after notification by the RWQCB. All amendments should be dated and directly attached to the SWPPP.

b. The RWQCB or local agency with the concurrence of the RWQCB may require the discharger to amend the SWPPP.

5. Source Identification

The SWPPP shall include: (a) project information and (b) pollutant source identification combined with an itemization of those BMPs specifically chosen to control the pollutants listed.

a. Project Information

(1) The SWPPP shall include a vicinity map locating the project site with respect to easily identifiable major roadways, geographic features, or landmarks. At a minimum, the map must show the construction site perimeter, the geographic features surrounding the site, and the general topography.

(2) The SWPPP shall include a site map(s) which shows the construction project in detail, including the existing and planned paved areas and buildings.

(a) At a minimum, the map must show the construction site perimeter; existing and proposed buildings, lots, roadways, storm water collection and discharge points; general topography both before and after construction; and the anticipated discharge location(s)

where the storm water from the construction site discharges to a municipal storm sewer system or other water body.

(b) The drainage patterns across the project area must clearly be shown on the map, and the map must extend as far outside the site perimeter as necessary to illustrate the relevant drainage areas. Where relevant drainage areas are too large to depict on the map, map notes or inserts illustrating the upstream drainage areas are sufficient.

(c) Temporary on-site drainages to carry concentrated flow shall be selected to comply with local ordinances, to control erosion, to return flows to their natural drainage courses, and to prevent damage to downstream properties.

3. Information presented in the SWPPP may be represented either by narrative or by graphics. Where possible, narrative descriptions should be plan notes. Narrative descriptions which do not lend themselves to plan notes can be contained in a separate document which must be referenced on the plan.

b. Pollutant Source and BMP Identification

The SWPPP shall include a description of potential sources which are likely to add pollutants to storm water discharges or which may result in nonstorm water discharges from the construction site. Discharges originating from off-site which flow across or through areas disturbed by construction that may contain pollutants should be reported to the RWQCB.

The SWPPP shall:

(1) Show drainage patterns and slopes anticipated after major grading activities are completed. Runoff from off-site areas should be prevented from flowing through areas that have been disturbed by construction unless appropriate conveyance systems are in place. The amount of anticipated storm water run-on must be considered to determine the appropriateness of the BMPs chosen. Show all calculations for anticipated storm water run-on, and describe all BMPs implemented to divert off-site drainage described in section A. 5 a. (2) (c) around or through the construction project.

(2) Show the drainage patterns into each on-site storm water inlet point or receiving water. Show or describe the BMPs that will protect operational storm water inlets or receiving waters from contaminated discharges other than sediment discharges, such as, but not limited to: storm water with

elevated pH levels from contact with soil amendments such as lime or gypsum; slurry from sawcutting of concrete or asphalt ;washing of exposed aggregate concrete; concrete rinse water; building washing operations; equipment washing operations; minor street washing associated with street delineation; and/or sealing and paving activities occurring during rains.

(3) Show existing site features that, as a result of known past usage, may contribute pollutants to storm water, (e.g., toxic materials that are known to have been treated, stored, disposed, spilled, or leaked onto the construction site). Show or describe the BMPs implemented to minimize the exposure of storm water to contaminated soil or toxic materials.

(4) Show areas designated for the (a) storage of soil or waste, (b) vehicle storage and service areas, (c) construction material loading, unloading, and access areas, (d) equipment storage, cleaning, and maintenance areas.

(5) Describe the BMPs for control of discharges from waste handling and disposal areas and methods of on-site storage and disposal of construction materials and construction waste. Describe the BMPs designed to minimize or eliminate the exposure of storm water to construction materials, equipment, vehicles, waste storage areas, or service areas. The BMPs described shall be in compliance with Federal, State, and local laws, regulations, and ordinances.

(6) Describe all post-construction BMPs for the project, and show the location of each BMP on the map. (Post-construction BMPs consist of permanent features designed to minimize pollutant discharges, including sediment, from the site after construction has been completed.) Also, describe the agency or parties to be the responsible party for long-term maintenance of these BMPs.

c. Additional Information

(1) The SWPPP shall include a narrative description of pollutant sources and BMPs that cannot be adequately communicated or identified on the site map. In addition, a narrative description of preconstruction control practices (if any) to reduce sediment and other pollutants in storm water discharges shall be included.

(2) The SWPPP shall include an inventory of all materials used and activities performed during construction that have the potential to contribute to the discharge of pollutants other than sediment in storm water. Describe the BMPs selected and the basis for their selection to eliminate or reduce these pollutants in the storm water discharges.

(3) The SWPPP shall include the following information regarding the construction site surface area: the size (in acres or square feet), the runoff coefficient before and after construction, and the percentage that is impervious (e.g., paved, roofed, etc.) before and after construction.

(4) The SWPPP shall include a copy of the NOI, and the Waste Discharge Identification (WDID) number. Should a WDID number not be received from the SWRCB at the time construction commences, the discharger shall include proof of mailing of the NOI, e.g., certified mail receipt, copy of check, express mail receipt, etc.

(5) The SWPPP shall include a construction activity schedule which describes all major activities such as mass grading, paving, lot or parcel improvements at the site and the proposed time frame to conduct those activities.

(6) The SWPPP shall list the name and telephone number of the qualified person(s) who have been assigned responsibility for prestorm, poststorm, and storm event BMP inspections; and the qualified person(s) assigned responsibility to ensure full compliance with the permit and implementation of all elements of the SWPPP, including the preparation of the annual compliance evaluation and the elimination of all unauthorized discharges.

6. Erosion Control

Erosion control, also referred to as "soil stabilization" is the most effective way to retain soil and sediment on the construction site. The most efficient way to address erosion control is to preserve existing vegetation where feasible, to limit disturbance, and to stabilize and revegetate disturbed areas as soon as possible after grading or construction. Particular attention must be paid to large mass-graded sites where the potential for soil exposure to the erosive effects of rainfall and wind is great. Mass graded construction sites may be exposed for several years while the project is being built out. Thus, there is potential for significant sediment discharge from the site to surface waters.

At a minimum, the discharger/operator must implement an effective combination of erosion and sediment control on all disturbed areas during the rainy season. These disturbed areas include rough graded roadways, slopes, and building pads. Until permanent vegetation is established, soil cover is the most cost-effective and expeditious method to protect soil particles from detachment and transport by rainfall. Temporary soil stabilization can be the single-most important factor in reducing erosion at construction sites. The discharger shall consider measures such as: covering with mulch, temporary seeding, soil stabilizers, binders, fiber rolls or blankets, temporary vegetation, permanent seeding, and a variety of other measures.

The SWPPP shall include a description of the erosion control practices, including a time schedule, to be implemented during construction to minimize erosion on disturbed areas of a construction site. The discharger must consider the full range of erosion control BMPs. The discharger must consider any additional site-specific and seasonal conditions when selecting and implementing appropriate BMPs. The above listed erosion control measures are examples of what should be considered and are not exclusive of new or innovative approaches currently available or being developed.

a. The SWPPP shall include:

(1) An outline of the areas of vegetative soil cover or native vegetation onsite which will remain undisturbed during the construction project.

(2) An outline of all areas of soil disturbance including cut or fill areas which will be stabilized during the rainy season by temporary or permanent erosion control measures, such as seeding, mulch, or blankets, etc.

(3) An outline of the areas of soil disturbance, cut, or fill which will be left exposed during any part of the rainy season, representing areas of potential soil erosion where sediment control BMPs are required to be used during construction.

(4) A proposed schedule for the implementation of erosion control measures.

b. The SWPPP shall include a description of the BMPs and control practices to be used for both temporary and permanent erosion control measures.

c. The SWPPP shall include a description of the BMPs to reduce wind erosion at all times, with particular attention paid to stock-piled materials.

7. Stabilization

(1) All disturbed areas of the construction site must be stabilized. Final stabilization for the purposes of submitting a NOT is satisfied when:

-All soil disturbing activities are completed AND EITHER OF THE TWO FOLLOWING CRITERIA ARE MET:

-A uniform vegetative cover with 70 percent coverage has been established OR:

-equivalent stabilization measures have been employed. These measures include the use of such BMPs as blankets, reinforced

channel liners, soil cement, fiber matrices, geotextiles, or other erosion resistant soil coverings or treatments.

(2) Where background native vegetation covers less than 100 percent of the surface, such as in arid areas, the 70 percent coverage criteria is adjusted as follows: If the native vegetation covers 50 percent of the ground surface, 70 percent of 50 percent (.70 X .50=.35) would require 35 percent total uniform surface coverage.

8. Sediment Control

The SWPPP shall include a description or illustration of BMPs which will be implemented to prevent a net increase of sediment load in storm water discharge relative to preconstruction levels. Sediment control BMPs are required at appropriate locations along the site perimeter and at all operational internal inlets to the storm drain system at all times during the rainy season. Sediment control practices may include filtration devices and barriers (such as fiber rolls, silt fence, straw bale barriers, and gravel inlet filters) and/or settling devices (such as sediment traps or basins). Effective filtration devices, barriers, and settling devices shall be selected, installed and maintained properly. A proposed schedule for deployment of sediment control BMPs shall be included in the SWPPP. These are the most basic measures to prevent sediment from leaving the project site and moving into receiving waters. Limited exemptions may be authorized by the RWQCB when work on active areas precludes the use of sediment control BMPs temporarily. Under these conditions, the SWPPP must describe a plan to establish perimeter controls prior to the onset of rain.

During the nonrainy season, the discharger is responsible for ensuring that adequate sediment control materials are available to control sediment discharges at the downgrade perimeter and operational inlets in the event of a predicted storm. The discharger shall consider a full range of sediment controls, in addition to the controls listed above, such as straw bale dikes, earth dikes, brush barriers, drainage swales, check dams, subsurface drain, sandbag dikes, fiber rolls, or other controls. At a minimum, the discharger/operator must implement an effective combination of erosion and sediment control on all disturbed areas during the rainy season.

If the discharger chooses to rely on sediment basins for treatment purposes, sediment basins shall, at a minimum, be designed and maintained as follows:

Option 1: Pursuant to local ordinance for sediment basin design and maintenance, provided that the design efficiency is as protective or more protective of water quality than Option 3.

OR

Option 2: Sediment basin(s), as measured from the bottom of the basin to the principal outlet, shall have at least a capacity equivalent to 3,600 cubic feet of storage per acre draining into the sediment basin. The length of the basin shall be more than twice the width of the basin. The length is determined by measuring the distance between the inlet and the outlet; and the depth must not be less than three feet nor greater than five feet for safety reasons and for maximum efficiency.

OR

Option 3: Sediment basin(s) shall be designed using the standard equation:

$$As=1.2Q/Vs$$

Where: As is the minimum surface area for trapping soil particles of a certain size; Vs is the settling velocity of the design particle size chosen; and Q=C x I x A where Q is the discharge rate measured in cubic feet per second; C is the runoff coefficient; I is the precipitation intensity for the 10-year, 6-hour rain event and A is the area draining into the sediment basin in acres. The design particle size shall be the smallest soil grain size determined by wet sieve analysis, or the fine silt sized (0.01mm) particle, and the Vs used shall be 100 percent of the calculated settling velocity.

The length is determined by measuring the distance between the inlet and the outlet; the length shall be more than twice the dimension as the width; the depth shall not be less than three feet nor greater than five feet for safety reasons and for maximum efficiency (two feet of storage, two feet of capacity). The basin(s) shall be located on the site where it can be maintained on a year-round basis and shall be maintained on a schedule to retain the two feet of capacity;

OR

Option 4: The use of an equivalent surface area design or equation, provided that the design efficiency is as protective or more protective of water quality than Option 3.

A sediment basin shall have a means for dewatering within 7-calendar days following a storm event. Sediment basins may be fenced if safety (worker or public) is a concern.

The outflow from a sediment basin that discharges into a natural drainage shall be provided with outlet protection to prevent erosion and scour of the embankment and channel.

The discharger must consider any additional site-specific and seasonal conditions when selecting and designing sediment control BMPs. The above listed sediment control measures are examples of what should be considered and are not exclusive of new or innovative approaches currently available or being developed.

The SWPPP shall include a description of the BMPs to reduce the tracking of sediment onto public or private roads at all times. These public and private roads shall be inspected and cleaned as necessary. Road cleaning BMPs shall be discussed in the SWPPP and will not rely on the washing of accumulated sediment or silt into the storm drain system.

9. Non-Storm Water Management

Describe all non-storm water discharges to receiving waters that are proposed for the construction project. Non-storm water discharges should be eliminated or reduced to the extent feasible. Include the locations of such discharges and descriptions of all BMPs designed for the control of pollutants in such discharges. Onetime discharges shall be monitored during the time that such discharges are occurring. A qualified person should be assigned the responsibility for ensuring that no materials other than storm water are discharged in quantities which will have an adverse effect on receiving waters or storm drain systems (consistent with BAT/BCT), and the name and contact number of that person should be included in the SWPPP document.

Discharging sediment-laden water which will cause or contribute to an exceedance of the applicable RWQCB's Basin Plan from a dewatering site or sediment basin into any receiving water or storm drain without filtration or equivalent treatment is prohibited.

10. Post-Construction Storm Water Management

The SWPPP shall include descriptions of the BMPs to reduce pollutants in storm water discharges after all construction phases have been completed at the site (Post-Construction BMPs). Post-Construction BMPs include the minimization of land disturbance, the minimization of impervious surfaces, treatment of storm water runoff using infiltration, detention/retention, biofilter BMPs, use of efficient irrigation systems, ensuring that interior drains are not connected to a storm sewer system, and appropriately designed and constructed energy dissipation devices. These must be consistent with all local post-construction storm water management requirements, policies, and guidelines. The discharger must consider site-specific and seasonal conditions when designing the control practices. Operation and maintenance of control practices after construction is completed shall be addressed, including short-and long-term funding sources and the responsible party.

11. Maintenance, Inspection, and Repair

The SWPPP shall include a discussion of the program to inspect and maintain all BMPs as identified in the site plan or other narrative documents throughout the entire duration of the project. A qualified person will be assigned the responsibility to conduct inspections. The name and telephone number of that person shall be listed in the SWPPP document. Inspections will be performed before and after storm events and once each 24-hour period during extended storm events to identify BMP effectiveness and implement repairs or design changes as soon as feasible depending upon field conditions. Equipment, materials, and workers must be available for rapid response to failures and emergencies. All corrective maintenance to BMPs shall be performed as soon as possible after the conclusion of each storm depending upon worker safety.

For each inspection required above, the discharger shall complete an inspection checklist. At a minimum, an inspection checklist shall include:

a. Inspection date.

b. Weather information: best estimate of beginning of storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall (inches).

c. A description of any inadequate BMPs.

d. If it is possible to safely access during inclement weather, list observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list result of visual inspection at relevant outfall, discharge point, or downstream location and projected required maintenance activities.

e. Corrective actions required, including any changes to SWPPP necessary and implementation dates.

f. Inspectors name, title, and signature.

The dischargers shall prepare their inspection checklists using the inspection checklist form provided by the SWRCB or RWQCB or on forms that contain the equivalent information.

12. Training

Individuals responsible for SWPPP preparation, implementation, and permit compliance shall be appropriately trained, and the SWPPP shall document all training. This includes those personnel responsible for installation, inspection, maintenance, and repair of BMPs. Those responsible for overseeing, revising, and amending the SWPPP shall also document their training. Training should be both formal and informal, occur on an

ongoing basis when it is appropriate and convenient, and should include training/workshops offered by the SWRCB, RWQCB, or other locally recognized agencies or professional organizations.

13. List of Contractors/Subcontractors

The SWPPP shall include a list of names of all contractors, (or subcontractors) and individuals responsible for implementation of the SWPPP. This list should include telephone numbers and addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers should also be included.

14. Other Plans

This SWPPP may incorporate by reference the appropriate elements of other plans required by local, State, or Federal agencies. A copy of any requirements incorporated by reference shall be kept at the construction site.

15. Public Access

The SWPPP shall be provided, upon request, to the RWQCB. The SWPPP is considered a report that shall be available to the public by the RWQCB under section 308(b) of the Clean Water Act.

16. Preparer Certification

The SWPPP and each amendment shall be signed by the landowner (discharger) or his representative and include the date of initial preparation and the date of each amendment.

SECTION B: MONITORING PROGRAM AND REPORTING REQUIREMENTS

1. Required Changes

The RWQCB may require the discharger to conduct additional site inspections, to submit reports and certifications, or perform sampling and analysis.

2. Implementation

a. The requirements of this Section shall be implemented at the time of commencement of construction activity (see also Section A. 2. Implementation Schedule). The discharger is responsible for implementing these requirements until construction activity is complete and the site is stabilized.

b. For ongoing construction activity involving a change in ownership of property covered by this General Permit, the new owner must complete a NOI and

implement the requirements of this Section concurrent with the change of ownership. For changes of information, the owner must follow instructions in C. 7. Special Provisions for Construction Activity of the General Permit.

3. Site Inspections

Qualified personnel shall conduct inspections of the construction site prior to anticipated storm events, during extended storm events, and after actual storm events to identify areas contributing to a discharge of storm water associated with construction activity. The name(s) and contact number(s) of the assigned inspection personnel shall be listed in the SWPPP. Pre-storm inspections are to ensure that BMPs are properly installed and maintained; post-storm inspections are to assure that the BMPs have functioned adequately. During extended storm events, inspections shall be required each 24-hour period. Best Management Practices (BMPs) shall be evaluated for adequacy and proper implementation and whether additional BMPs are required in accordance with the terms of the General Permit (see language in Section A. 11. Maintenance, Inspection, and Repair). Implementation of nonstorm water discharge BMPs shall be verified and their effectiveness evaluated. One time discharges of non-storm water shall be inspected when such discharges occur.

4. Compliance Certification

Each discharger or qualified assigned personnel listed by name and contact number in the SWPPP must certify annually that construction activities are in compliance with the requirements of this General Permit and the SWPPP. This Certification shall be based upon the site inspections required in Item 3 of this Section. The certification must be completed by July 1 of each year.

5. Noncompliance Reporting

Dischargers who cannot certify compliance, in accordance with Item 4 of this Section and/or who have had other instances of noncompliance excluding exceedances of water quality standards as defined in section B. 3. Receiving Water Limitations Language, shall notify the appropriate RWQCB within 30 days. Corrective measures should be implemented immediately following discovery that water quality standards were exceeded. The notifications shall identify the noncompliance event, including an initial assessment of any impact caused by the event; describe the actions necessary to achieve compliance; and include a time schedule subject to the modifications by the RWQCB indicating when compliance will be achieved. Noncompliance notifications must be submitted within 30-calendar days of identification of noncompliance.

6. Monitoring Records

Records of all inspections, compliance certifications, and noncompliance reporting must be retained for a period of at least three years from the date generated. With the exception of noncompliance reporting, dischargers are not required to submit these records.

SECTION C: STANDARD PROVISIONS FOR CONSTRUCTION ACTIVITY

1. Duty to Comply

The discharger must comply with all of the conditions of this General Permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act and is grounds for enforcement action and/or removal from General Permit coverage.

The discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this General Permit has not yet been modified to incorporate the requirement.

2. General Permit Actions

This General Permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the discharger for a General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the dischargers so notified.

3. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

4. Duty to Mitigate

The discharger shall take all responsible steps to minimize or prevent any discharge in violation of this General Permit, which has a reasonable likelihood of adversely affecting human health or the environment.

5. Proper Operation and Maintenance

The discharger shall at all times properly operate and maintain any facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this General Permit and with the requirements of Storm Water Pollution Prevention Plans (SWPPP). Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a discharger when necessary to achieve compliance with the conditions of this General Permit.

6. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor does it authorize any infringement of Federal, State, or local laws or regulations.

7. Duty to Provide Information

The discharger shall furnish the RWQCB, State Water Resources Control Board, or USEPA, within a reasonable time, any requested information to determine compliance with this General Permit. The discharger shall also furnish, upon request, copies of records required to be kept by this General Permit.

8. Inspection and Entry

The discharger shall allow the RWQCB, SWRCB, USEPA, and/or, in the case of construction sites which discharge through a municipal separate storm sewer, an authorized representative of the municipal operator of the separate storm sewer system receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

a. Enter upon the discharger's premises at reasonable times where a regulated construction activity is being conducted or where records must be kept under the conditions of this General Permit;

b. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

c. Inspect at reasonable times the complete construction site, including any off-site staging areas or material storage areas, and the erosion/sediment controls; and

d. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

9. Signatory Requirements

a. All Notice of Intents (NOIs), Notice of Terminations (NOTs), SWPPPs, certifications, and reports prepared in accordance with this Order submitted to the SWRCB shall be signed as follows:

(1) For a corporation: by a responsible corporate officer. For the purpose of this Section, a responsible corporate officer means: (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

(2) For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

(3) For a municipality, State, Federal, or other public agency: by either a principal executive officer, ranking elected official, or duly authorized representative. The principal executive officer of a Federal agency includes the chief executive officer of the agency or the senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrator of USEPA).

b. All SWPPPs, reports, certifications, or other information required by the General Permit and/or requested by the RWQCB, SWRCB, USEPA, or the local storm water management agency shall be signed by a person described above or by a duly authorized representative. A person is a duly authorized representative if:

(1) The authorization is made in writing by a person described above and retained as part of the SWPPP; or

(2) The authorization specifies either an individual or a position having responsibility for the overall operation of the construction activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position).

c. If an authorization is no longer accurate because a different individual or position has responsibility for the overall operation of the construction activity, a new authorization must be attached to the SWPPP prior to submittal of any reports, information, or certifications to be signed by the authorized representative.

10. Certification

Any person signing documents under Section C, Provision 9 above, shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

11. Anticipated Noncompliance

The discharger will give advance notice to the RWQCB and local storm water management agency of any planned changes in the construction activity which may result in noncompliance with General Permit requirements.

12. Penalties for Falsification of Reports

Section 309(c)(4) of the CWA provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

13. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the discharger is or may be subject to under Section 311 of the CWA.

14. Severability

The provisions of this General Permit are severable; and, if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

15. Reopener Clause

This General Permit may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of USEPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

16. Penalties for Violations of Permit Conditions

a. Section 309 of the CWA provides significant penalties for any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA or any permit condition or limitation implementing any such section in a permit issued under Section 402. Any person who violates any permit condition of this General Permit is subject to a civil penalty not to exceed $27,500 per calendar day of such violation, as well as any other appropriate sanction provided by Section 309 of the CWA.

b. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties which in some cases are greater than those under the CWA.

17. Availability

A copy of this General Permit shall be maintained at the construction site during construction activity and be available to operating personnel.

18. Transfers

This General Permit is not transferable. A new owner of an ongoing construction activity must submit a NOI in accordance with the requirements of this General Permit to be authorized to discharge under this General Permit. An owner who sells property covered by this General Permit shall inform the new owner of the duty to file a NOI and shall provide the new owner with a copy of this General Permit.

19. Continuation of Expired Permit

This General Permit continues in force and effect until a new General Permit is issued or the SWRCB rescinds this General Permit. Only those dischargers authorized to discharge under the expiring General Permit are covered by the continued General Permit.

NOTICE OF INTENT (NOI) TO COMPLY WITH THE TERMS OF THE GENERAL PERMIT TO DISCHARGE STORM WATER ASSOCIATED WITH CONSTRUCTION ACTIVITY

GENERAL INSTRUCTIONS

Who Must Submit

Discharges of storm water associated with construction that results in the disturbance of five acres or more of land must apply for coverage under the General Construction Activities Storm Water Permit (General Permit). Construction activity which is a part of a larger common area of development or sale must also be permitted. (For example, if 4 acres of a 20-acre subdivision is disturbed by construction activities, and the remaining 16 acres is to be developed at a future date, the property owner must obtain a General Storm Water Permit for the 4-acre project). Construction activity includes, but is not limited to: clearing, grading, demolition, excavation, construction of new structures, and reconstruction of existing facilities involving removal and replacement that results in soil disturbance. This includes construction access roads, staging areas, storage areas, stockpiles, and any off-site areas which receive run-off from the construction project such as discharge points into a receiving water. Construction activity does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility.

The owner of the land where the construction activity is occurring is responsible for obtaining a permit. Owners may obtain coverage under the General Permit by filing a NOI in accordance with the following instructions. Coverage for construction activity conducted on easements (e.g., pipeline construction) or on nearby properties by agreement or permission, or by an owner or lessee of a mineral estate (oil, gas, geothermal, aggregate, precious metals, and/or industrial minerals) entitled to conduct the activities, shall be obtained by the entity responsible for the construction activity. Linear construction projects which will have construction activity occurring in one or more than one Region should contact the State Water Resources Control Board at the number listed below prior to submitting an NOI application for specific information related to the use of the NOI form.

Construction Activity Not Covered By This General Permit

Storm water discharges in the Lake Tahoe Hydrologic Unit will be regulated by a separate permit(s) adopted by the California Regional Water Quality Control Board, Lahontan Region, and will not be covered under the State Water Resources Control Board's (SWRCB) General Permit. Storm water discharges on Indian Lands will be regulated by the U.S. Environmental Protection Agency.

Where to Apply

The NOI form, vicinity map, and appropriate fee must be mailed to the SWRCB at the following address:

State Water Resources Control Board
Division of Water Quality
Attn: Storm Water Permit Unit
P.O. Box 1977
Sacramento, CA 95812-1977

When to Apply

Property owners proposing to conduct construction activities subject to this General Permit must file a Notice of Intent prior to the commencement of construction activity.

Fees

The annual fee is either $250 or $500 depending on the construction site location. See Enclosure 1 of the Permit to determine your fee. Checks should be made payable to: SWRCB.

Completing the Notice of Intent (NOI)

The submittal to obtain coverage under the General Permit must include a completed NOI Form (Notice of Intent, attached), a vicinity map, and the appropriate annual fee. The NOI must be completely and accurately filled out; the vicinity map and annual fee must be included with the NOI or the submittal is considered incomplete and will be rejected. A construction site is considered to be covered by the General Permit upon filing a complete NOI submittal, and implementation of a defensible Storm Water Pollution Prevention Plan (SWPPP). Upon receipt of a complete NOI submittal, each discharger will be sent a receipt letter containing the waste discharger's identification (WDID) number.

Questions?

If you have any questions on completing the NOI please call the SWRCB at (916) 657-1146.

NOI-LINE-BY-LINE INSTRUCTIONS

Please type or print when completing the NOI Form and vicinity map.

SECTION I--NOI STATUS

Mark one of the two boxes at the top portion of the NOI. Check box 1 if the NOI is being completed for new construction. Check box 2 if the NOI is being submitted to report changes for a construction site already covered by the General Permit. An example of a change that warrants a resubmittal of the NOI is a change of total area of the construction site. The permit is non-transferable, a change of ownership requires a Notice of Termination (NOT) submittal and a new NOI. Complete only those portions of the NOI that apply to the changes (the NOI must always be signed). If box 2 is checked, the WDID number must be included.

SECTION II--PROPERTY OWNER

Enter the construction site owner's official or legal name and address; contact person (if other than owner), title, and telephone number.

SECTION III--DEVELOPER / CONTRACTOR INFORMATION

Enter the name of the developer's (or general contractor's) official or legal name, address, contact person, title, and telephone number. The contact person should be someone who is familiar with the construction site and is responsible for compliance and oversight of the general permit.

SECTION IV-CONSTRUCTION PROJECT INFORMATION

Enter the project name, site address, county, city, (or nearest city if construction is occurring in an unincorporated area), zip code, and telephone number (if any) of the construction site. Include an emergency contact telephone or pager number. Construction site information should include latitude and longitude designations, tract numbers, and/or mile post markers, if applicable. The site contact person should be someone who is familiar with the project, site plans, SWPPP, and monitoring program. All NOIs must be accompanied by a vicinity map.

Part A: Enter the total size in acres of all areas associated with construction activity, including all access roads.

Part B: Enter the total size in acres of the area to be disturbed by construction activity and the percentage of the area listed in Part A above that this represents.

Part C: Enter the percentage of the site that is impervious (areas where water cannot soak into the ground, such as concrete, asphalt, rooftops, etc.) before and after construction.

Part D: Include tract numbers, if available.

Part E: Enter the mile post marker number at the project site location.

Part F: Indicate whether the construction site is part of a larger common plan of development or sale. For example, if the construction activity is occurring on a two-acre site which is within a development that is five acres or greater, answer yes.

Part G: Enter the name of the development (e.g. "Quail Ridge Subdivision", "Orange Valley Estates", etc.).

Part H: Indicate when construction will begin (month, day, year). When a NOI is being submitted due to a change in ownership, the commencement date should be the date the new ownership took effect.

Part I: Indicate the percentage of the total project area to be mass graded.

Part J: Enter the estimated completion dates for the mass grading activities and for the project completion.

Part K: Indicate the type(s) of construction taking place. For example, "Transportation" should be checked for the construction of roads; "Utility" should be checked for installation of sewer, electric, or telephone systems. Include a description of the major construction activities, (e.g., 20 single family homes, a supermarket, an office building, a factory, etc.)

SECTION V--BILLING ADDRESS

To continue coverage under the General Permit, the annual fee must be paid. Indicate where the annual fee invoice should be mailed by checking one of the following boxes:

Owner: sent to the owners address as it appears in Section II.

Developer/Contractor: sent to the developer's address as it appears in Section III.

Other: sent to a different address and enter that address in the spaces provided.

SECTION VI--REGULATORY STATUS

Indicate whether or not the site is subject to local erosion/sediment control ordinances. Indicate whether the erosion/sediment control plan designed to comply with the ordinance addresses the construction of infrastructure and structures in addition to grading. Identify the name and telephone number of the local agency, if applicable.

SECTION VII--RECEIVING WATER INFORMATION

Part A: Indicate whether the storm water runoff from the construction site discharges indirectly to waters of the United States, directly to waters of the United States, or to a separate storm drain system.

Indirect discharges include discharges that may flow overland across adjacent properties or rights-of-way prior to discharging into waters of the United States.

Enter the name of the owner/operator of the relevant storm drain system, if applicable. Storm water discharges directly to waters of the United States will typically have an outfall structure directly from the facility to a river, lake, creek, stream, bay, ocean, etc. Discharges to separate storm sewer systems are those that discharge to a collection system operated by municipalities, flood control districts, utilities, or similar entities.

Part B: Enter the name of the receiving water. Regardless of point of discharge, the owner must determine the receiving water for the construction site's storm water discharge. Enter the name of the receiving water.

SECTION VIII--IMPLEMENTATION OF NPDES PERMIT REQUIREMENTS

Part A: Indicate the status of the SWPPP, date prepared, or availability for review. Also indicate if a tentative construction schedule has been included in the SWPPP (the inclusion of a construction activity schedule is a mandatory SWPPP requirement).

Part B: Provide information concerning the status of the development of a monitoring program, a component of the SWPPP which outlines an inspection and maintenance schedule for the proposed Best Management Practices (BMPs). Provide name and phone number of program preparer.

Part C: Provide the name and phone numbers of the responsible party or parties designated to insure compliance with all elements of the General Permit and SWPPP.

SECTION IX--VICINITY MAP AND FEE

Provide a "to scale" or "to approximate scale" drawing of the construction site and the immediate surrounding area. Whenever possible, limit the map to an 8.5" x 11' or 11" x 17" sheet of paper. At a minimum, the map must show the site perimeter, the geographic features surrounding the site, and general topography, and a north arrow. The map must also include the location of the construction project in relation to named streets, roads, intersections, or landmarks. A NOI containing a map which does not clearly indicate the location of the construction project will be rejected. Do not submit blueprints unless they meet the above referenced size limits.

SECTION X--CERTIFICATIONS

This section must be completed by the owner or signatory agent of the construction site*. The certification provides assurances that the NOI and vicinity map were completed in an accurate and complete fashion and with the knowledge that penalties exist for providing false information. Certification also requires the owner to comply with the provisions in the General Permit.

* For a corporation: a responsible corporate officer (or authorized individual). For a partnership or sole proprietorship: a general partner or the proprietor, respectively. For a municipality, State, Federal, or other public agency: either a principal executive officer, ranking elected official, or duly authorized representative.

Attachment 2

State Water Resources Control Board

NOTICE OF INTENT

TO COMPLY WITH THE TERMS OF THE
GENERAL PERMIT TO DISCHARGE STORM WATER
ASSOCIATED WITH CONSTRUCTION ACTIVITY (WQ ORDER No. 99-08-DWQ)

I. NOI STATUS (SEE INSTRUCTIONS)

MARK ONLY ONE ITEM 1. ☐ New Construction 2. ☐ Change of Information for WDID# _____

II. PROPERTY OWNER

Name	Contact Person		
Mailing Address	Title		
City	State	Zip	Phone ( ) --

III. DEVELOPER/CONTRACTOR INFORMATION

Developer/Contractor	Contact Person		
Mailing Address	Title		
City	State	Zip	Phone ( ) --

IV. CONSTRUCTION PROJECT INFORMATION

Site/Project Name	Site Contact Person		
Physical Address/Location	Latitude °	Longitude °	County
City (or nearest City)	Zip	Site Phone Number ( ) --	Emergency Phone Number ( ) --

A. Total size of construction site area: _____ Acres

B. Total area to be disturbed: _____ Acres (% of total _____)

C. Percent of site imperviousness (including rooftops):
Before Construction: _____%
After Construction: _____%

D. Tract Number(s): _____, _____

E. Mile Post Marker: _____

F. Is the construction site part of a larger common plan of development or sale?
☐ YES ☐ NO

G. Name of plan or development:

H. Construction commencement date: ____/____/____

I. % of site to be mass graded: _____

J. Projected construction dates:
Complete grading: ____/____/____ Complete project: ____/____/____

K. Type of Construction (Check all that apply):

1. ☐ Residential 2. ☐ Commercial 3. ☐ Industrial 4. ☐ Reconstruction 5. ☐ Transportation
6. ☐ Utility Description: _____ 7. ☐ Other (Please List): _____

V. BILLING INFORMATION

SEND BILL TO:	Name	Contact Person	
☐ OWNER (as in II. above)			
☐ DEVELOPER (as in III. above)	Mailing Address	Phone/Fax	
☐ OTHER (enter information at right)	City	State	Zip

VI. REGULATORY STATUS

A. Has a local agency approved a required erosion/sediment control plan? ☐ YES ☐ NO

Does the erosion/sediment control plan address construction activities such as infrastructure and structures? ☐ YES ☐ NO

Name of local agency: _____ Phone: ( ) --

B. Is this project or any part thereof, subject to conditions imposed under a CWA Section 404 permit of 401 Water Quality Certification? ☐ YES ☐ NO

If yes, provide details: _____

VII. RECEIVING WATER INFORMATION

A. Does the storm water runoff from the construction site discharge to (Check all that apply):

1. ☐ **Indirectly to waters of the U.S.**
2. ☐ **Storm drain system - Enter owner's name:** _____
3. ☐ **Directly to waters of U.S. (e.g. , river, lake, creek, stream, bay, ocean, etc.)**

B. Name of receiving water: (river, lake, creek, stream, bay, ocean): _____

VIII. IMPLEMENTATION OF NPDES PERMIT REQUIREMENTS

A. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) (check one)

☐ A SWPPP has been prepared for this facility and is available for review: Date Prepared: ____/____/____ Date Amended: ____/____/____

☐ A SWPPP will be prepared and ready for review by (enter date): ____/____/____

☐ A tentative schedule has been included in the SWPPP for activities such as grading, street construction, home construction, etc.

B. MONITORING PROGRAM

☐ A monitoring and maintenance schedule has been developed that includes inspection of the construction BMPs before anticipated storm events and after actual storm events and is available for review.

If checked above: A qualified person has been assigned responsibility for pre-storm and post-storm BMP inspections to identify effectiveness and necessary repairs or design changes. ☐ YES ☐ NO

Name: _____ Phone: ( ) --

C. PERMIT COMPLIANCE RESPONSIBILITY

A qualified person has been assigned responsibility to ensure full compliance with the Permit, and to implement all elements of the Storm Water Pollution Prevention Plan including:

1. Preparing an annual compliance evaluation. ☐ YES ☐ NO

Name: _____ Phone: ( ) --

2. Eliminating all unauthorized discharges. ☐ YES ☐ NO

IX. VICINITY MAP AND FEE (must show site location in relation to nearest named streets, intersections, etc.)

Have you included a vicinity map with this submittal? ☐ YES ☐ NO

Have you included payment of the annual fee with this submittal? ☐ YES ☐ NO

X. CERTIFICATIONS

"I certify under penalty of law that this document and all attachments were prepared under my direction and supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine or imprisonment. In addition, I certify that the provisions of the permit, including the development and implementation of a Storm Water Pollution Prevention Plan and a Monitoring Program Plan will be complied with."

IV. BASIS OF TERMINATION

_____ 1. The construction project is complete and the following conditions have been met.

- All elements of the Storm Water Pollution Prevention Plan have been completed.
- Construction materials and waste have been disposed of properly.
- The site is in compliance with all local storm water management requirements.
- A post-construction storm water operation and management plan is in place.

Date of project completion _____/_____/_____

_____ 2. Construction activities have been suspended, either temporarily _____ or indefinitely _____ and the following conditions have been met.

- All elements of the Storm Water Pollution Prevention Plan have been completed.
- Construction materials and waste have been disposed of properly.
- All denuded areas and other areas of potential erosion are stabilized.
- An operation and maintenance plan for erosion and sediment control is in place.
- The site is in compliance with all local storm water management requirements.

Date of suspension _____/_____/_____ Expected start up date _____/_____/_____

_____ 3. Site can not discharge storm water to waters of the United States (check one).

_____ All storm water is retained on site.

_____ All storm water is discharged to evaporation or percolation ponds offsite.

_____ 4. Discharge of storm water from the site is now subject to another NPDES general permit or an individual NPDES permit.

NPDES Permit No._____ Date coverage began _____/_____/_____

_____ 5. There is a new owner of the identified site. Date of owner transfer _____/_____/_____

V. **EXPLANATION OF BASIS OF TERMINATION** (Attach site photographs - see instructions).

VI. **CERTIFICATION:**

I certify under penalty of law that all storm water discharges associated with construction activity from the identified site that are authorized by NPDES General Permit No. CAS000002 have been eliminated or that I am no longer the owner of the site. I understand that by submitting this Notice of Termination, I am no longer authorized to discharge storm water associated with construction activity under the general permit, and that discharging pollutants in storm water associated with construction activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by a NPDES permit. I also understand that the submittal of this Notice of Termination does not release an owner from liability for any violations of the general permit or the Clean Water Act.

State Water Resources Control Board

INSTRUCTIONS FOR COMPLETING NOTICE OF TERMINATION FOR CONSTRUCTION ACTIVITY

Who May File

Dischargers who are presently covered under NPDES General Permit No. CAS000002 for discharge of storm water associated with construction activity may submit a Notice of Termination when they meet one of the following criteria.

1. The construction project has been completed and the following conditions have been met: all elements of the Stormwater Pollution Prevention Plan have been completed; construction materials and equipment maintenance waste have been disposed of properly; the site is in compliance with all local storm water management requirements including erosion/sediment control requirements and the appropriate use permits have been obtained; and a post-construction storm water operation and management plan is in place.

2. Construction activities have been suspended, either temporarily or indefinitely and the following conditions have been: all elements of the Stormwater Pollution Prevention Plan have been completed; construction materials and equipment maintenance waste have been disposed of properly; all denuded areas and other areas of potential erosion are stabilized; an operation and maintenance plan for erosion and sediment control is in place; and the site is in compliance with all local storm water management requirements including erosion/sediment control requirements. The date construction activities were suspended, and the expected date construction activities will start up again should be provided.

3. Construction site can not discharge storm water to waters of the United States. Please indicate if all storm water is retained on site or if storm water is collected offsite.

4. Discharge of construction storm water from the site is now subject to another NPDES general permit or an individual NPDES permit. The general permit or individual permit NPDES number and date coverage began should be provided.

5. There is a new owner of the identified site. If ownership or operation of the facility has been transferred then the previous owner must submit a Notice of Termination and the new owner must submit a Notice of Intent for coverage under the general permit. The date of transfer and information on the new owner should be provided. Note that the previous owner may be liable for discharge from the site until the new owner files a Notice of Intent for coverage under the general permit.

Where to File

The Notice of Termination should be submitted to the Executive Officer of the Regional Water Board responsible for the area in which the facility is located. See attached. If the Executive Officer, or his designated staff, agrees with the basis of termination, the Notice of Termination will be transmitted to the State Water Board for processing. If the Executive Officer, or his designated staff, does not agree with the basis of termination, the Notice of Termination will be returned. The Regional Water Board may also inspect your site prior to accepting the basis of termination.

LINE-BY-LINE INSTRUCTIONS

All necessary information must be provided on the form. Type or print in the appropriate areas only. Submit additional information, if necessary, on a separate sheet of paper.

SECTION I--WDID NO.

The WDID No. is a number assigned to each discharger covered under the General Permit. If you do not know your WDID No., please call the State Water Board or Regional Water Board and request it prior to submittal of the Notice of Termination.

SECTION II--OWNER

Enter the owner of the construction site's official or legal name (This should correspond with the name on the Notice of Intent submitted for the site), address of the owner, contact person, and contact person's title and telephone number.

SECTION III--CONSTRUCTION SITE INFORMATION

In Part A, enter the name of the developer (or general contractor), address, contact person, and contact person's title and telephone number. The contact person should be the construction site manager completely familiar with the construction site and charged with compliance and oversight of the general permit. This information should correspond with information on the Notice of Intent submitted for the site.

In Part B, enter the address, county, and telephone number (if any) of the construction site. Construction sites that do not have a street address must attach a legal description of the site.

SECTION IV--BASIS OF TERMINATION

Check the category which best defines the basis of your termination request. See the discussion of the criteria in the Who May File section of these instructions. Provide dates and other information requested. Use the space under Explanation of Basis of Termination heading.

SECTION V--EXPLANATION OF BASIS OF TERMINATION

Please explain the basis or reasons why you believe your construction site is not required to comply with the General Permit. To support your explanation, provide a site map and photograph of your site.

SECTION VI--CERTIFICATION

This section must be completed by the owner of the site.

The Notice of Termination must be signed by:

For a Corporation: a responsible corporate officer

For a Partnership or Sole Proprietorship: a general partner or the proprietor, respectively.

For a Municipality, State, or other Non-Federal Public Agency: either a principal executive officer or ranking elected official.

For a Federal Agency: either the chief or senior executive officer of the agency.

CONSTRUCTION NOI

1. **How do I know if I need this permit?**
Discharges of storm water associated with construction activity (storm water discharges) that results in the disturbance of five acres or more of total land area or which is a part of a larger common area of development or sale must be permitted. Construction activity includes clearing, grading, excavation, and reconstruction of existing facilities involving removal and replacement. Construction activity does not include routine maintenance maintain original line and grade, hydraulic capacity, or original purpose of the facility.

2. **Who must apply?**
The owner of the land where the construction activity is occurring is responsible for obtaining a permit. Owners may obtain coverage under the General Storm Water Permit to Discharge Storm Water Associated With Construction Activity (General Permit) by filing a NOI in accordance with the following instructions. Coverage for construction activity conducted on easements (e.g., pipeline construction), or on nearby properties by agreement or permission, shall be obtained by the entity responsible for the construction activity.

3. **Are there other requirements when applying for this permit?**
Storm water discharges in the Lake Tahoe Hydrologic Unit will be regulated by a separate permit(s) adopted by the California Regional Water Quality Control Board, Lahontan Region, and may not seek coverage under the State Water Board's general permit. Storm water discharges on Indian lands will be regulated by the U.S. Environmental Protection Agency.

4. **What is the application fee?**
The current annual fee is $250.00 for each construction site which discharges into a municipal separate storm sewer system regulated by an areawide urban storm water permit and $500.00 for all other construction sites.

5. **Where is the Primary Permit Location?**
The NOI should be mailed to the State Water Resources Control Board at the following address:

State Water Resources Control Board
Division of Water Quality
Attn: Storm Water Permit Unit
P.O. Box 1977
Sacramento, CA 95812-1977

6. **What are the timelines for applications/renewals?**

Owners of ongoing construction must file a NOI, along with the appropriate annual fee, by September 30, 1992. Owners of new construction (those beginning construction after September 30, 1992) must file a NOI prior to the commencement of construction. For ongoing construction activity involving a change of ownership, the new owner must submit a new NOI within 30 days of the date of change of ownership. Preferably, the NOI should be sent with the revocation prepared by the previous owner.

7. **What is the annual fee?**
The annual fee will be pro-rated in the second year to account for any overpayment from the application fee. Otherwise the annual fee is the same as the application fee.

8. **How long is this permit in effect?**
Your coverage under the general permit is in effect until you submit a Notice Of Termination (NOT) along with the accompanying information.

9. How can I avoid the most common mistakes made in applying for this permit?

10. What are the regulations that apply to this permit? Where can I get copies?

11. **Questions? Call....**
If you have any questions on completing the NOI after reading the following line-by-line instructions, please call us at (916) 657-1146.

AREAS OF THE STATE IN WHICH THE $250.00 ANNUAL FEE APPLIES

Alameda County: The entire county except for the area east of **Altamont Pass**.

Contra Costa County: The entire county.

El Dorado County: The area draining into **Lake Tahoe**.

Fresno County: The cities of **Clovis** and **Fresno** and unincorporated areas for the County within the city limits of **Fresno/Clovis**.

Kern County: The city of **Bakersfield** and unincorporated areas of the County within the city limits.

Los Angeles County: The entire county except for the cities of **Avalon, Lancaster, Palmdale**, and areas with zip codes 93523, 93534, 93535, 93536, 93543, 93544, 93550, 93551, 93553, 93560, and 93563.

Orange County: The entire county.

Placer County: The area draining into **Lake Tahoe**.

Riverside County: The entire county except for the area east of the **Santa Ana Regional Board** boundary line (this area is east of the mountain crest and does not drain into the Pacific Ocean) and the **Coachella Valley**.

Sacramento County: The entire county except for the city of **Isleton**.

San Bernardino County: The entire county except for the area north and east of the **Santa Ana Regional Board** boundary line (this area is north and east of the mountain crest and does not drain into the Pacific Ocean).

San Diego County: The entire county except for the area east of the **San Diego Regional Board** boundary line (this area is east of the mountain crest and does not drain into the Pacific Ocean).

San Mateo County: The entire county.

Santa Clara County: The entire county except for the area south of and including the city of **Morgan Hill** (this area does not drain into **South San Francisco Bay**).

Solano County: The cities of **Fairfield, Suisun City and Vallejo City**

Sonoma County: The city of **Santa Rosa**.

Stanislaus County: The city of **Modesto** and unincorporated areas within the city limits.

Ventura County: The entire county.

[1]Use approximate area (in acres) if no exact figure is available.

[2]Calculate running total in this column as follows:

Enter in column 2, line 1, the area from NOI minus the area in column 1.

Enter in column 2, line 2, the area in column 2, line 1, minus the area in line 2, column 1.

Enter in column 2, line 3, the area in column 2, line 2, minus the area in line 3, column 1, and so forth.

SUMMARY OF
IMPORTANT REVISIONS
GENERAL CONSTRUCTION STORM WATER PERMIT

DRAFT PERMIT	REVISED DRAFT PERMIT
Non-Storm Water Discharges	
Specifically states that non-storm water BMPs be implemented year-round. Provides better discussion of compliance concerning non-storm water discharges.	Same expanded discussion of non-storm water BMPs with the addition of requiring filtration for dewatering sediment basins in instances which could cause or contribute to an exceedance of the applcable RWQCB's Basin Plan.
Storm Water Pollution Prevention Plan (SWPPP)	
Specifies that a new owner may maintain the SWPPP only if it is current and applicable; otherwise it must be amended or redone.	Provides a time frame for SWPPP revision
Provides more specific requirements for SWPPP. Erosion control BMPs are to be described separately from sediment control BMPs. Design storms were specified for both erosion control BMPs and sediment control BMPs.	Design storm criteria has been removed for erosion control BMPs and minor sediment control BMPs. Trapping efficiency performance standards are specified for sediment basin design and maintenance pursuant to either local county ordinance, EPA criteria, standard surface area equation, or equivalent method. The 10-year, 6-hour rain event is specified for the standard equation design.
The term "final stabilization" is defined.	"Final stabilization" is defined, options for equivalent stabilization measures are discussed.
Post-construction language is broadened to include construction design decisions.	Post construction language has been altered to exclude design decisions, but addresses irrigation systems, illegal connections to storm drains, and down-stream effects from diverted flows.
Receiving Water Limitations Language	
Contains the same general narrative language as the 1992 permit, but also specifies a process to be followed if the permittee determines that their storm water discharges are causing or contributing to the exceedance of an applicable water quality standard	Same with minor changes.
Monitoring Program	
Requires inspections before and after storm events and every 24 hours during extended storm events.	Requires inspections before and after storm events and every 24 hours during extended storm events with language addressing safety considerations for entry following storms.
Minimum inspection requirements are listed. A sample inspection form has been developed as guidance.	The inspection form has been altered to reflect safety considerations.
Termination	
Allows and provides a mechanism to terminate or add coverage for parcels or tracts sold or transferred	Termination language in permit is minimal. Guidance will be developed to address mechanism for information changes such as sales or tranfers.

APPENDIX F

Copy of Notice of Termination Form

State of California
State Water Resources Control Board

NOTICE OF TERMINATION

OF COVERAGE UNDER THE NPDES GENERAL PERMIT NO. CAS000002
FOR DISCHARGES OF STORM WATER
ASSOCIATED WITH CONSTRUCTION ACTIVITY

Submission of this Notice of Termination constitutes notice that the owner (and his/her agent) of the site identified on this form is no longer authorized to discharge storm water associated with construction activity by NPDES General Permit No. CAS000002.

I. WDID NO. _____

II. OWNER

COMPANY NAME _____ CONTACT PERSON _____

STREET ADDRESS _____ TITLE _____

CITY _____ STATE _____ ZIP _____ PHONE _____

III. CONSTRUCTION SITE INFORMATION

A. DEVELOPER NAME _____ CONTACT PERSON _____

STREET ADDRESS _____ TITLE _____

CITY _____ CA ZIP _____ PHONE _____

B. SITE ADDRESS _____ COUNTY _____

CITY _____ CA ZIP _____ PHONE _____

IV. BASIS OF TERMINATION

_____ 1. The construction project is complete and the following conditions have been met.

- All elements of the Storm Water Pollution Prevention Plan have been completed.
- Construction materials and waste have been disposed of properly.
- The site is in compliance with all local storm water management requirements.
- A post-construction storm water operation and management plan is in place.

Date of project completion _____/_____/_____

_____ 2. Construction activities have been suspended, either temporarily _____ or indefinitely _____ and the following conditions have been met.

- All elements of the Storm Water Pollution Prevention Plan have been completed.
- Construction materials and waste have been disposed of properly.
- All denuded areas and other areas of potential erosion are stabilized.
- An operation and maintenance plan for erosion and sediment control is in place.
- The site is in compliance with all local storm water management requirements.

Date of suspension _____/_____/_____ Expected start up date _____/_____/_____

_____ 3. Site can not discharge storm water to waters of the United States (check one).

_____ All storm water is retained on site.

_____ All storm water is discharged to evaporation or percolation ponds offsite.

_____ 4. Discharge of storm water from the site is now subject to another NPDES general permit or an individual NPDES permit.

NPDES Permit No._____ Date coverage began _____/_____/_____

_____ 5. There is a new owner of the identified site. Date of owner transfer _____/_____/_____

Was the new owner notified of the General Permit requirements? YES ____ NO ____

NEW OWNER INFORMATION

COMPANY NAME _____ CONTACT PERSON _____

STREET ADDRESS _____ TITLE _____

CITY _____ STATE _____ ZIP _____ PHONE _____

V. **EXPLANATION OF BASIS OF TERMINATION** (Attach site photographs - see instructions).

VI. CERTIFICATION:

I certify under penalty of law that all storm water discharges associated with construction activity from the identified site that are authorized by NPDES General Permit No. CAS000002 have been eliminated or that I am no longer the owner of the site. I understand that by submitting this Notice of Termination, I am no longer authorized to discharge storm water associated with construction activity under the general permit, and that discharging pollutants in storm water associated with construction activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by a NPDES permit. I also understand that the submittal of this Notice of Termination does not release an owner from liability for any violations of the general permit or the Clean Water Act.

PRINTED NAME _____ TITLE _____

SIGNATURE: _____ DATE ____/____/____

REGIONAL WATER BOARD USE ONLY

This Notice of Termination has been reviewed, and I recommend termination of coverage under the subject NPDES general permit.

Printed Name _____ Region No. _____

Signature _____ Date _____/_____/_____

State of California
State Water Resources Control Board

INSTRUCTIONS FOR COMPLETING NOTICE OF TERMINATION FOR CONSTRUCTION ACTIVITY

Who May File

Dischargers who are presently covered under NPDES General Permit No. CAS000002 for discharge of storm water associated with construction activity may submit a Notice of Termination when they meet one of the following criteria.

1. The construction project has been completed and the following conditions have been met: all elements of the Stormwater Pollution Prevention Plan have been completed; construction materials and equipment maintenance waste have been disposed of properly; the site is in compliance with all local storm water management requirements including erosion/sediment control requirements and the appropriate use permits have been obtained; and a post-construction storm water operation and management plan is in place.

2. Construction activities have been suspended, either temporarily or indefinitely and the following conditions have been: all elements of the Stormwater Pollution Prevention Plan have been completed; construction materials and equipment maintenance waste have been disposed of properly; all denuded areas and other areas of potential erosion are stabilized; an operation and maintenance plan for erosion and sediment control is in place; and the site is in compliance with all local storm water management requirements including erosion/sediment control requirements. The date construction activities were suspended, and the expected date construction activities will start up again should be provided.

3. Construction site can not discharge storm water to waters of the United States. Please indicate if all storm water is retained on site or if storm water is collected offsite.

4. Discharge of construction storm water from the site is now subject to another NPDES general permit or an individual NPDES permit. The general permit or individual permit NPDES number and date coverage began should be provided.

5. There is a new owner of the identified site. If ownership or operation of the facility has been transferred then the previous owner must submit a Notice of Termination and the new owner must submit a Notice of Intent for coverage under the general permit. The date of transfer and information on the new owner should be provided. Note that the previous owner may be liable for discharge from the site until the new owner files a Notice of Intent for coverage under the general permit.

Where to File

The Notice of Termination should be submitted to the Executive Officer of the Regional Water Board responsible for the area in which the facility is located. See attached. If the Executive Officer, or his designated staff, agrees with the basis of termination, the Notice of Termination will be transmitted to the State Water Board for processing. If the Executive Officer, or his designated staff, does not agree with the basis of termination, the Notice of Termination will be returned. The Regional Water Board may also inspect your site prior to accepting the basis of termination.

LINE-BY-LINE INSTRUCTIONS

All necessary information must be provided on the form. Type or print in the appropriate areas only. Submit additional information, if necessary, on a separate sheet of paper.

SECTION I--WDID NO.

The WDID No. is a number assigned to each discharger covered under the General Permit. If you do not know your WDID No., please call the State Water Board or Regional Water Board and request it prior to submittal of the Notice of Termination.

SECTION II--OWNER

Enter the owner of the construction site's official or legal name (This should correspond with the name on the Notice of Intent submitted for the site), address of the owner, contact person, and contact person's title and telephone number.

SECTION III--CONSTRUCTION SITE INFORMATION

In Part A, enter the name of the developer (or general contractor), address, contact person, and contact person's title and telephone number. The contact person should be the construction site manager completely familiar with the construction site and charged with compliance and oversight of the general permit. This information should correspond with information on the Notice of Intent submitted for the site.

In Part B, enter the address, county, and telephone number (if any) of the construction site. Construction sites that do not have a street address must attach a legal description of the site.

SECTION IV--BASIS OF TERMINATION

Check the category which best defines the basis of your termination request. See the discussion of the criteria in the Who May File section of these instructions. Provide dates and other information requested. Use the space under Explanation of Basis of Termination heading.

SECTION V--EXPLANATION OF BASIS OF TERMINATION

Please explain the basis or reasons why you believe your construction site is not required to comply with the General Permit. To support your explanation, provide a site map and photograph of your site.

SECTION VI--CERTIFICATION

This section must be completed by the owner of the site.

The Notice of Termination must be signed by:

For a Corporation: a responsible corporate officer

For a Partnership or Sole Proprietorship: a general partner or the proprietor, respectively.

For a Municipality, State, or other Non-Federal Public Agency: either a principal executive officer or ranking elected official.

For a Federal Agency: either the chief or senior executive officer of the agency.

Storm Water Treatment Certification

FORM **P2**

Site Name and Address

CITY OF PASADENA WATER & POWER DEPT.

Approximate Project* Characteristics

Roofed Area	12,000 sq. ft.
Roadway/Parking Area (exposed)	42,000 sq. ft.
Landscaped/Vegetation	10,000 sq. ft.
Other Ground Level Impervious Areas (Ex: outdoor work or storage areas)	81,250 sq. ft.
Other: (describe)	sq. ft.
Total:	145,750 sq. ft.

Structural/Treatment BMP's

Area Designation (must correspond to designation on plans)	Area (Square Feet)	Average Impervious Factor	Estimated Runoff from 0.2" Rainfall	Anticipated Potential Pollutants	Type of BMP (Include model number if any)	BMP Location (Briefly describe)	Design Treatment Capacity	Design Overflow or Bypass Capacity
CB-9 (DWG.03)	8460	1.0	141	Oil & Grease Sediments	Ultra Drain Guard Oil & Sediment Model # 9222 *	Inside Catch Basin		
CB-10 (DWG.03)	15,400	1.0	257	Oil & Grease Sediments	Ultra Drain Guard Oil & Sediment Model # 9222	Inside Catch Basin		
CB-11 (DWG.04)	8025	1.0	134	Oil & Grease Sediments	Ultra Drain Guard Oil & Sediment Model # 9222	Inside Catch Basin		
CB-12 (DWG.03)	3150	1.0	53	Oil & Grease Sediments	Ultra Drain Guard Oil & Sediment Model # 9222	Inside Catch Basin		

Attach additional sheets as necessary.

Total Project Area: sq. ft.

If project alters 50% or more of the existing site, the total area subject to treatment must equal that of the entire site.

* See Attached detail sheet.

Affix Registered Engineer Wet Ink Stamp Here.

I certify that I am a Professional Engineer or Licensed Architect registered in the State of California, and that the treatment methods and capacities herein comply with the requirements established by the California Regional Water Quality Control Board, Los Angeles Region, and the State Water Resources Control Board for Standard Urban Stormwater Mitigation Plans (SUSMP).

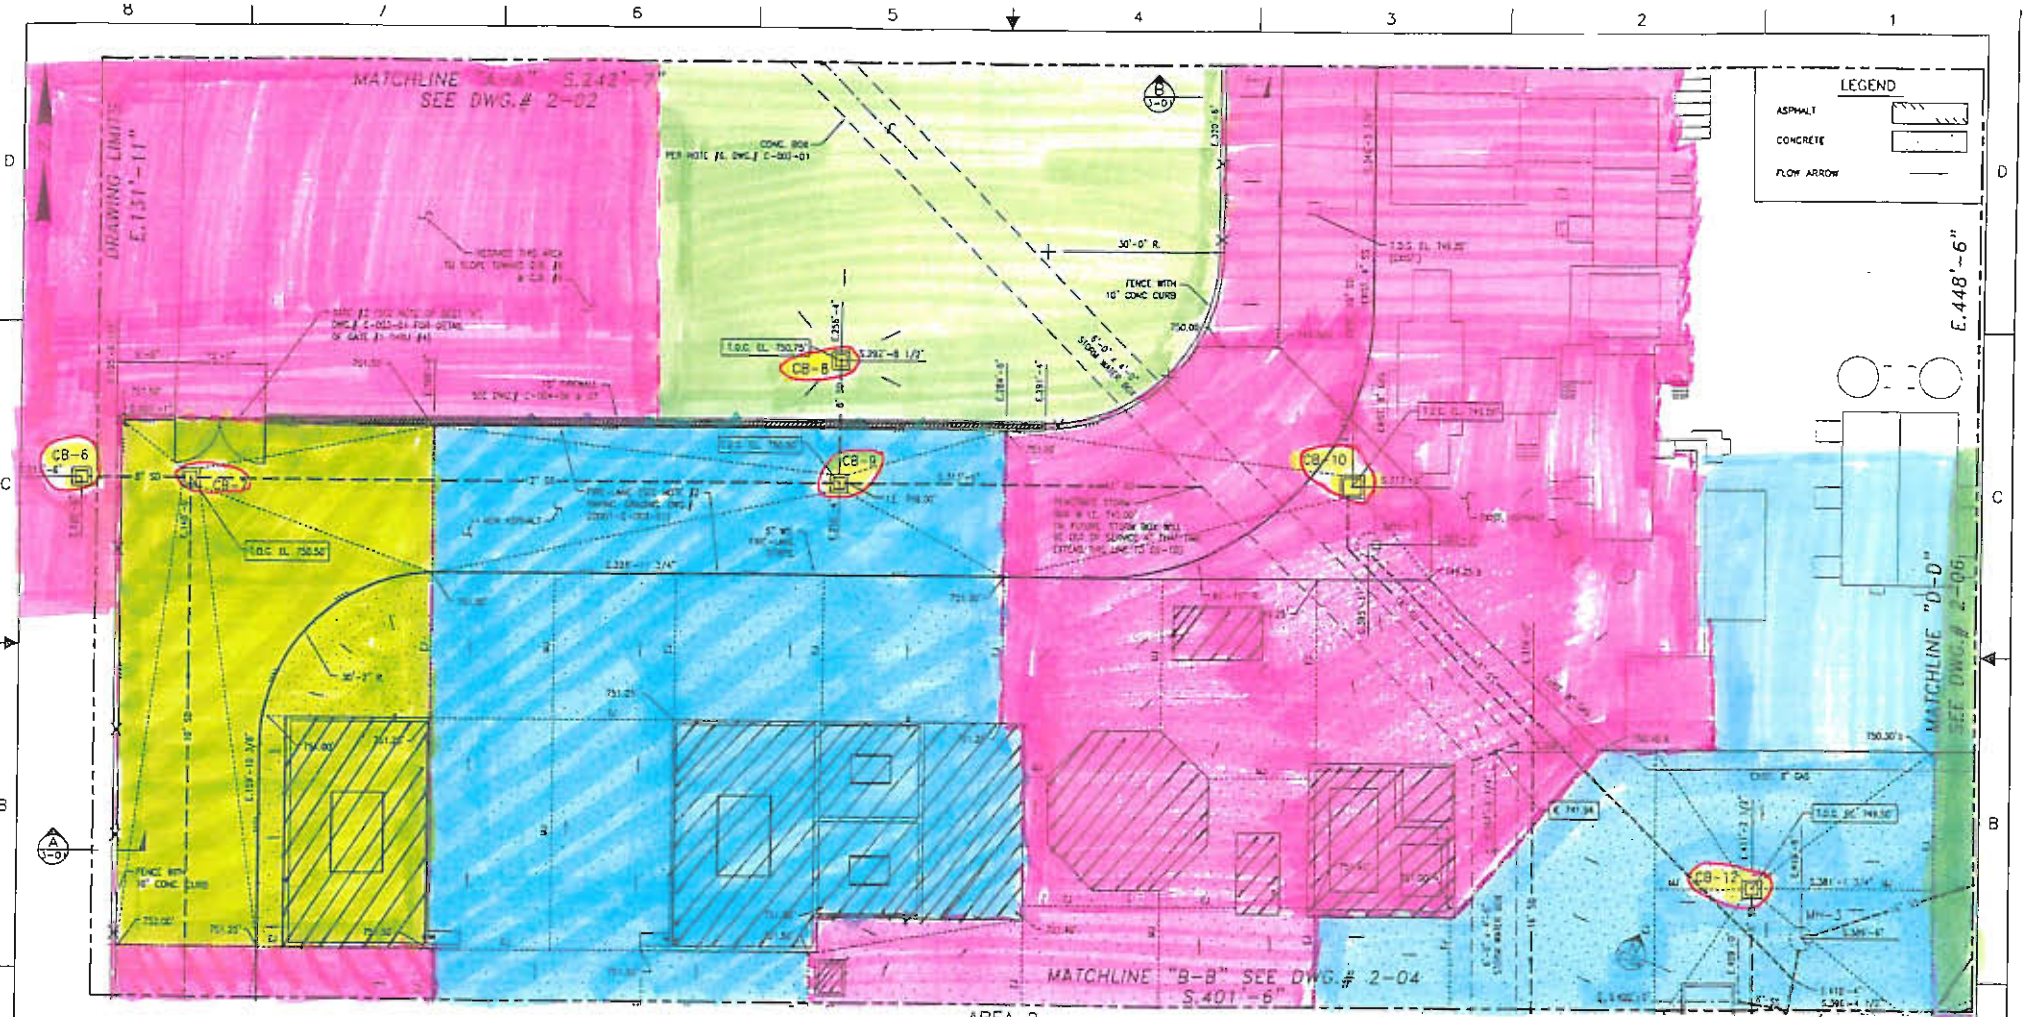
Strom Water Treatment Certification

City of Pasadena Water and Power Department

Power Plant Upgrade

43 and 85 E. State Street, Pasadena, CA 91105

February 3, 2003



Notes associated with Form P2 :

1) The drawings exhibit cross-hatched areas, which delineate pieces of equipment. Each piece of equipment has a self-contained rainwater collection pan to contain water that falls on the equipment. The collected water is then discharged through piping into an oil/water separator. The wastewater from the oil/water separator is discharged into a sanitary outfall permitted by the County Sanitation District of Los Angeles County. The separated products will be disposed off-site.

2) A filtration device will be installed in each storm water catch basin. This filter will prevent sediments and oil /grease from entering the storm drain catch basin. The device will be inspected and maintained in accordance with the manufacturer's instructions. The device is Ultra Drain Guard – for Oil and Sediment, Model#9222. A manufacturer's data sheet has been included as an attachment to the SUSMP.

3) General site grading across the facility will be established in a manner such that storm water runoff will not leave the site. All site areas drain to existing or new storm drain catch basins, where the identified BMP will be in place.

4) There is no significance to the color scheme utilized on the drawings, except to delineate the areas serviced by each storm drain catch basin identified.

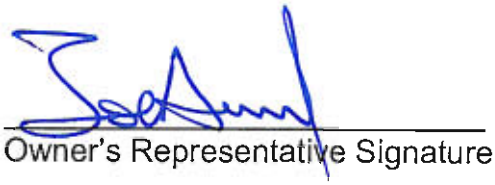
1. CERTIFICATIONS

General Project Certification

I certify that this Standard Urban Storm Water Mitigation Plan and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. The information contained herein is, to the best of my knowledge and belief, true, accurate and complete.

Owner's Representative Signature



Engineering Manager
Owner's Representatives Title

Joe Awad
Owner's Representative Name

February 3, 2003
Date

Post Construction/Maintenance Certification

Proper operation of Best Management Practices (BMPs) is an important component of reducing pollutants in urban and storm water runoff. As a responsible party, I certify that the BMPs will be implemented, monitored and maintained to ensure their continued effectiveness. In the event of a property transfer, the new owner will be notified of the BMPs in use at this site and must include written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year.

2. AMENDMENT LOG

Amend the SUSMP when conditions related to the project i.e. site, operation, and construction change that may affect the stormwater quality. The amendment shall be logged in the following table.

Amendment No.	Date	Brief Description of Amendment	Prepared By

3. OBJECTIVES

This Standard Urban Stormwater Mitigation Plan (SUSMP) has the following primary objectives.

- Identify and effectively eliminate non-stormwater discharges
- Identify sources for stormwater pollutants of concern after the project is constructed
- Identify, construct, implement and maintain appropriate post construction Best Management Practices (BMPs) to reduce the discharge of pollutants of concern from entering stormwater conveyance systems to the Maximum Extent Practicable
- Develop a maintenance program for BMPs to ensure storm water quality control.

This SUSMP conforms to the required elements of NPDES Permit No. CAS004001 adopted by California Regional Water Quality Control Board, Los Angeles on December 13, 2001, and governing municipal stormwater and urban run off discharges within Los Angeles County.

This SUSMP is prepared based on the currently available project information. This SUSMP would be modified appropriately if actual construction or operational practices affecting quality of stormwater discharges vary from those currently planned.

4. VICINITY MAP

The project vicinity map showing project location, stormwater conveyance systems, and general topography, is shown in Figure 1 and 1.1. The project is located on a generally flat area.

5. INTRODUCTION AND PROJECT DESCRIPTION

The City of Pasadena Power Plant Upgrade Project (is located on two contiguous properties i.e. 43 East State Street and 85 East State Street, Pasadena, California 91105 separated by Gold Line rail and Wallis Street as shown in Figure 2 and 3. The project consists of construction and operation of two simple cycle gas turbines named GT3 and GT4, and associated ancillary equipment at

the City's existing power plant facility. These gas turbines will use pipeline quality natural gas as fuel. Each gas turbine rated at 47.3 Megawatts is a necessary part of local electrical generation to provide electricity and maintain electrical system reliability in the City of Pasadena. The new gas turbines are expected to be operational in July 2003. Presently, the site is being cleared and graded for construction of the project. A Storm Water Pollution Prevention Plan (SWPPP) for construction is being prepared and Notice of Intent is submitted to the State of California, State Water Resources Control Board. Figure 3 shows current on-site and surrounding uses. Figure 4 illustrates a post construction asometric view of the subject project as proposed. Currently, the power plant facility operates under a General Industrial Activities Storm Water Permit, Facility ID (WDID) 419S000994. As the facility is modified, the existing facility SWPPP will also be modified.

6. DESCRIPTION OF STORM DRAINAGE SYSTEM AND OUTFALL

The Stormwater drainage system consisting of storm drains, pipes, catch basins and boundaries of the areas that drain to each catch basin is shown in Figure 5. Each catch basin will be equipped with sediment-oil/grease filter. Additionally, design of basins provides a secondary treatment.

7. CONTACT INFORMATION/LIST OF RESPONSIBLE PARTIES

7.1 Owners Responsible Person

Phone:(626) 744-6258, (626) 744-4019
Fax: (626) 395-7594

7.2 Contractors Responsible Person

To Be Determined (Contract is not awarded yet)

8. POLLUTANT SOURCE IDENTIFICATION AND BMP SELECTION

8.1 Non-Stormwater Control

Potential Sources of non-stormwater discharges include.

- Wash water generated by plant wash, pavement wash etc.
- Wastewater from concrete/asphalt cutting operation.
- Wastewater from water blasting for painting.
- Fluids from refuse dumpsters/bins.
- Eyewash or emergency first aid shower waters.
- Other operations or activities that generate waste water.

The risk of non-stormwater discharges in to the storm drain is minimized due to the following mitigation measures.

- Wash water generated by plant wash or any repair/maintenance activity will be contained, collected and discharged into the oil-water separator that will discharge in a permitted sanitary outfall or disposed off site.
- Paved areas will be dry swept or vacuumed
- Refuse dumpsters/bins will be maintained in good condition and emptied weekly. In the unlikely case of leaking fluids, the spills/leaks will be promptly cleaned and source disposed off-site.
- Discharge from eye wash and emergency showers will be either directed to sanitary system, or to a sump.
- The entire facility is fenced and all gates normally locked. Therefore, unauthorized non - stormwater discharges from outside sources are not expected.

8.2 Material Storage Areas

The following are the main material storage areas.

- Aqueous Ammonia Storage tanks
- Lubricants and maintenance supplies
- Cooling tower water treatment chemicals
- Water treatment chemicals
- Waste disposal
- Miscellaneous storage area for large parts, steel plates, pipes, scrap metal etc.

Areas where materials are to be stored will:

- be placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or
- be protected by secondary containment structures such as berms, dikes, or curbs.
- be paved and sufficiently impervious to contain leaks and spills.
- have a roof or awning to minimize collection of storm water within the secondary containment area, if feasible.

The main material storage areas are described below

8.2.1 Aqueous Ammonia Storage

The aqueous ammonia will be stored in aboveground storage tanks. Presently, a 12,000 gallons tank located at Broadway (figure 6) stores 29% ammonia concentration. This tank serves emission control equipment for steam electric generating unit Broadway 3. A new tank of 12,000 gallons capacity is proposed to be installed adjacent to the existing tank to store 19% aqueous ammonia for serving emissions control equipments for units GT3 & GT4. These tanks will be loaded from Glenarm site by tanker trucks through a piping system. Each tank will have its own independent delivery and supply system.

There is a minimal potential for aqueous ammonia to be discharged into storm drain in case of leaks. Each tank will have its independent secondary containment. Each containment would be equipped with a manually operated mechanical drain valve to drain storm water. These valves would be normally

kept closed. After each storm, plant personnel would visually inspect the quality of water and any evidence of aqueous ammonia leakage. If the storm water quality is not affected, the operator will open the valve, wait on-site until the water is drained and close the valve before leaving the site. In case, the stored storm water quality is suspected to be impacted by aqueous ammonia release, the water would be tested for presence of ammonia. If detectable of ammonia is found in the contained storm water, it would be disposed off-site to a permitted facility.

8.2.2 Storage of Lubricants and maintenance Supplies

Lubricants & maintenance supplies such as solvents, adhesives, paints, thinners, etc. will be stored in the designated covered structures designed with adequate containments both at Glenarm and Broadway sites.

Storage and handling of lubricants and maintenance supplies are minimal potential source of storm water pollution. The storage facilities will be covered, paved with concrete and secondarily contained. Major maintenance activities such as assembly, disassembly of parts, parts washing etc. are performed in enclosed structures, on paved areas covered with plastic sheeting, and in controlled environment. Leaks and drips are captured in drip pans or oil absorbing pads. A good housekeeping will further minimize sources of storm water pollution.

8.2.3 Cooling Tower Water Treatment Chemicals

The cooling tower water treatment chemicals stored in 55-gallon drums and 300-gallon portable totes will be placed underneath the cooling towers, and will have secondary containments.

The chemical storage area will not be exposed to storm water and have its secondary containment to prevent any spills entering storm drains. Loading of new chemical containers and unloading of empty containers for off-site disposal will be either done by PWP personnel or under their direct supervision. PWP employees performing such activities will be trained for safe handling, spill clean up and storm water pollution prevention.

8.2.4 Water Treatment Chemicals at Broadway

The water treatment system located at the northwest side of Broadway Plant (Figure 6) would use mainly antiscalant Polymers, inhibitors, caustic soda, sulfuric acid, brine solution that would be stored in 55 – 300 gallon containers.

Storage and handling of these chemicals is a potential source of stormwater pollution if not mitigated. The stormwater run off has the potential to wash away any spills or leaked fluids located at water treatment areas 5 & 6 (Figure 5) subsequently drain into the storm drains through catch basins servicing these drainage areas.

To prevent discharge of these chemicals into storm drains. The containers will be stored in enclosed area(s) to prevent storm water contact. Additionally, the storage area will have a secondary containment. The plant personnel transporting and storing these chemicals will be trained for safe handling and spill clean up procedures. Spill clean up kits will be located in the vicinity of water treatment system as well as at designated loading/unloading areas.

8.2.5 Waste Disposal Areas

The designated waste disposal area will be used for temporary storage of regulated wastes and empty chemical or lube containers for off-site disposal. The area will have a secondary containment and covered. The roof drain will divert storm water away from storage area. Non-compatible materials will not be stored together.

8.2.6 Miscellaneous Materials Storage

Bulk materials i.e. soil, sand etc. or large size materials i.e. pipes, equipment under repairs, scrap metal, etc. that are stored outdoors will be covered with plastic sheeting to prevent contact with storm water.

8.3 Trash Storage Areas

There will be several enclosed type small size trash receptacles located through out Broadway and Glenarm site. Plant personnel will periodically empty them in large trash bin or dumpster located on Glenarm site. The trash bins/dumpsters

will be on wheels for ease of movement for trash disposal without tipping them over. A Refuse contractor will empty the trash bins/dumpsters on weekly basis or more frequently if necessary. These large trash storage area(s) will meet the following requirements.

- Trash bin areas will have drainage from adjoining roofs and pavements diverted around the areas.
- Trash bin areas will be screened to prevent off-site transport of trash.

The trash containers will be checked for leaking fluids and repaired/replaced as necessary. Additionally, periodic dry sweeping and good housekeeping of the site will ensure that the trash storage areas pose minimal threat to storm water quality.

8.4 Natural Gas Compressors for Gas Turbines GT3 & 4

The natural gas compressors for gas turbines GT3 & 4 will be fully enclosed in a building. Therefore, the storm water will not come in contact of any machinery or lubricants.

8.5 Loading/Unloading of Materials

All materials used for usual operations and maintenance will be received from the contractor at Glenarm site at a designated location (Figure 6). The same area will be used for delivery of waste materials to the contractor for off site disposal. The plant personnel will be present at the time of actual receiving or delivery of materials. After physically taking delivery, all materials except aqueous ammonia will be transported by the plant personnel to appropriate locations. Materials destined for Broadway will be transported across private rail crossing between two sites.

Aqueous ammonia will be delivered by truck tankers at the Glenarm site and loaded into above ground tanks located at the Broadway through piping system. The delivery tanker will be parked in the contained loading area. As a standard procedure a plant operator and tanker driver will be physically present at the unloading station during unloading operation. Another operator will be present at the aqueous ammonia tank being filled at the Broadway location. Any leakages from connections for unloading would also be captured in the containment area.

The loading/unloading area would have a containment whose floor would slope towards a sump. The sump would be equipped with a manually operated sump pump. Any spills n this are will be promptly cleaned. After each storm event, a

plant personnel will visually inspect the quality of water such as oil sheen, discoloration and smell. If the water quality is found good it will be discharged into storm drain. Otherwise will be disposed off-site or into permitted sanitary outfall.

The plant vehicles used for transporting materials will be appropriately equipped for transporting these materials including navigation through rail crossing. All personnel handling these materials will be trained in driving, material handling, spill containment and clean up procedures.

Both operators and delivery drivers will be trained for spill detection, containment and cleanup without discharging into storm drain. In case of any spills the aqueous ammonia and rinsate will be pumped and disposed off site to a permitted facility.

8.6 Gas turbines GT3 & GT4, and ancillary equipment

The gas turbines and associated ancillary equipment such as blowers, pumps, heaters, ammonia injection skid, lube oil cooling water pump skids, gas fuel waste sump, water treatment module, air compressors, transformers, water wash collection tank, piping etc. are planned to be located on Glenarm site (figure 6). These equipment would be multi tiered open grated steel structures exposed to elements of environment including storm water. Thus creating a potential to affect storm water quality in drain areas 2 and 3 (figure 5) with pollutants including oil/grease, metals, chemical oxygen demand, Biochemical oxygen demand, sediments and suspended solids.

The potential to pollute storm water is minimized by the following mitigation measures.

- All equipment that has potential to contribute oil/grease and wash-water is equipped with secondary containments piped to an oil-water separator. The storm water coming in contact with these equipments will be captured in their individual containments to be directed to oil/water separator. The wastewater effluent from oil/water separator will be discharged into a sanitary outfall to be permitted by County Sanitation Districts of Los Angeles County. The separated waste oil will be dispose off-site to a permitted facility.

- Sediment and oil filters will be placed in all catch basins in the newly developed area.

- Paved areas will be dry swept.

- Lube oil drums including empty will be stored on secondary contained pallets in enclosed areas.

- Enclosed trash receptacles will be placed through out the site.

8.7 Cooling Towers for GT3 & GT4

The cooling towers for GT3 & GT4 would be located on west side of the gas turbines on Glenarm site (figure 6). Blow down from the cooling tower will be discharged in to a sewer out fall permitted by County Sanitation Districts of Los Angeles County. Therefore, cooling towers are a minimal potential risk to affect storm water quality.

8.8 Parking Lots

The modified parts of the facility are not proposed to be used as parking lot.

8.9 Strom water System Signage and Stenciling

Storm drain stencils will be placed directly adjacent to all catch basins with prohibitive language (such as: "NO DUMPING-DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping. Where stenciling is not practical, signs with similar prohibitive language will be posted. Legibility of stencils and signs will be maintained.

8.9 Maintenance, Inspection, and Repair of Site BMPs

The City of Pasadena Water & Power Department will be responsible for maintenance, inspection, repair and implementation of BMPs as the following schedule.

Best Management Practices (BMPs)	Inspection Frequency	Maintenance/Repair Program
Catch basin filters Catch basins Catch Basin Signage	Prior to forecast of first storm or before beginning of wet season, (October 1st) which ever occurs first. Once a month during wet season (October to May)	• Remove, dispose, and replace damaged, deteriorated, or otherwise unsuitable BMPs • Remove retained sediments before they reach ⅔ of the filter sediment holding capacity • Replace filter saturated with oil • Replace torn filters • Clean and dispose of accumulated debris and sediment deposited in catch basins • Restencil or post new signs if existing stencils or signs damaged or illegible.
Material Delivery and Storage Material Use Spill Prevention and Control Solid Waste Management Sanitary/Septic Waste Management	Weekly Prior to forecast storm At 24-hour intervals during extended rain events	• Keep storage areas clean, well organized, and equipped with ample clean-up supplies as appropriate for the materials stored • Repair or replace containment structures, covers and liners as needed to maintain proper function and protection • Properly remove and dispose accumulated rainwater from containment facilities • Cover any stockpiles with appropriate mats or covers. • Maintain waste fluid containers in leak proof condition. Repair or replace dumpsters that leak • Provide timely service and removal to prevent dumpsters and sanitary facilities from overflowing. • Schedule Refuse Contractor to pick up waste containers weekly.
Paved area sweeping and/or vacuuming	Quarterly or more frequently as needed	• Inspect site access points • Sweep sediments, trash, etc.
Oil/Water separators	Monthly	• Inspect and remove accumulated oil, grease, and floating debris before container reach ¾ of the holding capacity.

Best Management Practices (BMPs)	Inspection Frequency	Maintenance/Repair Program
Illicit Connection/Illegal Discharge Detection	Semi Annually	• Inspect site for evidence of illicit discharges or illegal dumping. • Observe site perimeter for evidence or potential of illicitly discharged or illegally dumped material that may enter the job site. • Eliminate illicit or illegal discharges or sewers.
Plastic Covers for outdoor stored materials	Prior to forecast of first storm or beginning or wet season (October 1st) whichever occurs first and monthly thereafter	• Replace and dispose torn or missing sections of plastic covers. Replace or supplement anchors as necessary to keep covers in place.

9. Training

Individuals for SWPPP preparation, implementation and compliance will be trained. This includes those personnel responsible for installation, inspection, maintenance and repair of BMPs. The training will include formal classroom training, web based on-line video training or combination of these.

UNDERGROUND PIPING GENERAL NOTES

1. GENERAL CONTRACTOR SHALL SUBMIT CONSTRUCTION SCHEDULE AND PLAN TO THE OWNER FOR REVIEW CONSTRUCTION SCHEDULE & PLAN SHALL BE BASED ON "NO SERVICE INTERUPTION" ON SANITARY SEWER AND STORMDRAIN FOLLOWING ARE SOME SUGGESTED SEQUENCE BUT NOT LIMIT TO:
   -COORDINATE BETWEEN ALL TRADES
   -WEATHER
   -PROVIDE ADEQUATE PUMPS TO DIVERT THE FLOWS
   -MAKE THE TIE-INS LAST
   -INSTALL NEW MANHOLE AROUND EXISTING LINE, DO NOT BREAK THE LINE UNTIL THE NEW LINE IS READY FOR SERVICE THEN PLUG UP THE OLD OUTLET OF THE EXISTING LINE
   (M.H #1 & 2 FOR EXAMPLE)
2. All WORK SHALL BE DONE IN ACCORDANCE WITH THE "STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSRTUCTION" AND "STANDARD PLANS FOR PUBLIC WORKS CONSTRUCTION", LATEST EDITION (GREEN BOOK)
3. ALL PIPING & FITTINGS FOR SANITARY SEWERS SHALL BE VITRIFIED CLAY PIPE (VCP AND IN ACCORDANCE WITH ASTM-C700 AND STANDARD SPEC GREEN BOOK ITEM 207-8 AND 208-2
4. ALL PIPING & FITTINGS FOR STORMDRAIN UNLESS NOTED OTHERWISE SHALL BE DRISCOPIPE 1000-SDR21 OR EQUAL AND IN ACCORDANCE WITH THE "GREEN BOOK" STANDARD SPEC ITEM 207-19 PIPE BEDDING, BACKFILL AND FIELD INSPECTION SHALL CONFIRM TO ITEM 306-1 2 12, 306-1 2 13, 306-1 2 12 306-1 2 12, 306-1 2 13
5. REINFORCED CONCRETE PIPE (RCP) FOR STORM DRAIN SHALL BE IN ACCORDANCE WITH ASTM-C497M AND SID. SPEC GREEN BOOK ITEM 207-2
6. REINFORCED BOX CULVERT SHALL BE IN ACCORDANCE WITH ASTM C-789 AND GREEN BOOK ITEM 207-2
   BOOK" STANDARD SPEC ITEM 207-19 PIPE BEDDING, BACKFILL AND FIELD INSPECTION SHALL CONFIRM TO ITEM 306-1 2 12, 306-1 2 13, 306-1 2 12
7. CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEST (EXFILTRATION TEST) WHICH ARE REQUIRED BY THE CITY OF PASADENA FOR SANITARY SEWER AND STORM DRAIN. BEDDING, BACKFILL AND FIELD INSPECTION SHALL CONFIRM TO ITEM 306-1 2 12, 306-1 2 13, 306-1 2 12
8. EXCAVATION OF 5 FEET OR MORE IN DEPTH SHALL REQUIRE SHORING AND BRACING. SHORING AND BRACING SHALL BE STANDARD SPEC GREEN BOOK ITEM 7-10-4-1
9. EXCAVATION SHALL BE DONE CAUTIOUSLY DUE TO EXISTING UNDERGROUND PIPING AND CONDUIT PROBING AND HAND EXCAVATING MAY BE REQUIRED
10. FOR CONSTRUCTION ON STATE STREET, ALL TRAFFIC CONTROL OPERATIONS SHALL CONFORM TO THE PROVISION OF THE SECTION 7-10, "PUBLIC CONVENIENCE AND SAFTY", OF THE PASADENA SUPPLEMENTS
11. BEDDING MATERIAL SHALL BE SAND AND, GRAVEL CRUSHED AGGREGATED OR NATIVE FREE- DRAINING GRANULAR MATERIAL HAVING A SAND EQUIVALENT OF NOT LESS THAN 30 BEDDING MATERIAL SHALL BE COMPACTED TO 85% RELATIVE COMPACTION

PAVING & GRADING NOTES

1. SEE DWG #20001-C-001-01 FOR GENERAL NOTES OF CONCRETE AND ASPHALT PAVEMENT
2. THE STRIPING ON BOTH SIDES OF FIRE LANE (ON PAVEMENT) ON THE CURB OR ON ONE SIDE OF WALL SHALL CONFORM TO THE CITY OF PASADENA STANDARDS.

NOTE COORDINATES OF THREE TBM'S SHALL BE USED TO SET LOCATION SYSTEM FOR THIS PROJECT.

Expiration Date _____
Stephen R. Maguin, Chief Engineer and General Manager
By _____
Position _____

Note: Please submit application first to the applicable City or County agency in which the point of discharge is located. Please contact the local agency for the required permit-processing fee. Submit the **original application** (Do not send copies).

CONTINUED ON NEXT PAGE

APPLICANT FOR PERMIT MUST READ THIS MATERIAL

IN CONSIDERATION OF THE GRANTING OF THIS PERMIT, the applicant agrees:

1. To furnish any additional information on industrial wastewater discharges as required by the Districts,

2. To accept and abide by all provisions of ordinances, policies and guidelines of the Districts,

3. To operate and maintain any required industrial wastewater treatment devices in a satisfactory approved manner,

4. To cooperate at all times with Districts' personnel, or their representatives, in the inspection, sampling and study of industrial wastewater facilities and discharges,

5. To immediately notify the Districts at (562) 699-7411 during normal working hours or (562) 437-6520 or 437-1881 after 4:00 P.M. or on weekends in the event of any accident, negligence or other occurrence that causes the discharge to the sewer of any material whose nature and quantity might be reasonably judged to constitute a hazard to the public health, environment, Districts' personnel or wastewater treatment facilities,

6. To pay to the Districts annually the required surcharge or user charge fee for industrial wastewater treatment,

7. To submit, as required by the Districts, accurate data on industrial wastewater discharge flows and wastewater constituents,

8. To operate only one industrial wastewater discharge point to the sewerage system under the authority granted by this permit,

9. To submit additional pages as required for furnish the necessary information if there is inadequate room on the reverse side of this permit form to complete submittal of requested data,

10. To apply for a revised Districts' Industrial Wastewater Discharge Permit if any change in industrial processes, production, method of wastewater treatment or operations creates a significant change in industrial wastewater quality, or if the quantity of wastewater discharged changes by more than 25% or other threshold level as specified in industrial waste permit requirements,

11. To provide immediate access to authorized personnel of the Districts to any facility directly or indirectly connected to the Districts' sewerage system under emergency conditions and at all other reasonable times.

FORM A: APPLICANT QUESTIONNAIRE

Name Of Company City of Pasadena, Water and Power Department

Company Contact Name Dan Angeles, Principal Engineer, dangeles@cityofpasadena.net

Company Contact E-mail _____ Phone Number (626) 744-6240

FORM A: APPLICANT QUESTIONNAIRE

1. Reason for Submittal - Circle A – New Permit, B – Permit Revision, C – Permit Addendum, or D – Permit Renewal and complete the corresponding questions.

A. New Permit (for new companies and for changes in ownership)

Type of business _____

Is the facility: ☐ New or ☐ Existing (please check)

If existing, previous company name _____

Type of business _____

Industrial Wastewater Discharge Permit No. _____

Provide a description of all manufacturing processes and wastewater producing operations in an attachment.

Are any changes being made to the facility's existing wastewater pretreatment/conveyance systems?
☐ Yes ☐ No If yes, briefly explain these modifications in attachments.

Is there more than one company discharging industrial wastewater at your facility? ☐ Yes ☐ No If yes, provide for each company its name, a separate address and a description of its operations. If feasible, each company must apply for a separate permit and must have its own incoming water meter and a separate industrial wastewater sampling point.

If your facility will involve a new connection to the public sewer, please check the point of connection:
☐ Local city sewer, ☐ Sanitation Districts' Trunk sewer.

If you are relocating, and had a previous Industrial Wastewater Discharge Permit, give your previous address _____, and permit number _____.
If you have received a temporary permit, give permit number _____.

All submittals for new permits **must** include a permit application, plans (if changes have occurred) and pertinent supporting information.

B. Revision of Existing Permit (for a 25 percent or more change in wastewater quantity/quality)

Permit number 5171 R-2.
Has your wastewater quantity and/or quality changed over 25 percent? ☒ Yes ☐ No If yes, documentation addressing the magnitude and reason(s) for the change must be submitted. If no, a revision is not required at this time.

Have there been any changes in production processes, wastewater pretreatment systems or sewerage plumbing?
☒ Yes ☐ No If yes, submit plans and describe these changes in attachments.

All submittals for a revised permit **must** include a permit application, plans (if changes have occurred) and supporting information.

C. Addendum to Permit (for modifications to the wastewater conveyance/pretreatment system)

Permit Number _____.

Attach a brief summary of the existing conditions and the proposed changes. All submittals for a permit addendum **must** include plans and supporting information. Applicant must also answer the questions on the back of this form (**2. Supporting Information Required**).

D. Permit Renewal (for permits with expiration dates)

Permit Number _____.

Have there been any changes in production processes, wastewater pretreatment systems or sewerage plumbing? ☐ Yes ☐ No If yes, submit plans and describe these changes in attachments.

All submittals for a permit renewal **must** include a permit application, plans (if changes have occurred) and supporting information.

1. Supporting Information Required

All submittals **must** include the following forms, which are included in Appendix 6.1:

Form A - Applicant Questionnaire
Form B - Calculation of Industrial Wastewater Discharge Flow Rate
Form C - Tank Schedule and Spill Containment Calculations
Form D - Check List

Furthermore, your company must answer the questions below to determine the additional supporting information that must be provided:

A. Waste Minimization (refer to Sections 2.4 and 3.3 E)
Please describe below or in an attachment all of your company's existing/proposed pollution prevention measures (e.g., reuse, product reformulation, process changes, housekeeping measures, etc.):

Has your company previously submitted a waste minimization plan to the Districts? ☐ Yes ☒ No If no, please read Sections 2.4 and 3.3E and submit the appropriate plan (if applicable). Your company is encouraged to obtain information on source reduction measures and options for your industrial processes by calling the Districts' Industrial Waste Section at (562) 908-4288, ext. 2900.

B. Wastewater Quality (refer to Sections 3.3G and H)
Please provide the results of at least two 24-hour composite analyses attesting to concentrations of chemical oxygen demand, suspended solids and any priority or regulated pollutants that may be found in your wastewater. Your company must also provide material safety data sheets of all chemicals used in the facility that may directly or indirectly contaminate your wastewater.

C. New Equipment (refer to Sections 3.3 F, J and K)
Is your company installing new pretreatment, monitoring, conveyance or industrial equipment that may have an impact on the quality or quantity of your wastewater? ☐ Yes ☒ No If yes, please provide catalog cuts of all units and important details such as: number of units, sizes, hours of operation, pump rating curves, operating parameters, etc.

D. Baseline Monitoring Report (refer to Sections 2.1 and 3.3 I)
Does your company currently fall under one of EPA's categories? ☒ Yes ☐ No If yes, your company must submit a Baseline Monitoring Report, unless it was submitted one in the past and there have been no changes in operations that may change your categorical standards.

E. Rainwater Management (refer to Section 3.2)
Are there any outdoor drains, trenches or sumps at your facility that are connected to the sewerage system? ☐ Yes ☒ No If yes, your company must submit plans and information that describe the existing means to divert rainwater from the sewerage system or a proposal to comply with the Districts' rainwater guidelines. Please be informed that new automatic rainwater diversion systems will not be approved unless the applicant proves that this is the only feasible alternative.

Attachment 1 – Form A Supplemental Responses

1B. Revision of Existing Permit: Change in wastewater quantity

The City of Pasadena is decommissioning the B3 steam power generating system presently located at the Broadway Power Plant. The B3 steam power plant is being replaced with a more efficient, cleaner burning new combined cycle power plant (GT-5) and associated ancillary systems to be located at the adjacent Glenarm facility. As with B3, GT-5 will also require demineralized water for its operation. The demineralized water treatment system will continue to operate at the Broadway facility. As a result, the annual average discharge to the Broadway sewer outfall box will be approximately 75,190 gpd (current permit limit is 17,500 gpd). The peak flow rate to the sewer outfall will not increase above the current permit limit of 200 gpm.

The B3 cooling tower will be decommissioned; wastewater will no longer be piped to the B3 cooling tower for temporary storage. All wastewater from the demineralization water treatment system will be piped either to Tank B2, the "marina" sump, or the Broadway sewer outfall box. The changes in sewerage piping may be found in the Broadway Industrial Wastewater Process Flow Diagram (M2-2-3) in Attachment 5.

Supporting Information

A. Waste Minimization

Refer to existing permit file.

B. Wastewater Quality

See wastewater analyses included in Attachment 4.

C. New Equipment

No new equipment will be installed, with the exception of new piping connecting the "marina" sump to Tank B2 and the Broadway sewer outfall box. The wastewater from the "marina" sump was previously piped to the B3 cooling tower. Refer to the Broadway Industrial Wastewater Process Flow Diagram (M2-2-3) in Attachment 5.

D. Baseline Monitoring Report

Baseline Monitoring Report on file with LACSD.

E. Rainwater Management

No changes to rainwater management facilities. Refer to existing permit file.

FORM B: CALCULATION OF INDUSTRIAL WASTEWATER DISCHARGE FLOW RATE

COMPANY NAME: City of Pasadena, Water and Power Department (Broadway 5171)

Calculation of flow rate is based on: (Check one)

_____ Adjusted metered water supply (Company must complete the calculations below)

X Direct measurement through a Districts' approval effluent flow measurement system *

_____ Estimate for a facility not yet in operation **

ADJUSTED METERED WATER SUPPLY CALCULATIONS (Round all figures to two decimals)

			MILLION GALLONS PER YEAR
I	Incoming Water		
1.	Metered Water Supply from Purveyor (Water Company). Use most recent 12 consecutive months and attach copies of water bills.		MGY
2.	Water Supply from Company Well. Attach meter or water master data for most recent 12 consecutive months.	0.00	MGY
3.	Water Received in Raw Materials, or by other means. Explain in attachments.	0.00	MGY
4.	Rainwater/Groundwater Discharged to the Sewerage System. Explain in attachments.		MGY
5.	Total Incoming Water. (add lines 1 to 4)	0.00	MGY
II	Water Losses		
6	Wastewater Discharged to Stormwater Drainage System. Explain in attachments. (NPDES Permit No. _____)		MGY
7	Water Lost Through Evaporation and Irrigation. (add lines a + b + c + d at the bottom of this form)	0.00	MGY
8	Water Lost in Products. Explain in attachments.		MGY
9	Sanitary Flow Deduction. (from line "e" on the back of this form)	0.00	MGY
10	Total Water Losess. (add lines 6 to 9)	0.00	MGY
III	Industrial Wastewater Discharged		
11	Calculated Industrial Wastewater Discharged to the public sewer. (subtract line 10 from line 5)	0.00	MGY
12	Any Proposed increase (+) or decrease (-) in industrial waste-water discharge to the public sewer? (explain in attachments) Enter or Circle one (+) (-)		MGY
13	Total proposed yearly industrial wastewater discharge. (add lines 11 and 12)	0.00	MGY
14	Average industrial wastewater flow. (use line 13 to calculate below)		

NOT USED
SEE ATTACHED
SUPPLEMENTAL CALCULATIONS

MILLION GALLONS PER YEAR	x	1,000,000	÷	Number of Discharge Days per Year	=	Gallons per Day
27.44	x	1,000,000	÷	365	=	75,190.00

This is the average daily flow rate that must be used on the application for industrial wastewater discharge. (It may be rounded to two significant figures).

Note: The applicant must also complete the calculations on the back of this page.

* If your company currently has an **approved effluent wastewater flow measurement system**, please submit effluent totalizer readings for the last twelve months. Your company does not have to complete the rest of this form.

** The company must submit detailed information that substantiates how the flow rate was estimated.

WATER LOSSES

a. COOLING TOWER LOSSES

Tonnage	x	Hours of Operation Per Year	x	Load[1]	x	1.38[2]	÷	1,000,000	=	Mil. Gal. Per Year	
	x		x		x	1.38	÷	1,000,000	=	0.00	
	x		x		x	1.38	÷	1,000,000	=	0.00	
									=	0.00	a

[1] Load = 0.5 to 0.80
[2] 1.38 = Gallons evaporated per hour per ton

b. BOILER LOSSES

Horse-power	x	Hours of Operation Per Year	x	Load[3]	x	% Evaporation[4]	x	3.82[5]	÷	1,000,000	=	Mil. Gal. Per Year	
	x		x		x		x	3.82	÷	1,000,000	=	0.00	
	x		x		x		x	3.82	÷	1,000,000	=	0.00	
											=	0.00	b

[3] Load = 0.50 to 0.80
[4] % Evaporation = (100 - % condensate returned)/100
[5] 3.82 = Gallons evaporated per hour per horsepower

c. OTHER EVAPORATE LOSSES
(Explain in attachments)

Million Gallons Per Year	
	c

d. IRRIGATION LOSSES

Square Feet of Land Irrigated	x	18.7[6]	÷	1,000,000	=	Mil. Gal. Per Year	
	x	18.70	÷	1,000,000	=	0.00	d

[6] 18.7 = Gallons irrigated per square foot per year

e. SANITARY FLOW DEDUCTION

No. Employees	x	Working Days Per Year	x	Gallons Per Employee Per Day	÷	1,000,000	=	Mil. Gal. Per Year	
	x	365	x	15	÷	1,000,000	=	0.00	e

NOT USED
SEE ATTACHED
SUPPLEMENTAL CALCULATIONS

INCOMING WATER METERS

Please list all the accounts (or other identification) for all the meters that measure the water supplied to this facility.

Meter #	Location	Account #
1560779	65 E State St, Pasadena	80145-6
1556580	130 Wallis St, Pasadena	80175-3

Abbreviations and Conversion Factors
MGY = million gallons per year
1 cubic foot = 7.48 gallons
1 acre foot = 325,900 gallons
1 acre = 43,560 square feet
1 CCF = 748 gallons

Attachment 2
Form B Supplemental Calculation of Broadway Industrial Wastewater Discharge

Broadway Industrial Wastewater Discharge 2011

Month	Gallons
January	773,800
February	321,800
March	442,600
April	989,900
May	664,000
June	492,400
July	932,500
August	1,036,000
September	701,300
October	892,600
November	733,700
December	320,600

Total	**8,301,200**

Attachment 2
Form B Supplemental Calculation of Broadway Industrial Wastewater Discharge

Demineralized Water Treatment System Wastewater	**Normal Average Flow (GPD)**	**Peak Flow (GPM)**
Softener Wastewater	10,560	270
Multimedia Filter Wastewater	2,350	485
Reverse Osmosis Dump and E-Cell Rinse Water	1,660	200
Drain Reverse osmosis and E-Cell Reject Water	59,910	84
Floor Drain	710	N/A
TOTAL	**75,190**	**200**

Refer to Power Engineers Drawing No M2-2-3, "Process Flow Diagram Broadway Industrial Wastewater" in Attachment 5.
Based on proposed GT5 8760 operating hours per year excluding scheduled maintenance and 750 start/stop cycles per year.

FORM C: TANK SCHEDULE & SPILL CONTAINMENT CALCULATIONS

Please complete one form for each containment area (make additional copies if necessary).

TANK I.D. NUMBER	TANK NAME	TANK DIMENSIONS[1]	TANK CONTENTS	pH	IS TANK ELEVATED[2]

No Changes - See File

[1] Specify height and diameter if tank is round; or length, width and height if tank is rectangular.

[2] If the tank is elevated above the ground on legs, specify the location (elevation) of the bottom of the tank. If the tank is located on a pad or solid platform, specify dimensions of the pad or platform.

2. Spill Containment Calculations (make additional copies if necessary).

Answer the following questions:

	Check One
a) If this is your company's first permit submittal to the Districts, do you store hazardous or restricted materials?	YES ☐ NO ☐
b) Does your company currently have tanks/equipment with hazardous or restricted solutions that lack adequate spill containment?	YES ☐ NO ☐
c) Is your company proposing any additions/modifications of tanks or equipment that will need spill containment?	YES ☐ NO ☐

If the answer to any of the questions above is "YES," your company must submit plans that describe and propose an adequate spill containment system and must complete the calculations below:

1. Containment Volume Required:

The required containment volume is equal to the capacity of the largest tank containing a solution that requires containment plus the volume of six inches of rain over the containment area (if the area is not roofed).

(1) = Volume of largest tank (assumed to spill) + volume of 6 inches of rain over contain area (if area is outdoors)

(1) = _____ + _____

(1) = _____ (specify units)

2. Containment Volume Provided:

The containment provided is equal to the volume of the dike, berm, sump or other containment structure minus the volume displaced by tanks, pads and other equipment within the containment area.

(2) = Volume of containment dike - volume displaced by tanks and other equipment

(2) = _____ — _____

(2) = _____ (specify units)

Subtract (1) from (2)

(2) — (1) = _____ (must be greater than zero to satisfy spill containment requirements)

Note: All drains, sumps and associated plumbing within spill containment areas must be clearly shown on submitted drawings.

No Changes - See File

FORM D: CHECK LIST FOR AN INDUSTRIAL WASTEWATER DISCHARGE PERMIT SUBMITTAL

COMPANY NAME: Pasadena Water and Power - Broadway Plant

1. Permit Application Form ..... [x]

2. Plans (Minimum size: 11" x 17"; maximum size 30" x 42") ..... [x]

   a. Required Plans:

      Sewerage Plan (location of equipment, process tanks and sewer lines) ..... [x]

      Plot Plan (location of facility, sampling point and connection to the public sewer) ..... On File [ ]

      Plans of Pretreatment Facilities ..... On File [ ]

   b. Additional Plans (if needed)

      Spill Containment System ..... [ ]

      Flow Monitoring System ..... [ ]

      Rainwater Management ..... [ ]

      Combustible Gas Monitoring System ..... [ ]

3. Supporting Information:

ALWAYS REQUIRED

- Applicant's Questionnaire (Form A) ..... [x]
- Estimation of Discharge Flow Rate and Water Bills (Form B) ..... [x]
- Tank Schedule and Spill Containment Calculations (Form C) ..... [x]
- Checklist (Form D) ..... [x]
- Process Description ..... [x]

COMPLETE FORM A TO DETERMINE WHICH OF THESE ARE NECESSARY

- Waste Minimization Plan ..... [ ]
- Material Safety Data Sheets ..... [ ]
- Wastewater Analyses ..... [x]
- Baseline Monitoring Report (for EPA categorical companies) ..... [ ]
- Pump Curves ..... [ ]
- Catalog Cuts of Pretreatment Equipment ..... [ ]
- Baseline Credit Information ..... [ ]
- Equipment Costs ..... [ ]
- Notification Report of the Discharge of Hazardous Wastes (if applicable) ..... [ ]

Attachment 3 – Process Description

The Broadway Plant will produce high quality demineralized water for use in power production at the adjacent Glenarm Plant. The demineralized water treatment system includes reverse osmosis and electrodeionization processes. The wastewater from the demineralized water treatment system will be discharged to the Broadway sewer outfall box.

REV. B 07/31/12

NOTES

1. ANNUAL AVERAGE DISCHARGE FROM BROADWAY SEWER OUTFALL WILL DECREASE BY 39,800 GPD WITH THE DECOMMISSIONING OF UNIT B3.
2. THE ANNUAL AVERAGE RATE OF PRODUCTION OF DEMINERALIZED WATER IS 101,900 GPD, BASED ON WASTEWATER FLOWS SHOWN AT OUTLET "E" AND A PRODUCTION RATE OF 170 GPM OF DEMINERALIZED WATER PER 270 GPM OF RAW WATER (DOES NOT INCLUDE REGENERATION WATER).
3. PROPOSED MARINA SUMP CONNECTION TO TANK B2 AND SEWER OUTFALL BOX DUE TO THE DECOMMISSIONING OF UNIT B3 INCLUDING THE B3 COOLING TOWER.
4. DUE TO ROUNDING DECIMAL PLACES, VALUES MAY NOT SUM UP EXACTLY.
5. VALUES BASED ON BROADWAY POWER PLANT INDUSTRIAL WASTEWATER FLOW DIAGRAM PREPARED BY CH2M HILL (DASHED LINES). BOLD ITEMS ARE PROPOSED ADDITIONS TO THE WASTEWATER SYSTEM.

THIS DRAWING WAS PREPARED BY POWER ENGINEERS, INC. FOR A SPECIFIC PROJECT, TAKING INTO CONSIDERATION THE SPECIFIC AND UNIQUE REQUIREMENTS OF THE PROJECT. REUSE OF THIS DRAWING OR ANY INFORMATION CONTAINED IN THIS DRAWING FOR ANY PURPOSE IS PROHIBITED UNLESS WRITTEN PERMISSION FROM BOTH POWER AND POWER'S CLIENT IS GRANTED.

APPLICANT FOR PERMIT MUST READ THIS MATERIAL

IN CONSIDERATION OF THE GRANTING OF THIS PERMIT, the applicant agrees:

1. To furnish any additional information on industrial wastewater discharges as required by the Districts,

2. To accept and abide by all provisions of ordinances, policies and guidelines of the Districts,

3. To operate and maintain any required industrial wastewater treatment devices in a satisfactory approved manner,

4. To cooperate at all times with Districts' personnel, or their representatives, in the inspection, sampling and study of industrial wastewater facilities and discharges,

5. To immediately notify the Districts at (562) 699-7411 during normal working hours or (562) 437-6520 or 437-1881 after 4:00 P.M. or on weekends in the event of any accident, negligence or other occurrence that causes the discharge to the sewer of any material whose nature and quantity might be reasonably judged to constitute a hazard to the public health, environment, Districts' personnel or wastewater treatment facilities,

6. To pay to the Districts annually the required surcharge or user charge fee for industrial wastewater treatment,

7. To submit, as required by the Districts, accurate data on industrial wastewater discharge flows and wastewater constituents,

8. To operate only one industrial wastewater discharge point to the sewerage system under the authority granted by this permit,

9. To submit additional pages as required for furnish the necessary information if there is inadequate room on the reverse side of this permit form to complete submittal of requested data,

10. To apply for a revised Districts' Industrial Wastewater Discharge Permit if any change in industrial processes, production, method of wastewater treatment or operations creates a significant change in industrial wastewater quality, or if the quantity of wastewater discharged changes by more than 25% or other threshold level as specified in industrial waste permit requirements,

11. To provide immediate access to authorized personnel of the Districts to any facility directly or indirectly connected to the Districts' sewerage system under emergency conditions and at all other reasonable times.

Attachment 1 – Application Form Supplemental Responses

12. Raw Materials Used for Unit GT-5

Natural gas, municipal water, and demineralized water are used at the Glenarm facility. Additional chemicals currently used are listed in the following table.

Product Name	Chemical Constituents
Oil and Grease	
SL10-046	Synthetic Hydrocarbon
Mobil Jet Oil II (Turbine Oil)	Synthetic Esters and Additives
MobilGear 629 (Gear Oil)	Base Oil and Additives
Mobil SHC 629 (Lubricant)	Synthetic Base Stocks and Additives
Mobil SHC 630 (Lubricant)	Synthetic Base Stocks and Additives
Mobil Rarus 427 (Compressor Oil)	Base Oil and Additives
MobilFluid 350 (Hydraulic Fluid)	Base Oil and Additives
MobilGear 632 (Gear Oil)	Base Oil and Additives
MobilGrease Special (Grease)	Base Oil and Additives
Mobil DTE 797 Oil (Turbine Oil)	Base Oil and Additives
Mobil DTE Oil Heavy Medium (Turbine Oil)	Base Oil and Additives
Exxon XD-3 50 (Engine Oil)	Base Oil and Additives
Mobilube HD 80W-90 (Gear Oil)	Base Oil and Additives
Hyvolt II (Transformer Oil)	Severely Hydrotreated Light Naphthenic Petroleum Oil, Butylated Hydroxytoluene (BHT) or 2,6-Di-tert-butyl-p-cresol (DBPC)
Water Treatment Chemicals	
Sulfuric Acid	Sulfuric Acid
ChemTreat CT-9006 Reverse Osmosis Treatment	Polyelectrolyte solution
ChemTreat BL124 (Boiler Water Treatment)	Sodium bisulfite
ChemTreat BL1260 (Boiler Water Treatment)	Carbohydrazide
ChemTreat BL1283 (Boiler Water Treatment)	Diethylhydroxylamine
ChemTreat BL1302 (Boiler Water Treatment)	Sodium Hydroxide
ChemTreat BL1551 (Steam Line Treatment)	Morpholine
ChemTreat BL1794 (Boiler Water Treatment)	Sodium Phosphate, tribasic
ChemTreat C2189G (Cooling Water Microbiocide)	1-Bromo-3-chloro-5,5-dimethylhydantoin
ChemTreat CL49 (Cooling Water Microbiocide)	Stabilized halogen biocide, Sodium hydroxide
ChemTreat CL2030 (Cooling	N,N-Dioctyl-N,N-dimethylammonium chloride,

Water Microbiocide and Algicide)	Ethanol
ChemTreat CL2150 (Cooling Water Microbiocide and Paper Slimicide)	5-chloro-2-methyl-4-isothiazolin-3-one, 2-methyl-4-isothiazolin-3-one
ChemTreat CL2156 (Cooling Water Microbiocide)	5-chloro-2-methyl-4-isothiazolin-3-one, 2-methyl-4-isothiazolin-3-one, Magnesium nitrate, Magnesium chloride
ChemTreat CL2871 (Closed System Treatment)	Sodium Molybdate, Nitrous Acid, sodium salt
ChemTreat CL3858 (Iron Cleaner)	1-Hydroxyethylidene-1,1-diphosphonic acid, Tetrapotassium salt
ChemTreat 4830 (Cooling Water Treatment)	2-Phosphono-1,2,4-butane tricarboxylic acid, sodium salt, Tetrapotassium pyrophosphate, Potassium hydroxide, Tolyltriazole, sodium salt, Potassium phosphate, tribasic
Quadrasperse CL4819 (Cooling Water Treatment)	2-Phosphono-1,2,4-butane tricarboxylic acid, Zinc chloride, Sodium hydroxide, Tolyltriazole, Sodium salt
Quadrasperse CL4855 (Cooling Water Treatment)	2-Phosphono-1,2,4-butane tricarboxylic acid, sodium salt, Sodium hydroxide, Tolyltriazole, Sodium salt
ChemTreat CL4910 (Cooling Water Microbiocide)	Sodium hypochlorite, Sodium bromide, Sodium hydroxide
ChemTreat CL6033 (Closed System Treatment)	Sodium tetraborate pentahydrate, Potassium hydroxide, Tolyltriazole, sodium salt
ChemTreat P828L (Water Clarification Agent)	Ferric sulfate
ChemTreat RL100 (Reverse Osmosis Treatment)	Sodium hydroxide
ChemTreat RL2000 (Reverse Osmosis Treatment)	Citric acid, Sodium citrate
Hydro Solv (Cleaning Agent)	Polyethylene glycol phenyl ether phosphate, Sodium tripolyphosphate, Ethanol, 2-butoxy-, phosphate, Amines, coco alkyl, ethoxylated compounds with polyethylene glycol monooleyl ether phosphate
Potassium Hydroxide Solution 8N	Potassium hydroxide
Green Clean (General purpose cleaner)	Dipropylene Glycol Methyl Ether, Sodium Carbonate
CalClean, Special HD (Detergent)	Sodium metasilicate, Potassium hydroxide
Evap-Green 4191 (Evaporator Coil Cleaner/Degreaser)	Alcohols, C9-11, ethoxylated
Transformer Chemicals	
C.F.E. P-9 (Epoxy Poliamide – Organic Zinc Primer)	Xilene, Zinc powder, Epoxy resin, catalyst

PEMEX RP – 5 Type B (Catalyzed epoxic tar coal primer)	Epoxy resin, catalyst, Xilene, MIBK, Tar Coal
C.F.E. A-12 (Polyurethane finish)	Titanium dioxide, Polyurethane resin, catclyst, Xilene, Tixogel, Extender
Other	
19% Aqueous Ammonia	Ammonia
Rochem Fyrewash 3 or similar	2-(2-butoxyethoxy)ethanol, Non ionic surfactants

The following additional chemicals will likely be used in Unit GT-5. MSDS are not available for all chemicals at this time as final determination of products has not been completed. MSDS will be provided to LACSD once final product selection is completed.

Product Name	**Chemical Constituents**	**Usage Location**
Cation Resin	To be determined by vendor	Condensate Polish units
Anion Resin	To be determined by vendor	Condensate Polish units
Mixed Bed Resin	To be determined by vendor	Condensate Polish units
Ammonia/Amine	Ammonia/TBD	OTSG (Steam Cycle Treatment)
Hydrazine or Eliminox	Hydrazine	OTSG (Steam Cycle Treatment)
R123	2,2-Dichloro-1,1,1-trifluoroethane	Gas turbine inlet chiller
R-134a	1,1,1,2-Tetrafluoroethane	Gas turbine inlet chiller

14. Wastewater Producing Operations

The following operations will contribute wastewater to be discharged to the sewer:

- Blowdown from cooling towers for Units GT-3, GT-4, and GT-5.
- Blowdown from inlet air coolers for Units GT-1 and GT-2.
- Drips and leaks from equipment skids for Units GT-3, GT-4, and GT-5. Collected wastewater will be treated in an existing oily water separator prior to discharge to sewer.

Additional details regarding these operations are included in the Process Description (Attachment 5).

17. Constituents of Wastewater Discharge

Wastewater analyses are included in Attachment 7. After the addition of Unit GT-5, the concentrations of chemicals in wastewater and the water chemistry parameters are expected to be similar to the analysis results presented in Attachment 7.

FORM A: APPLICANT QUESTIONNAIRE

Name Of Company City of Pasadena, Water and Power Department

Company Contact Name Dan Angeles, Principal Engineer, dangeles@cityofpasadena.net

Company Contact E-mail _____ Phone Number (626) 744-6240

FORM A: APPLICANT QUESTIONNAIRE

1. Reason for Submittal - Circle A – New Permit, B – Permit Revision, C – Permit Addendum, or D – Permit Renewal and complete the corresponding questions.

A. New Permit (for new companies and for changes in ownership)

Type of business _____

Is the facility: ☐ New or ☐ Existing (please check)

If existing, previous company name _____

Type of business _____

Industrial Wastewater Discharge Permit No. _____

Provide a description of all manufacturing processes and wastewater producing operations in an attachment.

Are any changes being made to the facility's existing wastewater pretreatment/conveyance systems?
☐ Yes ☐ No If yes, briefly explain these modifications in attachments.

Is there more than one company discharging industrial wastewater at your facility? ☐ Yes ☐ No If yes, provide for each company its name, a separate address and a description of its operations. If feasible, each company must apply for a separate permit and must have its own incoming water meter and a separate industrial wastewater sampling point.

If your facility will involve a new connection to the public sewer, please check the point of connection:
☐ Local city sewer, ☐ Sanitation Districts' Trunk sewer.

If you are relocating, and had a previous Industrial Wastewater Discharge Permit, give your previous address _____, and permit number _____.
If you have received a temporary permit, give permit number _____.

All submittals for new permits **must** include a permit application, plans (if changes have occurred) and pertinent supporting information.

B. Revision of Existing Permit (for a 25 percent or more change in wastewater quantity/quality)

Permit number 016373.
Has your wastewater quantity and/or quality changed over 25 percent? ☒ Yes ☐ No If yes, documentation addressing the magnitude and reason(s) for the change must be submitted. If no, a revision is not required at this time.

Have there been any changes in production processes, wastewater pretreatment systems or sewerage plumbing?
☒ Yes ☐ No If yes, submit plans and describe these changes in attachments.

All submittals for a revised permit **must** include a permit application, plans (if changes have occurred) and supporting information.

C. Addendum to Permit (for modifications to the wastewater conveyance/pretreatment system)

Permit Number _____.

Attach a brief summary of the existing conditions and the proposed changes. All submittals for a permit addendum **must** include plans and supporting information. Applicant must also answer the questions on the back of this form (**2. Supporting Information Required**).

D. Permit Renewal (for permits with expiration dates)

Permit Number _____.

Have there been any changes in production processes, wastewater pretreatment systems or sewerage plumbing? ☐ Yes ☐ No If yes, submit plans and describe these changes in attachments.

All submittals for a permit renewal **must** include a permit application, plans (if changes have occurred) and supporting information.

1. Supporting Information Required

All submittals **must** include the following forms, which are included in Appendix 6.1:

Form A - Applicant Questionnaire
Form B - Calculation of Industrial Wastewater Discharge Flow Rate
Form C - Tank Schedule and Spill Containment Calculations
Form D - Check List

Furthermore, your company must answer the questions below to determine the additional supporting information that must be provided:

A. Waste Minimization (refer to Sections 2.4 and 3.3 E)

Please describe below or in an attachment all of your company's existing/proposed pollution prevention measures (e.g., reuse, product reformulation, process changes, housekeeping measures, etc.):

Has your company previously submitted a waste minimization plan to the Districts? ☐ Yes ☒ No If no, please read Sections 2.4 and 3.3E and submit the appropriate plan (if applicable). Your company is encouraged to obtain information on source reduction measures and options for your industrial processes by calling the Districts' Industrial Waste Section at (562) 908-4288, ext. 2900.

B. Wastewater Quality (refer to Sections 3.3G and H)

Please provide the results of at least two 24-hour composite analyses attesting to concentrations of chemical oxygen demand, suspended solids and any priority or regulated pollutants that may be found in your wastewater. Your company must also provide material safety data sheets of all chemicals used in the facility that may directly or indirectly contaminate your wastewater.

C. New Equipment (refer to Sections 3.3 F, J and K)

Is your company installing new pretreatment, monitoring, conveyance or industrial equipment that may have an impact on the quality or quantity of your wastewater? ☒ Yes ☐ No If yes, please provide catalog cuts of all units and important details such as: number of units, sizes, hours of operation, pump rating curves, operating parameters, etc.

D. Baseline Monitoring Report (refer to Sections 2.1 and 3.3 I)

Does your company currently fall under one of EPA's categories? ☒ Yes ☐ No If yes, your company must submit a Baseline Monitoring Report, unless it was submitted one in the past and there have been no changes in operations that may change your categorical standards.

E. Rainwater Management (refer to Section 3.2)

Are there any outdoor drains, trenches or sumps at your facility that are connected to the sewerage system? ☒ Yes ☐ No If yes, your company must submit plans and information that describe the existing means to divert rainwater from the sewerage system or a proposal to comply with the Districts' rainwater guidelines. Please be informed that new automatic rainwater diversion systems will not be approved unless the applicant proves that this is the only feasible alternative.

Attachment 2 – Form A Supplemental Responses

1B. Revision of Existing Permit: Change in wastewater quantity

The City of Pasadena is decommissioning the B3 steam power generating system presently located at an adjacent facility known as the Broadway Power Plant. The B3 steam power plant is being replaced with a more efficient, clean burning, new combined cycle power plant (GT-5) and associated ancillary systems to be located at the Glenarm facility. The new combined cycle unit will be rated at 71 MW. The wastewater from unit GT-5 will be sent to the existing Glenarm sewer outfall. The quality of the wastewater is not expected to change significantly after the addition of unit GT-5, however, the quantity of discharge will be an annual average of approximately 99,411 gpd (current permit limit is 4,300 gpd). The peak flow rate to the sewer outfall will not increase above the current permit limit of 191 gpm.

Additional details regarding the changes in production processes, wastewater pretreatment, and sewerage plumbing may be found in the Process Description (Attachment 5) and in the Plans and Drawings (Attachment 8).

Supporting Information

A. Waste Minimization

All existing and proposed equipment skids include drip pans to collect any oily leaks. Drip pans have a relatively small footprint, limiting the surface area which can be contaminated with oily water. Any wastewater captured by the drip pans will be drained to an existing oily water separator to remove oil before water is discharged to the sewer. Waste oil is disposed of offsite.

The proposed Unit GT-5 includes a once through steam generator (OTSG) as the heat recovery steam generator (HRSG). In typical drum-type HRSGs, small amounts of water (blowdown) are continuously discarded to prevent the buildup of dissolved and suspended solids in the feedwater. The proposed OTSG, however, is a drum-free once-through HRSG. The OTSG has minimal blowdown requirement and therefore water consumption is reduced as compared to conventional type HRSGs.

A high efficiency cooling tower was selected for Unit GT-5. The cooling tower will include drift eliminators to reduce the drift to less than 0.0005% of the inlet water flow. The drift eliminators capture water droplets prior to their release into the atmosphere and return them to the cooling tower basin, reducing the losses in the cooling tower.

For additional waste minimization practices refer to existing permit file.

B. Wastewater Quality

See wastewater analyses included in Attachment 7.

C. New Equipment

New equipment for Unit GT-5 is shown on the GT-5 Plot Plan (SKM1-4, Attachment 8). The following equipment will impact the quantity and quality of wastewater:

- GT-5 Cooling Tower
- GT-5 Condensate Polish unit
- Drains from equipment skids

GT-5 will operate for a proposed maximum of 8,760 hours per year. Final equipment selection has not been completed at this time. Preliminary data sheets and drawings for the cooling tower and condensate polish unit are presented in Attachment 8. Final equipment data sheets and drawings will be submitted after final design has been completed.

D. Baseline Monitoring Report

See baseline monitoring report on file with LACSD.

E. Rainwater Management

There are no outdoor drains, trenches, or sumps at the facility that are connected to the sewer with the following exception: the new combined cycle unit will include several ancillary system equipment skids. Drip pans are provided beneath each of these skids to catch any drips or leaks. The drip pans are outdoors and, as such, they will also collect rainfall. The volume of potential rainfall is very small due to the small footprint area. All liquid collected in the drip pans will flow to an oily water separator prior to discharge to the Glenarm sewer outfall box. If the final design results in a drip pan area greater than 400 square feet, rain covers will be provided.

An updated Standard Urban Stormwater Mitigation Plan will be submitted before construction of GT-5 begins.

FORM B: CALCULATION OF INDUSTRIAL WASTEWATER DISCHARGE FLOW RATE

COMPANY NAME: City of Pasadena, Water and Power Department (Glenarm 16373)

Calculation of flow rate is based on: (Check one)

- ____ Adjusted metered water supply (Company must complete the calculations below)
- X Direct measurement through a Districts' approval effluent flow measurement system *
- X Estimate for a facility not yet in operation **

ADJUSTED METERED WATER SUPPLY CALCULATIONS (Round all figures to two decimals)

		MILLION GALLONS PER YEAR
I	Incoming Water	
1.	Metered Water Supply from Purveyor (Water Company). Use most recent 12 consecutive months and attach copies of water bills.	MGY
2.	Water Supply from Company Well. Attach meter or water master data for most recent 12 consecutive months.	0.00 MGY
3.	Water Received in Raw Materials, or by other means. Explain in attachments.	0.00 MGY
4.	Rainwater/Groundwater Discharged to the Sewerage System. Explain in attachments.	MGY
5.	Total Incoming Water. (add lines 1 to 4)	0.00 MGY
II	Water Losses	
6	Wastewater Discharged to Stormwater Drainage System. Explain in attachments. (NPDES Permit No. ____)	MGY
7	Water Lost Through Evaporation and Irrigation. (add lines a + b + c + d at the bottom of this form)	0.00 MGY
8	Water Lost in Products. Explain in attachments.	MGY
9	Sanitary Flow Deduction. (from line "e" on the back of this form)	0.00 MGY
10	Total Water Losess. (add lines 6 to 9)	0.00 MGY
III	Industrial Wastewater Discharged	
11	Calculated Industrial Wastewater Discharged to the public sewer. (subtract line 10 from line 5)	0.00 MGY
12	Any Proposed increase (+) or decrease (-) in industrial waste-water discharge to the public sewer? (explain in attachments)	Enter or Circle one (+) (-) MGY
13	Total proposed yearly industrial wastewater discharge. (add lines 11 and 12)	0.00 MGY
14	Average industrial wastewater flow. (use line 13 to calculate below)	

NOT USED SEE ATTACHED SUPPLEMENTAL CALCULATIONS

MILLION GALLONS PER YEAR	x	1,000,000	÷	Number of Discharge Days per Year	=	Gallons per Day
	x	1,000,000	÷	365	=	0.00

This is the average daily flow rate that must be used on the application for industrial wastewater discharge. (It may be rounded to two significant figures).

Note: The applicant must also complete the calculations on the back of this page.

* If your company currently has an **approved effluent wastewater flow measurement system**, please submit effluent totalizer readings for the last twelve months. Your company does not have to complete the rest of this form.

** The company must submit detailed information that substantiates how the flow rate was estimated.

WATER LOSSES

a. COOLING TOWER LOSSES

Tonnage	x	Hours of Operation Per Year	x	Load[1]	x	1.38[2]	÷	1,000,000	=	Mil. Gal. Per Year	
	x		x		x	1.38	÷	1,000,000	=	0.00	
	x		x		x	1.38	÷	1,000,000	=	0.00	
									=	0.00	a

[1] Load = 0.5 to 0.80
[2] 1.38 = Gallons evaporated per hour per ton

b. BOILER LOSSES

Horse-power	x	Hours of Operation Per Year	x	Load[3]	x	% Evaporation[4]	x	3.82[5]	÷	1,000,000	=	Mil. Gal. Per Year	
	x		x		x		x	3.82	÷	1,000,000	=	0.00	
	x		x		x		x	3.82	÷	1,000,000	=	0.00	
											=	0.00	b

[3] Load = 0.50 to 0.80
[4] % Evaporation = (100 - % condensate returned)/100
[5] 3.82 = Gallons evaporated per hour per horsepower

c. OTHER EVAPORATE LOSSES
(Explain in attachments)

Million Gallons Per Year	
	c

d. IRRIGATION LOSSES

Square Feet of Land Irrigated	x	18.7[6]	÷	1,000,000	=	Mil. Gal. Per Year	
	x	18.70	÷	1,000,000	=	0.00	d

[6] 18.7 = Gallons irrigated per square foot per year

e. SANITARY FLOW DEDUCTION

No. Employees	x	Working Days Per Year	x	Gallons Per Employee Per Day	÷	1,000,000	=	Mil. Gal. Per Year	
	x	365	x	15	÷	1,000,000	=	0.00	e

NOT USED
SEE ATTACHED
SUPPLEMENTAL CALCULATIONS

INCOMING WATER METERS

Please list all the accounts (or other identification) for all the meters that measure the water supplied to this facility.

Meter #	Location	Account #
1560779	65 E State St, Pasadena	80145-6
1556580	130 Wallis St, Pasadena	80175-3

Abbreviations and Conversion Factors
MGY = million gallons per year
1 cubic foot = 7.48 gallons
1 acre foot = 325,900 gallons
1 acre = 43,560 square feet
1 CCF = 748 gallons

Attachment 3 - Form B Supplemental Calculations - GT-5 Industrial Wastewater Discharge Rate

GT-5 Permitted Annual Operating Hours	**8760**

GT-5 Wastewater Flows during GTG Operation At Full Load	**Normal Flow at Annual Average Conditions**	**Peak Flow at Maximum Ambient Temperature**
Cooling Tower Blowdown (gpm)	37	55
Condensate Polisher (gpm)	2	10
Miscellaneous Drains (gpm)	2	11
Hose Bibs (gpm)	0	20
Cooling Tower Blowdown (gpd)	40,949	-
Condensate Polisher (gpd)	2,206	-
Miscellaneous Drains (gpd)	2,206	-

Note 1: Because of rounding decimal places, values may not match exactly.

Note 2: Flow rates based on GT Pro version 20 output/process calculations (see Drawing M2-2-1 in Attachment 8).

GT-5 Wastewater Flows during Start-Up and Shut-Down	**Normal Flow at Annual Average Conditions**	**Peak Flow at Maximum Ambient Temperature**
Cooling Tower Blowdown @ 100% Load (gpm)	37	55
Cooling Tower Blowdown @ 75% Load (gpm)	29	38
Cooling Tower Blowdown @ 50% Load (gpm)	25	33
Cooling Tower Blowdown @ 25% Load (gpm)	21	31
Condensate Polisher (gpm)	2	10
Miscellaneous Drains (gpm)	2	11
Cooling Tower Blowdown (gpd)	8,515	-
Condensate Polisher (gpd)	608	-
Miscellaneous Drains (gpd)	608	-

Note 3: Cooling tower flow (gpd) based on assumption that each load scenario occupies 25% of the total start-up and shut-down time.

Glenarm Industrial Wastewater Discharge Rates	**Annual Average Flow (gpd)**	**Peak Flow (gpm)**
Cooling Tower GT-3	16,200	26
Cooling Tower GT-4	16,200	26
Cooling Tower GT-5 (without fountain)	49,464	55
Existing Fountain (Note 4)	64	25-40
Cooling Tower GT-5 (with fountain)	49,528	55
Condensate Polisher GT-5	2,814	10
Oil Water Separator	14,614	100
Inlet Air Cooling Blowdown GT-1	27	25-40
Inlet Air Cooling Blowdown GT-2	27	25-40
Total	**99,411**	**191**

Total Wastewater (gal/year)	36,284,995
Sanitary Deduction (gal/year) (31 employees, 15 gpd)	169,725
Total Proposed Wastewater Discharge (gal/year)	**36,115,270**

Note 4: Fountain will drain to the GT-5 Cooling Tower and be used as process water.

Note 5: Refer to Drawings M2-2-1 and M2-2-4 for additional details.

Attachment 3 - Form B Supplemental Calculations - GT-5 Industrial Wastewater Monthly Discharge

Glenarm Industrial Wastewater Discharge 2011

Month	Gallons
January	26,700
February	67,700
March	52,000
April	21,100
May	21,500
June	24,000
July	37,900
August	15,500
September	20,900
October	11,800
November	7,100
December	26,900

Total	**333,100**

FORM C: TANK SCHEDULE & SPILL CONTAINMENT CALCULATIONS

Please complete one form for each containment area (make additional copies if necessary).

TANK I.D. NUMBER	TANK NAME	TANK DIMENSIONS[1]	TANK CONTENTS	pH	IS TANK ELEVATED[2]
	Condensate Storage Tank	~15 ft diam, ht TBD	Demineralized Water	approx 7	No; no containment required
	Demineralized Water Tank	~25 ft diam, ht TBD	Demineralized Water	approx 7	No; no containment required
	Waste Water Storage Tank	~25 ft diam, ht TBD	Waste Water	approx 7	No; no containment required
	GT5 Wash Water Waste Tank	~1000 gal (dimensions TBD)	Waste wash water from periodic interior washing of turbines	approx 7	No, located in concrete containment pit

[1] Specify height and diameter if tank is round; or length, width and height if tank is rectangular.

[2] If the tank is elevated above the ground on legs, specify the location (elevation) of the bottom of the tank. If the tank is located on a pad or solid platform, specify dimensions of the pad or platform.

2. Spill Containment Calculations (make additional copies if necessary).

Answer the following questions:

	Check One
a) If this is your company's first permit submittal to the Districts, do you store hazardous or restricted materials?	YES ☒ NO ☐
b) Does your company currently have tanks/equipment with hazardous or restricted solutions that lack adequate spill containment?	YES ☐ NO ☒
c) Is your company proposing any additions/modifications of tanks or equipment that will need spill containment?	YES ☒ NO ☐

If the answer to any of the questions above is "YES," your company must submit plans that describe and propose an adequate spill containment system and must complete the calculations below:

1. Containment Volume Required:

The required containment volume is equal to the capacity of the largest tank containing a solution that requires containment plus the volume of six inches of rain over the containment area (if the area is not roofed).

(1) = Volume of largest tank (assumed to spill) + volume of 6 inches of rain over contain area (if area is outdoors)

(1) = 1000 gal + TBD

(1) = TBD (specify units)

2. Containment Volume Provided:

The containment provided is equal to the volume of the dike, berm, sump or other containment structure minus the volume displaced by tanks, pads and other equipment within the containment area.

(2) = Volume of containment dike - volume displaced by tanks and other equipment

(2) = TBD — TBD

(2) = TBD (specify units)

Subtract (1) from (2)

(2) — (1) = TBD (must be greater than zero to satisfy spill containment requirements)

Note: All drains, sumps and associated plumbing within spill containment areas must be clearly shown on submitted drawings.

FORM C: TANK SCHEDULE & SPILL CONTAINMENT CALCULATIONS

Please complete one form for each containment area (make additional copies if necessary).

TANK I.D. NUMBER	TANK NAME	TANK DIMENSIONS[1]	TANK CONTENTS	pH	IS TANK ELEVATED[2]
NA	Cooling Tower Scale and Corrosion Inhibitor Storage Tank	6'6" Ht x 4' Diam (540 gallon tank)	Cooling tower water treatment chemical (Quadrasperse CL4819)	13.7	No
NA	Cooling Tower Biocide A Storage Tank	6'6" Ht x 4' Diam (540 gallon tank)	Cooling tower water treatment chemical (ChemTreat CL49)	13.6	No
NA	Acid Storage Tank	6'6" Ht x 4' Diam (540 gallon tank)	Cooling tower water treatment chemical (Sulfuric Acid)	<1	No

[1] Specify height and diameter if tank is round; or length, width and height if tank is rectangular.

[2] If the tank is elevated above the ground on legs, specify the location (elevation) of the bottom of the tank. If the tank is located on a pad or solid platform, specify dimensions of the pad or platform.

2. Spill Containment Calculations (make additional copies if necessary).

Answer the following questions:

	Check One
a) If this is your company's first permit submittal to the Districts, do you store hazardous or restricted materials?	YES ☒ NO ☐

(1) = Volume of largest tank (assumed to spill) + volume of 6 inches of rain over contain area (if area is outdoors)

(1) = 540 gallons + 0 gallons

(1) = 540 gallons (specify units)

2. Containment Volume Provided:

The containment provided is equal to the volume of the dike, berm, sump or other containment structure minus the volume displaced by tanks, pads and other equipment within the containment area.

(2) = Volume of containment dike - volume displaced by tanks and other equipment

(2) = TBD — TBD

(2) = TBD (specify units)

Subtract (1) from (2)

(2) — (1) = TBD (must be greater than zero to satisfy spill containment requirements)

Note: All drains, sumps and associated plumbing within spill containment areas must be clearly shown on submitted drawings.

FORM C: TANK SCHEDULE & SPILL CONTAINMENT CALCULATIONS

Please complete one form for each containment area (make additional copies if necessary).

TANK I.D. NUMBER	TANK NAME	TANK DIMENSIONS[1]	TANK CONTENTS	pH	IS TANK ELEVATED[2]
NA	Cooling Tower Biocide B Storage Tank	40" Ht, 22" Diam (60 gallon)	Cooling tower water treatment chemical (ChemTreat CL2156)	3.8	No
NA	Cooling Tower Biocide C Storage Tank	40" Ht, 22" Diam (60 gallon)	Cooling tower water treatment chemical (ChemTreat CL2130)	8.8	No

[1] Specify height and diameter if tank is round; or length, width and height if tank is rectangular.

[2] If the tank is elevated above the ground on legs, specify the location (elevation) of the bottom of the tank. If the tank is located on a pad or solid platform, specify dimensions of the pad or platform.

2. Spill Containment Calculations (make additional copies if necessary).

Answer the following questions:

	Check One
a) If this is your company's first permit submittal to the Districts, do you store hazardous or restricted materials?	YES ☒ NO ☐
b) Does your company currently have tanks/equipment with hazardous or restricted solutions that lack adequate spill containment?	YES ☐ NO ☒
c) Is your company proposing any additions/modifications of tanks or equipment that will need spill containment?	YES ☒ NO ☐

If the answer to any of the questions above is "YES," your company must submit plans that describe and propose an adequate spill containment system and must complete the calculations below:

1. Containment Volume Required:

The required containment volume is equal to the capacity of the largest tank containing a solution that requires containment plus the volume of six inches of rain over the containment area (if the area is not roofed).

(1) = Volume of largest tank (assumed to spill) + volume of 6 inches of rain over contain area (if area is outdoors)

(1) = 60 gallons + 0 gallons

(1) = 60 gallons (specify units)

2. Containment Volume Provided:

The containment provided is equal to the volume of the dike, berm, sump or other containment structure minus the volume displaced by tanks, pads and other equipment within the containment area.

(2) = Volume of containment dike - volume displaced by tanks and other equipment

(2) = 17.1 cu. ft. (128 gal) — 3.9 cu. ft (29 gal)

(2) = 13.2 cu. ft. (99 gal) (specify units)

Subtract (1) from (2)

(2) — (1) = 39 gal (must be greater than zero to satisfy spill containment requirements)

Note: All drains, sumps and associated plumbing within spill containment areas must be clearly shown on submitted drawings.

FORM C: TANK SCHEDULE & SPILL CONTAINMENT CALCULATIONS

Please complete one form for each containment area (make additional copies if necessary).

TANK I.D. NUMBER	TANK NAME	TANK DIMENSIONS[1]	TANK CONTENTS	pH	IS TANK ELEVATED[2]
NA	OTSG Ammonia Tank	42" Ht, 50" W, 44" L (400 gallon)	Steam cycle water treatment chemical (Ammonia)	Approx 11.6 for 1N soln	Yes, approx 6 inches
NA	OTSG Hydrazine Tank	42" Ht, 50" W, 44" L (400 gallon)	Steam cycle water treatment chemical (Hydrazine or Eliminox)	<1 for Eliminox	Yes, approx 6 inches

[1] Specify height and diameter if tank is round; or length, width and height if tank is rectangular.

[2] If the tank is elevated above the ground on legs, specify the location (elevation) of the bottom of the tank. If the tank is located on a pad or solid platform, specify dimensions of the pad or platform.

2. Spill Containment Calculations (make additional copies if necessary).

Answer the following questions:

	Check One

(2) = TBD (specify units)

Subtract (1) from (2)

(2) — (1) = TBD (must be greater than zero to satisfy spill containment requirements)

Note: All drains, sumps and associated plumbing within spill containment areas must be clearly shown on submitted drawings.

Attachment 4 – Form C Supplemental Information

1. The small water treatment chemical storage tanks for the cooling tower and OTSG do not have tank numbers as they are small, replaceable units.

2. GT-5 Wash water waste tank (1,000 gallons, dimensions to be determined by vendor) will be located in a concrete containment pit with a minimum volume of 1,100 gallons plus the volume of six inches of rain over containment area. Plans will be submitted at a later date.

3. Cooling Tower Scale and Corrosion Inhibitor (540 gal, ChemTreat CL4819), Biocide A (540 gal, ChemTreat CL49), and Sulfuric Acid (540 gal) will be stored together in a concrete bermed area with a containment volume greater than 594 gallons (110% of largest tank). Tanks and containment area will be located under a roof or cover to prevent rainfall from entering containment area. Containment design has not been completed; plans will be submitted at a later date.

4. Cooling Tower Biocide B (ChemTreat CL2156) and Biocide C (ChemTreat CL2130) will each be stored in identical 60 gallon tanks inside individual secondary containment units with containment volume of 99 gallons. Tanks and containment will be located under a roof or cover to prevent rainfall from entering containment area.

5. OTSG chemicals (ammonia and hydrazine or Eliminox) will be stored in 400 gallon tanks inside a common secondary containment unit. Containment design and dimensions to be determined by vendor; minimum containment volume will be 440 gallons. Tanks and containment will be located under a roof or cover to prevent rainfall from entering containment area. Plans will be submitted at a later date.

6. Fuel gas compressor drains tank and final filter skid drains tank will be located in concrete containment pits with a minimum containment volume of 110 gallons plus the volume of six inches of rain over containment area. Plans will be submitted at a later date.

FORM D: CHECK LIST FOR AN INDUSTRIAL WASTEWATER DISCHARGE PERMIT SUBMITTAL

COMPANY NAME: Pasadena Water and Power - Broadway Plant

1. Permit Application Form ..... [x]

2. Plans (Minimum size: 11" x 17"; maximum size 30" x 42") ..... [x]

   a. Required Plans:

      Sewerage Plan (location of equipment, process tanks and sewer lines) ..... [x]

      Plot Plan (location of facility, sampling point and connection to the public sewer) ..... On File [ ]

      Plans of Pretreatment Facilities ..... On File [ ]

   b. Additional Plans (if needed)

      Spill Containment System ..... [ ]

      Flow Monitoring System ..... [ ]

      Rainwater Management ..... [ ]

      Combustible Gas Monitoring System ..... [ ]

3. Supporting Information:

ALWAYS REQUIRED

- Applicant's Questionnaire (Form A) ..... [x]
- Estimation of Discharge Flow Rate and Water Bills (Form B) ..... [x]
- Tank Schedule and Spill Containment Calculations (Form C) ..... [x]
- Checklist (Form D) ..... [x]
- Process Description ..... [x]

COMPLETE FORM A TO DETERMINE WHICH OF THESE ARE NECESSARY

- Waste Minimization Plan ..... [ ]
- Material Safety Data Sheets ..... [ ]
- Wastewater Analyses ..... [x]
- Baseline Monitoring Report (for EPA categorical companies) ..... [ ]
- Pump Curves ..... [ ]
- Catalog Cuts of Pretreatment Equipment ..... [ ]
- Baseline Credit Information ..... [ ]
- Equipment Costs ..... [ ]
- Notification Report of the Discharge of Hazardous Wastes (if applicable) ..... [ ]

Attachment 5 - Process Description

The proposed Glenarm Power Plant expansion includes a combined cycle unit, GT-5, and associated infrastructure. An overall site plan and a detailed general arrangement of Unit GT-5 are included in Attachment 8. The new combined cycle unit is rated for a maximum output of 71 MW at the annual average condition. Detailed design and final equipment selection has not yet been completed. Preliminary design results include the following equipment:

- Gas turbine rated for approximately 56 MW
- Steam turbine rated for approximately 15 MW
- Once Through Steam Generator (OTSG) to generate steam
- Gas turbine inlet air filter
- Condenser
- Chiller for cooling the gas turbine combustion air to maximize power output
- Cooling tower to provide cooling water to the steam condenser, chiller, and auxiliary cooling water system
- Gas turbine water injection system to inject demineralized water for gas turbine intercooling
- Auxiliary cooling water system including heat exchanger and lube oil coolers
- Selective Catalytic Reduction (SCR) NOx control system, CO Catalyst, and stack
- Ammonia vaporization skid
- Water injection skid for NOx control
- Fuel gas filter and compressor skid
- Demineralized water storage tank, wastewater storage tank, condensate storage tank, and associated forwarding pumps
- Condensate polish skid to maintain water quality in the steam cycle
- Pumps associated with the above equipment

Gas turbine systems generate electric power by compressing chilled ambient air, heating the air through natural gas combustion, and then expanding the hot gas over a power turbine which turns the generator. The hot gas turbine exhaust is directed into the OTSG to produce steam for the steam turbine.

The cooling water system, the auxiliary cooling water system, and the chilled water system are closed loop systems with service water used for make-up water. Cooling water will be used to cool the turbine lube oil, generator lube oil, and the condenser. Chilled water will be used to cool the gas turbine inlet air. Cooling tower water will be sampled at the chemical injection skid to maintain the water chemistry and keep the cooling tower clean. Due to deposit build-up, the cooling tower will need to periodically blowdown. Blowdown from the cooling tower will be pumped to the proposed Glenarm wastewater storage tank prior to discharge to the Glenarm sewer outfall box.

SCR NOx control systems will use two methods to reduce NOx emissions from the gas turbines to the atmosphere. First, demineralized water will be injected into the gas turbine to control NOx formation in the combustion chamber. Second, ammonia will be injected downstream into the gas turbine exhaust.

Ammonia will be supplied from the existing ammonia storage tanks located on the adjacent Broadway site to the ammonia vaporizer skid located near the SCR control system.

The closed loop steam cycle will utilize demineralized water generated at the adjacent Broadway site. The steam turbine uses steam generated in the OTSG to generate additional power. After expansion in the turbine, the steam is condensed in the condenser and pumped to the condensate polish units to remove trace dissolved minerals and suspended matter thus ensuring the high purity of the water in the loop. The water is then returned to the OTSG via the boiler feedwater tank. Steam cycle make-up water will be added from the new demineralized water storage tank. Blowdown from the condensate polish unit will be pumped to the proposed Glenarm wastewater storage tank prior to discharge to the Glenarm sewer outfall box.

The various ancillary components of combined cycle unit are provided on equipment skids that include drip pans to collect any leaks or drips. The collected liquid will be piped to the existing oil water separator. Waste oil will be recovered from the OWS and disposed of offsite. The treated water will be pumped to the proposed Glenarm wastewater storage tank prior to discharge to the Glenarm sewer outfall box.

Raw Materials

Natural gas, municipal water, demineralized water, water treatment chemicals, oils, grease, and refrigerants will be used at the Glenarm power plant. The complete list of materials is presented in Attachment 1.

Operating Hours

Unit GT-5 will be permitted to operate up to 8,760 hours per year. Actual operating hours will be less than 8,760 due to startup and shutdown cycles and scheduled maintenance.

Wastewater Producing Operations

Wastewater will be produced by various plant processes as described above and as shown in the Process Flow Diagram Glenarm Industrial Wastewater (M2-2-4, Attachment 8). Wastewater producing operations include:

- Cooling towers for Units GT-3 and GT-4
- Drips and leaks from Units GT-3 and GT-4 equipment skids
- Cooling tower for Unit GT-5
- Condensate polish equipment for Unit GT-5
- Drips and leaks from Unit GT-5 equipment skids and hose bibs for equipment cleaning
- Periodic drainage of evaporative coolers for Units GT-1 and GT-2
- GSU and Auxiliary Transformer Containments (drained to grade, or pumped out if contaminated)

Estimates of flow rates for each of these operations are presented in Attachment 3 – Form B Supplemental Calculations. The following paragraphs present a detailed description of the new sources of wastewater.

GT-5 Cooling Tower

The cooling tower for GT-5 will generate approximately 37 gpm of blowdown during normal operating conditions and 55 gpm during the maximum ambient conditions. This blowdown rate is based on 6 cycles of concentration and the use of the City's potable water as make-up water. Unit GT-5 will operate a proposed maximum of 8,760 hours per year, with an annual average of flow of 49,464 gallons per day (gpd) at normal conditions. The water treatment equipment for the cooling tower will include chemical totes and metering pumps. Chemical totes will be stored on a spill containment skid, similar to that used for the GT-3 and GT-4 cooling towers, and in concrete containment pits. Water treatment chemicals will include pH adjustment chemicals, anti-scalant and corrosion inhibitors, and biocides. The GT-5 cooling tower will use the same chemicals as those used in the treatment of cooling towers for Units GT-3 and GT-4, resulting in wastewater with chemical concentrations similar to that being discharged from the operating cooling towers. Cooling tower blowdown will be sent directly to the Glenarm sewer outfall box by gravity flow or to the proposed Glenarm wastewater storage tank for temporary storage.

Condensate Polish Equipment

The condensate polish equipment is used to reclaim the high purity water from the condenser. The condensate polishing process includes filtration to remove suspended solids, such as corrosion products, and ion exchange to remove contaminant ions. Wastewater is generated by the condensate polish units during blowdown, filter backwashing, and resin regeneration. The rate of wastewater generation is expected to be 2 to 10 gpm, with an annual average discharge rate of 2,814 gpd. Wastewater from the condensate polish unit will be sent directly to the Glenarm sewer outfall box by gravity flow or to the proposed Glenarm wastewater storage tank for temporary storage. Demineralized water generated by the water treatment equipment at the Broadway plant will be used as steam cycle make-up water.

Drips and Leaks and Hoses

Drips and leaks from process equipment will be collected in the drip pans located below all equipment skids. Hose bibs located near equipment skids provide water to wash equipment periodically. Wastewater from equipment cleaning will also be directed to the drip pans of equipment skids. Water collected in the drip pans of equipment skids will be fed to a common header and sent by gravity flow to the existing OWS for pre-treatment, prior to discharge to the Glenarm sewer outfall box. Any oil or grease in the wastewater will be removed in the OWS and pumped to the waste oil storage tank for offsite disposal. The oil-free water from the OWS will be pumped to the proposed Glenarm wastewater storage tank prior to discharge to the Glenarm sewer outfall box. The amount of wastewater collected in the drip pans will vary. The total flow rate due to drips and leaks into drip pans for GT-5 equipment skids is expected to range from 2 to 11 gpm. The maximum flow rate for the hoses is expected to be 20 gpm. The anticipated annual average discharge rate from the GT-5 equipment drip pans is 2,814 gpd.

Periodically, the gas turbine will undergo a compressor water wash. Water or a water & detergent combination are mixed in a tank external to the gas turbine and then sprayed through various nozzles inside the turbine. Wash water is collected in various drain hubs on the gas turbine skid and, based upon water chemistry, is either sent to the wash water drains tank or oily water separator. Water collected in the wash water drains tank is pumped out and disposed of offsite.

Subject: **Soil Thermal Resistivity Tests**
Pasadena Water & Power, Pasadena, California

Dear Dr. Mortazavi:

In-Situ soil thermal resistivity tests were conducted on July 19, 2011 at the Pasadena Water & Power facility in Pasadena, California in accordance with ASTM Standard D5334. Additional soil thermal resistivity tests were conducted in the laboratory on soil core samples acquired from the site. Laboratory data were collected from July 19, 2011 to August 08, 2011 by Hydrologue, Inc.

The site consisted of open ground partially covered with weathered asphalt and reinforced concrete. Obstructions in the survey areas consisted of above-ground piping, several storm drains and culverts, storage containers and vehicles.

In-situ soil thermal resistivity data were collected at 3 locations (Figure 1). Test locations were identified as RT-1, RT-2 and RT-3 which were located near boreholes BH-1, BH-3 and BH-5, respectively. Thermal resistivity test and borehole location data were taken with a Trimble ProXRS GPS system using Beacon differential corrections (Table 1).

Table 1: Resistivity Sounding Locations

Sounding ID Borehole ID	Northing	Easting
RT-1	1,868,574	6,516,289
RT-2	1,868,539	6,516,418
RT-3	1,868,515	6,516,344
BH-1	1,868,585	6,516,275
BH-3	1,868,582	6,516,427
BH-5	1,868,519	6,516,341

Note: Coordinates in California State Plane, NAD 83, Zone V (0405), US Feet

EQUIPMENT AND METHODOLOGY

Generally, thermal measurements are made to assess the thermal properties of soil or soft rock where an underground power cable system has been or will be installed. The concern is that electricity flowing in a conductor generates heat. A resistance to heat flow between the cable and ambient environment causes a rise in the cable temperature. Excessive temperature shortens cable life, reduces efficiency and can lead to catastrophic failure. Therefore, soil thermal properties are an important part of the overall design (Decagon Devices Application Note 13943-01, 2009).

The Decagon Devices KD-2 Pro portable meter and associated TR-1 soil and rock sensor were used for this investigation. As provided by the manufacturer, a delrin cylinder of known thermal properties was used to verify sensor performance.

The KD-2 Pro portable meter works in accordance with ASTM D 5334-08 by providing a linear hear source and temperature measuring element. Typically a heating element and a temperature sensor are placed inside a small needle tube with length around 30 times its diameter. The needle is firmly placed in the test material and allowed to equilibrate. Subsequently, temperature is monitored while the needle is heated and then again after the heating element is turned off, each for a predetermined amount of time dependent on material type and needle size (Decagon Devices Application Note 13943-01, 2009).

The relationship between water content and thermal resistivity is often termed the thermal dryout curve. Soil thermal properties depend strongly on water content and also temperature, density and composition. In-situ soil has fixed composition and density and typically exhibits small variations in temperature only slightly affecting thermal resistivity values. Therefore, the main variable is moisture content. Values from the dryout curve represent the effect of moisture content on thermal resistivity and are an integral part of the overall design for underground power cable systems (Decagon Devices Application Note 13994-01, 2011).

FIELD PROCEDURES

Before conducting thermal measurements, batteries in the thermal meter were checked to ascertain appropriate levels. A quick site reconnaissance was performed and general site conditions recorded on the field log.

Thermal measurements were made with the Decagon Devices KD-2 Pro unit using the soil and rock sensor (TR-1). Sensor performance verification was conducted before taking measurements using a Delrin calibration cylinder, as provided by the manufacturer. Performance verification results were recorded on the field log and stored on internal memory.

In-situ thermal measurements were made at predetermined locations and depths. Typically the sensor is pushed into the material and shaded from direct sunlight or possible wind gusts to minimize potential temperature fluctuations at the sensor. Data acquisition with the soil and rock sensor requires approximately 5 minutes per reading. A

minimum of two readings per location were acquired to ascertain consistency and repeatability. A minimum of 15 minutes between measurements is recommended to allow the sensor and surrounding material to reestablish temperature equilibrium. Practically, 20-30 minutes were allowed between readings.

Laboratory thermal measurements were made on previously acquired soil core samples. Hydrologue, Inc. determined the dry density and moisture content of select soil samples. After collecting thermal measurements, the samples were saturated for 24 hours. Thermal and moisture content measurements were repeated on the saturated samples.

DATA PROCESSING

Data from the KD-2 Pro unit were exported as a spreadsheet. Measured laboratory soil core physical parameters (eg. moisture content, dry density, physical description) were manually entered into the spreadsheet. Thermal and physical parameter data were used to determine points on the thermal dryout curve per manufacturer recommendations. Data are presented as graphs of thermal resistivity and moisture content. All data are summarized on a comprehensive table.

RESULTS

In-situ and laboratory soil core thermal resistivity data are attached as Table 2. Thermal dryout curve points were established on laboratory soil core sample measurements at dry and saturated moisture content. Results are presented as thermal conductivity (K) in units of $W/(m \cdot K)$, as well as thermal resistivity (rho) in units of $^{o}C \cdot cm/W$, as requested by Hydrologue, Inc. Thermal dryout curves are attached as Figures 2 – 6.

All data files and field logs are archived.

SUMMARY

Soil thermal resistivity measurements were collected at three in-situ locations, as directed by Hydrologue, Inc., and from soil core samples acquired from five locations at the Pasadena Water & Power facility. Measurements were made in accordance with ASTM standard D5334. At least two measurements per in-situ location were acquired to ascertain consistency and repeatability. Soil core sample measurements were collected by Hydrologue, Inc. at depths of interest. Soil core sample measurements were made on dry and saturated samples to obtain two points on the dryout curve. In-situ thermal resistivity measurements made at BH-1, BH-3 and BH-5 are within the respective dryout curve (Figures 2, 3, and 4). Soil moisture content for in-situ locations was assumed to correspond with soil core sample moisture content from the nearest depth interval. Thermal resistivity measurements were also made on soil core samples from additional locations BH-4 and BH-8 and data were used to generate respective thermal dryout curves (Figures 5, and 6). Measurements were consistent and repeatable exhibiting low error values. Laboratory samples from BH-5 at 19.5 – 21ft exhibit a thermal range larger than adjacent BH-5 samples (Table 2). The soil composition (i.e., gravely sand) likely

caused the large moisture content range of 1.4% for dry and 10.2% for saturated (Table 2), consequently leading to the exhibited thermal variability.

All data are summarized on Table 2.

If you have any questions concerning this investigation, please call us at 951-549-1234.

Sincerely,

GEO*Vision* Geophysical Services

1. COORDINATES OF THREE TBM'S SHALL BE USED TO SET LOCATION SYSTEM FOR THIS PROJECT.
2. ALL ELEVATIONS ARE SHOWN (GE) DRAWINGS CAN BE CONVERTED TO CITY ELEVATIONS BY SUBSTRACTING 0.056FT. THIS CONVERSION IS BASED ON PASADENA CITY BENCH MARK MONUMENT STA.#0025 @ EL.750.556' (ALUMINUM SURVEY DISK AT INTERSECTION OF GLEN ARM ST. & RAYMOND AVE.)

UNDERGROUND PIPING GENERAL NOTES:

1. GENERAL CONTRACTOR SHALL SUBMIT CONSTRUCTION SCHEDULE AND PLAN TO THE OWNER FOR REVIEW. CONSTRUCTION SCHEDULE & PLAN SHALL BE BASED ON "NO SERVICE INTERUPTION" ON SANITARY SEWER AND STORMDRAIN. FOLLOWING ARE SOME SUGGESTED SEQUENCE BUT NOT LIMIT TO:
   -COORDINATE BETWEEN ALL TRADES.
   -WEATHER
   -PROVIDE ADEQUATE PUMPS TO DIVERT THE FLOWS
   -MAKE THE TIE-INS LAST.
   -INSTALL NEW MANHOLE AROUND EXISTING LINE, DO NOT BREAK THE LINE UNTIL THE NEW LINE IS READY FOR SERVICE THEN PLUG UP THE OLD OUTLET OF THE EXISTING LINE (M.H. #1 & 2 FOR EXAMPLE).
2. All WORK SHALL BE DONE IN ACCORDANCE WITH THE "STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION" AND "STANDARD PLANS FOR PUBLIC WORKS CONSTRUCTION", LATEST EDITION (GREEN BOOK), INCLUDING SUPPLEMENTS.
3. ALL PIPING & FITTINGS FOR SANITARY SEWERS SHALL BE VITRIFIED CLAY PIPIE (VCP AND IN ACCORDANCE WITH ASTM-C700 AND STANDARD SPEC. GREEN BOOK ITEM 207-8 AND 208-2.
4. ALL PIPING & FITTINGS FOR STORM DRAIN UNLESS NOTED OTHERWISE SHALL BE DRISCOPIPE 1000-SDR21 OR EQUAL AND IN ACCORDANCE WITH THE "GREEN BOOK" STANDARD SPEC. ITEM 207-19. PIPE BEDDING; BACKFILL AND FIELD INSPECTION SHALL CONFORM TO ITEM 306-1.2.12, 306-1.2.13, 306-1.3
5. REINFORCED CONCRETE PIPE (RCP) FOR STORM DRAIN SHALL BE PRECAST AND IN ACCORDANCE WITH ASTM-C497M AND STD. SPEC. GREEN BOOK ITEM 207-2.
6. PRECAST REINFORCED CONCRETE BOX (RCB) CULVERT (6' SPAN x 4' RISE) SHALL CONFORM TO CALTRANS STANDARD XS 4-27 FOR MAXIMUM EARTH COVER DEPTH OF 10 FEET PLUS HS20 LIVELOAD. FOR DETAILS OF PRECAST RCB OF STRAIGHT JOINTS AND ELBOW, SEE "HYDRO CONDUIT" VENDOR DRAWING #A, B, C AND B150-CE-1243, THE DRAWINGS TO BE STAMPED BY CALIFORNIA LICENSED PROFESSIONAL CIVIL ENGINEER.
7. CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEST (EXFILTRATION TEST...) WHICH ARE REQUIRED BY THE CITY OF PASADENA FOR SANITARY SEWER AND STORM DRAIN PIPE. BEDDING; BACKFILL AND FIELD INSPECTION SHALL CONFORM TO ITEM 306-1.2.12, 306-1.2.13, 306-1.3
8. EXCAVATION OF 5 FEET OR MORE IN DEPTH SHALL REQUIRE SHORING AND BRACING. SHORING AND BRACING SHALL BE STANDARD SPEC. GREEN BOOK ITEM 7-10-4-1. AND CALIFORNIA OSHA STANDARDS
9. EXCAVATION SHALL BE DONE CAUTIOUSLY DUE TO EXISTING UNDERGROUND PIPING AND CONDUIT. PROBING AND HAND EXCAVATING MAY BE REQUIRED
10. FOR CONSTRUCTION ON STATE STREET, ALL TRAFFIC CONTROL OPERATIONS SHALL CONFORM TO THE PROVISION OF THE SECTION 7-10, "PUBLIC CONVENIENCE AND SAFETY", OF THE PASADENA SUPPLEMENTS. AND TO THE "WATCH" HANDBOOK
11. BEDDING MATERIAL SHALL BE SAND AND, GRAVEL CRUSHED AGGREGATED OR NATIVE FREE- DRAINING GRANULAR MATERIAL HAVING A SAND EQUIVALENT OF NOT LESS THAN 30. BEDDING MATERIAL SHALL BE COMPACTED TO 85% RELATIVE COMPACTION.
12. A PERMIT FROM THE CITY OF PASADENA DEPARTMENT OF PUBLIC WORK IS REQUIRED PRIOR TO ANY WORK IN THE PUBLIC RIGHT OF WAY. THE PERMIT MAY BE OBTAINED AT CITY HALL 100 N. GARFEILD AVE. ROOM 212, TELEPHONE 626-744-4195
13. ALL WORK TO BE INSPECTED PER CBC 2001, SECTION 1701 & 1702

PAVING & GRADING NOTES:

1. SEE DWG. #20001-C-001-01 FOR GENERAL NOTES OF CONCRETE AND ASPHALT PAVEMENT. SEE TYP. ASPHALT & CONC. PAVEMENT DETAIL, DWG.# C002-09
2. THE STRIPING ON BOTH SIDES OF FIRE LANE (ON PAVEMENT) ON THE CURB OR ON ONE SIDE OF WALL SHALL CONFORM TO THE CITY OF PASADENA STANDARDS.

MATCHLINE E. 389'5" C.O.D. 20001−E−004−03

MATCHLINE S. −468'−3" C.O.D. 20001−E−004−02

SEE DETAIL 1 (THIS DWG.)

NOTES:

1. ALL DUCTBANK CONDUITS TO BE RIGID PVC SCHEDULE 40.
2. TOP OF RED CONCRETE OF DUCT BANK SHALL BE A MINIMUM OF 6" BELOW ANY BOTTOM OF PIPE.
3. MINIMUM 6'−0" RADIUS SHALL BE USED FOR 35KV CONDUIT AT GSU TRANSFORMERS 3−377 AND 4−377.
4. ALL CONDUITS 4" & 6" CONDUIT SERIES #1500 WITH 15KV CABLES, THE MIN. RADIUS OF CONDUIT STUB−UP SHALL BE 36".
5. FOR ALL CONDUITS 2",3" THE MIN. RADIUS OF CONDUIT STUB−UP OR ELBOWS SHALL BE 18" AND FOR 4"C IT SHALL BE 24" MIN.
6. TOP OF DUCTBANK ELEVATIONS SHALL BE AS NOTED THIS DWG. OR DUCTBANK SECTIONS.
7. FOR STUB−UP LOCATIONS, SEE DWG. E008 SERIES.
8. ALL UNDERGROND PULL BOXES, PROVIDED BY CONTRACTOR, SHALL BE PRECAST CONCRETE, AS MANUFACTURED BY JENSEN PRECAST, PER APPROVED SPECIFICATIONS BY PWP. FOR PULL BOX INFORMATION REFER TO VENDOR DRAWING NUMBER 8−L−1322. FOR SIZE AND CONDUIT PENETRATIONS SEE DWG. E009 SERIES.
9. T.O.D. EL. SHALL BE "48'−0" FOR THE PORTION NOTED FOR THE 15KV BANK TO UGPB−3 AND THEN GRADUALLY REDUCED GOING EAST.
10. DUCTBANKS SOUTH OF 4−377 AND EAST OF 3−410 SHALL BE REINFORCED WITH REBARS. ALSO THE BACKFILL SOIL ALL AROUND UGPB−3 SHALL BE WELL COMPACTED TO PREVENT UGPB−3 FROM SHIFTING DUE TO BEING CLOSE TO 4−377 FOUNDATION SEE CIVIL DWG. C001−01 FOR STANDARD COMPACTION.
11. THE DUCTBANK BETWEEN UGPB−9 AND WEST PIPE PIT, CROSSING ABOVE THE STORM SEWER, SHALL BE REINFORCED WITH REBARS TO PREVENT POTENTIAL DAMAGE FROM HEAVY EQUIPMENT USAGE DURING GENERATOR 3−1 REMOVAL. SEE SECTIONS 23B AND 24 DWG. E004−10 FOR REBAR DETAILS.
12. ALL 35KV CONDUITS TERMINATING AT UGPB5 ARE SHOWN ON DWG. 2001−E004−13
13. THE RED CONCRETE MIX FOR FILLING IN ALL DUCTBANK SHALL BE 3000 PSI. STRENGTH AND BE A MAX. OF ½" SIZE OF AGGREGATE.

GENERAL NOTES – PIPING

1. SEE DRAWING C–004–01 FOR PROJECT BENCHMARK.
2. CONTRACTOR SHALL SUPPLY ALL MATERIALS UNLESS NOTED OTHERWISE.
3. ALL MATERIALS SHALL BE IN ACCORDANCE WITH THE PIPING DRAWINGS AND APPLICABLE SPECIFICATIONS. SUBSTITUTIONS ARE NOT PERMITTED WITHOUT WRITTEN APPROVAL FROM PW&P.
4. PIPING BRANCH CONNECTIONS ARE TO BE MADE IN ACCORDANCE WITH THE BRANCH CONNECTION CHARTS INCLUDED WITH THE PIPING SPECIFICATIONS UNLESS NOTED OTHERWISE.
5. FABRICATE, INSPECT, AND TEST ALL METALLIC PIPING PER PROJECT SPECIFICATIONS AND ASME B31.1. ALL WELDS ON FUEL GAS LINES ARE TO BE 100% X–RAYED.
6. INSTALL ALL HDPE AND PVC PIPING IN ACCORDANCE WITH MANUFACTURER'S INSTRUCTIONS.
7. PRESSURE TEST ALL PIPING AS DESIGNATED IN THE PIPING LINE LIST.
8. INSTALL EXPANSION JOINTS PER MANUFACTURER'S RECOMMENDATIONS. DO NOT PRESSURE TEST THROUGH EXPANSION JOINTS.
9. USE CAUTION DURING EXCAVATION. EXISTING UNDOCUMENTED ELECTRICAL AND PIPE LINES MAY EXIST.
10. ALL UNDERGROUND METALLIC LINES ARE TO BE COATED AND WRAPPED PER COATING SPECIFICATION PU1. COAT & WRAPPING TO EXTEND TO (BUT NOT INCLUDING) FIRST FLANGE ABOVE GRADE.
11. ALL UNDERGROUND METALLIC LINES ARE TO HAVE CATHODIC PROTECTION. INSTALL FLANGE INSULATION KITS AT FIRST FLANGE ABOVE GRADE. SEE ELECTRICAL DRAWINGS FOR CATHODIC PROTECTION DETAILS.
12. ALL UNDERGROUND GRAVITY DRAIN LINES (DESIGNATIONS OW & WW) ARE TO BE INSTALLED WITH A MINIMUM SLOPE OF 0.5% UNLESS NOTED OTHERWISE.
13. COMPLETE TESTING AND INSPECTION ON UNDERGROUND LINES BEFORE BACKFILL IS PLACED.
14. BACKFILL PIPE TRENCHES PER BEDDING DETAIL ON DWG. C–003–01.
15. DRAIN LINES FROM SKIDS TO DRAIN HUBS ARE TO BE FIELD ROUTED AS SHOWN ON THE F&IDS.

NOTES:

1. SEE DWG. P-001-01 FOR GENERAL NOTES.
2. LINES OW7004-6"-MB1T AND WW7001-4"-MB1T ARE DESIGNED WITH A MINIMUM SLOPE OF 0.5%. INSTALL THESE LINES IN ACCORDANCE WITH THE WORK POINT (W.P.) ELEVATIONS INDICATED TO AVOID INTERFERENCES WITH OTHER UNDERGROUND PIPING AND STORM SEWERS. WORK POINT ELEVATIONS SHOWN ARE TO CENTERLINE OF PIPE.
3. LINE BD9007-6"-MB1T IS NOT SLOPED. INSTALL AT BOP ELEVATIONS SHOWN.
4. SEE P-003-02, 03 & 04 FOR DRAIN LINE DETAILS.

RE: GEOPHYSICAL INVESTIGATION REPORT
Geophysical Survey
Pasadena Power Plant
85 East State Street
Pasadena, California

Dear Dan:

Hydrologue retained GeoVision, geophysical services (GeoVision) to perform a geophysical investigation at the Pasadena Power Plant located at 85 East State Street in Pasadena, California. The purpose of the investigation was to screen an approximately 1.5 acre area of the Site for subsurface infrastructure that may interfere with future construction. Geophysical techniques used during the investigation included various electromagnetic (EM) methods and magnetic methods. These methods complement one another as each responds to different physical properties and has different strengths and limitations.

The geophysical survey is described in the attached GeoVision repot No. 10105 dated April 14, 2010. Please note that the north direction shown on the map is grid north.

Several buried metallic objects/debris were indentified in the EM data. These anomalies may be associated with former subsurface infrastructure or other debris.

There are two additional geophysical anomalies that are probably associated with larger buried metallic objects/debris. These anomalies are labeled as "BM" on the color contour maps attached to the GeoVision report and maybe related to subsurface infrastructure or unmapped reinforced concrete. However, because the exact source of these larger anomalies is unknown, consideration should be given to uncovering the anomalies to determine their source. Several pipes and other subsurface linear anomalies were identified in the EM data as well.

These anomalies are probably related to former building footprints and abandoned subsurface utilities. Additionally, two anomalies, labeled A-1 and A-2 may be caused by underground vault/access structures related to the metallic lids on the surface of the area. The full extent of these anomalies may have been masked by the presence of nearby reinforced concrete. The reinforced concrete may also mask further subsurface structures in the survey area.

The geophysical survey was designed to map metallic, subsurface infrastructure with 5 feet diameter or larger.

HI has prepared this report for the exclusive use of Pasadena Power Plant only. It is GeoVision opinion that the geophysical survey was appropriately designed to locate such objects less than about 8 feet deep; except in portions of the survey area where data was affected by surface structures, such as excavations, fences, other large surface metallic objects and areas with reinforced concrete. No other warranty, either expressed or implied, is made.

This opportunity to be of service is sincerely appreciated. If you have any questions concerning this report, please do not hesitate to contact this office.

Very Truly Yours,
HYDROLOGUE, INC.

Seyed Morteza Mortazavi, Ph.D
R.G.E. 2216

APPENDIX A GEOPHYSICAL TECHNIQUES FOR SHALLOW ENVIRONMENTAL INVESTIGATIONS

1 INTRODUCTION

A geophysical investigation was conducted on March 30th, 2010 at the Pasadena Power Plant located at 85 East State Street in Pasadena, California. The purpose of the investigation was to screen an approximate 1.5 acre area of the site for subsurface infrastructure that may interfere with future construction.

The site consisted of a rectangular lot, divided by a chain link fence in the southeast and the west and a building to the north. The site featured some scattered metallic debris and surface metallic objects related to power plant activities and areas with reinforced concrete (see Figure 1).

Geophysical techniques used during this investigation included various electromagnetic (EM) methods and the magnetic method. These methods complement one another as each responds to different physical properties and has different strengths and limitations.

Geophysical techniques used during the investigation are discussed in Section 2. Field procedures are described in Section 3. Data processing and interpretation are discussed in Section 4. The results of the geophysical survey are presented in Section 5 and our professional certification is presented in Section 6.

2 GEOPHYSICAL TECHNIQUES

This section presents background information on the EM and magnetic methods used during this investigation. A description of the geophysical methods used during this investigation, common applications of the methods, photographs of the instruments and example applications are included in Appendix A.

EM equipment used during this investigation consisted of a Geonics EM-31 Terrain Conductivity Meter (EM-31) and a Geonics EM-61 Mk2A high-resolution digital metal detector (EM-61). The EM-31 consists of a transmitter and receiver coil, one at each end of a 12-foot long boom. An alternating current is applied to the transmitter coil, causing the coil to radiate a primary EM field. This primary field generates eddy currents in subsurface materials, which give rise to a secondary EM field. The EM-31 measures the components of the secondary EM field both in-phase and 90-degrees out-of-phase with the primary EM field. The out-of-phase component is converted to apparent conductivity in millisiemens per meter (mS/m) and the in-phase component is measured as parts per thousand (ppt) of the primary EM field. A negative EM-31 response with positive shoulders is generally observed over shallow, buried metallic objects. When the instrument boom is orientated parallel to a long, linear conductor such as a pipe, a positive response centered over the conductor is typically observed. The EM-31 must pass directly over or immediately adjacent to a buried metallic object to detect it. Because of the 12-foot separation between the transmitter and receiver coils, the EM-31 cannot detect very small, buried metallic objects. Approximately 70% of the EM-31 conductivity response arises from material in the upper 18 feet; however, the instrument is most sensitive to materials in the upper 5 feet.

The EM-61 has a single transmitter and two receiver coils. The bottom coil is the transmitter during the current on-time and receiver during current off-time. The top-coil, mounted 40-cm above the bottom coil, is a receiver coil only. The transmitter and receiver electronics controls are mounted on a backpack or on the instrument handle and a hand-held data logger is used to store field measurements. During operation, a half-duty cycle waveform is applied to the transmitter coil. During the off-time, the receiver coils measure the decay of eddy currents, in millivolts (mV), produced in subsurface metallic objects by the pulsed primary EM field. The top coil is gained in such a manner that the instrument response to a metallic object lying on the surface will be approximately equal at both the top and bottom coils. The effects of surface debris can, therefore, be suppressed by calculating the differential response (subtraction of the bottom coil from top coil response). Positive EM-61 anomalies centered over the source are typically observed over buried metallic objects. Above ground metallic objects will often give rise to a negative differential response, as the top coil response is larger than the bottom coil response.

The magnetometer used during this investigation consisted of a Geometrics G858 optically pumped cesium-vapor magnetometer (G858). This instrument measures the intensity of the earth's magnetic field in nanoteslas (nT) and, optionally, the vertical gradient of the earth's magnetic field in nanoteslas per meter (nT/m). The vertical magnetic gradient is calculated by measuring the total magnetic field with two sensors at different heights, subtracting the top sensor reading from the bottom sensor reading, and dividing by the sensor separation.

Buried ferrous metallic objects give rise to anomalies in the earth's magnetic field. These anomalies are generally dipolar with a positive response south and a negative response north of the object. The dimensions and amplitude of a magnetic anomaly are a function of the size, mass, depth and magnetic properties of the source. Magnetometers are not able to detect nonferrous metals such as aluminum or brass. The magnetometer has the greatest depth of investigation of the instruments applied to this survey.

3 FIELD PROCEDURES

This section describes the field procedures used during the investigation, including site preparation, EM-31, EM-61 and magnetometer survey procedures.

3.1 Site Preparation

Before conducting the geophysical investigation, the extent of the survey area was established by Hydrologue representatives. Various points of a 240 ft by 300 ft grid were set up using a Nikon NPL-362 pulse laser station. Afterwards, a 10- by 10-foot grid was marked on the ground within the survey area with surveyors paint, a 300-ft survey rope and the established grid points. Obvious surface cultural features that could potentially affect the geophysical data (i.e. buildings, fences, etc.) were identified in the field and plotted onto a scaled, hand-drawn site map. Prior to geophysical data collection, a full site utility survey was performed by **GEO***Vision*. The results of the utility survey were marked on the ground and mapped using a Trimble Real-Time Kinematic (RTK) differential GPS system. Various points on the geophysical grid were also surveyed and used to combine the geophysical grid and the utility survey into a single map. A combined site map showing the location of the geophysical survey area, surficial features and results of the utility survey is attached as Figure 1.

3.2 Geonics EM-31 Survey

The EM-31 was assembled and battery levels were checked and found to be within acceptable levels. The EM-31 digital data logger was then programmed with the appropriate file name and sample interval. EM-31 measurements were made at 5 foot intervals along east to west (E-W) survey lines spaced 5 feet apart using the 10-foot grid points for spatial control. The EM-31 data were stored in a digital data logger along with line and station number. If an error was made on a survey line (missed station, etc.), the line was repeated. EM-31 data were downloaded to a laptop computer at the end of the survey using the computer program DAT31W by Geonics Limited.

3.3 Geonics EM-61Mk2A Survey

The EM-61 was assembled and battery levels were checked and found to be within acceptable levels. The EM-61 digital data logger was then programmed with the appropriate file name and sample interval. EM-61 measurements were made at 2.5 foot intervals along east to west (E-W) survey lines spaced 5 feet apart using the 10-foot grid points for spatial control. The EM-61 data were stored in a digital data logger along with line and station number. If a location error was made on a survey line (extra station, etc.), the line was repeated. EM-61 data were downloaded to a laptop computer at the end of the survey using the computer program DAT61MK2 by Geonics Limited.

3.4 Geometrics G858 Survey

Prior to data acquisition, the G858 was programmed with the appropriate sampling interval and grid settings. Measurements of the earth's total magnetic field intensity and vertical gradient data were made with the G-858 at 0.2-second intervals as the operator walked along parallel east to west (E-W) survey lines nominally spaced 5 feet apart. A marker was inserted in the data as the operator crossed a 5 ft grid mark. The 0.2-second sampling interval resulted in an average station spacing of about 0.5 feet. The magnetic data were stored in the internal memory of the magnetometer along with time of measurement. If an error was made on a survey line (wrong survey line, etc.), the line was repeated. Magnetic data were downloaded to a laptop computer at the end of the survey using the program MAGMAP 2000 by Geometrics, Inc.

4 DATA PROCESSING AND INTERPRETATION

This section presents the data processing procedures and interpretation of the geophysical data.

4.1 Data Processing

Color-enhanced contour maps of EM and magnetic data were generated using the Geosoft® Oasis montaj ™ geophysical mapping system. The maps were color-enhanced to aid in the interpretation of subtle anomalies. Prior to map generation, a number of preprocessing steps were completed and included:

- Backup of all original field data files.
- Correcting of all data acquisition errors (typically only deleting the first portion of a reacquired line, renaming lines incorrectly labeled, deleting additional readings outside the grid, etc.)
- Reformatting field data files to free format XYZ files containing line number, station, time (if applicable), and field measurements.
- Applying small adjustments to EM-61 and/or EM-31 station locations to compensate for data being recorded while the operator was walking.
- Merging of multiple data files into a single file and sorting, if necessary.

These data adjustments were made using a combination of commercial and in-house software. All adjustments made to data files and resulting file names were documented and are retained in project files.

The output of the data preprocessing was a data file containing line and station number and the geophysical measurements. These data files were imported into the Oasis montaj® mapping system and the following data processing steps applied:

- Reformatting of data files to Oasis montaj® format
- Generating final map scale
- Gridding data using a 1 to 2.5-foot cell size and down- and cross-line splines
- Masking grid in areas where data not acquired (i.e. around site perimeter, fence locations)
- Applying a Hanning filter to smooth the data, if necessary
- Generating color zone file describing color for different data ranges
- Contouring the data
- Generating map surrounds (title block, legend, scale, color bar, north arrow, etc.)
- Annotating anomalies
- Merging various plot files and plotting final map

The names of the files generated and the processing parameters used were documented and are retained in project files. All files generated during the processing sequence were archived on a backup drive.

4.2 Interpretation

Color-enhanced contour maps of the EM-61 Channel 3 (CH3) response and the EM-31 in-phase response are presented as Figures 2 and 3, respectively. Color-enhanced contour maps of the EM-31 conductivity response, EM-61 differential response and magnetic responses were also generated. These maps are not presented as they did not reveal additional information and were, therefore, considered redundant. The color bar indicates the amplitude of the measured quantity with the magenta and cyan colors representing high and low amplitudes, respectively. The light orange, yellow and light green colors indicate average "background" values of the measured quantity.

Areas covered by reinforced concrete had a severe impact on the EM-31 and EM-61 data responses. The reinforced concrete effectively masked any other responses in the EM-31 and EM-61 data.

Several surface anomalies imaged in the data were caused by surface metallic debris. These anomalies are labeled with “SM” on the respective contour maps.

There are several anomalies in the EM data that are interpreted as being caused by small buried metallic objects/debris. These anomalies are labeled with a “B” or a red dot on the color-enhanced contour maps (Figures 2 and 3) and the site map (Figure 1). Many of these anomalies are likely associated with former infrastructure debris or other discarded objects. No attempt was made to identify all of these anomalies on the color contour maps. Any unmarked anomalies are likely caused by very small sources and will have very little impact on future construction activities.

There are two anomalies in the EM data that are interpreted as being caused by large buried metallic objects/debris. The anomalies are identified with boxes and are labeled “BM” on the site map and the EM color-enhanced contour maps (Figures 1, 2 and 3). Both of these anomalies are located in close proximity to the buildings in the north. These anomalies are likely related to subsurface infrastructure or unmapped areas of reinforced concrete. Both anomalies give rise to large, positive EM-61 CH3 responses and strong, negative EM-31 responses. The EM-31 responses are not continuous throughout each zone. This may indicate that the sources of the anomalies are not from a single, large metallic object, but rather multiple objects/debris.

There are several anomalies in the EM data that are interpreted as being caused by underground pipes or other linear subsurface infrastructure. Many of these anomalies coincide with mapped utilities located during the utility location survey conducted prior to this investigation. In locations where the interpreted underground pipelines and the mapped utilities do not agree (line extensions, etc.), the interpreted pipelines are labeled “IP” on the site map (Figure1).

There are two additional anomalies interpreted in the EM data that warrant further discussion. These anomalies are located in the northeastern portion of the site and are labeled A-1 and A-2. Both of these anomalies are located south of an area containing reinforced concrete and south of the building. These anomalies give rise to strong, positive

EM-61 CH3 responses and strong, negative EM-31 in-phase responses. The negative EM-31 in-phase responses also have positive responses surrounding them. The lack of a single, coherent negative response with clear positive shoulders indicates that these anomalous zones may consist of multiple buried objects or a single object that changes orientation. Each anomalous zone is coincident with metallic access lids seen at the surface. A limited visual field inspection indicated that the lids lead to a large vault/junction access. Anomalies A-1 and A-2 may be associated with the extents of the vault/junction access locations. However, due to the presence of the nearby reinforced concrete, the extents of anomalies A-1 and A-2 may be obscured to the north and may further continue beneath the reinforced concrete slabs.

5 CONCLUSIONS

A geophysical investigation was conducted on March 30th, 2010 at the Pasadena Power Plant located on 85 East State Street in Pasadena, California. The purpose of the investigation was to screen an approximate 1.5 acre area for metallic subsurface infrastructure that may interfere with future construction. Interpretation of the geophysical data and the results of the utility survey conducted prior to this investigation are presented in Figure 1. Color-enhanced contour maps of the EM-61 CH3 response and EM-31 in-phase response are presented as Figures 2 and 3, respectively. Several buried metallic objects/debris were indentified in the EM data. These anomalies may be associated with former subsurface infrastructure or other debris. There are also several very small buried metallic objects that are unmarked on each of the color contour maps. These objects should not have any impact on construction activities at the site.

There are two additional geophysical anomalies identified in the EM-61 and EM-31 data that may be associated with larger buried metallic objects/debris. The anomalies are labeled as "BM" on the color contour maps and maybe related to subsurface infrastructure or unmapped reinforced concrete. However, because the exact source of these larger anomalies is unknown, consideration should be given to uncovering the anomalies to determine their source. Several pipes and other subsurface linear anomalies were identified in the EM data. These anomalies are likely related to former building footprints and abandoned subsurface utilities.

Additionally, two anomalies, labeled A-1 and A-2, are identified in the EM-61 and EM-31 data. These anomalies may be caused by underground vault/access structures related to the metallic lids on the surface of the area the area. The full extent of these anomalies may be masked by the presence of nearby reinforced concrete. The reinforced concrete may also mask further subsurface structures in the survey area.

The geophysical survey was designed to map metallic, subsurface infrastructure with dimensions of greater than 5 feet. It is our opinion that the geophysical survey was appropriately designed to locate such objects less than about 8 feet deep; except in portions of the survey area where data was affected by surface structures, such as excavations, fences, other large surface metallic objects and areas with reinforced concrete.

6 CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision of and reviewed by a **GEO*Vision*** California Professional Geophysicist.

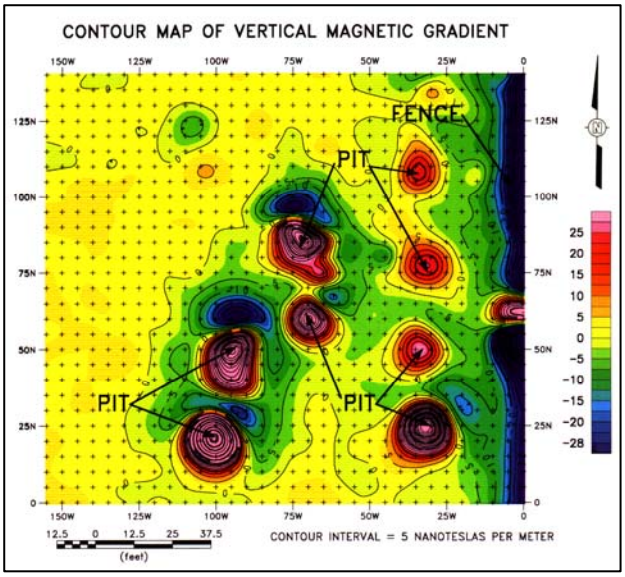
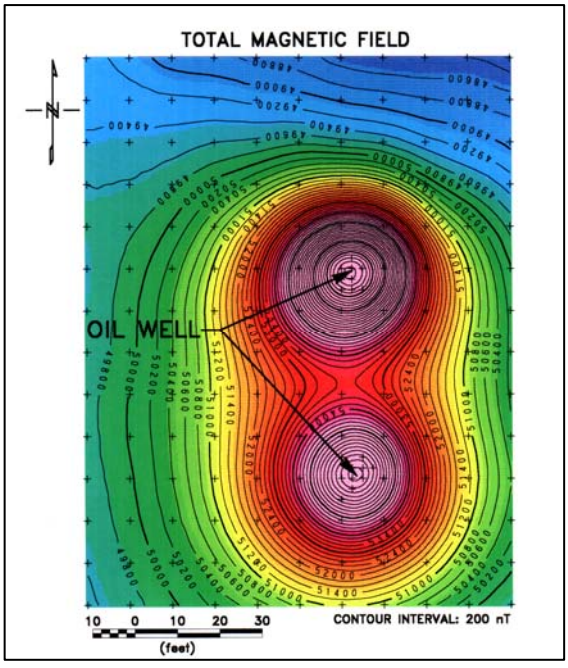
GEOPHYSICAL TECHNIQUES FOR SHALLOW ENVIRONMENTAL INVESTIGATIONS

GEOVision geophysical services



MAGNETIC METHOD

The magnetic method generally involves the measurement of the earth's magnetic field intensity or vertical gradient of the earth's magnetic field. Anomalies in the earth's magnetic field are caused by induced or remanent magnetism. Induced magnetic anomalies are the result of secondary magnetization induced in a ferrous body by the earth's magnetic field. The shape and amplitude of an induced magnetic anomaly is a function of the orientation, geometry, size, depth, and magnetic susceptibility of the body as well as the intensity and inclination of the earth's magnetic field in the survey area. The magnetic method is an effective way to search for small metallic objects, such as buried ordnance and drums, because magnetic anomalies have spatial dimensions much larger than those of the objects themselves. Typically, a single buried drum can be detected to a depth of about 10 feet. Larger metallic objects can often be located to greater depths. Induced magnetic anomalies over buried objects such as drums, pipes, tanks, and buried metallic debris generally exhibit an asymmetrical, south up/north down signature (positive response south of the object and negative response to the north).



Geometrics G858 Cesium Magnetic Gradiometer

Magnetic data is typically acquired along a grid with results being presented as color-enhanced contour maps generated by the Geosoft™ Mapping System or OASIS montaj. The approximate location and depth of magnetic objects can be calculated using the Geosoft™ UXO System.

Magnetic Survey to Locate Pits Containing Buried Metallic Containers

Magnetic Survey to Locate Abandoned Oil Wells

Magnetic surveys are typically conducted to:

- Locate abandoned steel well casings
- Locate buried tanks and pipes
- Locate pits and trenches containing buried metallic debris
- Detect buried unexploded ordnance (UXO)
- Map old waste sites and landfill boundaries
- Clear drilling locations
- Map basement faults and geology
- Investigate archaeological sites

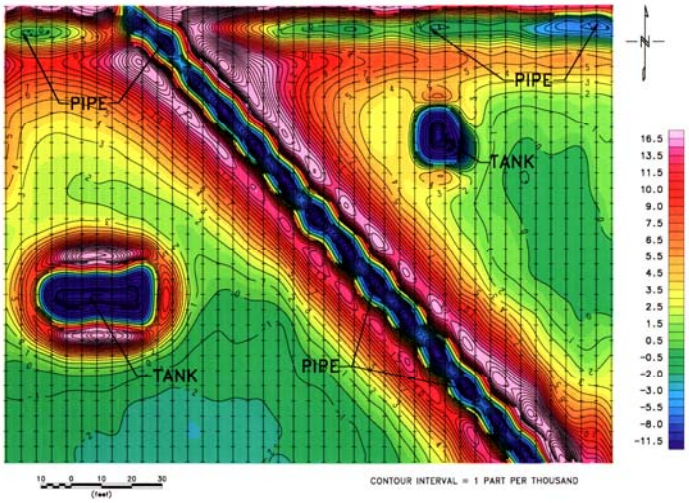
ELECTROMAGNETIC METHODS

Electromagnetic (EM) methods typically applied to shallow environmental investigations include frequency domain EM methods, such as EM induction and EM utility location methods, time domain electromagnetic (TDEM) metal detection methods, and ground penetrating radar (GPR) methods.

EM Induction Method



EM induction surveys are often conducted using the Geonics EM-31 terrain conductivity meter (EM-31). The EM-31 consists of a transmitter coil mounted at one end and a receiver coil mounted at the other end of a 3.7-meter long plastic boom. Electrical conductivity and in-phase component field strength are measured and stored along with line and station numbers in a digital data logger. In-phase component measurements generally only respond to buried metallic objects; whereas conductivity measurements also respond to conductivity variations caused by changes in soil type, moisture or salinity and the presence of nonmetallic bulk wastes. The EM-31 must pass over or immediately adjacent to a buried metallic object to detect it. Typical EM-31 anomalies over small, buried metallic objects consist of a negative response centered over the object and a lower amplitude positive response to the sides of the object. When the instrument boom is oriented parallel to long, linear conductors such as pipelines a strong positive response is observed. The EM-31 can explore to depths of about 6 meters, but is most sensitive to materials about 1 meter below ground surface. Single buried drums can typically be detected to depths of about 5 feet.

Geonics EM-31 Terrain Conductivity Meter

EM-31 surveys are typically conducted to:

- Locate buried tanks and pipes
- Locate pits and trenches containing metallic and/or nonmetallic debris
- Delineate landfill boundaries
- Delineate oil production sumps and mud pits
- Map conductive soil and groundwater contamination
- Map soil salinity in agricultural areas
- Characterize shallow subsurface hydrogeology
  - Map buried channel deposits
  - Locate sand and gravel deposits
  - Locate conductive fault and fracture zones

Geonics EM-31 Survey to Locate Underground Storage Tanks

EM Utility Location Methods

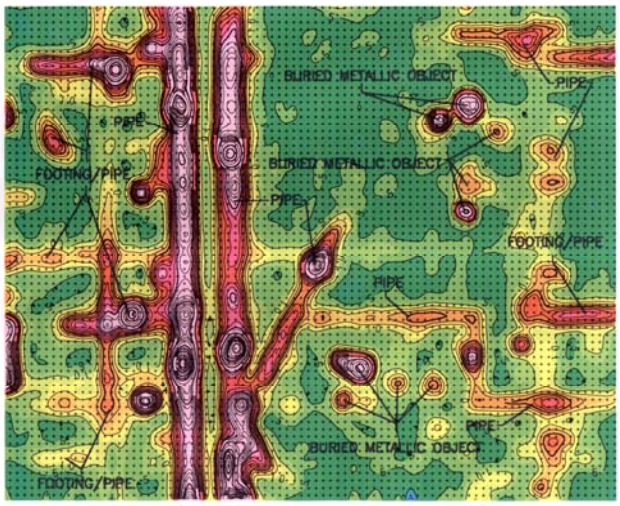
EM utility locators; such as the Metrotech 810, Metrotech 9890 and Radiodetection RD400, are designed to accurately trace metallic pipes and utility cables and clear drilling/excavation locations. These utility locators consist of a separate transmitter and a receiver. The transmitter emits a radio frequency EM field that induces secondary fields in nearby metallic pipes and cables. The receiver detects these fields and is used to accurately locate and trace the pipes, often to distances over 200 feet from the transmitter. Many of the utility locators have a passive 60Hz mode to locate live electrical lines. Modern utility locators are also capable of providing rough depth estimates of the pipes.

Metrotech EM Utility Locator

1124 Olympic Drive, Corona, California 92881, ph. 951-549-1234 fx. 951-549-123 www.geovision.com

TDEM Metal Detection Methods

A Geonics EM-61 (EM-61) is a high sensitivity, time-domain, digital metal detector which is often used to detect both ferrous and non-ferrous metallic objects. It is designed specifically to locate buried metallic objects such as drums, tanks, pipes, UXO, and metallic debris and to be relatively insensitive to above ground structures such as fences, buildings, and vehicles.



Geonics EM-61 Digital Metal Detector

The EM-61 consists of two square, 1-meter coils, one mounted over the other and arranged on a hand-towed cart. The bottom coil acts as both a transmitter and receiver while the top coil is a receiver only. While transmitting the bottom coil generates a pulsed primary magnetic field, which induces eddy currents into nearby metallic objects. When the transmitter is in its off cycle both coils measure the decay of these eddy currents in millivolts (mV) with the results being stored in a digital data logger along with position information. The decay of the eddy currents is proportional to the size and depth of the metallic target. A symmetrical positive anomaly is recorded over metallic objects with the peak centered over the object.

The signal from the top coil is amplified in such a way that both coils record effectively the same response for a metallic object on the surface and the top coil records a larger response for buried metallic objects. The response of near surface objects can, therefore, be suppressed by subtracting the lower coil response from the upper coil response (differential response).

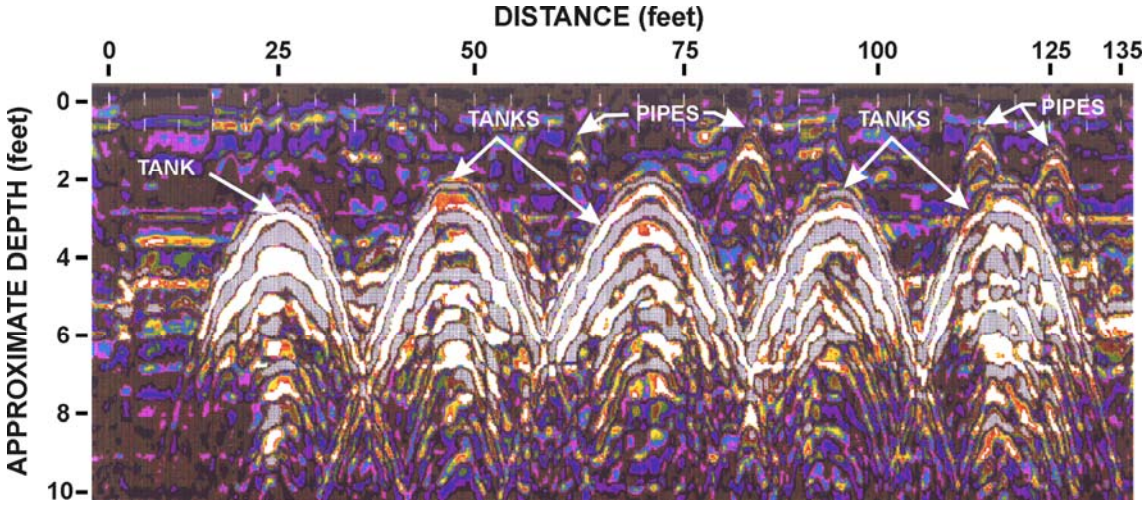
In practice, the usable depth of investigation of the EM-61 depends on the size and shape of the object and the amount of above ground interference encountered at the site. A single buried drum can often be detected at a depth of about 10 feet.

Geonics EM-61 Survey to Map Subsurface Infrastructure

GPR Methods

Ground-penetrating radar (GPR) is a high-frequency electro-magnetic method commonly applied to a number of engineering and environmental problems.

GSSI SIR-10A GPR Unit



A GPR system radiates short pulses of high-frequency EM energy into the ground from a transmitting antenna. This EM wave propagates into the ground at a velocity that is primarily a function of the relative dielectric permittivity of subsurface materials. When this wave encounters the interface of two materials having different dielectric properties, a portion of the energy is reflected back to the surface, where it is detected by a receiver antenna and transmitted to a control unit for processing and display.

Depth penetration is a function of antenna frequency and the electrical conductivity of the soils in the survey area. Lower frequency antennas achieve greater depth penetration than higher frequency antennas, but have poorer spatial resolution. Conductive soils, such as clays, attenuate the radar waves much more rapidly than resistive dry sand and rock. In many environments in California, depth penetration of 500 and 300 MHz antennas is limited to 3 to 5 feet. Depth penetration may be greater if shallow soils consist of clean sands and less if shallow soils consist of clay.

GPR surveys are typically conducted to:

- Locate and delineate underground storage tanks (metallic and non-metallic)
- Locate metallic and nonmetallic pipes and utility cables
- Map rebar in concrete structures
- Map landfill boundaries
- Delineate pits and trenches containing metallic and nonmetallic debris
- Delineate leach fields and industrial cribs
- Delineate previously excavated and backfilled areas
- Map shallow groundwater tables
- Map shallow soil stratigraphy
- Map shallow bedrock topography
- Map shallow subsurface voids and cavities
- Characterize archaeological sites

Geophysical Survey Systems Inc. (GSSI) SIR-2 or SIR-10 GPR systems with antennas in the frequency range of 50 to 1,000 MHz are often used during GPR investigations. Mala Geoscience and Sensors and Software, Ltd also manufacture GPR systems. GPR data is processed using a variety of software including the RADAN™ or GRADIX software packages by GSSI and Interpex Ltd., respectively.

Dear Mr. Angeles:

This report presents information gathered during our investigation and our opinions regarding the soils engineering factors affecting the construction of the proposed Glenarm Repowering Project (GT-5 Combined Cycle Installation) (Figures 3 & 4) at the southeast corner of the intersection of South Fair Oaks Avenue and Glenarm Street in the City of Pasadena, California (hereinafter referred to as "Site") (Figure 1). This investigation was performed from June 8, 2011 through August 2011 in conformance with the Pasadena Water & Power, Glenarm Repowering Project, GT-5 Combined Cycle Installation, Geotechnical Requirements, prepared by Power Engineers, dated May 3, 2011, and consisted of field exploration, laboratory testing, engineering analysis of the field and laboratory data, and preparation of this report.

DESCRIPTION OF SITE

The Site is located at the southeast corner of the intersection of South Fair Oaks Avenue and East Glenarm Street in Pasadena, California (Figure 1). The Site was first developed at the turn of the century with the existing warehouse building in its southwest comer. The Site now contains an inactive oil-and-natural-gas-fired electric generating station used by the Pasadena Water and Power Department from 1906 through 1977.

In 1906, Pasadena Water and Power Department constructed the original steam-plant building. The facility was demolished before construction of the tank farm in 1971. The existing non-operational steam plant occupies the Site's north side and currently consists of two attached buildings, including the eastern building, constructed in the early 1920s, and the western building, constructed in the early 1930s. Each of the existing buildings includes boiler and turbine generator areas. Both systems in the west building remain in place but Pasadena Water and Power Department removed the systems from the east building during the 1950s. Pasadena Water and Power Department later installed a few machine tools in the former boiler area of the east building. Some of those machine tools remain.

The topography of the Site is relatively flat. Mixed property uses surround the Site and include the Gold Line right of way (ROW) and the Water and Power Department Broadway Steam Plant to the east, a Southern California Edison substation and Water and Power Department Electrical and Maintenance shop to the south, and several commercial businesses to the west. Residential areas of Pasadena and South Pasadena are within 1,000 feet west and south of the Site, respectively. The Metropolitan Transit Authority presently owns the railroad Gold Line ROW along the east property boundary.

PROPOSED DEVELOPMENT

We understand that the proposed project consists of the construction of the Glenarm Repowering Project (GT-5 Combined Cycle Installation) (Figure 4). We also understand that the proposed stacks are approximately 12 feet in diameter and 125 feet high. Total approximate live and loads for Steam and Gas Turbine generators are 1,300 and 620 kips, respectively. The approximate total horizontal earthquake load for each turbine system and stack is about 205 kips. The approximate total wind loads for each turbine system and stack are 130 and 65 kips.

The project will consist of one Combustion Turbine Generator (CTG), one Steam Turbine Generator STG, once Through Steam Generator OTSG, OTSG Stack, Transformer, fuel gas compressor, Cooling Towers and associated equipment, driveways, and a parking lot. Some of the equipment will be subject to vibrations. Based on the available information, we understand that most of the structures and equipment will be constructed at or near the level of the existing ground surface. No basements or other underground structures are planned. We understand that major equipment and structures are planned to be supported on large concrete mats.

FIELD EXPLORATION

Subsurface conditions were explored by drilling 10 soil borings; 3 to a depth of 60 feet below ground surface (bgs), and seven to 50-feet bgs. Soil borings were placed in the vicinity of the requested boring locations by Power Engineers, Inc. Soil borings were drilled by R & C Drilling using a drilling rig equipped with hollow-stem augers to observe and sample the materials that will provide foundation support for the proposed equipment (Figure 4). Soil samples were collected at 5 foot intervals from each boring using six 2½-inch diameter by 1-inch long and two 2½-inch diameter by 3-inch long brass tubes mounted within a 2½-inch inside diameter Modified California split-spoon drive sampler. A Hydrologue geologist supervised drilling operations and logged all soil borings in accordance with the Unified Soil Classification System (Appendix A). Additionally, a Standard Penetration Test was performed at each sampling interval using a Standard Split Spoon Sampler. The blow count for each 6-inch penetration of the Standard Sampler was recorded in the boring logs. The number of blows required for the last 12-inch penetration of the Standard Split Spoon Sampler into the formation is the SPT blow counts.

The sampler was attached to sampling rods, lowered to the sampling depth, and then was driven 18-inches into the formation. Blow counts per last 12-inch of penetration of the sampler were recorded to evaluate the consistency of the formation. No groundwater was encountered during drilling. Undisturbed and bulk samples of the soils were collected from within the boreholes. The undisturbed soil samples were sealed immediately in water-tight containers for shipment to our laboratory for geotechnical testing.

SOIL CONDITION

Fill

Man-made fill was encountered to a depth of approximately 5 to 10 feet below ground surface (bgs) in the exploratory borings. The man-made fill consists of dark brown to brown clay, and silty sand in moist and moderately compact conditions. Deeper man-made fill may be present in unexplored areas of the Site.

Natural Ground

The Site is underlain by stream channel deposits of gravel, sand and silt (Qg) and alluvial fan outwash from major canyon grades northward into Q_a. The Site appears to be within the northern terminus of the Alhambra Wash. The Qg deposits underlying the Alhambra Wash intersect a concealed portion of the Eagle Rock Fault. According to Figure 16, the north side of the Site is covered with Holocene young Alluvial Fan Deposits, Qyf1, while the southeast of the Raymond Hills is covered with Pleistocene Alluvial Fan Deposits, Qof3gs. Raymond Hill and Grace Hill are mapped as pre-Quaternary bedrock. The Eagle Rock Fault is described in the following sections.

According to the Geologic Map of the Pasadena Quadrangle by Thomas W. Dibblee, Jr. dated 1989 (Figure 6), adjacent to the east and north sides of the Site is Q_a and west side of the Site is alluvium Q_{of} consisting of older dissected surfacial sediment alluvial fans from San Gabriel Mountains.

At the Site, beneath the man-made fill, brown to brown sandy silt, olive brown gravelly sand, and silty sand and in moist and moderately dense to dense conditions were encountered.

PHYSICAL SITE LOCATION

The coordinates of the Site are approximately 118.1494° west longitude, 34.1268° north latitudes. The Site is located at an elevation of approximately 752 feet above Mean Sea Level (MSL). The local surface drainage and topographic pattern is generally to the southeast and locally to the east, with a local topographic gradient of approximately 0.01 foot/foot, toward the east (Figure 1).

GEOLOGIC SETTING

The Pasadena Power Plant (Site) is located along the northeastern side of the Raymond Hills and eastern side of Grace Hill at the terminus of the Alhambra Wash in the southern portion of the City of Pasadena within Raymond Basin, a structurally elevated low relief surface lying to the northwest of the prominent San Gabriel Basin. The Raymond Basin is a triangular shaped alluvial plain that abuts the steep and high San Gabriel Mountains to the north and the moderate relief San Rafael Hills to the west. The active Raymond Fault forms its south-southeast boundary and separates the Raymond and San Gabriel Basins.

The Pasadena/Altadena/Sierra Madre areas are considered seismically active, where moderate sized earthquakes occur infrequently and active and potentially active faults abound. The east-west trending San Gabriel Mountains rises more than one mile above the basin floor with the steep southerly flank of the range, representing a recessed fault scarp of the Sierra Madre Fault zone. The north side of the San Gabriel Mountains is bounded by the active San Andreas Fault and represents the main boundary between the North American and Pacific tectonic plates. The Raymond Fault is trending east-northeast, a branch, and closely related to the Sierra Madre Fault that separates the Raymond and San Gabriel Basins. All of these faults have ruptured historically and have produced moderate to major earthquakes.

As a result of the continued movement between the plate boundaries, major north to south compressive forces are created across the region. These have resulted in uplift of mountains and chains of hills and depressed adjoining basins shaping a sequence of east-west trending uplands which collectively form the Transverse Ranges Physiographic Provence of Southern California. The adjacent basin floors are filled as a result of the uplands erosion and transport of sedimentary deposits. In the vicinity of the Site, alluvium of Pleistocene and Holocene age (Figure 16) was deposited by rivers and streams flowing south from the San Gabriel Mountain San Rafael Hills. The San Rafael Hills are characterized by small- and medium-sized rounded hills and intervening valleys. These drainages migrated back and forth, forming broad coalescing alluvial fans. Today the Raymond Basin is filled with several hundred feet of alluvial materials. Underlying the alluvium is a thick sequence of Tertiary age sedimentary rocks and below that is basement rock composed of granitic intrusive rocks of Mesozoic age and pre-Cambrian(?) metasediments (Figure 9). The depth to basement rock varies from a few feet near the mountain and hill front to nearly 2000 feet in the southerly portion of the basin.

A major geomorphic feature in the area is the Arroyo Seco, which extends through Pasadena down the west-central part of the area and veers southwesterly near the Pasadena/South Pasadena City boundary. The Arroyo Seco is a steep-walled, flat-floored ravine about 500 to 1,000 feet wide and 50 feet deep. The arroyo widens into a relatively flat plain in South Pasadena. This change in relief is related to the Raymond Fault scarp, which crosses the area on the southern side of Raymond Hill, on the south side of Pasadena Power Plant as a result of vertical displacement on the Raymond Fault. Relief across the scarp is about 40 or 50 feet, but has been highly modified by urban development.

The San Gabriel Valley, which encompasses the southeastern side of Raymond Basin, is essentially a flat, gently south-sloping surface consisting of ancient (Pleistocene age) alluvial fans, flood plain, and basin fill alluvium. Elevations in the northern part of the Valley are in the 800- to 900-foot range, whereas in the south, elevations are in the 400- to 500-foot range. The flatness of the San Gabriel Valley surface is interrupted by several small hills and knolls which are outliers of the Repetto and San Rafael Hills. The largest of these hills is Raymond Hill, which is about 90 feel high. A smaller knoll just northwest of Raymond Hill is called Grace Hill (Figure 7). The other knolls are not named and are relatively subtle features that go largely unnoticed by the general public. Because of the bedrock exposures, these small knolls are important for understanding the geology of the region.

STRATIGRAPHY

The majority of rocks in the area consist of Tertiary age (16 million years old) marine sedimentary rocks of Topanga Formation (Figures 8 and 9). It is important to recognize that the geologic profiles in Figure 9 and 10 are idealized and simplified to represent the entire area. The south of the area consists primarily of rock formations, whereas the east, west and north sides of the area have thick alluvial deposits over the rock formations at depth.

Quaternary-age alluvium occurs at the Site proximity to a depth of approximately 200 feet thick (190 feet at R-09Z3B3), and at the south side of the Site in the Raymond Hill area where it is much thinner and on the order of 0 to 50 feet (43 feet at R-09-Z3B6). Alluvium at the proximity of the Site consists of clay, silt, and sand with a major component of gravels and cobbles and some boulders, all composed of igneous and metamorphic rocks.

The principal formation in the southernmost portion of Figure 7 is the Fernando Formation, which consists of soft and weak, massive claystone and siltstone. The Fernando Formation overlies the Puente Formation in the southern part of Figure 7. The contact is sharp and possibly unconformable (Dibblee, 1992).

The sedimentary rock at the proximity of the Site is composed of the Topanga Formation and includes a wide variety of rock types ranging from coarse-grained rocks such as breccia, conglomerate, and sandstone to fine-grained sandstone and siltstone with minor claystone (mudstone). The part of the Topanga Formation north of the Raymond Fault is predominantly sandstone, conglomerate, and breccia. The Topanga Formation also has intrusive volcanic rocks. For example, a 10-foot-thick zone of hard volcanic rock was encountered in previous Caltrans study within boring EMI-2, drilled immediately south of the Raymond Fault.

The bedrock on the northern side of the Site, north of the San Rafael Fault, consists of the Cretaceous age (approximately 120 to 160 million years ago) basement complex that is generally mapped in exposures of the San Rafael Hills as Wilson Diorite or Quartz Diorite (Dibblee, 1989c; Lamar, 1970).

AREA GROUNDWATER CONDITIONS

The Raymond Basin and San Gabriel Basin have been extensively utilized for groundwater resources. Water wells drilled in both basins have produced good aquifer data necessary for the groundwater depth and flow direction determination. Groundwater is resupplied to the Raymond Basin from surface runoff in the San Gabriel Mountains. The Raymond Fault to the south forms a very effective groundwater barrier causing groundwater to cascade over the fault and fall about 200 feet.

The groundwater surface elevation ranges from about 1,400-feet near the mountain front in the north to 450-feet near the Raymond Fault. In the past, springs and small ponds have formed to the south of the Raymond Fault scarp. The groundwater in the basin is unconfined and has a southeast

gradient of 0.02- to 0.06- foot per foot. Perched groundwater was not encountered to the depth explored at the Site (60 feet bgs). Reported highest groundwater depth at the Site proximity was about 50 feet bgs. Reported groundwater depth by a Caltrans consultant on the south side of the Site (south of San Rafael Fault in boring R-09-Z3B6) was 51.2 and on the north side of the Site was 136 feet (north of San Rafael Fault in boring R-09Z3B3). Both borings were converted to piezometers after drilling.

SITE GROUNDWATER

Groundwater was not encountered at the Site to the depth explored (60 feet bgs). Based on the Los Angeles County Department of Public Works (LACDPW), the closest active well near the Site is Well # 4057H (personal communication with Miguel Osorio of LACDPW, December 17, 2009), located two blocks northeast of the Site at the intersection of Ohio Street and South Euclid Avenue. The depth to groundwater was measured at approximately 120.7 feet bgs on May 10, 2004. Ground surface elevation at this well is about 750 feet above mean sea level (MSL).

The closest inactive well near the Site is Well # 4056C, located near the railroad track at the intersection of Thomas Guide Grid Lines 6 and 7 (just south of Fillmore Street). The depth to water was last measured at approximately at 164.3 feet bgs on October 25, 1974. The ground surface elevation at this well is about 757.8 feet above MSL.

A groundwater well was discovered beneath a concrete block and slab during the demolition activities at the vicinity of then proposed gas turbine generators GT1 and GT2 at the Site. The demolition contractor excavated the perimeter of the well to approximately 15 feet below ground surface using a backhoe. A 12-inch steel conductor casing and a 2-inch diameter steel inner pipe was observed. The gap between the inner pipe and outer casing was filled with soil but the inner pipe was found open and the depth to water was measured by the contractor using a measuring tape and found to be about 85 feet below ground surface (bgs) with at least 5 feet of water. This is consistent with the depth to water reported by the LACDPW measured on May 16, 2002 from the nearby Well # 4057H.

TECTONIC SETTING

Tectonic processes (faulting and earthquakes) are very active in the Site region. Figures 6, 7, 12 and 13 show the Site location relative to the known active and potentially active faults. Obviously, the closer a site is to an active fault, the greater potential there is for surface rupture and high earthquake ground motions. The Site does not lie close to any known active fault capable of surface fault rupture. However, the queried and buried trace of the San Rafael Fault is shown to cross the northeastern corner of Jacob Parking Lot (Figure 14). It should be noted that, on Figure 6, the fault is shown to cross through the Pasadena Power Plant entering from the west and exiting from southeast corner along the Alhambra Wash.

The faults that trend mostly to the east-west are those associated with the Transverse Ranges. They produce mostly reverse (thrust) movement along north dipping planes which trend along southerly

facing upland flanks. The active thrusts in the region include the Sierra Madre, Cucamonga, Raymond, and Santa Monica-Hollywood Faults. Another type of thrust fault is a blind thrust, these faults also are associated with the same process that elevated the Transverse Ranges, but the fault has been remained buried and undetectable unless it produces an earthquake. The Raymond Fault, projecting along the south side of the Raymond Basin, at one time, may have been a blind thrust but because of continued activity it ruptured the ground surface.

The dominant fault system in the region is associated with the San Andreas Fault zone. The system moves in a right lateral northwest trending direction with locally some vertical movement. The San Jacinto, Whittier-Elsinore, Newport-Inglewood, Palos Verdes and Mojave Desert faults are coupled with the San Andreas (plate boundary) system. All of these faults have ruptured historically and produced moderate to major sized earthquakes.

STRUCTURAL GEOLOGY

As shown in Figures 9 and 10, the geologic strata are deformed into a series of folds and faults. Most of the folds and faults are continuations of geologic structures in the Santa Monica Mountains and the Elysian Hills to the southwest. These structures trend southeasterly through the Repetto Hills and continue below the flat-lying Quaternary alluvium of the San Gabriel Valley. The major folds are the Elysian Park Anticline and the South Pasadena Anticline.

The folding shown in Figures 9 and 10 is generalized and simplified. In reality, there are numerous small-scale folds within the larger fold trends. Frequent changes in bedding orientation due both to folding and faulting should be expected at depths.

Many of the faults are intra-formational features, meaning that the faults offset rocks of the same type. However, some of the faults could comprise highly fractured or clayey gouge zones.

One seismic reflection profiles, Z3-G1 was conducted by Caltrans at the proximity of the Site on the north side of San Rafael Fault Trace. Line Z3-G1 has a length of 1,912 ft.

LINE Z3-GL

The processed P-wave seismic section for Line Z3-G1 with interpretation is presented in Figure 11. Surface wave soundings were conducted in the northern and southern portions of seismic line Z3-G1. The S-wave velocity models for these soundings are very similar indicating that there may not be significant lateral velocity variation in the immediate vicinity of the seismic line. There is only about 15 feet (4.5 m) of elevation change along the seismic line and groundwater depth may not be highly variable. Therefore, the velocity assumptions and the groundwater depth estimate may represent actual Site conditions.

A sub-horizontal, continuous seismic reflector possibly associated with the top of bedrock or weathering contact within bedrock is interpreted between approximately 175 to 270 feet on the line

Z3-G1 seismic section (Figure 11). This reflector appears too deep for groundwater or the bedrock surface, which were encountered in the area at about 148 feet (45 m) and 185 feet (56 m), respectively. Assuming some lateral velocity variation in P-wave velocity across the Z3-G1, the reflector may be associated with the top of crystalline bedrock but could also be associated with an abrupt contact between highly weathered and slightly weathered bedrock.

There is no reflectivity below the interpreted bedrock reflector because bedrock consists of crystalline rock, with no bedding. The absence of significant reflectivity within the bedrock unit makes conclusive fault interpretation impossible. There are multiple discontinuities in the bedrock reflector, approximately located near 200, 550, 840, 1,100, 1,340 and 1,440 feet. Many of these bedrock discontinuities may be associated with topographic variation of the bedrock surface or bedrock weathering contacts. It is also possible that some of the discontinuities are related to bedrock offsets caused by faulting rather than erosion.

LOCAL AND REGIONAL FAULTING

The potentially active Sierra Madre Fault Zone is over 60-miles long and is located just about 5.6 (7.3 EQFAULT) miles to the north of the Site. The fault displays dominantly reverse (vertical) movement and forms a very irregular and deeply incised scarp which, in places, may be several hundred feet high. The fault zone strikes roughly east-west and locally dips northward at 18 to 70 degrees beneath the San Gabriel Mountains. Locally, at the foot of the range, the fault has been mapped most notably with basement rock thrust southward over older alluvium. A potentially active fault is one that has ruptured in the last two million years, but no evidence has been found to suggest rupture in the last 10,000-years. This infers that the fault has a relatively long recurrence interval.

The Sierra Madre Fault, in the Pasadena, Altadena and Sierra Madre areas, has not been placed into an active category or an Alquist-Priolo Earthquake Fault Zone as designated by the California Division of Mines and Geology. The potential for direct surface fault rupture through the subject Site is judged to be nil based on available geologic and fault related technical data. The upper bound (moment magnitude) earthquake assigned to the Sierra Madre Fault is M6.7 and the calculated slip rate is 3.0 mm per year. The fault is assigned to a Type B category. The entire Raymond Basin lies in Seismic Zone 4. Because of the proximity of this potentially active fault, it may produce significant ground motion effects should it rupture in the area closest to the Site and produce a major earthquake.

Our prior review of the City of Pasadena General Plan identified a possible fault approximately along Washington Boulevard, but the General Plan map did not show a City Fault Hazard Management Zone along the fault. We subsequently discovered a different General Plan map showing a Fault Hazard Management Zone for critical facilities along the fault.

The City General Plan indicates that the zoning is based upon a possible active strand of the Sierra Madre fault that was identified by Rubin in 1992. Rubin, along with Kerry Sieh, published an article in the

proceedings of the Association of Engineering Geologists 1992 Annual Meeting. The article, which is two pages long, discusses topographic steps in the stream profile of Arroyo Seco in Pasadena, and in Thompson Wash and its adjacent alluvial fan in La Verne. Their study utilized geomorphic analysis of 1928 Fairchild aerial photographs and a 1924 6-minute U.S. Geological Survey topographic map to supplement field mapping in the identification of possible fault traces. In the Arroyo Seco area, the authors report that modem stream channels and active fan surfaces show multiple topographic steps that indicate youthful deformation, and that topographic steps in Arroyo Seco are coincident with a dramatic change in channel width. The Thompson Wash study area is too distant to be relevant to this investigation.

It is worth noting that, although the Pasadena General Plan attributes the fault locations shown in the General Plan map to Rubin (1992), there is no corresponding map in the Rubin report. The report only contains two illustrations showing topographic profiles along Arroyo Seco and in the Thompson Creek area. Both profiles are quite small with a horizontal scale of one inch equals approximately 4,000 feet and vertical scale of one inch equals approximately 2,000 feet. During our research, we did not locate any other publications attributed to Rubin in 1992. A 1998 article prepared by Rubin and others was located. It discusses a geologic fault investigation at the Loma Alta Park site at the base of the San Gabriel Mountains more than 4 miles north of the Site.

The faults of most interest to the proposed Power Plant projects are the active faults that might result in ground rupture and displacement during an earthquake, and faults that might generate strong shaking of project facilities. The faults of most interest to the project are the Raymond Fault, the San Rafael Fault, and the Eagle Rock Fault.

The faults of greatest significance to the project are described in detail below. The locations of these faults are shown on Figures 6, 7, 8, 10, 12 and 13 and in the representative geologic profiles (Figures 9 and 10). These faults represent earthquake shaking hazards, but only the Raymond and Alhambra Wash faults located outside of the Site are identified as Alquist-Priolo Earthquake Fault Zones (APEQFZ), which implies a surface rupture potential. Such a designation indicates the fault is well known and its location is well defined. Other potentially active faults may not be identified as APEQFZ because their locations are not well defined and/or they have not generated earthquakes in historical time. The City of Pasadena Safety Element (City of Pasadena, 2003) has designated a "fault hazard management zone" for the Eagle Rock Fault, which means that geological studies are required for determining the potential for fault rupture before development occurs within the zone.

The active Raymond Fault Trace strikes east-northeast, 1.0 (1.9 EQFAULT) miles south of the Site, along the south boundary of the Raymond Basin. The length of the fault is 12 to 15.5 miles depending upon various interpretations, dips to the north beneath the basin at generally a high angle, and has produced lateral and vertical displacements. A well developed scarp to 100-feet high along with sag ponds, offset drainages, back tilted surfaces, springs, a groundwater barrier and pressure ridges suggest its surface rupture is relatively young. Carbon dating gave movement within the last 2,500-years. The fault has been assigned to a Type B Category with an upper bound (moment) magnitude earthquake of 6.5, and a slip rate of 0.1 to 0.4 mm per year.

The State of California (CGS) has established an APEQFZ along the Raymond Fault from the San Gabriel Mountains in the east to near the intersection of Avenue 50 and York Boulevard on the west. The Raymond Fault extends southwesterly from the Sierra Madre Fault Zone at the base of the San Gabriel Mountains through the communities of Monrovia, Arcadia, San Marino, and Pasadena to the Raymond Hill area of South Pasadena, where the Raymond Fault trends more westerly through the communities of South Pasadena, Highland Park, and possibly into Los Angeles. The fault forms a gentle arc, convex toward the south across the alluvial deposits of the San Gabriel Valley. The fault is best expressed in the San Marino and South Pasadena area, where it forms a prominent escarpment up to about 150 feet high.

A prominent linear gravity anomaly extending easterly from the southern margin of the Santa Monica Mountains, under the Los Angeles River plain, and into the Repetto Hills indicates that the Hollywood Fault may extend easterly into the Repetto Hills, and has led to the interpretation by some that the Hollywood and Raymond Faults may be interconnected. Others (Dolan, References 10 and 11) have postulated that the Raymond Fault is directly connected with the Hollywood Fault and other faults within the southern frontal fault system of the Transverse Ranges. The westerly continuation of the Raymond Fault into the Los Angeles River floodplain is uncertain. For the purposes of this study, it is assumed that the Raymond and Hollywood Faults are independent features.

The most recent major rupture on the Raymond Fault occurred in Holocene time, sometime about 1,000 to 2,000 years ago (Crook et al., 1987; Weaver and Dolan, 2000, Reference 10). The largest earthquake within the project area in historical times was the 1988 Pasadena Earthquake with a magnitude (ML) of 5.0; this shock was interpreted by Jones et al to have occurred on the Raymond Fault (1990).

Currently, most geoscientists consider the Raymond Fault to be a left-lateral reverse-oblique fault that dips steeply (approximately 80 degrees) to the north. Geological trenching across the fault scarp indicates average rates of fault slip between 0.1 and 0.4 millimeters per year (mm/yr) (SCEC, 2009; Dolan et al., 2000, Reference 10). More recently, the rate of slip has been estimated to be about 1.5 mm/yr and the recurrence interval at 3,300 years (Dolan et al., 2000; Cao et al., 2003; Weaver and Dolan, 2000, Reference 10). The maximum earthquake estimated by the CGS (2009, Reference 10) is in the range of M_w= 6.0 to 7.0. Merriam and Shantz (2007, Reference 10) estimate a maximum earthquake of 6.6.

The nature of potential surface displacements on the Raymond Fault is poorly known. Due to the lack of earthquake history on the Raymond Fault, seismic design for the fault must be based on empirical fault/earthquake relationships from worldwide data. Based on a length of 12 miles, a down-dip width of 10 miles, and average slip of 1.6 to 3.3 feet a maximum earthquake of Mw=6.7 was estimated. Such earthquakes could generate average displacements of 0.3 to 1.5 feet per event and maximum displacements of 0.8 to 3.4 feet per event.

Alhambra Wash Fault

The Alhambra Wash Fault is a short northwest-southeast-trending fault in the southern part of the San Gabriel Valley (Figure 6). The faults surficial expression is approximately 1.5 miles long and extends from I-60 on the southeast to San Gabriel Boulevard on the northwest. The fault is designated as an APEQFZ and, therefore, is considered to be active.

Extensive fault trench investigations revealed faults generally dipping to the northeast, with the northeast side down (normal separation). It was postulated that the fractures in the exploratory trenches were due to three or four fault rupture events in latest Quaternary time with the latest event occurring about 1,000 years ago. The fault appears to have right-lateral, normal oblique slip with a lateral slip rate of about 0.1 to 0.2 mm/yr and a vertical slip rate of about 0.8 mm/yr.

Although there is no compelling direct geological evidence, several investigators have considered the fault to project to the northwest approximately coincident with the Alhambra Wash, which originates in the Raymond Hill region of South Pasadena.

Dibblee considers the fault to be an extension of the Workman Hill Fault and infers the fault to continue northwesterly well beyond Valley Boulevard into the City of Alhambra. However, there is no oil well data to support such an interpretation and fault associated geomorphic feature extends no farther northwesterly than the I-10 freeway.

Contour of the historically highest groundwater in the southwest San Gabriel Valley changes direction quite abruptly at the northwesterly projection of the Alhambra Wash Fault (CDMG, 1998b) suggesting that the fault forms a groundwater barrier in Quaternary-age sediments. The edge of the groundwater barrier extends beyond I-10 approximately to Mission Road in central Alhambra.

The potential for surface displacement on the Alhambra Wash Fault is poorly known and, like the Raymond Fault, must be based on empirical fault length/earthquake magnitude relationships. According to these empirical relationships, the maximum magnitude of an event on the Alhambra Wash Fault could be about 6.25. Based on this, potential surface rupture displacement along the Alhambra Wash Fault would be expected to be much less than those that would be expected along the Raymond Fault discussed above.

Eagle Rock and San Rafael Faults

The Eagle Rock and San Rafael Faults, in the Pasadena, area, have not been placed into an active category or an APEQFZ as designated by the California Division of Mines and Geology. Existing geological maps (Figures 6, 7, 8, 12 and 13) show different locations for the Eagle Rock and San Rafael Faults. The principal difference is that Lamar's (Figure 7) map shows the San Rafael and Eagle Rock Faults as separate features. The San Rafael Fault extends southeasterly from within the San Rafael Hills to the north edge of the Grace Hill, Raymond Hill and the smaller associated knolls, essentially along the same trace as Dibblee's Eagle Rock Fault. At the eastern end Lamar

splits the fault into two splays or branches; one extends through the top of Raymond Hill and the other is a dotted line (that is, a subsurface fault) trending more easterly past Arroyo Parkway and into the hills north of the main trace of the Raymond Fault. Lamar maps the Eagle Rock Fault to the south of the San Rafael Fault within the knolls and projecting south of Raymond Hill (Figure 7). The differences between the fault mapping are not really significant from an earthquake hazard perspective, but the differences might be important for the Pasadena Power Plant projects, in that if there is only one fault (as indicated by Dibblee), the fault crosses the Power Plant, while in the case of two separate faults (as indicated by Lamar) it may be located within the northern portion of the Jacob Parking lot or outside of the present Site. Borehole R-09-Z3B3 excavated during Caltrans study (Figure 8, Appendix F, and Reference 10) encountered a significant zone of fault gouge believed to be the San Rafael Fault. The Eagle Rock and San Rafael Faults do not extend across the Raymond Fault.

Both the Eagle Rock and San Rafael Faults are considered potentially active faults, as defined in the above. According to the Caltrans Seismic Design Criteria (2009) fault database, the Eagle Rock Fault is estimated at having a maximum earthquake magnitude of 6.8.

Although the San Rafael Fault is not well documented, the approximate magnitude of the maximum earthquake can be estimated using worldwide empirical data on earthquake magnitude and fault length data. These estimates indicate a maximum magnitude of about 6.0.

Eagle Rock Fault

The Eagle Rock Fault and San Rafael Fault are considered in this study to be separate and discrete features following the mapping of Lamar (1970). The Eagle Rock Fault will not cross the Power Plant but the San Rafael Fault crosses the northeast corner of Jacob Parking Lot. The Eagle Rock Fault, which has been mapped as an eastward continuation of the Verdugo Fault in the City of Glendale is shown to trend along the southerly side of the San Rafael Hills across the Arroyo Seco then along the back (north) sides of Grace and Raymond Hills in the southwestern corner of Pasadena (Figures 6, 7, 8, 12 and 12). The Eagle Rock Fault in Raymond Basin is shown to be buried beneath older alluvial units. An exposure of the fault in the Arroyo Seco shows an 80-degree northeast dip with basement rock to the north juxtaposed to Tertiary age sedimentary rocks to the south (Figure 8). It is believed to be a northeast dipping thrust fault (movement would be up on the north side). No detail study of this fault has been available. It has been linked to the Verdugo Fault to the northwest and to the Raymond Fault to the south and southeast. The Eagle Rock Fault is believed to merge with the Raymond Fault near Lacy Park in San Marino. These linkages (discontinuous fault strands that seem to line up/merge with or connect to the aforementioned faults) are uncertain and have not been thoroughly investigated.

With regard to the earthquake potential, the Eagle Rock Fault is not in the State fault database (CGS, 2004; Peterson, et al, 1996), but is mentioned in the Southern California Earthquake Center (SCEC) database with a 0.1-millimeter per year slip rate and a potential to rupture with the Verdugo fault. It is not thought that the Eagle Rock Fault would be an independent earthquake generating fault, since known recency of surface faulting and earthquake activity on the Raymond

(Hill) fault should make it more likely to release strain energy (e.g., 1988 M=5 Pasadena earthquake) build up in the site area. Likewise the southern/central portions of the Verdugo fault have been determined to show Holocene offset, so it would seem to have a higher potential to generate an earthquake northwest of the Arroyo Seco. The similarity in style of faulting (reverse) and slip rates (neither slip rate is well constrained) between the Verdugo and Eagle Rock Faults make them more similar than do the same factors for the Raymond and Eagle Rock Faults. The Verdugo Fault (as represented in the State database) is, in our opinion, an appropriate fault analog for the maximum earthquake magnitude on the Eagle Rock Fault.

Fault rupture hazard potential appears low, however the Eagle Rock Fault is considered potentially active, but lacks specific studies to define the actual recency of fault movement. It has been placed within a fault hazard management zone of the City of Pasadena Safety Element (2003), which requires geologic study to determine rupture potential for developments within the zone, may be associated with the Verdugo fault to the northwest or the Raymond Fault to the south and southeast (both faults are considered active).

Eagle Rock Fault rupture investigation methods for La Loma bridge located in the proximity of the Arroyo Seco included literature review and analysis/summary, and surface geologic mapping. For bridge design the Caltrans fault rupture studies consider a number of additional data gathering methods, e.g., aerial photo interpretation/analysis, geophysical surveys, exploration trenching, and soil stratigraphy or age-dating. Caltrans additional field exploration to evaluate the Eagle Rock Fault was limited by access and logistics constraints to the Arroyo Seco channel and the right (east) bank south of the bridge where the fault has been mapped and is expected to be located (Reference 17). The geotechnical engineer applied deterministic and probabilistic methods for the bridge analysis.

The Eagle Rock Fault is about 2,000 feet south of the San Rafael Fault. The fault extends southeasterly into the Topanga Formation rocks in the knolls west and south of Raymond Fault. Seismic-reflection line Z3-G2 (Reference 10) extends across its trace and indicates folding and faulting. Although the relationships are not clear, the seismic-reflection data are compatible with a steeply north-dipping fault. In addition, surface wave soundings Z3-S6 and Z3-S7 (Reference 10) were conducted at the northern and southern ends of seismic line Z3-G2, respectively. S-wave velocity models for these soundings indicate that there is significant lateral velocity variation along the seismic line, possibly resulting from a fault bisecting seismic line Z3-G2. The Eagle Rock Fault is considered potentially active. According to the Caltrans Seismic Design Criteria (2009) fault database, the Eagle Rock Fault could produce an earthquake with a maximum magnitude of about 6.8.

San Rafael Fault

The San Rafael Fault, which appears to exist separately from the easternmost Eagle Rock Fault, is the easternmost segment of the Verdugo-Eagle Rock-San Rafael Fault system. On the northwest, the fault apparently dies out to the north of the Eagle Rock Fault as a series of disjointed strands in the basement complex of the San Rafael Hills. To the southeast of the hills, the fault may be

expressed by irregular terrain in a nearly flat surface overlying terrace deposits in the vicinity of San Rafael School (locality 60a, Figures 7 and 7-1). Farther southeast, the fault is well-exposed where it separates granitic rocks from conglomerate-breccia of the Topanga Formation on the west side of Arroyo Seco (locality 60b, Figure 7 and 7-1). The fault continues east-southeast, along the north side of Grace and Raymond Hills, generally expressed by linear topographic lows and other features on the surface of the terrace underlain by older alluvial deposits (localities 62 and 63, Figures 7 and 7-1). The dip of the fault, as it is expressed at localities 57, 59 and 60b, probably is very steep to vertical, similar to the dip of the easternmost part of the Eagle Rock Fault. The fact that the fault may be expressed along the surface of terrace deposits suggests that it has been active in late Quaternary time (700,000 to present). At locality 65, a deflected south-trending drainage suggests left slip along the fault. An additional fault of parallel trend (locality 61) and a photo lineament north of locality 63 occur along the general trend of the San Rafael Fault segment.

The San Rafael Fault occurs on the north side of Raymond Hill and separates basement complex rock from the Topanga Formation (Figures 6, 7, 8, 12 and 13). Published geologic maps (Lamar, 1970, Figure 7) show two surface traces. The aerial photograph lineament analysis and drilling performed for Caltrans project (Reference 10) suggests the more likely location is the northern branch. Borehole R-09-Z3B3 encountered a light-gray clay fault gouge about 85 feet thick. This material is primarily sheared and pulverized basement diorite rock. The large thickness of the gouge encountered in the boring is reportedly believed to represent the down-dip thickness (that is, the boring was drilled down a steeply dipping fault zone). If so, the width of the fault zone would be expected to be approximately 20 to 40 feet. The San Rafael Fault is considered potentially active and according to empirical relationships, could produce an earthquake with a maximum magnitude of about 6.0.

Historical aerial photographs were not analyzed for this study since the Site does not lie within or immediately near an APEQFZ. In addition, the regional geologic mapping by the United States Geological Survey did not indicate any anomalies suggestive of surface faulting within the subject Site. Boring data was used to develop cross sections across the subject Site regardless of the thick coarse-grained mixed nature of the alluvial units or crystalline basement rock.

According to the opinion of Geotechnical Professional Inc. (GPI) opinion (Reference 37 and 38), the Eagle Rock (San Rafael) Fault does not pose a significant potential for ground rupture at the Blair 1B Magnet School primarily because there has been no evidence of Holocene activity on this fault, and subsurface investigations for projects in the vicinity of the Blair 1B Magnet School site (across the Highway 110 from the Pasadena Power Plant) have disclosed a very consistent subsurface soil profile with no indication of layer offsets that would be indicative of faulting. GPI opinion was based on an updated review of existing geologic information on the Eagle Rock (San Rafael) fault as well as a more detailed analysis of subsurface information from geotechnical investigations performed at the Blair Magnet School site and nearby sites.

GPI re-evaluated subsurface data from their original investigation at the Blair Magnet School site as well as data from other nearby sites.

Subsurface investigations at the site for Blair Magnet School as well as Blair High School to the west, Allendale Elementary School to the northeast and a commercial project site Ms-mile to the northwest, disclosed a very consistent soil profile, which typically included a layer of sandy silt or fill at the surface, underlain by a dark gray-brown to black clay, an olive gray-brown sandy to clayey silt and dense granular deposits consisting of well graded mixtures of sand, silt, gravel and cobbles. At some locations, the clay layer was replaced with fill or mixed into fills. Of primary significance is the continuity of this soil profile between the site of Blair Magnet School and Blair High School, because essentially the same soil profile is observed on both sides of the inferred alignment of the fault. The referenced report contains a site plan with the locations of borings, cone penetration tests and subsurface sections, together with the inferred alignment of the fault. GPI also presented contact elevations for the top of the dense granular deposits below the surficial clay and silt layers. The subsurface data included boring and CPT logs from their geotechnical investigations, as well as boring logs from geotechnical investigations performed by Converse Foundation Engineers in 1964 for the original construction at Blair High School. GPI presented three subsurface cross sections across the inferred alignment of the fault. The subsurface cross sections show a consistent soil profile with no evidence of vertical offsets that would be indicative of fault rupture at their site. The only general trend GPI had observed was a gradual dip of about one percent from northwest to southeast, which is roughly parallel to the overall dip in the natural ground surface.

GPI performed additional investigation reported in References 37 and 38 and confirms that there are several continuous subsurface layers across their site area. However, several of these layers appear to change character or pinch out locally. According to GPI such pinch outs are characteristic of alluvial fan deposits, however they speculated that one of these local variations may be an anomaly representative of a fault offset. Their additional investigation at closer spacing and greater depth penetration, demonstrated that the "anomaly" was underlain by continuous strata and therefore, the "anomaly" was probably due to depositional variations rather than to tectonics (i.e. faulting). According to GPI such depositional variations are completely within the character of the alluvial-fan deposits at their site area which consist of stream-channel, flood-plain, and distal debris flow lenses. In fact, such variations were clearly seen in their trench excavated as part of their investigation.

According to GPI based on their addition CPT data, the premise of Holocene activity on the San Rafael fault is virtually negated. In spite of an intensive array of investigative methods aimed at identifying Holocene activity, no evidence of Holocene activity has been uncovered.

GPI stated that although it appeared quite certain that there was a fault at depth, there was not any credible evidence of surface faulting in Holocene time. The "lineament" postulated by Weber (1980) is, at most, only a local topographic feature within ancient Pleistocene alluvium (Qt); this feature is not present within younger Pleistocene alluvium (Qalo). For example, there is a terrace of Pleistocene Oalo alluvium bordering the east margin of Arroyo Seco (Crook et al. 1987; Lamar, 1970; Weber, 1980) that shows no evidence of a surface scarp where the location of the fault has been documented quite closely. In other words, Weber's lineament is an ancient earlier Pleistocene feature that formed before the late-Pleistocene Qalo was deposited and has since been undergoing slow degradation.

GPI stated that their site and the surrounding area have been saturated with an extensive suite of surface and subsurface investigations that demonstrate the San Rafael Fault has not experienced surface rupture in Holocene time and therefore, it is not an active fault.

In summary, the fault has not been demonstrated to break pre-Holocene alluvial sediments that are widespread in the Pasadena Power Plant area, and therefore, in our opinion, the fault has no potential for fault rupture hazard at the Pasadena Power Plant Site.

SEISMICITY

Commercially available computer programs EQFAULT and EQSEARCH by Thomas F. Blake Computer Services were used to perform a fault search, and a historical earthquake search within a radius of 100 miles. The program uses the California digitized active fault file that includes the thrust faults beneath Southern California.

Historical seismicity for the past 200 years was evaluated using the computer program EQSEARCH (Blake, 2002). Our computer analysis provides a compilation of documented earthquakes (including aftershocks) with magnitudes greater than 5.0, within a 100-mile radius from Pasadena Power Plant. The computer program also estimates peak ground accelerations that would result at the Site from each earthquake using a choice of attenuation relationships. For our evaluations, we used attenuation relationships proposed by Campbell and Bozorgnia (1999). Average estimates of ground motion were obtained by using the attenuation relationship for mean. The parameters used in the attenuation relationship distinguish between fault types producing the earthquake. However, EQSEARCH limits the source type to a choice of only one of three types (strike-slip, dip-slip, or blind-thrust). For our evaluations, we selected the dip-slip option which produces conservative estimates of ground motion.

Historic earthquakes with magnitudes of M5.0 and greater and within a 100-mile radius of Pasadena Power Plant are summarized in Appendix D. The table shows epicentral distance, depth, date, magnitude, and estimated peak horizontal acceleration and intensity for each earthquake found, and is sorted by ascending epicentral distance to the Site (from the closest to the farthest). In total the computer search found 156 earthquakes (including aftershocks) in the designated time period, distance and magnitude.

The largest historical earthquake has an estimated magnitude of 7.7 epicentered approximately 77.8 miles, (125.3 kilometers) from the Site, and Modified Mercalli intensity of VI. The closest earthquake to the Site has an estimated magnitude of 6.3 epicentered approximately 3.4 miles (5.5 kilometers) from the Site, and Modified Mercalli intensity of X.

Based on our EQSEARCH analyses, these earthquakes produced a maximum estimated Site peak ground acceleration of 0.519g. Considering that this event occurred many decades before earthquakes were instrumented, the data should be considered very approximate.

More recently, during the life of the existing Power Plant facility, the largest local historic earthquakes near the Raymond Basin were the October 1, 1987, M5.9 Whittier Narrows; the October 4, 1987, M5.3 aftershock; December 3, 1988, M4.9 Pasadena; and June 28, 1991, M5.4 Sierra Madre events and January 17, 1994, M6.7 Northridge Earthquake. These all occurred in a relatively short time period, all showed north dipping reverse movement and none produced surface fault rupture. The Pasadena event may have actually occurred on the Raymond Fault.

Damage from any of the earthquakes in vicinity of the Pasadena Power Plant was generally light though some older structures sustained moderate damage, but no collapse. Damage during the Whittier Narrows Earthquake (1987) was substantial in Whittier and the East Los Angeles area, however. Based on our EQSEARCH analyses, these earthquakes produced estimated peak ground acceleration of 0.287g at the Site vicinity. The central portion of the Sierra Madre Fault (the segment closest to the Pasadena Power Plant) has produced only a few historic minor earthquakes. In 1971 the western portion of the Sierra Madre Fault (the active San Fernando Fault) ruptured and resulted in a M6.4 event about 25-miles to the west. This event produced major damage and loss of life. The extreme eastern section (active Cucamonga Fault) has moved in the last several thousands of years, but today remains quiet.

LIQUEFACTION

The subject Site is not within a "Liquefaction Hazard Zone", as delineated by the State of California, in compliance with Chapter 7.8, Division 2 of the California Public Resources Code (Seismic Hazards Mapping Act). No groundwater was encountered at the Site to the maximum depth of 60 feet below ground surface explored.

LABORATORY TESTING

Classification

Soils were classified visually according to the Unified Soil Classification System. Unit weight and moisture content were determined for each undisturbed sample. Results of density and moisture content, together with soil classifications, are shown on the attached boring logs.

Direct Shear Tests

In order to determine the shear strength of the on-Site soils, direct shear tests were performed on representative undisturbed samples of the on-Site soils. To simulate possible adverse field conditions, the samples were saturated prior to shearing. Graphic summaries of the test results are attached.

Expansion Test

Expansion tests were performed on a representative samples of the on-Site soil in accordance with ASTM 4829/UBC Standard 18-2 to evaluate their volume change with increasing moisture conditions. The results are as follows:

Sample Location	Depth (ft)	Soil Description	Expansion Index	Potential Expansion
BH-1	1 - 5	Brown silty sand	1.6	Very Low
BH-2	1 - 5	Dark brown clayey sand	0	Very Low
BH-4	1 - 5	Dark brown clayey sand	3.2	Very Low
BH-8	1-5	Brown silty sand with gravel	2.6	Very Low

Consolidation Test

To investigate the settlement of the soils under the pressure of the proposed foundations, load consolidation tests were performed on undisturbed samples of the soil collected from boring BH-3 at depth of 10 feet bgs, boring BH-4 at a depth of 20 feet bgs, boring BH-6 at a depth of 5-6.5' feet bgs, boring BH-7 at depths of 30 and boring BH-9 at a depth of 4.5 feet bgs.

Axial loads were carried to a maximum of 11,500 lbs/sq.ft. To hasten consolidation and simulate possible adverse field conditions, water was added at an axial load of 1,400 lbs/sq.ft. Compressibility of the soils within the zone of significant stress was investigated and the results considered in our engineering analysis. Graphic plots of the load consolidation curves are attached.

Compaction Test

The maximum dry density and optimum moisture content of the on-Site soils were determined in the laboratory in accordance with the ASTM D-1557-07 test method. The results are as follows:

Sample Location	Soil Description	Maximum Dry Density (PCF)	Optimum Moisture Content (%)
BH-1 @ 1-5'	Brown silty sand with gravel	131.3	8.8
BH-4 @1-5'	Brown silty sand with gravel	129.5	7.5
BH-8 @1-5'	Brown silty sand with gravel	132.0	9.5

Particle Size Analysis

Particle size analyses were performed on bulk samples of the soils collected from boring BH-1 at a depth of 1-5 feet bgs, boring BH-4 at a depth of 1-5 feet bgs and boring BH-8 at a depth of 1-5 feet bgs, in accordance with the American Society for Testing and Materials Standard (ASTM D422).

Organic Content

Nine organic carbon content tests were performed on select samples where high PID reading was obtained using ASTM Standard D2974. The organic content of the tested samples vary from 0.1 to 1.9 percent.

Sample I.D.	Organic Content Percen	PID Reading ppm_v
BH2 @ 26'	0.6	362
BH3 @ 16.5'	1.9	2.7
BH6 @ 16'	1.7	10,000
BH-7 @ 35'	0.1	-
BH-8 @ 9'	0.6	227
BH8 @ 10.5'	1.1	227
BH-9 @ surface	1.9	204
BH-9 @ 6.5'	1.3	12.3
BH-9 @ 7.5	0.6	12.3

R-Value Test and Modulus of Subgrade Reaction

R-value tests were performed on bulk samples of the soils collected from borings BH-2 and BH-9 at a depth of 1 to 5.0 feet bgs. The results of these tests indicate R-values of 60 and 67, respectively.

Chemical Tests

To address the presence of chemicals deleterious to construction materials and utility lines, chemical tests (sulfate, chloride, pH and soil resistivity) for the on-Site soils have been performed.

Bulk samples of the soil collected from boring B-1, B-2, B-4, B-6, and B-8 at a depth of 0 to 5.0 feet below ground surface were tested to determine its chloride and sulfate concentrations, as well as its pH and soil resistivity. The test results indicate 18.8 mg/Kg to 22.7 mg/Kg concentrations of chloride and 20.6 mg/Kg to 30.5 mg/Kg concentrations of sulfate. The soil pH varies from 7.52 to 7.55. The following summarizes the results of the analytical testing, with appropriate recommendations.

Sample Location	PH	Sulfate (%)	Chloride (%)	Oxidation-Reduction Potential mv@25°	Soil Resistivity Ohm-cm
BH-1 @ 0-5'	7.87	0.003	0.00165	599	4,394
BH-2 @0-5'	8.19	0.002	0.002	566	-
BH-4 @ 0-5'	8.14	0.001	0.0014	550	5,847
BH-8 @ 0-5'	8.25	0.003	0.0014	515	4,293
BH-9 @ 0-5'	8.39	0.01	0.002	563	-

Soils with sulfate concentrations more than 1,000 ppm (0.1%) are generally reported to have a moderate corrosive effect on foundation concrete. Normal Portland cement may be used for concrete in contact with the Site soils. Soils with less than 200 ppm (0.02%) of chloride generally have been observed to induce low corrosion on mild grade steel exposed to subsoil.

Any type of cement may be used for concrete structures and pipes because the sulfate concentration is negligible, 0 to 0.1 percent, per 1997 Uniform Building Code (UBC) Table 19-A-4 and American Concrete Institute (ACI-318) Table 4.3.1.

Standard concrete cover over reinforcing steel may be used for concrete structures and pipe in contact with these soils.

Redox Potential

The redox potential essentially is a measure of the degree of aeration in soil. A high redox potential indicates a high oxygen level. Low redox values may provide an indication that conditions are conductive to anaerobic microbiological activity. Sampling of soil will obviously lead to oxygen exposure and unstable redox potentials are thus likely to be measured in disturbed soils.

A major factor in determining soil corrosivity is its electrical resistivity. The electrical resistivity of a soil is a measure of its resistance to the flow of electrical current. Corrosion of buried metal is an electrochemical process in which the amount of metal loss due to corrosion is directly proportional to the flow of electrical current from the metal into the soil. Corrosion currents, following Ohm's Law, are inversely proportional to its electrical resistance. Lower electrical resistance results from higher moisture and chemical salts concentrations and indicate corrosive soil condition.

The electrical resistivity of each sample was measured in a soil box per ASTM G57 in its as-received condition and again after saturation with distilled water. Resistivities are at about their lowest value when the soil is saturated. The pH of the saturated samples was measured.

A correlation between electrical resistivity and corrosivity for ferrous metals is:

Soil Resistivity In ohm-centimeters In ohm-centimeters			**Corrosivity Category**
Over		10,000	Mildly corrosive
2,000	to	10,000	Moderately corrosive
1,000	to	2,000	Corrosive
Below		1,000	Severely corrosive

Other soil characteristics that may influence corrosivity in metals are pH, chemical salt concentrations, soil types, aeration, anaerobic conditions, and site drainage.

Based on the soil resistivity, on-Site soils are in the moderately corrosive category in a saturated condition.

The soil pH varies from 7.87 to 8.39. This range is slightly basic and does not increase soil corrosivity.

The soil is classified as corrosive to ferrous metals and negligible for sulfate attack on concrete.

CORROSION CONTROL RECOMMENDATIONS

The life of buried materials depends on their thickness, strength, loads, construction detail, soil moisture, etc., in addition to soil corrosivity, and is, therefore, difficult to predict. However corrosion control methods will increase the life of buried materials.

Steel Pipe

Abrasive blast underground steel piping and apply a dielectric coating such as polyurethane, extruded polyethylene, a tape coating system, hot applied coal tar enamel, or fusion bonded epoxy intended for underground use.

Bond underground steel pipe with rubber gasketed, mechanical, grooved end, or other nonconductive type joints for electrical continuity. Electrical continuity is necessary for corrosion monitoring and cathodic protection.

Electrically insulate each buried steel pipeline from dissimilar metals and metals with dissimilar coatings (cement-mortar vs. dielectric), and above ground steel pipe to prevent formation of dissimilar metal corrosion cells and to facilitate the application of cathodic protection.

Apply cathodic protection to steel piping as per NACE International Standard RPO169-2002. The amount of cathodic protection current needed can be minimized by coating the pipe.

As an alternative to dielectric coating and cathodic protection, apply a ¾-inch cement mortar coating or encase in 3 inches thick concrete.

Some steel piping systems, such as for gas and oil, require special corrosion and cathodic protection that must be evaluated for each specific application.

Iron Pipe - Pressurized:

Encase pressurized cast and ductile iron underground piping per AWWA Standard CI05, coat with epoxy or polyurethane, or with wax tape per AWWA C217. The thin factory-applied asphaltic coating of ductile iron pipe for protection during transportation and aesthetic purposes does not constitute a corrosion control coating. Electrically insulate underground iron pipe from dissimilar metals and from above ground iron pipe with insulating joints per NACE International Standard RP0286-2002. Bond all non-conductive type joints for electrical continuity. Apply cathodic protection to cast and ductile iron piping as per NACE International Standard RPO 169-2002.

For protection of Non-Pressurized iron pipe one of the following alternatives can be selected:

- Polyethylene encase cast- and ductile-iron piping per AWWA Standard CI05. Electrically insulate underground pipe from dissimilar metals and from above ground iron pipe with insulating joints per NACE International Standard RP0286-2002. Protect all non-cast iron and non-ductile iron fittings and valves with wax tape per AWWA Standard C2I7-99 after assembly.
- Concrete encase all buried portions of metallic piping so that there is a minimum of 3-inches of concrete cover provided over and around surfaces of pipe, fittings, and valves.
- Apply cathodic protection to cast and ductile iron piping as per NACE International Standard RPO 169-2002. The amount of cathodic protection current can be minimized by coating the piping.

Copper Tubing

In the absence of tests for ammonium and nitrate in the soil, protect buried copper tubing by one of the following measures:

- Soil contact may be prevented by installing the tubing above ground.
- Use a factory coated copper pipe with a minimum of 100-mil thickness such as "Aqua Shield" or similar products. Polyethylene coating protects against elements that corrode copper and prevents contamination between copper and its sleeve. However, the coating must be continuous with no cuts or defects for underground piping.

- Wrapping of copper with 12-mil polyethylene pipe wrapping tape with butyl rubber mastic over a suitable primer. Protect wrapped copper tubing by applying cathodic protection per NACE International Standard RPO169-2002. The amount of cathodic protection current can be minimized by coating the tubing.

Plastic and Vitrified Clay Pipe

No special precautions are required for plastic and vitrified clay piping placed underground from a corrosion viewpoint. Protect all fittings and valves with wax tape per AWWA Standard C217-99 or epoxy.

All pipes, appurtenances, and fittings not protected by cathodic protection

Coat bare metal such as valves, bolts, flange joints, joint harnesses, and flexible couplings with wax tape per AWWA Standard C217-99 after assembly.

Where metallic pipelines penetrate concrete structures such as building slabs, vault walls, and thrust blocks use plastic sleeves, rubber seals, or other dielectric material to prevent pipe contact with the concrete and reinforcing steel.

CONCLUSIONS AND RECOMMENDATIONS

1. General

From a soils engineering standpoint, the construction of the proposed Glenarm Repowering Project (GT-5 Combined Cycle Installation) is feasible. The proposed generators and related appurtenances can be founded on rigid mat foundation or cast-in-place concrete frictional piles. The mat foundation should be founded entirely on the properly compacted fill or dense natural ground. The existing man-made fill and organic soil (organic content of the on-site organic soil vary from 0.1 to 1.9 percent (Appendix A)) are not appropriate for the support of the proposed generators and related appurtenances if mat and shallow spread and continuous footing are used. The existing man made fill should be removed and replaced as properly compacted fill.

The potential for active faulting at the proposed project Site is studied based on previous and recent boring data, as well as previous excavation data at the Site, publicly available data from an ongoing study of the region by Caltrans/Metropolitan Transportation Agency

feasibility study for the 710 freeway extension as a tunnel through the Alhambra-Pasadena area, and GPI geotechnical investigations at Blair High School and Allendale School.

The Caltrans/Metropolitan Transportation Agency feasibility study included:

- compilation and analysis of published data and literature,
- historical aerial photograph review,
- geological mapping,
- continuous coring of deep boreholes,
- down-hole geophysics (e.g. seismic velocity)
- down-hole acoustic teleview
- seismic-reflection profiling
- surface-wave geophysics.

The Eagle Rock-San/Rafael Faults have been a prime focus in the Caltrans Metropolitan Transportation Agency study because the proposed tunnel will probably pass through the fault. The so-called Eagle Rock/San Rafael Faults have been discussed by numerous geoscientists over the past few decades and are shown on several geological maps, notably Lamar (1970), Crook et al. (1987), and Dibblee (1989), as well as several others (e.g. Weber, 1980; California Division of Mines and Geology, 1978). All of these investigations except CDMG (1978) were regional studies and did not really focus on the Eagle Rock/San Rafael Faults. Consequently none of these maps show the faults in the same location. However, the CDMG (1978) categorically states that no evidence of Holocene activity has been found by any investigation. Based on the CDMG (1978), our own investigation, Caltrans/Metropolitan Transportation Agency findings, and GPI re-evaluated subsurface data from their original investigation at the Blair Magnet School, it is our opinion that the fault is not active.

In HI's study the Eagle Rock/San Rafael Faults are considered as two discrete faults as shown by Lamar (1970); the southern fault is the Eagle Rock Fault, extending from the Eagle Rock area, crossing Arroyo Seco, and into the small hills and knolls west of Raymond Hill (Figure 13). The northern fault is the San Rafael Fault; this fault is basically parallel to the Eagle Rock Fault and similarly passes through Arroyo Seco, but extends to the north side of the Raymond and Grace Hills.

Lamar shows the San Rafael Fault bifurcating near Raymond Hill with one branch cutting through the rocks at the top of Raymond Hill and the other branch under the alluvium north of the hill extending towards Blair and Allendale schools. Although in the Caltrans/Metropolitan Transportation Agency report the southern branch is shown on their geological maps, and included in the final 710 tunnel report, but they could not find any evidence of such a fault on aerial photographs or during field geological mapping, or drilling.

In addition to the CDMG (1978) fault evaluation report, the Caltrans/Metropolitan Transportation Agency investigation, Wilson Geosciences, (Diaz-Yourman and Associates,

2007), and GPI geotechnical investigations at the adjoining Blair High School investigation, treated the Eagle Rock/San Rafael Faults as their primary focus.

The only location in the area where the fault can be identified is in Arroyo Seco where the fault extends under the La Loma Bridge (Figure 14). During a recent investigation by Wilson Geosciences (WGI), they excavated a trench on the west side of Arroyo Seco and found faulting within the Tertiary-age Topanga Formation rocks (Reference 17). The fault was entirely within Tertiary-age rocks and did not displace the overlying Quaternary alluvium. Although the faults in their trench exposure may not represent the main branch of the fault, the location is consistent with the change in rock type contact from igneous rocks on the north to the Tertiary-age Topanga Formation on the south. The trench exposure, in conjunction with boreholes and seismic refraction data, locate the fault location quite closely to the eastern end of the bridge. This location is slightly north of the location on Lamar's map and has a slightly more easterly trend than the Lamar's or Dibblee's maps.

The Caltrans/Metropolitan Transportation Agency drilled several boreholes in the area, at the proximity to the Pasadena Power Plant. Three of the holes revealed important information relative to the San Rafael Fault (R-09-Z3B3, R09-Z3B6, and R-06EM3). The boring R09-Z3B6 is located on State Street just south of the railway and near the Pasadena Power Plant. Borings R-09-Z3B3 and R06EM3 are located about 5,000 feet west of the Pasadena Power Plant along Pasadena Avenue (Figure 8, and 9).

Boring R-06EM3 was drilled in the park along Pasadena Avenue north of Arlington Drive. This boring was drilled to a depth of 201 feet and encountered alluvium at 50 foot depth below the ground surface (bgs) and Topanga Formation from 50 feet to the bottom of the hole. There was no indication of faulting; therefore the San Rafael Fault must be north of the boring. In addition, there was no indication of a southern branch as shown by Lamar.

Boring R-09-Z3B3 was drilled about 800 feet to the north of R-06EM3 in the grassy median just south of Bellefontaine Street (Figures 8 and 9). This boring was drilled to a depth of 275 feet and encountered old alluvium (Pleistocene age) to 185.5 feet bgs and light-gray clay fault gouge from 185.5 to the bottom of the hole. The fault gauge was intensely sheared, altered, pulverized, highly plastic clay and sandy clay. Reportedly, petrographic thin-section analysis of fault gauge included pebbles indicative of an origin from dioritic igneous rock. These relationships were verified by downhole acoustic teleview. The apparent great thickness of gouge (i.e. 90 feet) is interpreted by Caltrans/Metropolitan Transportation Agency to be due to the borehole extending down a steeply dipping fault. Geometric calculations indicate about an 80 degree northerly dip; the true thickness of the zone is probably more on the order of 20 to 40 feet. In any event, this gouge places the surface projection of the fault quite close to the intersection of Hurlbut Street and Pasadena Avenue (Figures 8 and 9).

The third boring, R09-Z3B6, was on State Street just south of the railway tracks, northeast of Raymond Hill and west of the power plant (Figures 8 and 9). This boring extended to a

depth of 326 feet bgs and encountered about 15 feet of alluvium overlying Topanga sandstone and conglomerate. Data from this boring suggests that there is no north-dipping fault through the top of Raymond Hill as shown by Lamar and Dibblee. Furthermore, the Caltrans/Metropolitan Transportation Agency believes that the lack of any apparent faulting indicates that the northern splay of Lamar's fault must be north of the boring (within Pasadena Power Plant).

A seismic-reflection line was run along Raymond Avenue from Glenarm Street to the north (Figures 8 and 11). The seismic-reflection line did not reveal any major faults, indicating that any faulting is south of Glenarm Street. Projecting the San Rafael Fault to the southeast based on these 3 borings and the seismic-reflection line places the fault directly through the Jacob Parking Lot (Figures 8 & 14). Groundwater was reported at depths of 51.5 and 136 feet in borings R-09-Z3B6 and R-09Z3B3 located south and north of San Rafael Fault respectively. A drop of 32.8 feet in groundwater elevations in the above borings is interpreted to be related to the San Rafael Fault.

Although Hydrologue believes the San Rafael Fault may cross the Jacob Parking lot and recognizes that the location may be somewhat imprecise, the fault appears to be located outside of the present proposed project that consists of the construction of a GT-5 Combined Cycle. However, it is important to find out whether the fault is active and represents a fault-rupture hazard at the proposed project Site. Reportedly, the Caltrans/Metropolitan Transportation Agency aerial-photograph analysis and geological mapping did not find any evidence of Holocene activity on the San Rafael Fault. As mapped, the fault trend crosses within Pleistocene-age alluvial deposits (Figures 14 and 16). The Pleistocene-age is well established by numerous carbon 14 dates (Crook et al., 1987). In support of the Pleistocene age, Caltrans boreholes found weathered, oxidized alluvium with crumbly clasts and multiple pedogenic soil horizons.

Crook et al. (1987) indicate two ages of alluvium along the San Rafael Fault trend; these are less recent alluvium Qal_2 and older alluvium Qal_3 at the Site proximity (Figures 14 and 16). Reportedly, Caltrans/Metropolitan Transportation Agency analysis of vintage Fairchild aerial photographs (late 1920s to 1950s) did not reveal any evidence of topographic fault scarps along the trace of the San Rafael Fault in either less recent or the older Holocene alluvium indicating that the fault has not been active in latest Quaternary time. The only surficial indication of a fault is the crude alignment of the widely spaced knolls and hills (i.e. Grace Hill, Raymond Hill, etc). This type of geomorphology is typical of what geologists call a fault-line scarp. A fault-line scarp is a scarp that represents the eroded remnant of an ancient fault. Such a feature is consistent with a Pleistocene age of latest displacement on the San Rafael Fault.

Reportedly, according to the borehole data adjacent to Blair and Allendale schools, near-surface stratigraphic relationships, revealed in the shallow geotechnical borings, indicate lack of Holocene activity on the San Rafael Fault. These borings indicate a black, clayey soil similar to one we observed during grading operations related to the construction of

GT1 and GT2 within the Pasadena Power Plant, overlie the Pleistocene alluvium (this layer was not observed during our investigation of the Boilers 1 & 2 but was observed during present investigation). This black soil is widespread throughout the area and is characteristic of a well-developed organic soil horizon on the Pleistocene alluvium. Although there are no carbon dates available for this soil, the thickness alone indicates a substantial age, perhaps several thousand years. The presence of carbonate nodules in the material supports advanced age. However, these clayey horizons are typically "cumulative" soil horizons that are difficult to date precisely. The consistent thickness, and consistent depth of this unit across the area indicates tectonic stability, and that there has not been any Holocene fault displacement at the Site.

According to GPI and based on their recent additional CPT data, the premise of Holocene activity on the San Rafael fault is virtually negated. In spite of an intensive array of investigative methods aimed at identifying Holocene activity, no evidence of Holocene activity has been uncovered.

GPI stated that although it appeared quite certain that there was a fault at depth, there was not any credible evidence of surface faulting in Holocene time.

GPI stated that the Blair High School site and the surrounding area have been saturated with an extensive suite of surface and subsurface investigations that demonstrate the San Rafael fault has not experienced surface rupture in Holocene time and therefore, it is not an active fault.

In conclusion, based on the above, Hydrologue believes the present data indicate that the San Rafael Fault may cross through the Jacob Parking Lot, but also it has not been active in Holocene time and, therefore, the present Site is suitable for development of the proposed project.

The City of Pasadena Safety Plan has specific geologic investigation requirements for development within the Fault Hazard Management Zones for the Sierra Madre and Raymond Faults, but not for Eagle Rock (San Rafael) Fault. We attached a copy of pages 26 through 30 of the City of Pasadena Safety Element which describes the policies for mitigation of Seismic Hazards. We contacted Mr. Neville Pereira (626-744-7601) City of Pasadena, to enquire whether the City does require fault trench studies for the Eagle Rock or not (San Rafael Fault). He advised HI that this should be determined by the California Geologic Survey. Based on the distance of the trace of the San Rafael Fault, it is our opinion that the proposed development area adjacent and south of historic power plant will not be affected by the San Rafael Fault.

Based on the above, summary shallow trenching for fault study is not recommended. However, the existing man-made fill and organic soil are recommended to be removed and the existing man-made fill will be replaced with properly compacted fill. We recommend the excavation be inspected for the purpose of fault study prior to the placement of the backfill. We will prepare an addendum report to document our finding and revise our recommendation if the data shows a need for it.

Concentrations of total recoverable petroleum hydrocarbons were encountered in some of the shallow soil samples collected and analytically tested at the Site. The vertical and lateral extent of the impacted soils are not yet defined (as the date of this report), certain environmental regulations are relevant to the potential off-Site disposal of the soils.

The potential expansion of the on-Site surface soils is considered to be very low. The construction plans for the gas turbine generators should take into account the appropriate soils engineering features of the Site.

The on-Site soil is in moderately corrosive category in a saturated condition.

Recommendations for grading are presented in the following section. Personnel from our firm should observe and test the reworking of the upper soils and the compaction of all required fill.

2. Grading

In order to provide support for rigid mat foundation, floor slabs, and adjacent concrete walks, slabs and parking, all existing man-made fill, organic soils and all disturbed and loose natural soils should be excavated. The approximate depth of the excavation according to our exploratory borings is 5 to 10 feet. Where possible, the excavation of the fill should extend at least equal to the thickness of the fill beyond the foundation perimeter in plan, otherwise the footings should be deepened to be founded on firm natural ground encountered at a depth of 5 to 10 feet bgs. The non organic excavated soil should be replaced as properly compacted fill in the excavation. Any required additional fill should be properly compacted.

To provide good support for asphaltic paving, all of the existing fill and disturbed and loose natural soils should be excavated and replaced as properly compacted fill. The existing fill was found to be up to 5 to 10 feet thick in our exploratory boring locations. However, if the possibility of some settlement with associated cracking and greater than normal maintenance of the asphaltic paved areas is acceptable, then the overexcavation of only the upper 2 feet of existing fill soils will be required; the lower portion of the existing fill could be left in place. Beneath Portland cement concrete paving, all of the existing fill should be removed and replaced as properly compacted fill.

2.1 Site Preparation and Compaction

Asphalt pavements, slabs, foundations, demolition and organic debris, fuel petroleum hydrocarbon and lead impacted soil, organic soil, vegetation and other unsuitable materials should be stripped and removed from the Site. Water lines or other old utility lines or installations to be abandoned should be removed. Cavities resulting from removal of buried obstructions and trees extending below finished grades should be backfilled with properly

compacted fill. The recommended minimum thickness of the compacted fill below the bottom of the footings founded on compacted soil is 3 feet.

After clearing the Site and recommended 5- to 10-foot deep excavation, the exposed soils at the bottom of the excavation should be carefully observed for the removal of all unsuitable deposits. Next, the bottom of the excavation should be rolled with heavy compaction equipment. The upper 6 inches of exposed soils should be compacted to at least 90 percent of the maximum density obtainable by the ASTM Designation D1557 Standard. After compacting the exposed soils at the bottom of the excavation, any required fill should be placed in loose lifts not more than 8 inches thick and compacted to at least 95 percent of the maximum density obtainable by the ASTM Designation D1557 Standard. The moisture content of the on-Site soils at the time of compaction should vary no more than 2% below or above optimum moisture content.

2.2 Material for Fill

The on-Site soils cleaned from any organic soil, debris or organic matter (i.e., tree roots), fuel petroleum and lead impacted soil and oversized rocks may be used in required fills. Any required imported fill should consist of relatively non-expansive soils with an Expansion Index of less than 35. Any import material should contain sufficient fines (binder) so as to be relatively impermeable and provide a stable sub-grade when compacted.

2.3 Pipeline Sub-grade, Bedding and Trench Backfill

2.3.1 Sub-grade Preparation

Pipelines may be laid in trench excavations. Based on the subsurface information obtained from the borings, existing fill soils are anticipated to be present beneath pipelines. If fill soils are encountered beneath the pipeline invert, they should be excavated and re-compacted as properly compacted fill soils. Pipelines may be supported either on undisturbed natural soils or on properly compacted fill soils. The excavation for the pipeline and the placing of the bedding material should be carefully performed in order to prevent loose or disturbed soils from remaining in the bottom of the excavation.

2.3.2 Pipe Bedding and Pipe Zone Backfill

Typical pipe bedding and pipe zone backfill details are shown on Figure 20, for typical pipe backfill and pipeline trench conditions. Unshaped bedding is typically used for pipeline support. Material for pipe bedding and pipe-zone backfill could be either on-Site sand and sandy soils or imported sand and gravelly sand, free from organic matter, loam, contaminates, or other deleterious substances. The material should meet the gradation requirements shown below when tested in accordance with ASTM D422. Based on the information obtained during our field explorations, it is our opinion that in general, the

on-Site sandy soils may be suitable for the pipe-bedding or pipe zone backfill. This should be checked during the construction.

Sieve Size No.	Percentage Passing Sieve (by weight)
½"	100
4	70-100
16	50-90
50	10-40
200	0-10

To provide a uniform bearing condition, we recommend a minimum 6-inch layer of bedding material be placed beneath pipes. Pipe zone backfill will be required all around proposed pipes and to a height of 6 inches above the top of pipes. The pipe bedding and pipe zone backfill materials should be compacted to at least 95% of the maximum density obtainable by the ASTM Designation D1557 method of compaction. The pipe-zone backfill materials may be compacted in place by vibration or may be backfilled with 1- to l'/2-sack sand-cement slurry.

We recommend that the backfill along the sides of the pipe be placed simultaneously and brought up to at least the top of the pipe in equal lifts and level heights during the backfill operation.

2.3.3 Trench Backfill

The soils at the Site are suitable for use as trench backfill cleaned of any debris, vegetation, and cobbles larger than 6 inches. Although not anticipated, to avoid nesting of larger particles, the trench backfill should not contain more than 10% of particles greater than 3 inches. We recommend these soils be compacted by mechanical means.

Any required imported fill should consist of relatively non-expansive soils (Expansion Index less than 35 per ASTM D-4829). Imported fill material should contain sufficient fines (binder material) so the resulting compacted fill will not rut under the wheels of compaction equipment. The use of cobbles or rock fragments larger than 3 inches in size should be avoided. Nesting of these materials should be avoided. Trench backfill should be compacted to at least 90% of the maximum dry density obtainable by the ASTM D1557 method of compaction.

After placement of pipe zone backfill around the pipe, the final backfill above the pipe zone (as shown on Figure 20) should be placed in layers and mechanically compacted to at least 90% of the maximum dry density obtainable by the ASTM Designation D 1557 method of compaction with the exception of the upper 3 feet of backfill beneath pavements which should be compacted to at least 95% of the maximum dry density obtainable by the ASTM Designation D 1557 method of compaction. Any required fill should be placed in horizontal

lifts, not more than 12 inches in loose thickness. It is recommended that the soils be compacted at moisture contents ranging from optimum moisture content to 2% above optimum moisture content at the time of compaction.

2.4 Field Observation

The reworking of the upper soils and the compaction of all required fill should be observed and tested by a representative of our firm. The observation and testing should include:

1. Observe the clearing and grubbing operations for proper removal of all unsuitable materials.
2. Observe the exposed sub-grade (bottom of the excavation) in areas to receive fill and in areas where excavation has resulted in the desired finished sub-grade, observe proof-rolling, and delineate areas requiring over-excavation.
3. Perform visual observation to evaluate the suitability of on-Site and import soils for fill placement; collect and submit soil samples for required or recommended laboratory testing where necessary.
4. Perform field density and compaction testing to determine the percentage of compaction achieved during fill placement.
5. Observe and probe foundation materials to confirm that suitable bearing materials are present at the design foundation depths.

The governmental agencies having jurisdiction over the project should be notified prior to commencement of grading so that the necessary grading permits may be obtained and arrangements may be made for the required inspection(s).

2.5 Idealized Soil Profile

The following table presents an idealized soil profile of the existing conditions under proposed mat foundations for major equipment (i.e. gas turbines generator GTG).

Depth Below Existing Ground Surface	Soil Classification	Consistency	Density (pcf)	Average Shear Velocity (ft/s)
0 to x feet*	Properly Compacted Fill	Engineered	120	1,200
x to 10 feet**	Sandy silt and clayey sand (SP)	Mod. dense	100	700
10 to 40 feet	Silty Sand (SM)	Mod. Dense	110	900
40 to 60 feet	Poorly Graded Sand (SP)	Dense	110	1,000

*x represents the depth of properly compacted fill beneath the mat foundation, and needs to be corrected by the depth of embedment of the mat to correspond to depth below existing ground surface.

**This layer should be removed where excavation and re-compaction occurs to 10 feet below grade.

2.5.1 Dynamic Characteristics of on-Site Soil

Based on our tests results, the average shear wave velocity in the upper 30 feet is about 725 feet per second. We have assumed that average shear wave velocity in the upper 30 feet will be increased to at least 1,200 feet per second after ground improvement. Therefore, the dynamic shear modulus (small-strain shear modulus), G_{max}, may be taken as 5,000,000 pounds per square foot in areas of compacted soil and as 3,500,000 per square foot in natural ground. The poisson's ratio of the soil may be taken as 0.3. The material damping ratio of the soil (small strain) may be taken as 0.05.The spring constant can be calculated using adjusted shear modulus (for anticipated soil strain(Reference 36 and 39, Appendices J and K)) and poison's ratio using various formula from pages 26 through 29 of the reference 36 (Appendix J) . The depth to rigid layer at the Site may be taken as infinite (with respect to the size of the foundations). The total unit soil weight (for the purpose of dynamic computations) may be taken as 120 pounds per cubic foot in areas of ground improvement and 110 pounds per cubic foot in other areas. A vertical modulus of sub-grade reaction of 175 pounds per cubic inch may be used for design of shallow foundations on improved ground. This value is a unit value for use with a 1-foot-square area. The modulus should be reduced in accordance with the following equation when used with the larger foundations:

$$K_R = K\,[(B+1)/2B]$$

Where K_R = Reduced sub grade modulus
K = Unit sub grade modulus
B = Foundation width in feet

3. Foundation Design

Based on our evaluation of the Site conditions and findings of this investigation, it is concluded that rigid mat foundation resting entirely on the properly compacted fill (the recommended minimum thickness of compacted fill below the bottom of the footing is 3 feet) or embedded into dense natural ground or cast-in-place concrete frictional piles embedded into dense natural ground will provide adequate foundation support for the proposed project. Reinforcement of footings and piles should be determined by the structural engineer.

3.1 Rigid Mat Foundations

Bearing Value

Rigid mat foundation carried at least 3 feet into undisturbed properly compacted fill, at least 10 feet wide, and at least 3 feet below the lowest adjacent grade or floor level can be designed to impose a net dead plus live load pressure of 3,000 pounds per square foot.

Footings for minor structures including any auxiliary retaining walls, free standing walls and elevator shaft that are structurally separate from the main foundations may be continuous or spread designed to impose a net dead-plus-live load pressure of 1,800 pounds per square foot, at a depth of 2 feet below the lowest adjacent grade. Such footings should be at least 1 foot wide and may be established in either properly compacted fill or undisturbed moderately dense natural soils.

A one-third increase in the allowable bearing values can be used for wind or seismic loads. The recommended bearing values are net values, and the weight of concrete in the footings can be taken as 50 pounds per cubic foot; the weight of soil backfill can be neglected when determining the downward loads.

While the actual bearing value of the compacted fill will depend on the material used and the compaction methods employed, the recommended value will be applicable if acceptable soils are used and are compacted as recommended. The bearing value of the fill should be confirmed after completion of the grading.

Modulus of Sub-grade Reaction

For design of the mat-type foundation, a modulus of sub-grade reaction of 175 pounds per cubic inch may be used for compacted soil. This value is a unit value for use with a 1-foot-square mat. The modulus should be reduced in accordance with the following equation when used with a larger mat:

$$K_R = K\,[(B+1)/2B]$$

Where K_R = Reduced sub grade modulus
K = Unit sub grade modulus
B = Foundation width in feet

Settlement

The settlement of the proposed equipment, supported on rigid mat foundation in the manner recommended, will be about 1 inch. Differential settlement between adjacent elements (50 feet apart horizontally) is expected to be about 0.25 inch or less.

Lateral Loads

Lateral loads may be resisted by soil friction against the footings and the floor slab and by the passive resistance of the soils. A coefficient of friction of 0.35 may be used between the floor slab and the supporting soils, and between the rigid mat foundation and the supporting soils. The passive resistance of the undisturbed natural soils or properly compacted fill

against footings may be assumed to be 250 pounds per cubic foot to a maximum of 3,500 psf. One-third increase in the passive value may be used for wind or seismic loads.

The passive resistance of the soils and the frictional resistance between the floor slab and the supporting soils and between the rigid mat foundation and the supporting soils may be combined with 30 percent reduction in passive resistance in determining the total lateral resistance.

3.2 Drilled Cast-in-Place Concrete Frictional Piles

Vertical Capacities

The average downward and upward frictional capacities of 500 and 250 psf are recommended for cast-in-place concrete piles at least 24 inches wide and 50 feet deep. One-third increase may be used for wind or seismic loads. The recommended frictional capacity is based on the strength of the soils and may be used from a depth 15 feet below the ground surface to the bottom of the pile; the compressive and tensile strength of the pile sections should be checked to verify their structural capacity. A negative skin friction of 200 pounds per square foot should be used for that portion of the pile in contact with the existing man-made fill.

Piles in groups should be spaced at least 3.0 diameters on center. If the piles are so spaced, no reduction in the capacities of the piles need be considered due to group action.

Settlement

The settlement of the drilled cast-in-place piles in the manner recommended is expected to be less than 1/2-inch.

Differential settlement between adjacent elements (50 feet apart) is expected to be about 0.25 inch or less.

Lateral Loads

Lateral loads may be resisted by the piles through the passive resistance of the undisturbed natural soils or properly compacted fill adjacent to the piles. An allowable lateral resistance of 300 pounds per square foot per linear foot of depth up to a maximum of 4,000 pounds per square foot may be used to calculate lateral resistance of the piles drilled into dense natural ground starting at 15 feet bgs. One-third increase in the passive value may be used for wind or seismic loads.

The subsurface conditions can be modeled by assuming a continuous soil layer with a friction angle of 30 degrees and a density of 100 pounds per cubic foot in the top 10 feet and 110 pounds per cubic foot below 10 feet. The sub-grade modulus K_H can be assumed 90 pci except for the upper 10 feet of soil profile. Sub-grade modulus, cohesion and Soil strain of 60, 250 psf and 0.005 (ε_{50}) can be assumed for the upper 10 feet of clayey sand.

The passive resistance of properly compacted fill against pile caps and grade beams may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot. A one-third increase in the passive value may be used for wind or seismic loads. The resistance of the piles and the passive resistance of the soils against pile caps and grade beams may be combined without reduction in determining the total lateral resistance.

It will be necessary to provide some flexibility in the foundation system in order to accommodate the anticipated deflections. One possible solution to the high bending moments and shear forces experienced by the shafts is to drill holes with larger diameters than the shafts in the upper clayey and fill the resulting space with a low-strength bentonite slurry or similar "weak" material (i.e. A slurry mixture can be placed within the annulus space with a unit weight of approximately 85 pcf and an undrained shear strength of 150 psf). It is even feasible that this annulus space around the upper portion of the shaft be left open to provide no resistance to lateral deflections within the Stratum 1 sands. This would allow the shaft to deflect without the strong horizontal reaction of the upper dense sands. A schematic of one possible system incorporating this concept is shown in Figure 20.

Ultimate Design Factors

When considering an ultimate design approach, the recommended design values provided in the previous sections may be multiplied by the factors shown below:

Item	Ultimate Design Factor
Bearing Pressure	3.0
Passive Pressure	1.3
Coefficient of Friction	1.5

Installation

Piles spaced closer than five diameters on centers should be drilled and filled alternately, with the concrete permitted to set at least eight hours before drilling any adjacent holes. All drilled piles excavation should be observed by personnel of our firm. Piles excavations should be filled with concrete as soon after drilling and inspection as possible: the holes should not be left open overnight. The concrete should be placed with special equipment so

that the concrete is not allowed to fall freely more than 5 feet and to prevent concrete from striking the walls of the excavations. Cobbles and boulders will be encountered during drilling operations and casing may be needed where natural ground is prone to caving. Casing and other requirements of the California State Division of Industrial Safety and CALOSHA, should be followed during construction.

Water or water seepage may be encountered in the piles excavations. The water should be removed from the pile excavations by pumping prior to placing the concrete.

Because of the presence of granular soils beneath the Site, the installation of drilled cast-in-place concrete piles will require special provisions to prevent caving of shaft side walls during construction. Special drilling provisions for caving include, but are not limited to, wetting of the upper soils prior to drilling, and/or use of casing.

Among other precautions, the drilling speed should be reduced as necessary to minimize vibration and sloughing of the sand deposits. Pile excavations should be filled with concrete as soon after drilling and inspection is completed; the holes should not be left open overnight. A collar should be placed around the mouth of the shaft after drilling to prevent soils from entering the excavation, and the pile shafts should be covered until concrete is placed.

Concrete should be pumped from the bottom up through a rigid pipe extending to the bottom of the drilled excavation, with the pipe being slowly withdrawn as the concrete level rises. The discharge end of the pipe should be at least 5 feet below the surface of the concrete at all times during placement. The discharge pipe should be kept full of concrete during the entire placing operation and should not be removed from the concrete until all of the concrete is placed and fresh concrete appears at the top of the pile. The volume of concrete pumped into the hole should be recorded and compared to design volume.

Only competent drilling contractors with experience in the installation of drilled cast-in-place piles in similar soil conditions should be considered for the pile construction. We suggest requesting the contractor to submit a list of similar projects along with references for each project.

Observation

The drilling of the piles and the placing of the concrete should be observed continuously by personnel of our firm. Our personnel should verify that pile excavations have at least the design diameters and penetrations into dense natural ground.

4. Retaining Walls

Cantilevered and restrained retaining walls with level backfill may be designed for assumed earth pressure equivalent to 30 and 45 pounds per cubic foot assuming that they are backfilled at least with 2 feet of non-expansive soil (as measured from the interior face of

the wall). External loads on the walls should be added to the recommended pressures. In addition to the recommended earth pressure, the retaining wall should be designed to resist surcharges in accordance with the County of Los Angeles and City of Pasadena Building Codes. Also, adequate drainage should be provided behind the walls to prevent the build-up of hydrostatic pressure.

Prior to backfilling, the excavation between retaining walls and temporary cut banks should be cleared of all loose materials, debris, and construction materials, etc. Soil placed as backfill should be compacted by mechanical means to at least 90 percent of the maximum dry density as determined by the ASTM: D-1557 Laboratory Standard. Ideally, the top two feet of backfill exposed to water infiltration should consist of clayey materials so that a relatively impervious condition is developed. Some settlement of the backfill should be anticipated and any utilities supported therein should be designed to accept differential settlement.

To preclude the adverse effects of possible intercepted subsurface seepage, it is recommended that a sub-drain system consisting of a 4-inch perforated drain pipe encased in three cubic feet per lineal foot of coarse gravel or No. 4 crushed rock be placed above and adjacent to the heel of retaining wall footings. The drain shall be sloped to direct all intercepted waters to approved and designated areas.

The contractor should be informed that the use of heavy compaction equipment in close proximity to the retaining walls cause excessive wall movement and/or earth pressure in excess of design values.

5. Slabs-on-Grade

When sub-grade is prepared as recommended in the above grading section, the building floor slabs and other concrete slabs may be supported on grade. Construction activities and exposure to the environment may cause deterioration of the prepared sub-grade. Therefore, we recommend that our field representative observe the condition of the final sub-grade immediately prior to slabs-on-grade construction and, if necessary, perform further density and moisture content tests to determine the suitability of the final prepared sub-grade. Subgrade soils for all concrete flatwork should be moisture conditioned to 3 percent above optimum moisture content within twenty-four hours prior to placement of concrete. The moisture content of the slab sub-grade should be kept at about optimum moisture content with periodic sprinkling of the slab sub-grade. Measures should be taken to maintain optimum moisture until concrete is placed.

Slabs-on-grade should be calculated for the anticipated live and dead loads by the structural engineer. Slabs-on-grade not subject to vehicular and other equipment traffic, should be a minimum of 4 inches (full) thick underlain by four inches of gravel and reinforced with 6 x

6 W2.9 X W2.9 welded wire mesh or No. 4 bars spaced 16 inches center to center in both directions, placed slightly above the slab mid-height. In areas where vinyl or other moisture-sensitive floor covering is planned, a 6-mil Visqueen should be placed beneath the slab, on the top of the above mentioned gravel layer with two-inch layer of sand between the concrete slab and the Visqueen to aid in curing. Cracks that develop in concrete slab-on-grade should be filled and sealed prior to placing floor coverings. Frequent control joints should be incorporated into the slab construction, particularly in the areas of reentrant corners, to help control cracking. The vapor barrier should be evaluated for holes and/or punctures, and the edges overlapped and taped, prior to placement of concrete. Any holes or punctures observed should be properly repaired. The barrier should be covered with two inches of sand to help protect it during construction. The sand should be lightly moistened just prior to placing the concrete. Relatively impervious floor coverings (i.e. vinyl, linoleum, etc.) that cover concrete slab-on-grade may block the passage of moisture vapor through the concrete slab, which could result in damage to the floor covering. It is suggested that after the concrete slab has sufficiently cured, the concrete slab surface be sealed with a commercial sealant prior to placing the floor covering. The compatibility and recommendations for placing of the concrete sealer, mastic, and floor covering should be verified by the floor covering manufacturer prior to sealing the concrete or placing of the floor covering.

The suggested gradation for the gravel is as follows:

Sieve Size	Percent Passing
3/4"	90-100
No. 4	0-10
No. 100	0-3

If a membrane is used, a low-slump concrete should be used to minimize possible curling of the slabs. The 2-inch-thick layer of coarse sand to be placed over the membrane will reduce slabs curling. If this sand bedding is used, care should be taken during the placement of the concrete to prevent displacement of the sand. The concrete slabs should be allowed to cure properly before placing vinyl or other moisture-sensitive floor covering.

Joints for concrete slabs on grade must be carefully designed. Joint spacing is dependent upon slab thickness and concrete properties and should be selected by the structural engineer. Joint should be properly sealed. Unless local conditions and concrete properties indicate otherwise, the joint spacing (in feet) should not exceed approximately twice the slab thickness (in inches). Joint spacing may be increased if slabs are heavily reinforced.

During hot weather, the contractor should take appropriate curing precautions after placement of concrete to minimize cracking of the slabs. The potential for slab cracking may be lessened by the addition of fiber mesh to the concrete, and/or control of water/cement ratio. Concrete should be cured by protecting it against loss of moisture and rapid temperature change for at least seven (7) days after placement. Mist curing,

waterproof paper, white polyethylene sheeting, white liquid membrane compound, or a combination thereof, may be used after finishing operations have been completed. The edges of concrete slabs exposed after removal of forms should be immediately protected to provide continuous curing.

5.1 Tile Flooring

Tile flooring can crack, reflecting cracks in the concrete slab below the tile. Therefore, the slab designer should consider additional steel reinforcement of concrete flat work where tile will be placed. The tile installer should consider installation methods that reduce possible tile cracking. A vinyl crack isolation membrane (approved by the Tile Council of America/Ceramic Tile Institute) is recommended between tile and concrete flat work.

5.2 Concrete Walks, Driveways, Access Ramps, Curb and Gutter

Except as modified herein, concrete walks, driveways, access ramps, curb and gutters should be constructed in accordance with Section 303-5, Concrete Curbs, Walks, Gutters, Cross-Gutters, Alley Intersection, Access Ramps, and Driveways, of the Standard Specifications for Public Work.

At least the upper 12 inches of the sub grade soils under these structures should be scarified; moisture conditioned to slightly above optimum and compacted to at least 90 percent relative compaction.

The sub-grade soils under the driveways, if any, should be pre-soaked prior to pouring concrete in accordance with the recommendations provided for concrete slabs-on-grade of the specification, Slabs-on-Grade. The thickness of the driveways should be spaced not more than 10 feet apart. Driveways wider than 12 feet should be provided with a longitudinal control joints.

Concrete walks subjected to pedestrian and bicycle loading should be at least four (4) inches thick. Transverse joint should be spaced 15 feet or less and should be cut to a depth of one fourth the slab thickness.

It is recommended that the proposed exterior perimeter slabs (sidewalks, patios, walkways, etc.) be designed to be relatively independent of foundation stems (free-floating) to help mitigate cracking due to foundation settlement and/or expansion.

Positive drainage should be provided away from all driveways and sidewalks to prevent seepage of surface and/or subsurface water into the concrete base and/or subgrade.

6. Drainage

A positive surface gradient should be provided adjacent to all structures so as to direct surface water run-off away from the foundations, slabs, and landscaped areas towards suitable discharge facilities. Ponding of surface water should not be allowed on pavements or adjacent to the building even during the construction period. All roof and wall surface drainage should be collected and conducted by a non-erosive device to the street.

7. Construction Cuts

Construction cuts up to 5 feet in depth may be cut vertically provided they do not undermine existing equipment foundations, buildings, walls, public streets or alleys. Deeper construction cuts should be laid back at 1:1 (horizontal:vertical) gradient or be shored. No surcharge loads should be allowed within four feet from the top of cuts or inside a line drawn at 45 degrees from the toe of the excavation. Exposed slope surfaces should be kept moist (but not saturated) during construction to minimize local sloughing. Screening may be necessary on the slope surface to protect the workmen. Where there is insufficient space for sloped excavations, shoring should be used. If the construction cuts removes lateral support of the existing building or equipment foundations, the existing foundations should be underpinned or construction cut be shored. An equivalent fluid pressure of 24 PCF may be used for the design of temporary shoring with no surcharge. The surcharge from the existing foundations should be added to the recommended equivalent fluid pressure in accordance with the Los Angeles County and City of Pasadena Building Codes. If the construction cuts are to remain open for more than two weeks or if rain is expected while the construction cuts are open, they should be covered by a plastic membrane. All construction cuts should comply with the State of California Construction Safety Orders (Cal/OSHA).

8. Planters

Planters adjacent to the foundations should be avoided, and where planters are planned adjacent to the building, they should have the bottom and walls waterproofed and a drain system installed beneath the planter to carry water away from the building area.

9. Pavement

9.1 General

To provide support for paving, the sub-grade soils should be prepared as recommended in Section 2.0. Compaction of the sub-grade to at least 95%, including trench backfills, will be important for paving support. The preparation of the parking area sub-grade should be done

immediately prior to the placement of the base course. Proper drainage of the paved areas should be provided since this will reduce moisture infiltration into the sub-grade and increase the life of the paving.

9.2 Asphaltic Paving

The required asphaltic paving and base course thicknesses will depend on the anticipated wheel loads and volume of traffic (Traffic Index). Assuming that the paving sub-grade will consist of the on-Site soils or comparable import soils compacted to 95% as recommended, the recommended paving sections for various Traffic Indices is presented in the following table. The paving sections were determined using the Caltrans design method and an assumed R value of 35 based on the R-value tests.

Asphalt Concrete (A.C.) Paving Thickness

Traffic Use	Traffic Index	A.C. (inches)	Base Course (inches)
Automobile Parking	5	3.5	4
Driveway and Light Truck Drives	6	4.0	5
Roadways and Heavy Truck Drives	7	4.5	6

Careful inspection is recommended to verify that the recommended thicknesses or greater are achieved and that proper construction procedures are used. We can provide paving sections for other Traffic Index values if desired.

9.3 Portland Cement Concrete Paving

Portland cement concrete paving sections were determined in accordance with procedures developed by the Portland Cement Association. Concrete paving sections for a range of Traffic Indices are presented below. We have assumed that the Portland cement concrete will have a compressive strength of at least 3,000 pounds per square inch.

Portland Cement Concrete (P.C.C.) Paving Thickness

Traffic Use	Traffic Index	P.C.C. (inches)	Base Course (inches)
Automobile Parking	5	5	4
Driveways and Light Truck Drives	6	5	4
Roadways and Heavy Truck Drives	7	6	4

We recommend that the concrete paving be properly reinforced. In addition, dowels are recommended at joints in the paving to reduce any possible offsets.

9.4 Base Course

The base course for both asphaltic and concrete paving should meet the specifications for Class 2 Aggregate Base as defined in the latest edition of the State of California, Department of Transportation (Caltrans) Standard Specifications. Alternatively, the base course should meet the specifications for untreated base as defined in Section 200-2 of the latest edition of the Standard Specifications for Public Works Construction (Green Book). The base course should be compacted to at least 95%.

Careful inspection is recommended to verify that the recommended thickness or greater are achieved and that proper construction procedures are used.

10. Observation

Construction cuts, footing and cast in place concrete pile excavation should be examined by us prior to forming and placement of steel to confirm that the soil conditions meet the requirements set by this report. Footings and pile excavation should be kept moist (not saturated) and the concrete should be poured as soon as possible after excavations are complete, examined and approved by us and the City of Pasadena inspectors. Inspection of foundation and pile excavations may also be required by other appropriate reviewing governmental agencies. The contractor should be familiar with the inspection requirements of the reviewing agencies. Foundations should be deepened if necessary to reach satisfactory supporting soils. Water within the foundation and pile excavations should be removed and any softened soils excavated prior to pouring the foundations. Backfill around and over footings and utility trench backfill within the building areas should be mechanically compacted and tested, flooding should not be used.

11. Plan Review

Formal plans should be reviewed by Hydrologue, Inc. Should the plans differ substantially from preliminary information provided to us, additional geotechnical work may be required.

12. Waterproofing

Rooms or spaces located below grade have a history of moisture intrusion, seepage, and leakage. Conventional waterproofing materials, such as asphalt emulsion, have often proved ineffective. Certain precautions can be taken to reduce the possibility of future seepage problems. Superplasticized and water-retardant concrete may be utilized to make pouring easier and reduce cracking and shrinkage. Also important is the use of a sub-drain

which daylights to the atmosphere. The sub-drain should be covered with gravel to facilitate collection of water.

13. Ground Motion

3.1 General

Seismic design for the proposed industrial development is performed in accordance with the 2007 CBC, which is identical to the 2006 IBC. In the 2006 IBC, the methodology to develop input ground motion parameters for use in seismic design is based on ASCE-7, *Minimum Design Loads for Buildings and Other Structures.* The procedure outlined in ASCE-7 is based on the MCE, which is defined as an earthquake that results in ground motions that have a 2 percent chance of being exceeded in 50 years (a 2,475-year recurrence interval). This procedure is outlined in Table 1.

Table 1
Summary of ASCE-7 Procedure for Seismic Design

Step	Procedure	Reference
1	Compute Generalized Response Spectrum	ASCE 11.4.5
2	Compute MCE Response Spectrum	ASCE 11.4.6
3	Compute Probabilistic MCE Response Spectrum	ASCE 21.2.1
4	Compute Deterministic MCE Response Spectrum	ASCE 21.2.2
5	Compute Deterministic Lower Limit on MCE Response Spectrum	ASCE 21.2.2 (Figure 21.2-1)
6	Compute Site-Specific MCE Response Spectrum	ASCE 21.2.3
7	Compute Two-Thirds of Site Specific MCE Response Spectrum	ASCE 21.3
8	Compute 80 Percent of Generalized Design Response Spectrum	ASCE 21.3
9	Compute Final Design Response Spectrum	ASCE 21.3

The steps summarized in Table 1 are briefly discussed in the following sections.

13.2 Generalized Response Spectrum

The generalized response spectrum for a site is developed by identifying the spectral ordinates at periods of 0.2 and 1 second and identifying the appropriate site class in accordance with Table 1613.5.2 of the 2006 IBC. The spectral ordinates are computed using JAVA Ground Motion Calculator (USGS).

Based on the data obtained from the borings at the Site, the soils at the Site may be classified as Site Type D.

Section 11.4.5 of ASCE-7 summarizes the development of the generalized design response spectrum. The seismic design parameters associated with this Site are summarized in Table 2 computed by JAVA Ground Motion Calculator.

Table 2
Seismic Design Parameters

Parameter	Short Period (T = 0.2 second)	1-Second Period (T, = 1.0 second)
Mapped Spectral Acceleration	S_s =2.550g	S_1= 0.850g
Site Class	D	
Site Coefficient, F_a and Fv	1.0	1.5
Adjusted Spectral Acceleration, S_M	S_{MS}=2.550g	S_{M1} = 1.276 g
Design Spectral Response Acceleration Parameters, S_D	S_{DS}=1.700g	S_{D1}= 0.850g

The generalized response spectrum determined for the Site is presented in Table 3.

13.3 MCE Response Spectrum

The MCE response spectrum is simply defined as the generalized response spectrum multiplied by 1.5.

13.4 Probabilistic MCE Response Specturum

The probabilistic MCE response spectrum is developed by performing a PSHA that takes into account faults that are a potential source of strong ground shaking at the Site based on a given risk, defined as the recurrence Interval. For the MCE, the recurrence interval is 2,475 years, which corresponds to ground motions that have a 2 percent probability of being exceeded in 50 years, as stated in Section 21.2.1 of ASCE-7.

We performed the PSHA using the computer software program EZ Frisk, Version 7.31 using following attenuation relationships (collectively referred to as the NGA Relationships).

- Boore and Atkinson (2008)
- Campbell and Bozorgnia (2008)
- Chiou and Youngs (2008)

In our analysis and based on the data collected from our borings and the prior data, we assumed a shear wave velocity of 1,100 fps to represent the soils at the Site.

The resulting probabilistic MCE response spectrum is presented in Table 3.

13.5 Deterministic MCE Response Spectrum

The deterministic MCE response spectrum is also developed by using EZ Frisk in conjunction with the attenuation relationships and soil stiffness estimate discussed in the "Probabilistic MCE Response Spectrum" section of this report. The deterministic approach simply considers the maximum ground acceleration that may occur at the Site as a result of an earthquake. The deterministic analysis differs from the probabilistic analysis in that recurrence intervals are not considered.

In accordance with ASCE-7 Section 21.2.2, the ordinates of the deterministic response spectrum are multiplied by 1.5 to obtain the ordinates for the deterministic MCE response spectra. The resulting deterministic MCE is presented in Table 3.

13.6 Deterministic Lower Limit on MCE Response Spectrum

The deterministic lower limit MCE response spectrum is defined in ASCE-7 Section 21.2.2 as the response spectrum that results using prescribed spectral ordinates of 1.5 and 0.6 for 0.2 and 1 second periods, respectively. The resulting deterministic lower limit on MCE response spectrum is presented in Table 3.

13.7 Site-Specific MCE Response Spectrum

As outlined in ASCE-7 Section 21.2.3, the Site-specific MCE response spectrum shall be taken as the lesser of the probabilistic MCE and the deterministic MCE. The resulting Site-specific MCE response spectrum is presented in Table 3.

13.8 67 Percent of the Site-Specific MCE Response Spectrum

Section 21.3 of ASCE-7 allows the Site-specific MCE response spectrum to be factored by two-thirds for subsequent comparison to 80 percent of the generalized response spectrum computed in Step 1 ("Generalized Response Spectrum"). Sixty-seven percent of the Site-specific MCE is presented in Table 3.

13.9 80 Percent of the Generalized Design Response Spectrum

Section 21.3 of ASCE-7 establishes the lower bound for design ground motions as 80 percent of the generalized response spectrum computed in Step 1 ("Generalized Response Spectrum" section of this report). Eighty percent of the generalized response spectrum is presented in Table 3.

13.10 Final Design Response Spectrum

To develop the final design response spectrum, the lesser of the values obtained from the probabilistic MCE and the deterministic MCE were taken at each period. If the resulting value is less than 80 percent of the generalized response spectrum, the value from the 80 percent response spectrum is used. The resulting final design response spectrum is, therefore, a hybrid curve based on the generalized response spectrum, the probabilistic MCE response spectrum, and the deterministic MCE response spectrum. The final design response spectrum is presented in table 3.

Table 3

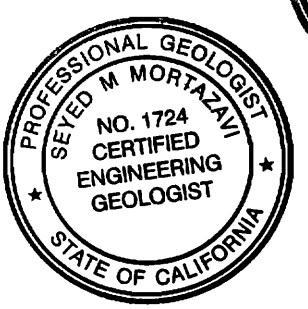
The results of our seismic analysis are summarized graphically on Figures 21 and 22.

From Table 3, it can be concluded: S_{DS}=1.604g, S_{D1}=1.125g, seismic design category is D.

This report has been prepared for the exclusive use of the City of Pasadena Power Plant, their design consultants and for the specific project discussed herein. Since the report has not been prepared for use by other parties, it may not contain sufficient information for other parties or other uses. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by geotechnical consultants practicing in this or similar localities.

The recommendations provided in this report are based upon our understanding of the described project information and on our interpretation of the data collected during the subsurface explorations and laboratory testing. The recommendations and opinions expressed in this report reflect our best estimate of project requirements based on information obtained at exploratory borings, and sampling locations on the date indicated. It must be recognized, however, that evaluation of subsurface deposits, such as those present at the Site, are subject to the influence of undisclosed and unforeseen variations in soil conditions that may occur at different times and intermediate, unexplored areas. This report has been prepared in accordance with generally accepted soils engineering practices. No other warranties, either expressed or implied, are made as to the professional advice provided under the terms of our contract and included in this report.



The recommendations provided in this report are also based upon the assumption that the necessary geotechnical observations and testing during construction will be performed by representatives of our firm. The field observation services are considered a continuation of the geotechnical investigation and essential to verify that the actual soil conditions are as anticipated. This also provides for the procedure whereby the client can be advised of unanticipated or changed conditions that would require modifications of our original recommendations. In addition, the presence of our representative at the Site provides the client with an independent professional opinion regarding the geotechnical-related construction procedures.

This opportunity to be of service is sincerely appreciated. If you have any questions concerning this report, please do not hesitate to contact this office.

Very Truly Yours,
HYDROLOGUE, INC.

Seyed Morteza Mortazavi, Ph.D.

62. A slight rise to the south in very gently sloping terrain underlain by older alluvium (Qoa) may have been caused by fairly recent movement along the San Rafael fault.

63. The trace of the San Rafael fault is represented by low breaks in slope and by irregular terrain on a nearly flat surface developed on the surface of older alluvium (Qoa).

64. Buwalda (1940) described essentially flat or even slightly north-dipping surface areas as being the product of upwarping along the fault.

UNITS (from Lamar, 1970)

Quaternary Deposits

- Qto — Old Terrace and fan alluvium: primarily sand and gavel
- Qalo — Old Alluvium, sand and gravel
- Qvoa — Very Old Alluvium: primarily cobbles and coarse gravel

Fernando Formation (Pliocene; Undifferentiated)

- Tf — Siltstone: massive

Puente Formation (Late Miocene)

- Tp — Interbedded Siltstone, claystone, mudstone, shale and sandstone, brown, gray, and black

Topanga Formation (Middle Miocene)

- Tt — Predominantly sandstone and conglomerate with abundant interbeds of siltstone and mudstone; brown, dark gray, and black.

Crystalline Basement Rocks (Mesozoic)

- Wqm / Wqg — Primarily Diorite and gneiss; generally highly fractured

SYMBOLS (All locations are approximate)

- Z4-B4 — Continuous Core Boring (CH2M HILL, this study)
- 14D1 — Water Production Well (CDWR, 1966)
- Z5-G2 — Seismic Reflection Line (CH2M HILL, this study)
- C23f — Caltrans Boring (1974a)
- B4(NM) — Ninyo and Moore (1999)
- EMI-2 — Continuous Core Boring (EMI, 2006)
- ES-2 — Caltrans Boring (1974b)

- Historically Highest Groundwater Level (CDMG, 1998f, 1998d)
- 2006 Groundwater Level (MSGW, 2006 and RBMB, 2006)
- Inactive Fault
- Active Fault
- Geologic Contact, dashed where inferred or indefinite

MAP EXPLANATION

Zones of Required Investigation:

Liquefaction
Areas where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslides
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

COMMENTS

This laboratory request covers the following listed samples which were analyzed for the parameters indicated on the attached Analytical Result Report. All analyses were conducted using the appropriate methods as indicated on the report. This cover letter is an integral part of the final report.

Order No.	Client Sample Identification
1174485	BH-1 (Bulk)
1174486	BH-2 (Bulk)
1174487	BH-4 (Bulk)
1174488	BH-8 (Bulk)
1174489	BH-9 (Bulk)
1174490	Laboratory Method Blank

Thank you for the opportunity to be of service to your company. Please feel free to call if there are any questions regarding this report or if we can be of further service.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
Client: Hydroqual
Date Received: 6/16/11
Sample(s) received in cooler: (Yes) No
Shipping Information:
Project:
Sampler's Name: Yes (No)
No (Skip Section 2)

Section 2
Was the cooler packed with: ✓ Ice ___ Ice Packs ___ Bubble Wrap ___ Styrofoam ___ Paper ___ None ___ Other
Cooler or box temperature: 4.8
(Acceptance range is 2 to 6 Deg. C.)

Section 3	YES	NO	N/A
Was a COC received?	✓		
Is it properly completed? (IDs, sampling date and time, signature, test)	✓		
Were custody seals present?		✓	
If Yes – were they intact?			
Were all samples sealed in plastic bags?	✓		
Did all samples arrive intact? If no, indicate below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were correct containers used for the tests required?	✓		
Was a sufficient amount of sample sent for tests indicated?	✓		
Was there headspace in VOA vials?			✓
Were the containers labeled with correct preservatives?			✓
Was total residual chlorine measured (Fish Bioassay samples only)? *			✓

*: If the answer is no, please inform Fish Bioassay Dept. immediately.

-END OF SEARCH- 156 EARTHQUAKES FOUND WITHIN THE SPECIFIED SEARCH AREA.

TIME PERIOD OF SEARCH: 1800 TO 2000

LENGTH OF SEARCH TIME: 201 years

THE EARTHQUAKE CLOSEST TO THE SITE IS ABOUT 3.4 MILES (5.5 km) AWAY.

LARGEST EARTHQUAKE MAGNITUDE FOUND IN THE SEARCH RADIUS: 7.7

LARGEST EARTHQUAKE SITE ACCELERATION FROM THIS SEARCH: 0.519 g

COEFFICIENTS FOR GUTENBERG & RICHTER RECURRENCE RELATION:
a-value= 1.582
b-value= 0.386
beta-value= 0.888

TABLE OF MAGNITUDES AND EXCEEDANCES:

Earthquake Magnitude	Number of Times Exceeded	Cumulative No. / Year
4.0	156	0.77612
4.5	156	0.77612
5.0	156	0.77612
5.5	57	0.28358
6.0	28	0.13930
6.5	12	0.05970
7.0	7	0.03483
7.5	2	0.00995

Appendix E

Guide Specifications for Drilled Pile Installation

GUIDE SPECIFICATIONS FOR DRILLED PILE INSTALLATION

1. Pile installation shall be performed during continuous observation by Hydrologue, Inc. (HI) to confirm that the recommended undisturbed native materials are penetrated, that depths of installed piles are at least as large as indicated on the foundation plan, and that pile installation has been performed as specified herein. The contractor shall provide access and necessary facilities, including drop lights, at contractor expense to accommodate pile observations.

2. Pile installation shall be performed such that compliance with all safety rules and requirements is achieved, including requirements of the State of California Construction Safety Orders Section 1542 or the latest replacement.

3. Pile lengths indicated on the plans are approximate. Actual lengths of piles to be installed will depend upon the depth to suitable supporting materials.

4. Piles shall be located as indicated on the drawings. Any pile installed, having a center more than 3 inches off of plan center lines will require structural analysis. The cost of such analysis and any work and/or materials resulting from correcting an error in location of piles shall be borne by the contractor.

5. Piles shafts shall be machine-drilled. The pile excavation shall be plumb to a tolerance of not more than 1 inch in 6 feet.

6. Where caving soils are encountered, casing or other methods approved by HI shall be used to support pile excavations. The inside diameter of casing shall be larger than the diameter of the pile as indicated on the foundation plans, so that drilling can be accomplished within the casing. Drilling fluids shall not be used to support the excavation without the specific recommendation of the drilling fluid manufacturer with respect to use in pile installation, and approval by the owner and HI. If drilling fluids are used, concrete must be placed with a pipe or tremie extending to the bottom of the excavation. The concrete level must be maintained above the bottom of the pipe such that drilling fluid does not contaminate placed concrete. If groundwater is encountered, pile excavations shall be dewatered, casing will be required, and concrete shall be tremied from the bottom of the pile hole upward.

7. At the completion of drilling, secure covers shall be placed over open pile excavations. Concrete placement shall begin within 4 hours after completion of drilling. Placed concrete shall have a slump of 6 inches, with a tolerance of ± 1 inch. Concrete shall not be allowed to fall freely more than 6 feet, in accordance with the 1991 Standard Specifications for Public Works Construction (1991 Edition) Section 303-1.8.3. Concrete pumps, tremies or other such devices shall be used to comply with this requirement. Casing may be raised slowly as the pile excavation is filled with concrete, provided that the bottom of the casing is never less than 2 feet **below** the level of the concrete. Concrete placement shall continue until suitable concrete extends to the top of the pile excavation. The tremie or concrete

pump pipe may be raised slowly as the pile excavation is filled with concrete, provided that the bottom of the pipe is never more than 6 feet above the level of the concrete. Concrete placement shall be continuous without interruption, and at such a rate that fresh concrete will not be deposited on concrete hardened sufficiently to form seams or planes of weakness.

8. Piles spaced closer than 5 pile diameters center-to-center shall be drilled and filled with concrete alternately, allowing at least 12 hours after concrete placement in a pile before drilling an adjacent pile.

9. Reinforcement shall be rigidly installed and secured to prevent movement or dislodgement during concrete placement.

10. In the event that pile installation procedures specified above are not adhered to, the owner may require the contractor to core the pile to confirm that a continuous concrete pile has been installed. The cost of such coring will be borne by the contractor.

11. Any piles deemed by the owner to be defective shall be replaced with substitute piles as directed by the owner. Cost of installation of such substitute piles will be borne by the contractor. Costs associated with analysis and design of substitute piles shall also be borne by the contractor.

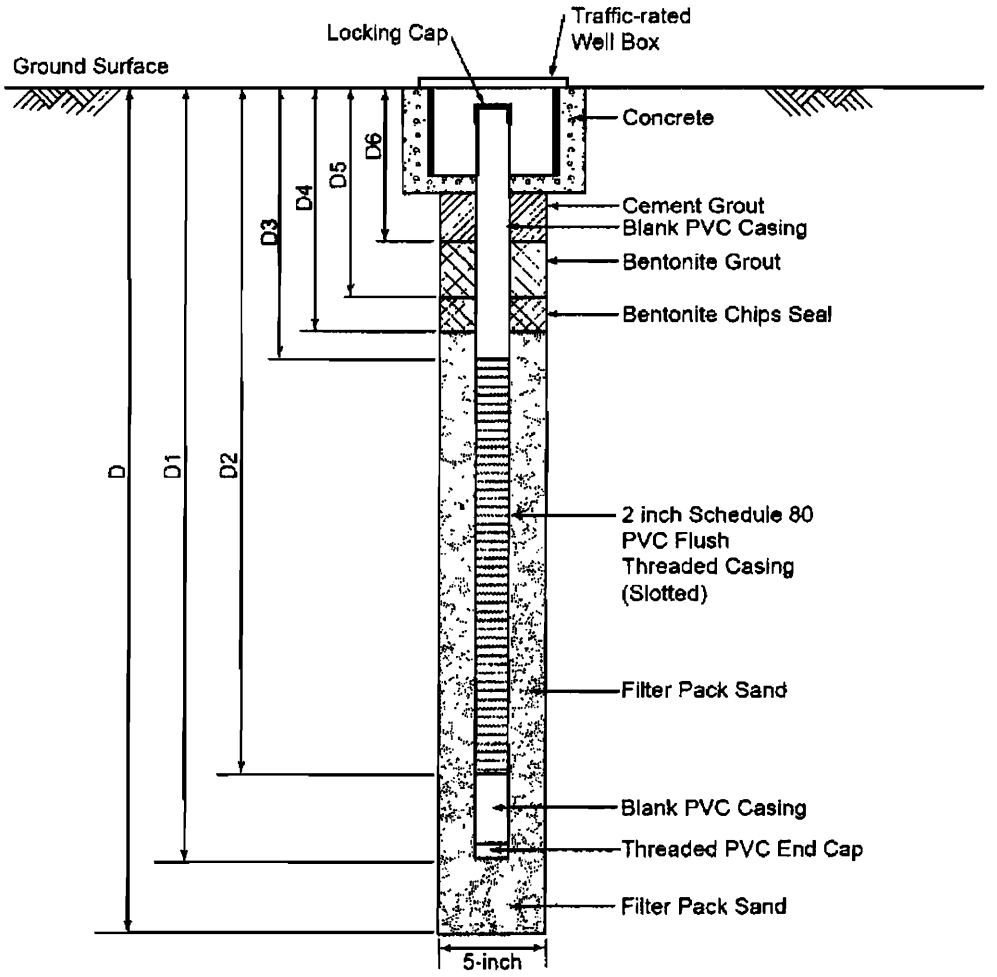
Table B-1 from Reference 10

Groundwater Monitoring



Details of typical piezometer installation are shown in Figure B-1. The piezometers were constructed using 2-inch-diameter polyvinyl chloride (PVC) Schedule 80 pipe set in the borehole. The bottom of the pipe was slotted and capped, and the annular space around the slotted pipe was backfilled with Monterey No. 3 clean sand. Approximately 100 feet of screen interval were used in each piezometer, 25 feet below invert and 25 feet above crown of the anticipated tunnel. The area above the sand was sealed with bentonite chips, the remaining annulus was filled with bentonite grout, and the annulus within upper 8 feet was filled with cement grout. Each piezometer was completed with a locking cap and traffic-rated well box, except at boring locations R-09-Z1B8 and R-09-Z3B2 where standpipes were used because of grassland at the surface.

TABLE B-1
Summary of Piezometers Installation

Boring/ Piezometer Designation	Ground Surface Elevation (feet)	Depth of Piezometer (feet)	Depth to top of Screen (feet)	Depth to Bottom of Screen (feet)	Date Measured	Groundwater Elevation[1] (feet)

NOTES:

This map is intended for general land use planning only. Information on this map is not sufficient to serve as a substitute for detailed geologic investigations of individual sites, nor does it satisfy the evaluation requirements set forth in geologic hazard regulations.

Fault lines on the map are used solely to approximate the fault location. The width and location of the faults should not be used in lieu of site-specific investigations, evaluation, and design.

Detailed geologic investigations, including trenching studies, may make it possible to refine the location and activity status of a fault. All faults may not be shown. This map should be amended as new data become available and are validated.

Earth Consultants International (ECI) makes no representations or warranties regarding the accuracy of the data from which these maps were derived. ECI shall not be liable under any circumstances for any direct, indirect, special, incidental, or consequential damages with respect to any claim by any user or third party on account of, or arising from, the use of this map.

Pasadena, California

Plate 1-2

SAFETY ELEMENT GOALS AND POLICIES

The following are recommendations for the Safety Element policy framework for the City of Pasadena based on findings presented in the Technical Background Report.

SEISMIC HAZARDS:

Goal S-1: Minimize injury and loss of life, property damage, and other impacts caused by seismic shaking, fault rupture, ground failure, earthquake-induced landslides, and other earthquake-induced ground deformation.

Policy S-1: The City will monitor development or re-development within the Fault Hazard Management Zones identified for both the Sierra Madre and Raymond faults.

Program S1-1: The City will cooperate with State and Federal agencies in conducting geological investigations of the Sierra Madre and Raymond faults. The City will investigate the possibility of partnering with the Earthquake Hazards Program of the U.S. Geological Survey to better identify the active traces of the Sierra Madre fault.

Program S1-2: The City shall require geological studies, such as fault-trenching, of the ***defined traces*** of the Sierra Madre and the Raymond fault traces shown on Plate P-1. The studies shall be conducted by State-certified engineering geologists following the guidelines established in the Alquist-Priolo Earthquake Fault Studies Act. This should apply to the development and redevelopment of residential, commercial or industrial parcels or tracts that amount to 5,000 square feet or more. The City Geologist shall review the fault studies to ensure that the excavations were conducted with an acceptable level of effort to determine whether or not there are active faults through the proposed development, and that suitable fault setbacks are defined.

Program S1-3: The City will require geological studies of the ***less well-defined traces*** of the Sierra Madre fault shown on Plate P-1 for critical facilities proposed within this zone. The studies shall be conducted by State-certified engineering geologists.

Policy S-2: The City will ensure that current geologic knowledge and State-certified professional review are incorporated into the design, planning and construction stages of a project, and that site-specific data are applied to each project.

Program S2-1: The City shall retain on staff, or on a contract basis, a State-certified engineering geologist and a geotechnical engineer to review all geotechnical studies for proposed development or redevelopment, including fault studies (Programs S1-1 through S1-3), and to review grading operations (Programs S2-3 and S2-4). These individuals, whether on staff or under contract to the City, are referred to herein as the City Geologist and City Geotechnical Engineer, respectively.

Program S2-2: The City will modify the fault hazard management zones for the Raymond and Sierra Madre faults as data obtained from the implementation of Programs S1-1 through S1-3 become available. Modification of the map will be conducted by or under the direction of the City Geologist.

Program S2-3: The City shall require geological and geotechnical investigations in areas of potential seismic or geologic hazards as part of the environmental and development review process. The City shall not approve proposals and projects for development or redevelopment which do not provide for mitigation of seismic or geologic hazards to the satisfaction of the responsible agencies.

Program S2-4: The City shall continue to require preliminary geological investigations of tract sites by State-registered geotechnical engineers and certified engineering geologists (in accordance with the California Building Code).

Program S2-5: The City shall continue to require liquefaction assessment studies in areas identified as susceptible to liquefaction in accordance with the California Geological Survey Special Publication 117 Guidelines, and the Southern California Earthquake Center's procedures to implement Special Publication 117.

Policy S-3: The City will strive to ensure that the design of new, and the performance of existing structures address the appropriate earthquake hazards.

Program S3-1: The City shall continue to enforce the seismic design provisions for Seismic Zone 4 of the California Building Code, including near-source seismic conditions.

Program S3-2: The City will identify un-retrofitted buildings, including tilt-up construction, non-ductile reinforced concrete, and tuck-under parking and other soft-story construction. A catalog of these buildings in the City will be completed.

Program S3-3: The City shall prepare a plan for structural retrofit of such buildings identified under Program S3-2.

Program S3-4: The City will disclose to the buyer through City occupancy programs the potential problems with unbolted foundations in pre-1935 residences.

Program S3-5: The City will require prior to the reconstruction of damaged / destroyed buildings in hazard management zones, especially fault zones, to prove that the site can be safely restored using earthquake-resistant building techniques and land development policies as identified under Program S-1.2.

Policy S-4: The City will ensure to the fullest extent possible that, in the event of a major disaster, essential structures and facilities remain safe and functional, as required by current law. Essential facilities include hospitals, police stations, fire stations, emergency operation centers, communication centers, generators and substations, and reservoirs.

Program S-4.1: The City will continue to encourage the participation of the Planning and Development Departments during the early, conceptual stages of a critical facility project to assess its feasibility, with emphasis on issues such as surface fault rupture potential, liquefaction susceptibility, and inundation potential.

Program S-4.2: The City will encourage compliance with the 1974 Hospital Facilities Seismic Safety Act, the 1986 California Earthquake Hazards Reduction Act and SB 1953. The City will continue to work with the Huntington Memorial Hospital and state agencies to ensure that the hospital buildings will remain occupiable and operational following a maximum magnitude earthquake on the Raymond or Sierra Madre faults.

Program S-4.3: The City will seek cooperative agreements with regional hospitals outside City limits that can provide medical assistance in the event that the Huntington Hospital does not have sufficient beds to accommodate all of the casualties resulting from an earthquake or other disaster. Open areas, such as parks and school fields, from which victims could be airlifted to regional hospitals if necessary will be identified as part of this program.

Policy S-5: The City will continue earthquake strengthening and provisions for alternate or back-up essential services, such as water, sewer, electricity, and natural gas pipelines and connections throughout the City. First priority for this program should be for the essential services within the identified fault hazard management zones.

Program S-5.1: The City shall conduct seismic analysis of essential infrastructure such as water, sewer, electricity, and natural gas lines and make any structural changes necessary to withstand seismic activities. This may include additional strengthening, shoring and/or flexible pipelines in areas that cross fault hazard zones.

Policy S-6: The City will ensure to the fullest extent possible that, in the event of a major disaster, dependent care and high-occupancy facilities will remain safe.

Program S-6.1: The City's Building Department shall continue to review existing and proposed projects to ensure that stairways and elevators in high-occupancy buildings are adequately strengthened.

Program S-6.2: The City's Fire Department, as part of their annual review of businesses and dependent care facilities, shall encourage and educate the owners or operators of these facilities about emergency generators, and the value of securely anchoring computers, shelving, and other non-structural elements.

Policy S-7: The City will educate the public on the hazards that can pose a risk to the City and its residents, and will describe loss reduction strategies that can be used to mitigate the specific hazards identified.

Program S-7.1: The City will regularly review the technical data on public safety and seismic safety for use in the planning process and undertake a technical update to the Safety Element as needed. This includes the periodic update of the maps that support the Technical Background Report with newly developed data obtained in response to geological studies undertaken for fault, liquefaction or landslide studies. Where sufficient data are developed to indicate that an area currently identified as susceptible to liquefaction is NOT liquefiable, modify the map to eliminate the need for future studies in that area. Results of these findings will be submitted to the California Geological Survey.

SAFETY ELEMENT GOALS AND POLICIES

Program S-7.2: The City will continue to develop an effective system for communicating information about risk and loss reduction strategies to City staff in all departments responsible for implementing the programs defined in the Safety Element.

Program S-7.3: The City will develop a web-based system to communicate to the City's residents, workers and visitors the hazards specific to the City, and, most importantly, to describe the loss reduction strategies that homeowners and workers can implement at home and the work place to reduce their risk.

GEOLOGIC HAZARDS

Grading and construction operations are necessary to correct for unstable soils, soil erosion, landsliding and flooding (debris and/or mudflows) in hillside areas. This is sometimes in conflict with the desire to preserve the aesthetic or natural conditions of the existing topography. There must be a balance of the two objectives.

Goal G-1: Minimize the risk to life or limb, and property damage resulting from soil and slope instability.

Policy G-1: Whenever possible, mitigation of geologic hazards will be conducted without violating the property owners' rights to modify or improve their investment, along with preserving the aesthetic or natural conditions of the area through minimal grading. When these goals are in conflict, protection of life and property will take precedence.

Program G1-1: In the areas of Pasadena susceptible to slope instability, the City will require geotechnical investigations that include engineering analyses of slope stability, provide surface and subsurface drainage specifications, and provide detailed design for fill placement and excavation.

Program G1-2: The City will discourage any grading beyond that which is necessary to create adequate and safe building pads. The City Geologist and Geotechnical Engineer shall conduct regular inspection of grading operations to maximize site safety and compatibility with community character.

Program G1-3: In the hillside or mountainous areas of Pasadena, the City will discourage excessive grading of slopes greater than 3:1 (horizontal:vertical), and will encourage varied slope ratios on design slopes to reduce the visual impact of grading.

Program G-1.4: The City shall prohibit cut or fill slopes steeper than 2:1.

Program G-1.5: The City will not permit the reconstruction of structures meant for human habitation that were damaged or destroyed by failed slopes unless the applicant can prove that the remedial measures proposed will improve the unstable slope conditions making the site suitable for redevelopment.

Policy G-2: The City will continue to participate in regional programs designed to protect the groundwater resources of the Raymond Basin while protecting the area from the hazard of regional ground subsidence.

Program G-2.1: The City will continue to encourage water conservation through public education.

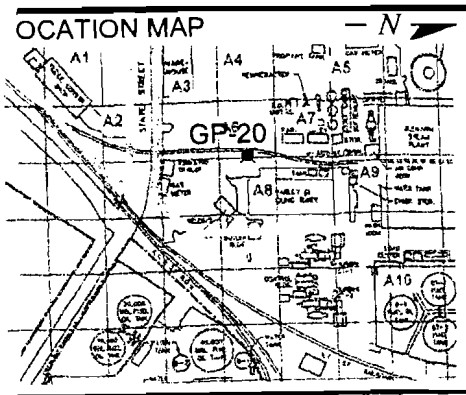
Program G-2.2: The City will participate in a technical group consisting of representatives from various cities in the Raymond Basin brought together to evaluate the feasibility of implementing artificial recharge programs, protecting groundwater quality, monitoring the ground water, and publishing annual reports on basin conditions.

FLOOD HAZARDS:

Goal F-1: Minimize injury, loss of life, property damage, and economic and social disruption caused by flood and inundation hazards.

Policy F1-1: The City will discourage development in flood hazard areas and will strengthen the City's maintenance program for storm water detention basins, culverts and storm drains to minimize future flooding events.

Program F-1.1: The City will continue to participate in the National Flood Insurance Program.



Program F-1.2: The City shall, in cooperation with the Los Angeles County Flood Control Department, conduct studies of drainage and dam improvements in selected areas at the base of the San Gabriel Mountains and the San Rafael Hills, to identify where improvements may be necessary.

Program F-1.3: The City shall encourage the development of parks and recreational facilities in the Arroyo Seco area,

A. VIBRATION IN VERTICAL MODE

Equipment Data

Given a high speed generator with a frequency dependent amplitude

$F_o := 4000 \cdot lb$

Weight of vibrating equipment and foundation block Wo=300,000lb

Operating frequency f=1250 rpm $f := 20.83 \cdot sec^{-1}$ cycles/sec;

$\omega := f \cdot 2 \cdot \pi$ $\omega = 130.879 \cdot sec^{-1}$ rad/sec; Dimension: $B := 18 \cdot ft$ $L := 14 \cdot ft$

Soil Properties

Total unit weight $\gamma_t := 120 \cdot \frac{lb}{ft^3}$ Poisson's ratio $\nu := 0.35$;

Shear Modulus $G := 6700 \cdot \frac{lb}{in^2}$

Equivalent Radius

$r_0 := \sqrt{\frac{B \cdot L}{\pi}}$ $r_0 = 8.956$

Spring Constant

$K_z := \frac{4 \cdot G \cdot r_0}{1 - \nu}$ $K_z = 5.318$

Mass Ratio

$\rho := \frac{\gamma_t}{32.2 \cdot \frac{ft}{sec^2}}$ $m := \frac{W_o}{32.2 \cdot \frac{ft}{sec^2}}$ $B_z := \frac{(1 - \nu) \cdot m}{4 \cdot \rho \cdot r_0^3}$

$\rho = 3.727$ $m = 9.317$ $B_z = 0.565$

Damping Ratio

$D_z := \frac{0.425}{\sqrt{B_z}}$

$D_z = 0.565$

Static Amplitude

$A_s := \frac{F_o}{K_z}$

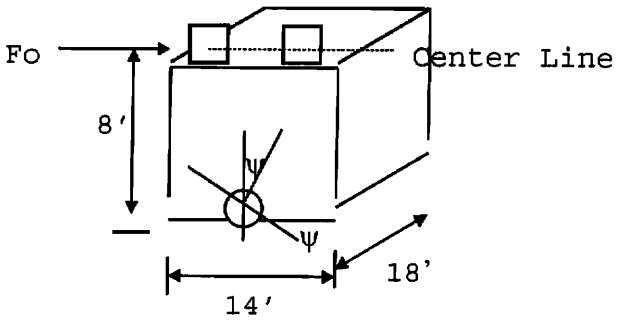
$A_s = 9.027 \cdot 10^{-4} \cdot in$

Natural Frequency

$\omega_n := \sqrt{\frac{K_z}{m}}$

$\omega_n = 75.548 \cdot sec^{-1}$ rad/sec

Dynamic Amplitude



$\frac{\omega}{\omega_n} = 1.732$ Then from Figure 7 (B) and for D = 0.56 M = 1.1

$A_{max} := A_s \cdot M$ $A_{max} = 9.929 \cdot 10^{-4} \cdot in$ Maximum dynamic amplitude

Figure 8

Example Calculation of Vertical, Horizontal, and Rocking Motions

B. EXAMPLE CALCULATION FOR HORIZONTAL TRANSLATION AND ROCKING

Equipment Data

Assume constant amplitude $F_0 := 300 \cdot lb$ Dimensions $B := 18 \cdot ft$ $L := 14 \cdot ft$

Weight of foundation and machinery $W := 400000 \cdot lb$

Mass Moment of Inertia around axis of rotation $I_\psi := 400000 \cdot lb \cdot ft \cdot sec^2$

Operating Frequency f=350 rpm $f := 5.8 \cdot sec^{-1}$ cycles/sec $\omega := f \cdot 2 \cdot \pi$

ω = 36.442 rad/sec

Soil Properties

Total Unit Weight $\gamma_t := 120 \cdot \frac{lb}{ft^3}$ Poisson's Ratio $\nu := 0.35$

Shear Modulus $G := 6700 \cdot \frac{lb}{in^2}$

HORIZONTAL TRANSLATION ONLY

Equivalent Radius

$r_0 := \sqrt{\frac{B \cdot L}{\pi}}$

r_0 = 8.956

Spring Constant

$K_x := \frac{32 \cdot (1 - \nu) \cdot G \cdot r_0}{7 - 8 \cdot \nu}$

K_x = 4.279

Mass Ratio

$m = \frac{400000 \cdot lb}{32.2 \cdot \frac{ft}{sec^2}}$

m = 1.242

$\rho := \frac{120 \cdot \frac{lb}{ft^3}}{32.2 \cdot \frac{ft}{sec^2}}$

ρ = 3.727

$B_x := \frac{7 - 8 \cdot \nu}{32 \cdot (1 - \nu)} \cdot \frac{m}{\rho \cdot r_0^3}$

B_x = 0.937

Damping Ratio

$D_x := \frac{0.288}{\sqrt{B_x}}$

D_x = 0.298

Static Displacement

$A_s := \frac{F_o}{K_x}$

A_s = 8.413

Natural Frequency

$\omega_n := \sqrt{\frac{K_x}{m}}$

ω_n = 58.693 rad/sec

Figure 8 (Continued)
Example Calculation of Vertical, Horizontal, and Rocking Motions

Dynamic Amplitude

$\frac{\omega}{\omega_n} = 0.621$ From Figure 7 (A), $M := 1.4$

$A_{max} := A_s \cdot M$

$A_{max} = 1.178$ Maximum Horizontal Movement

ROCKING ALONE

$r_0 := \left(\frac{B \cdot L^3}{3 \cdot \pi}\right)^{\left(\frac{1}{4}\right)}$ $B_\psi := \frac{3 \cdot (1 - \nu)}{8} \cdot \frac{I_\psi}{\rho \cdot r_0^5}$ $F_0 := (300\,lb) \cdot (8 \cdot ft)$

$r_0 = 8.508$ $B_\psi = 0.454$ $F_0 = 2.88$

Spring Constant

$K_\psi := \frac{8 \cdot G \cdot r_0^3}{3 \cdot (1 - \nu)}$

$K_\psi = 2.926$ lb*in/rad

Damping Ratio

$D_\psi := \frac{0.15}{\left(1 + B_\psi\right) \cdot \sqrt{B_\psi}}$

$D_\psi = 0.153$

Natural Frequency

$\omega_n := \sqrt{\frac{K_\psi}{I_\psi}}$

$\omega_n = 78.07$

Static Rotation

$A_\psi := \frac{F_0}{K_\psi}$

$A_\psi = 9.844$ radians

Dynamic Amplitude

$\omega := 131 \cdot sec^{-1}$ From Figure 7 (A), $M := 0.4$

$\frac{\omega}{\omega_n} = 1.678$ Maximum Rocking Movement Horizontal Motion At Machine Centerline

$A_{\psi.max} := A_\psi \cdot M$ Movement $:= A_{\psi.max} \cdot (8 \cdot ft)$

$A_{\psi.max} = 3.938$ Movement $= 3.15$ radians

NOTE:

Above analysis is approximate since horizontal and rocking modes are coupled.

A lower bound estimate of first mode frequency may be calculated based on natural frequency w_n for rocking mode alone, and horizontal translation mode alone.

Figure 8 (Continued)
Example Calculation of Vertical, Horizontal, and Rocking Motion

1.4.1.5 Dynamic Soil Properties. Guidance on dynamic soil properties and their determination is given in Sections 2 and 3.

There are several interrelated criteria for design of foundations for machinery. The most fundamental is that the vibratory movement be held to a level below that which could damage the machinery or cause settlement of loose soils. In many cases there are too many unknowns to solve this problem. The other criterion is to proportion the foundation such that resonance with the operating frequency of the machine is avoided. For high frequency machines (say over 1000 rpm) it is common to "low tune" the foundation, so that the foundation frequency is less than half the operating frequency. For low frequency machines (say under 300 rpm) it is common to "high tune" the foundation, so that the fundamental frequency is at least twice the operating frequency.

1.4.2 Design to Avoid Resonance. Settlements from vibratory loads and displacements of the machinery itself in all directions are accentuated if imposed vibrations are resonant with the natural frequency of the foundation soil system. Both the amplitude of foundation motion and the unbalanced exciting force are increased at resonance. Compact cohesionless soils will be densified to some degree with accompanying settlement. Avoidance of resonance is particularly important in cohesionless materials, but should be considered for all soils. To avoid resonance, the following guidelines may be considered for initial design to be verified by the previous methods.

1.4.2.1 High-Speed Machinery. For machinery with operating speeds exceeding about 1000 rpm, provide a foundation with natural frequency no higher than one-half of the operating value, as follows:

a) Decrease natural frequency by increasing the weight of foundation block, analyze vibrations in accordance with the methods discussed.

b) During starting and stopping the machine will operate briefly at the resonant frequency of the foundation. Compute probable amplitudes at both resonant and operating

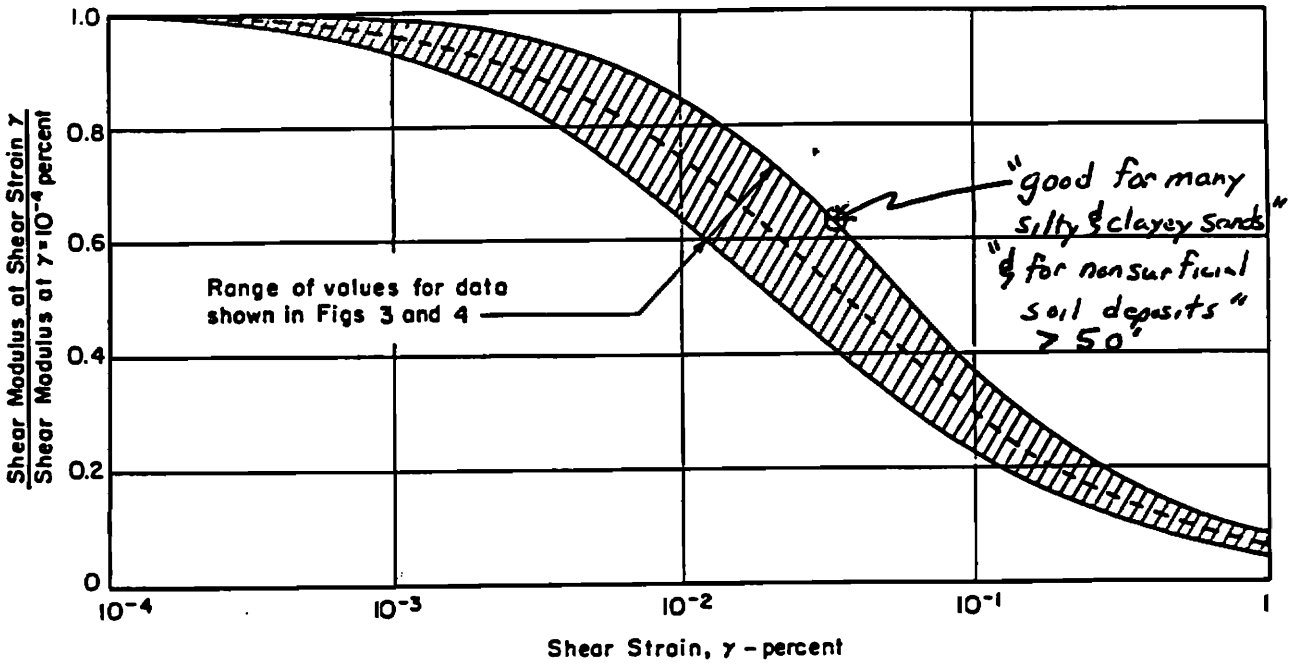
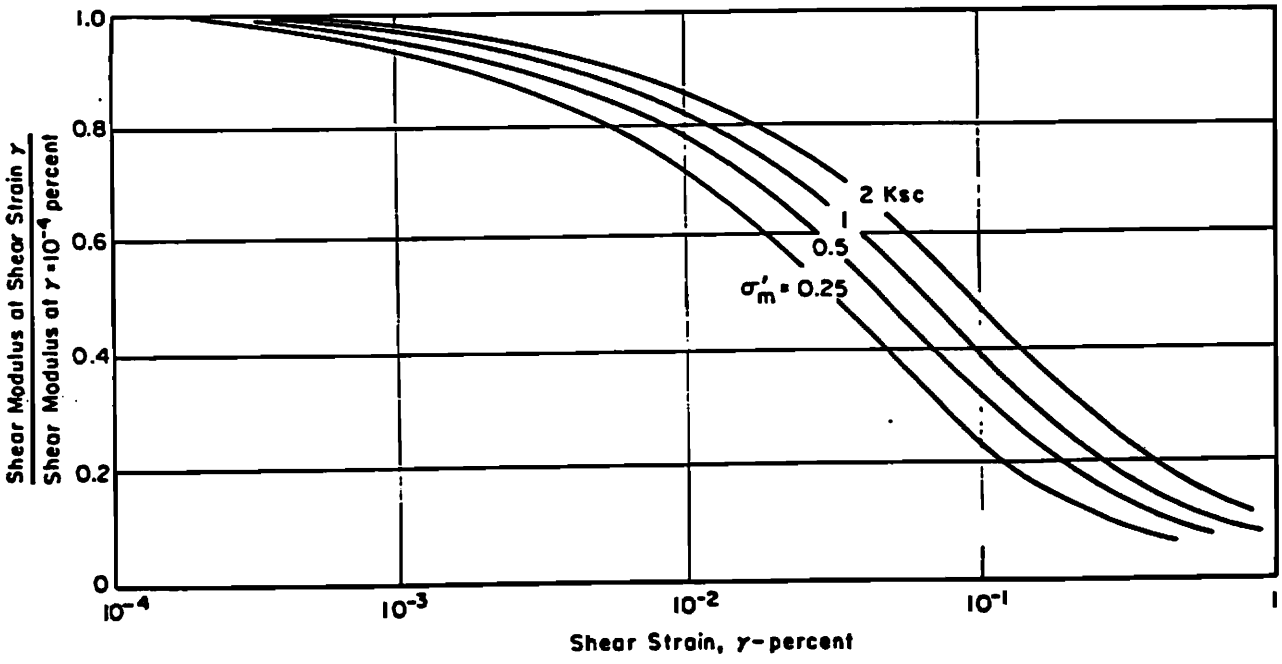
Dynamic Shear Modulus & Material Damping, Jonathan D. Bray



"Dynamic Shear Modulus & Material Damping"

Jonathan D. Bray, Ph.D., P.E.
Professor of Geotechnical Engineering
University of California at Berkeley



Abstract

Considerable effort has been devoted toward developing analytical techniques for evaluating the seismic response of soil deposits. Practicing engineers often employ these analytical procedures in the evaluation of potential seismic hazards at project sites. Yet, the accuracy and reliability of seismic response analyses are highly dependent on the characterization of the subsurface conditions and the evaluation of the dynamic properties of the critical soil strata. Specifically, the results of dynamic analyses are often quite sensitive to the shear modulus and material damping ratio versus shear strain relationships employed by the engineer. The overheads for a discussion of this topic are enclosed, as well as a recent paper by Stokoe et al. (2004) on this topic.

1.0 INTRODUCTION

Hydrologue, Inc. (HI) has been retained by the City of Pasadena to conduct a limited phase II environmental site assessment for the site located at the southeast corner of the intersection of Fair Oaks Avenue and Glenarm Street in the City of Pasadena, California (hereinafter referred to as "Site") (Figure 1), in the northwestern portion of the City of Pasadena Power Plant, the south side of the Glenarm Building where the Glenarm Repowering Project (GT-5 Combined Cycle Installation) will be constructed (Figures 2 & 3).

This limited assessment consisted of collecting split soil samples during geotechnical drilling for analytical testing. The soils engineering investigation for the proposed GT-5 Combined Cycle generator was also conducted by Hydrologue, Inc. and reported separately.

2.0 DESCRIPTION OF SITE

The Site is located at the southeast corner of the intersection of South Fair Oaks Avenue and East Glenarm Street in Pasadena, California (Figure 1). The Site was first developed in the early 20th century with the existing warehouse building in its southwest corner. The Site now contains an inactive oil-and-natural-gas-fired electric generating station used by the Pasadena Water and Power Department from 1906 through 1977.

In 1906, the Pasadena Water and Power Department constructed the original steam-plant building. The facility was demolished before construction of the tank farm in 1971. The existing non-operational steam plant (i.e. the Glenarm Building) occupies the Site's northwestern corner and currently consists of two attached buildings, including an eastern building, constructed in the early 1920s, and a western building, constructed in the early 1930s. Each of the extant buildings includes boiler and turbine generator systems. Both systems in the west building remain in place but Pasadena Water and Power Department removed the systems from the east building during the 1950s. The Pasadena Water and Power Department later installed a few machine tools in the former boiler area of the east building. Some of those machine tools remain.

The topography of the Site is relatively flat. Mixed land uses surround the Site and include a commercial building, The Metropolitan Transit Authority-owned Gold Line light rail right of way (ROW) and the City of Pasadena Water and Power's Broadway Steam Plant to the east, a Southern California Edison substation and the Water and Power Department Electrical and Maintenance shop to the south, and several commercial businesses to the west. Residential areas of Pasadena and South Pasadena are within 1,000 feet of the site to the west and south respectively.

3.0 PROPOSED DEVELOPMENT

We understand that the proposed project consists of the construction of the Glenarm Repowering Project (GT-5 Combined Cycle Installation) (Figures 2 & 3).

4.0 BACKGROUND

Two environmental investigation reports were made available to us by the City of Pasadena Department of Water and Power. These reports partially cover the present Site (Figures 4 & 5):

4.1 Summary of Additional Soil Assessment Activities (Phase III) Reference 3

The report was prepared by Pacific Environmental Group and the IT Group PEG/IT and dated September 3, 1999.

The scope of PEG/IT work included drilling forty soil borings to assess subsurface soil conditions at the Site (Figures 2 & 3). Soil borings were located in areas of concern identified in PEG/IT's Phase II Report (PEG/IT, 1999b). The Phase II Report recommended further subsurface environmental assessment to better define impact to the soils in focused areas. The report also includes a risk-based review to determine whether potential restrictions to development of the Site may be warranted due to impacted soil.

The assessment was performed primarily in the central portion of the Site, but also included a few additional locations as shown in Figures 4 & 5 of the referenced report. The locations included the area near boring B-8A, at which the Phase II investigation identified a concentration of mercury. Although mercury concentrations appeared to attenuate with depth, the Phase II investigation did not define the lateral extent. The Phase II Report also suggested further investigation for volatile organic compounds (VOCs), lead, copper, and heavy hydrocarbon impact near borings B-10A through B-10F. Although lead and copper concentrations appeared to attenuate with depth, the vertical and lateral extent of the impact was not defined to regulatory action limits. Lastly, the area near borings B-12 and B-13A required further investigation for vertical and lateral definition of lead concentrations. Lead concentrations identified by the Phase II Report in this area increased with depth.

4.1.1 Subsurface Conditions

Subsurface lithologies encountered during drilling and sampling consisted primarily of sandy silt and silty sands to the total depth explored, though many borings also contained lithologies that ranged from clays to gravelly sands. Some possible hydrocarbon was observed in samples collected from the various soil borings, as noted on boring PEG/IT logs. Appendix C contains the complete PEG/IT borings logs.

The highest PID reading recorded by PEG/IT was 70.0 parts per million by volume from the sample collected from boring GP-17 at l.5' bgs.

The geologists noted that borings GP-39A and GP-40 contained a lithology zone that appeared impacted by hydrocarbons, based on its dark gray to black color and hydrocarbon-like odor. However, analytical results indicated that no TPH existed at any of the samples above, and laboratory reporting limits and TRPH analysis determined that only a small concentration of

TRPH existed above laboratory detection limits. This black layer of silt and clay was observed at an approximate depth of 3 to 7 feet bgs and contained sharp upper and lower contacts indicative of the presence of artificial fill material. The lateral extent of this material is not known.

4.1.2 Analytical Results for Volatile Organic Compounds (VOCs)

PEG/IT analyzed the samples collected from boring GP-10 at 5-feet bgs, boring GP-15 at 5-feet bgs, and boring GP-34 at 5-feet bgs for VOCs (Figure 4). Laboratory analyses did not detect any VOCs above method detection limits in these samples.

4.1.3 Analytical Results for Polychlorinated Biphenyls (PCBs)

PEG/IT reported that laboratory analyses did not detect concentrations of PCBs above laboratory method detection limits in samples analyzed for PCBs. The samples analyzed for PCBs were GP-40 at 1.5-feet bgs, GP-4, GP-11, GP-14, GP-19, GP-39, and GP-40 at 5-feet bgs and GP-7 at 7-feet bgs (Figures 4 & 5). Table 1 of the PEG/IT report (Appendix D) summarizes PCB data, including laboratory reporting limits.

4.1.4 Analytical Results for Total Recoverable Petroleum Hydrocarbons (TRPH) and Total Petroleum Hydrocarbons (TPH) Fuel Characterization

The laboratory detected TPH above method detection limits in 17 of the 44 samples analyzed for TPH fuel characterization. The 17 samples were collected from a total of eleven borings. Sixteen samples contained carbon22 to carbon33 (oil) range hydrocarbons, two contained carbon10 to carbon22 (diesel) range hydrocarbons, and two contained carbon6 to carbon10 (gasoline) range hydrocarbons. The detectable levels of TPH in all samples ranged from 100 mg/kg to 3,810 mg/kg, with the highest concentration (oil range) found in boring GP-14 at 7-feet bgs. The next highest concentration detected in a sample other than GP-14 (9,000 ppm TRPH @ 5’ depth and 3,810 ppm oil range TPH @ 7’ depth, inside present Site) occurred in the sample from boring GP-15 (outside of present Site) at 1.5-feet bgs. TPH concentrations appear to attenuate laterally to the north, east, and west. With the exception of borings GP-10 (280 ppm oil range TPH @ 7’ depth, inside the Site) and B-5 (from Phase II), no TPH impact to soil was observed south of boring GP-14. In general, TPH concentrations in most borings attenuate with depth (Figure 5).

The most common fuel type detected appears to be motor oil or similar heavy hydrocarbons. Based on this determination and the apparently dark stained soils at GP-39 and GP-40 for which the laboratory detected no TPH, PEG/IT, in consultation with the Water and Power Department, requested Associated Laboratory to analyze selected samples for TRPH in an effort to confirm that no petroleum hydrocarbons existed outside the normal TPH range. Those samples with high TPH levels were also found to contain higher TRPH levels. TRPH was detected in one sample from boring GP-40 at a concentration of 44 mg/kg, well below the Site clean-up level of 10,000 ppm (Figure 5). Table 2 of the PEG/IT report (Appendix D) summarizes analytical results for TPH fuel characterization and TRPH.

4.1.5 Analytical Results for Lead

PEG/IT reported total lead concentration for 83 samples collected from 34 borings. If any total lead concentrations exceeded the 50 ppm, PEG/IT directed the laboratory to perform a soluble lead analysis on that sample for STLC comparison. Additional samples were analyzed by the California Toxicity Characteristic Leaching Procedure in order to obtain preliminary data for possible waste disposal characterization.

Detected total lead concentrations exceeded 50 ppm in 23 samples. The Laboratory analyzed each of these samples for soluble lead and found that five samples contained soluble lead at a concentration that exceeded the STLC threshold and two samples contained soluble lead at the STLC threshold. The highest soluble lead concentration was found in the sample from boring GP-19 (outside present Site) at 1.5-feet bgs (36.4 mg/kg). Most other elevated levels of total lead and soluble lead also occurred in the upper 1.5-feet bgs samples. Furthermore, at most boring locations, lead levels attenuated with depth (Figures 4 & 5). Analytical results for lead are summarized in Table 3 of the PEG/IT report (Appendix D). If the excavated soil from areas where elevated soluble lead in soil sample is reported is planned to be disposed off-site, the stock pile soil samples should be tested for soluble lead prior to its disposal.

4.1.6 Analytical Results for Copper

PEG/IT reported the total copper concentrations for 48 samples collected from 20 soil borings. All samples contained some copper concentrations, but none contained total copper exceeding the TTLC threshold for copper. Moreover, none of the samples were determined to contain copper at or more than ten times the STLC threshold. Table 4 of PEG/IT report (Appendix D) summarizes copper regulatory limits and analytical results. It should be noted that the mercury concentration of soil sample collected from boring 8A was not confirmed in confirmatory soil samples collected by PEG/IT.

4.1.7 Analytical Results for Mercury

PEG/IT reported total mercury concentrations for samples collected at GP-34 through GP-37, GP-39, and GP-40 at depths of 1.5- and 5-feet bgs. Although most samples contained low levels of mercury, no samples contained detectable mercury concentrations that exceeded TTLC (20 ppm) or ten times STLC (0.2 ppm) for mercury. Table 5 of the PEG/IT repot (Appendix D) summarizes mercury regulatory limits and analytical results.

4.1.8 Analytical Results for Title 22 Metals

Four soil samples collected at depths of 1.5 and the 5 feet bgs from borings GP-39 and GP-40 were analyzed for Title 22 Metals. The 5 feet bgs samples were collected in the center of the black stained layer. Although various metal concentrations were detected in each of the above referenced soil samples, only the total lead concentration of soil samples collected at a depth of 1.5 feet from boring GP-40 exceeded 50 ppm (75.3 mg/kg). TTLC threshold concentration for lead is 1,000 ppm. All other analytes were below the TTLC and ten times the STLC levels.

Based on known analytical data from the Phase II and the Phase III performed by PEG/IT and the risk-based review performed by Gradient (subsidiary of PEG/IT), PEG/IT required no further action at this Site.

4.2 Report of Soils Investigation, Pasadena Water and Power Plant

This report was prepared by Hunter-Kennedy and Associates, Inc., for Southwest Industries and is dated July 30, 2003 (Reference 4).

Hunter-Kennedy reported that to make way for Site improvements, soil from selected areas in the Pasadena Water and Power Plants was tested and where necessary, excavated and disposed of off-Site. This operation was conducted beginning in October 2002 and continued through March 2003. The overall activities can be broadly classified into three project areas: Marley Cooling Tower foundation adjacent acid lines, duct banks and other associated structures; Burn Tank; and East-West Tanks. Only the Marley Cooling Tower foundation partially overlaps the present Site.

As a part of the removal of the Marley Cooling Tower foundation adjacent acid lines, duct banks and other associated structures by Southwest Industries, Hunter-Kennedy performed soil sampling and analytical testing for the underlying soil. The Marley Cooling Tower was located in the western portion of the "Glenarm power plant". The Hunter-Kennedy testing found that the soil beneath the Marley Cooling Tower was contaminated to a depth of 10 feet with varying degrees of petroleum related hydrocarbons and lead. Uncovered during the testing excavation was: (1) an area to the south of the tower (hereafter referred to as the "Oil Pit") which contained contaminated soil to a depth of 22 feet, and (2) a "tank ring" which appeared to be an old tank foundation at a depth of 10 feet near the south east corner of the tower. This tank ring area was contaminated to a depth of 12 feet. The soil underlying the duct banks, acid line and other associated structures generally did not contain levels of contaminants above the specified action levels for this project.

Soil underneath the Marley Cooling tower that contained varying concentration of petroleum hydrocarbons and lead was excavated to a depth of 10 feet at the southern end of the cooling tower and 5 feet at the northern end, 22 feet at the Oil Pit location, and 12 feet at the tank ring location (see figure 5). Excavated soil was placed in stockpiles and tested for profiling purposes for off-site disposal.

Sample locations were determined based upon the specified collection of one sample per 50 foot grid. A total of 25 samples were initially collected at depths of 1 and 5 feet below the surface (after the foundation was removed).

4.2.1 Cooling Tower

4.2.1.1 Initial Investigation (Figure 1a of the Hunter-Kennedy report, Appendix G)

The initial sample (PPPI) was collected ahead of the scheduled grid sampling when discolored soil was discovered after demolition of a small utility building located just southeast of the

cooling tower. This sample was analyzed for CAM metals and STLC lead. The results were below action levels.

On October 7 through October 16, 2002, soil samples were collected from 13 locations (samples A 1-1 through C 15-5) from depths of 1 and 5 feet.

At 9 locations, the laboratory analysis did not detect contaminant levels above the limits established for the project. However, at the remaining locations, petroleum hydrocarbon levels in excess of 10,000 mg/kg in three samples (A5-5, B5-5 and C5-5) and metal concentrations exceeding the STLC limit in 17 samples were detected.

4.2.1.2 Additional Investigation (Figure 1b of the Hunter-Kennedy report, Appendix G)

Based upon these results, additional samples were collected on January 15 and 20, 2003, in a 15-foot grid pattern at depths of 9 feet (wall/face samples) and 10 feet (bottom). These samples were analyzed for Petroleum hydrocarbons in the C10-20 and C20-30 ranges and soluble lead (STLC). Petroleum hydrocarbon levels detected in these samples were below the action levels. Laboratory results reported one sample with STLC levels above the action levels. A confirmation sample (LCS) collected March 3, 2003 did not find detectable levels of STLC lead.

4.2.1.3 Tank Ring (Figure 1c of the Hunter-Kennedy report, Appendix G)

As the excavation of the soil near the southeast portion of the cooling tower area was extended to a depth of 10 feet, a "tank ring" was discovered. The ring was a three-foot wide concrete ribbon, approximately 30 feet in diameter. The soil within the ring was discolored (black). The visually discolored soil was removed to a depth of 12 feet. One sample contained petroleum hydrocarbon levels above the action level. Three samples were collected at the 12-foot level and analyzed for petroleum hydrocarbons C10-20 and C20-30 and soluble lead (STLC). None of the results exceeded action levels.

4.2.1.3 New Storm Drain Trench (Figure 1c of the Hunter-Kennedy report, Appendix G)

While excavating a trench for the installation of a new storm drain under the former cooling tower location, a discolored area at an approximate depth of 12 feet was observed. Three samples were collected; two from the bottom at a depth of 12 feet and one from the wall face at a depth of 10 feet. Petroleum hydrocarbon levels in the samples were below action levels.

4.2.1.4 Conclusion

Contamination, primarily petroleum hydrocarbons or soluble lead, was detected to depths of 5 feet under the former Marley Cooling Tower (excavated 10 feet); 10 feet at the tank ring (excavated 12 feet); and 19 feet at the oil pit (excavated 22 feet). Elevated results reported in the soil below the "pipeline" were not confirmed by the follow-up tests.

Soil underlying the Burn Tank had elevated concentration of petroleum hydrocarbons and soluble lead detected to depths of 8 feet. The burn tank area was excavated to a depth of 10 feet below ground surface. Soil underneath the Marley Cooling tower that contained varying concentration of

petroleum hydrocarbons and lead was excavated to a depth of 10 feet at the southern end of the cooling tower and 5 feet at the northern end, 22 feet at the Oil Pit location, and 12 feet at the tank ring location (see figure 5). Excavated soil was properly disposed off-Site.

No chemical of concerns were detected at or above action levels in the soil underlying the East-West Tanks.

5.0 PRE-DRILLING

Prior to drilling activities, a Site visit was conducted by HI staff and Principal Geologists. The locations of the proposed borings were discussed with the City of Pasadena Project Managers and adjusted to avoid buried obstacles identified in a previous geophysical survey of the Site. Due to the existence of underground pipes and utilities, several adjustments were necessary. A Site-specific Health and Safety Plan was prepared and followed during field activities. Health and safety issues related to the Site conditions and drilling activities were discussed with the drilling crew.

6.0 FIELD EXPLORATION

Subsurface conditions were explored by drilling 10 soil borings; 3 to a depth of 60 feet below ground surface (bgs), and seven to 50-feet bgs. Soil borings were placed in the vicinity of the requested boring locations by Power Engineers, Inc. Soil borings were drilled by R & C Drilling using a drilling rig equipped with hollow-stem augers to observe and sample the materials potentially affected by the previous Site operation (Figures 2 & 3). Soil samples were collected at 5 foot intervals from each boring using six 2½-inch diameter by 1-inch long and two 2½-inch diameter by 3-inch long brass tubes mounted within a 2½-inch inside diameter Modified California split-spoon drive sampler. A Hydrologue geologist supervised drilling operations and logged all soil borings in accordance with the Unified Soil Classification System (Appendix A). Additionally, a Standard Penetration Test was performed at each sampling interval using a Standard Split Spoon Sampler. All drilling equipments were steam-cleaned prior to being used.

All sampling equipment was cleaned prior to drilling at each boring location. Following sample collection, all sampling equipment, including the brass rings, were brushed clean in a solution of non-phosphate cleanser and rinsed with tap and distilled water and then shaken to remove excess moisture.

The sampler was attached to sampling rods, lowered to the sampling depth, and then was driven 18-inches into the formation. Blow counts per last 12-inches of penetration of the sampler were recorded to evaluate the consistency of the formation. No groundwater was encountered during drilling.

After sample recovery, the ends of the lowest 3-inch long brass tube were covered with Teflon sheets and plastic caps and secured with silicon tape.

Additionally, samples planned to be analytically tested for Volatile Organic Compounds (VOCs) were prepared using the EPA SW5035 Method from the bottom sampling ring as described below. The sampling and preservation protocols use the ESS Lock N' Load 5035 Soil Syringe Sampler. The Soil Syringe Sampler is a one-time use tool which collects approximately 5 grams of soil. The soil collected from the Soil Syringe Sampler is then transferred into pre-weighed 40-mL vials with appropriate preservatives.

Method 5035 requirements for sampling and preserving soil followed as detailed below:

- VOA vial prepared with sodium bisulfate preservative (5ml of de-ionized ultrapure water and 1 gram of Sodium Bisulfate preservative) – low level volatiles. In the field, HI staff measured 5 grams of soil using a Soil Syringe Sampler and added it to the VOA vial. Since the entire sample is consumed during each test, HI used two VOA vials per soil sample.
- VOA vial prepared with methanol preservative (10 ml of methanol (MeOH)) – high level volatiles. In the field, HI staff measured 10 grams of soil using a Soil Syringe Sampler and added it to the VOA vial. Each methanol sample can be analyzed more than once; therefore, only one method VOA was needed. The methanol solution becomes the actual representation of the soil sample being submitted. Since the MeOH virtually "masks" the low-level analytes, only volatiles with concentrations exceeding 200 ppb appear when analyzed.
- Standard boring sleeve followed by preservation in the lab – both high and low level volatiles.

The soil samples were labeled with the sample identification, date and time of sampling and the HI project number, and delivered to an off-Site state certified laboratory for hazardous waste testing. Prior to use, all the tubes were washed in a non-phosphate cleanser solution rinsed with tap water and then distilled water.

For each sampling interval within the borings, the soil contained in the second 3-inch long sleeve from the tip of the sampler was used for headspace analysis to determine if volatile hydrocarbon vapors were emanating directly from the soil using a photoionization detector (PID) MiniRAE 2000 Portable VOC Monitor, calibrated against an isobutylene gas standard. Each sample was placed in an airtight Ziploc™ plastic bag. The Ziploc plastic bags were placed in the sun for approximately 5 minutes and the headspace in each bag was analyzed using a PID. The headspace readings were recorded on the boring logs (Appendix A).

The soil samples were logged on requisite chain-of-custody record forms (Appendix B) and immediately delivered to American Scientific Laboratory (ASL), a State of California Certified Hazardous Waste Testing Laboratory (Certificate # 2200). The soil samples were labeled with the sample identification, date and time of sampling and the HI project number.

7.0 EQUIPMENT DECONTAMINATION

All hollow stem augers were steam-cleaned prior to being used. Following sample collection, all sampling equipment, including the brass rings, were brushed clean in a solution of non-phosphate cleanser and rinsed with tap and distilled water and then shaken to remove excess moisture.

8.0 FIELD QAULITY ASSURANCE/QUALITY CONTROL

For field quality assurance/quality control (QA/QC) purposes, field/equipment blanks and trip blanks were prepared daily, along with the collected soil samples. The field/equipment blanks are used to demonstrate whether the sampling procedures have any positive interference on the analytical results. The field/equipment blanks were prepared by flushing the decontaminated sampling equipment with purified water and collecting the water in sample containers. The trip blanks were supplied by ASL and are used to provide a measure of the potential positive interference introduced by sample preservation, transportation, and storage. The aforementioned QA/QC blanks were handled and processed in exactly the same manner as other samples, as described above. In addition to the requested analysis, ASL analyzed QA/QC samples which consisted of the analysis of matrix spike/matrix spike duplicates, method blanks, check samples and standards. Copies of the laboratory reports are included in Appendix B.

9.0 PHYSICAL SITE LOCATION

The coordinates of the Site are approximately 118.1494º west longitude, 34.1268º north latitudes. The Site is located at an elevation of approximately 752 feet above Mean Sea Level (MSL). The local surface drainage and topographic pattern is generally to the southeast and locally to the east, with a local topographic gradient of approximately 0.01 foot/foot, toward the east (Figure 1).

10.0 GEOLOGIC SETTING

The City of Pasadena Power Plant (Site) is located along the northeastern side of the Raymond Hills and eastern side of Grace Hill at the terminus of the Alhambra Wash in the southern portion of the City of Pasadena and Raymond Basin, a structurally elevated low relief surface lying to the northwest of the prominent San Gabriel Basin. The Raymond Basin is a triangular shaped alluvial plain that abuts the steep and high San Gabriel Mountains to the north and the moderate relief San Rafael Hills to the west. The active Raymond Fault forms the south-southeast boundary and separates the Raymond and San Gabriel Basins.

The Pasadena/Altadena/Sierra Madre areas are considered seismically active, where moderate sized earthquakes occur infrequently and active and potentially active faults abound. The east-west trending San Gabriel Mountains raise more than one mile above the basin floor with the steep southerly flank of the range, representing a recessed fault scarp of the Sierra Madre fault zone. The north side of the San Gabriel Mountains is bounded by the active San Andreas Fault and represents the main boundary between the North American and Pacific tectonic plates. The Raymond fault is trending east-northeast, a branch, and closely related to the Sierra Madre Fault that separates the Raymond and San Gabriel Basins. All of these faults have ruptured historically and have produced moderate to major earthquakes.

As a result of the continued movement between the plate boundaries, major north to south compressive forces are created across the region. These have resulted in uplift of mountains and

chains of hills and depressing adjoining basins shaping a sequence of east-west trending uplands which collectively form the Transverse Ranges Physiographic Provence of Southern California. The adjacent basin floors are filled as a result of the uplands erosion and transport of sedimentary deposits. In the vicinity of the Site, alluvium of Pleistocene and Holocene age was deposited by rivers and streams flowing south from the San Gabriel Mountain and San Rafael Hills. The San Rafael Hills are characterized by small- and medium-sized rounded hills and intervening valleys.

These drainages migrated back and forth, forming broad coalescing alluvial fans. Today the Raymond Basin is filled with several hundred feet of alluvial materials. Underlying the alluvium is a thick sequence of Tertiary age sedimentary rocks and below that is basement rock composed of granitic intrusive rocks of Mesozoic age and pre-Cambrian (?) metasediments. The depth to basement rock varies from a few feet near the mountain and hill fronts to nearly 2,000 feet in the southerly portion of the basin.

A major geomorphic feature in the area is the Arroyo Seco, which extends through Pasadena down the west-central part of the area and veers southwesterly near the Pasadena/South Pasadena city boundary. The Arroyo Seco is a steep-walled, flat-floored ravine about 500 to 1,000 feet wide and 50 feet deep. The arroyo widens into a relatively flat plain in South Pasadena. This change in relief is related to the Raymond Fault scarp, which crosses the area on the southern side of Raymond Hill. This scarp is a result of vertical fault displacement. Relief across the scarp is about 40 or 50 feet, but has been highly modified by urban development.

The San Gabriel Valley, which encompasses the southeastern side of Raymond Basin, is essentially a flat, gently south-sloping surface consisting of ancient (Pleistocene age) alluvial fans, flood plain, and basin fill alluvium. Elevations in the northern part of the Valley are in the 800- to 900-foot range, whereas in the south, elevations are in the 400- to 500-foot range. The flatness of the San Gabriel Valley surface is interrupted by several small hills and knolls which are outliers of the Repetto and San Rafael Hills. The largest of these hills is Raymond Hill, which is about 90 feet high. A smaller knoll just northwest of Raymond Hill is called Grace Hill. The other knolls are not named and are relatively subtle features that go largely unnoticed by the general public. Although subtle, these small knolls are important for understanding the geology of the region because they are bedrock exposures that reveal information regarding the surrounding subsurface geology.

11.0 STRATIGRAPHY

The majority of rocks in the area consist of Tertiary age (16 million years old) marine sedimentary rocks of the Topanga Formation. It is important to recognize that the geologic profile in Figure 9 is idealized and simplified to represent the entire zone. The south of the area (Figure 6) consists primarily of rock formations, whereas the east, west and north sides of the area have thick alluvial deposits over the rock formations.

Quaternary-age alluvium occurs at the Site proximity to a depth of approximately 200 feet (190 feet at R-09Z3B3), and at the south side of the Pasadena Power Plant where it is much thinner and on the order of 0 to 50 feet (43 feet at R-09-Z3B6). Alluvium at the proximity of the Site consists

of clay, silt, and sand with a major component of gravel and cobbles and some boulders, all composed of igneous and metamorphic rocks.

The principal formation in the southernmost portion of area (Figure 7) is the Fernando Formation which consists of soft and weak massive claystone and siltstone. The Fernando Formation overlies the Puente Formation in the southern part of the area (Figure 7). The contact is sharp and possibly unconformable (Dibblee, 1992).

The sedimentary rock at the proximity of the Site is composed of the Topanga Formation and includes a wide variety of rock types ranging from coarse-grained rocks such as breccia, conglomerate, and sandstone to fine-grained sandstone and siltstone with minor claystone (mudstone). The part of the Topanga Formation north of the Raymond Fault is predominantly sandstone, conglomerate, and breccia. The Topanga Formation also has intrusive volcanic rocks. For example, a 10-foot-thick zone of hard volcanic rock was encountered in a previous Caltrans study within boring EMI-2, immediately south of the Raymond Fault.

The bedrock northern side of the Site, north of the San Rafael Fault, consists of the Cretaceous age (approximately 120 to 160 million years ago) basement complex that is generally mapped in exposures of the San Rafael Hills as Wilson Diorite or Quartz Diorite (Dibblee, 1989c; Lamar, 1970).

12.0 GROUNDWATER CONDITIONS WITHIN RAYMOND BASIN

The Raymond Basin and San Gabriel Basin, to the southeast, have been extensively utilized for groundwater resources. Water wells drilled in both basins have produced good aquifer data for the groundwater depth and flow direction. Groundwater is resupplied to the Raymond Basin from surface runoff in the San Gabriel Mountains. The Raymond Fault to the south forms a very effective groundwater barrier causing groundwater to cascade over the fault and fall about 200 feet.

The groundwater surface elevation ranges from about 1,400-feet near the mountain front in the north to 450-feet near the Raymond Fault. In the past, springs and small ponds have formed to the south of the Raymond Fault scarp. The groundwater in the basin is unconfined and has a southeast gradient of 0.02 to 0.06 -foot per foot. Perched groundwater was not encountered to the depth explored at the Site (60 feet bgs). Reported highest groundwater depth at the Site proximity was about 50 feet bgs. Reported groundwater depth by the Caltrans consultant on the south side of the Site (south of San Rafael Fault in boring R-09-Z3B6) was 51.2 and on the north side of the Site was 136 feet (north of San Rafael Fault in boring R-09Z3B3). Both borings were converted to pizometers after drilling.

13.0 TECTONIC SETTING

Tectonic processes (faulting and earthquakes) are very active in the Site region. Figures 6 to 9 show the Site location relative to known active and potentially active faults. Obviously, the closer

a site is to an active fault, the greater potential there is for surface rupture and high earthquake ground motions. The Site does not lie close to any known active fault capable of surface fault rupture. However, the queried and buried trace of the San Rafael Fault is shown to cross or skirt the extreme corner of Jacob Parking Lot, east of Old Power Plant Building (Figures 6 to 9). It should be noted that in Figure 6 the fault is shown to cross through the Pasadena Power Plant entering from the west and exiting from the southeast corner along the Alhambra Wash. The nomenclature Eagle Rock or San Rafael faults were kept identical to their referenced sources in the figures 6 to 8.

The faults that trend mostly to the east-west are those associated with the Transverse Ranges. They produce mostly reverse (thrust) movement along north dipping planes which trend along southerly facing upland flanks. The active thrusts in the region include the Sierra Madre, Cucamonga, Raymond, and Santa Monica-Hollywood Faults. Another type of thrust fault is a blind thrust. These faults also are associated with the same process that elevated the Transverse Ranges, but the fault has remained buried and undetectable unless it produces an earthquake. The Raymond Fault, projecting along the south side of the Raymond Basin, at one time, may have been a blind thrust but because of continued activity it ruptured the ground surface.

The dominant fault system in the region is associated with the San Andreas Fault Zone. The system moves in a right lateral northwest trending direction with locally some vertical movement. The San Jacinto, Whittier-Elsinore, Newport-Inglewood, Palos Verdes and Mojave Desert Faults are coupled with the San Andreas (plate boundary) system. All of these faults have ruptured historically and produced moderate to major sized earthquakes.

14.0 STRUCTURAL GEOLOGY

As shown in Figure 9, the geologic strata are deformed into a series of folds and faults. Most of the folds and faults are continuations of geologic structures in the Santa Monica Mountains and the Elysian Hills to the southwest. These structures trend southeasterly through the Repetto Hills and continue below the flat-lying Quaternary alluvium of the San Gabriel Valley. The major folds are the Elysian Park Anticline and the South Pasadena Anticline.

The folding shown in Figure 9 is generalized and simplified. In reality, there are numerous small-scale folds within the larger fold trends. Frequent changes in bedding orientation due both to folding and faulting should be expected at depth.

Many of the faults are intra-formational features, meaning that the faults offset rocks of the same type. However, some of the faults could comprise highly fractured or clayey gouge zones.

15.0 LOCAL AND REGIONAL FAULTING

The potentially active Sierra Madre Fault Zone is over 60-miles long and is located just about 5.6 miles to the north of the Site. The fault displays dominantly reverse (vertical) movement and forms a very irregular and deeply incised scarp which, in places, may be several hundred feet

high. The fault zone strikes roughly east-west and locally dips northward at 18 to 70 degrees beneath the San Gabriel Mountains. Locally, at the foot of the range, the fault has been mapped most notably with basement rock thrust southward over older alluvium. A potentially active fault is one that has ruptured in the last two million years, but no evidence has been found to suggest rupture in the last 10,000-years. This infers that the fault has a relatively long recurrence interval.

The Sierra Madre Fault, in the Pasadena, Altadena and Sierra Madre areas, has not been placed into an active category or an Alquist-Priolo Earthquake Fault Zone as designated by the California Division of Mines and Geology. The potential for direct surface fault rupture through the subject Site is judged to be nil based on available geologic and fault related technical data. The upper bound (moment magnitude) earthquake assigned to the Sierra Madre Fault is M6.7 and the calculated slip rate is 3.0 mm per year. The fault is assigned to a Type B category. The entire Raymond Basin lies in Seismic Zone 4. Because of the proximity of this potentially active fault, it may produce significant ground motion effects should it rupture in the area closest to the Site and produce a major earthquake.

The faults of most interest to the proposed Power Plant project are the active faults that might result in ground rupture and displacement during an earthquake, and faults that might generate strong shaking of project facilities. The faults of most interest to the project are the Raymond Fault, the San Rafael Fault, and the Eagle Rock Fault.

The faults of greatest significance to the project are described in detail below. The locations of these faults are shown in Figures 6 to 8, and in the representative geologic profiles (Figures 9). These faults represent earthquake shaking hazards, but only the Raymond and Alhambra Wash faults located outside of the Site are identified as Alquist-Priolo Earthquake Fault Zones (APEQFZ), which implies a surface rupture potential. Such a designation indicates the fault is well known and its location is well defined. Other potentially active faults may not be identified as APEQFZ because their locations are not well defined and/or they have not generated earthquakes in historical times. The City of Pasadena Safety Element (City of Pasadena, 2003) has designated a "fault hazard management zone" for the Eagle Rock Fault, which means that geological studies are required for determining the potential for fault rupture before development occurs within the zone.

The active Raymond Fault Trace strikes east-northeast, 1.0 mile south of the Site, along the south boundary of the Raymond Basin. The fault is 12 to 15.5 miles long depending upon which interpretation is accepted, dips to the north beneath the basin at generally a high angle, and has produced lateral and vertical displacements. A well-developed scarp to 100-feet high along with sag ponds, offset drainages, back tilted surfaces, springs, a groundwater barrier and pressure ridges suggest its surface rupture is relatively young. Carbon dating gave movement within the last 2,500-years. The fault has been assigned to a Type B Category with an upper bound (moment) magnitude earthquake of 6.5, and a slip rate of 0.1 to 0.4 mm per year.

The State of California (CGS) has established an APEQFZ along the Raymond Fault from the San Gabriel Mountains in the east to near the intersection of Avenue 50 and York Boulevard in the west. The Raymond Fault extends southwesterly from the Sierra Madre Fault Zone at the base of the San Gabriel Mountains through the communities of Monrovia, Arcadia, San Marino, and

Pasadena to the Raymond Hill area of South Pasadena, where the Raymond Fault trends more westerly through the communities of South Pasadena, Highland Park, and possibly into Los Angeles. The fault forms a gentle arc, convex toward the south across the alluvial deposits of the San Gabriel Valley. The fault is best expressed in the San Marino to South Pasadena area, where if forms a prominent escarpment up to about 150 feet high.

A prominent linear gravity anomaly extending easterly from the southern margin of the Santa Monica Mountains, under the Los Angeles River plain, and into the Repetto Hills indicates that the Hollywood fault may extend easterly into the Repetto Hills, and has led to the interpretation by some that the Hollywood and Raymond Faults may be interconnected. Others (Dolan, Reference 15) have postulated that the Raymond Fault is directly connected with the Hollywood Fault and other faults within the southern frontal fault system of the Transverse Ranges. The westerly continuation of the Raymond Fault into the Los Angeles River floodplain is uncertain. For the purposes of this study, it is assumed that the Raymond and Hollywood Faults are independent features.

The most recent major rupture on the Raymond Fault occurred in the Holocene time, about 1,000 to 2,000 years ago (Crook et al., 1987; Weaver and Dolan, 2000, Reference 15). The largest earthquake within the project area in historical times was the 1988 Pasadena Earthquake with a magnitude (M_L) of 5.0; this shock was interpreted by Jones et al. (1990) to have occurred on the Raymond Fault.

Currently, most geoscientists consider the Raymond Fault to be a left-lateral reverse-oblique fault that dips steeply (approximately 80 degrees) to the north. Geological trenching studies across the fault scarp indicate average rates of fault slip between 0.1 and 0.4 millimeters per year (mm/yr). More recently, the rate of slip has been estimated to be about 1.5 mm/yr and the recurrence interval at 3,300 years (Dolan et al., 2000; Cao et al., 2003; Weaver and Dolan, 2000, Reference 15). The maximum earthquake estimated by the CGS is in the range of M_w= 6.0 to 7.0.

The nature of potential surface displacements on the Raymond Fault is poorly known. Due to the lack of earthquake history on the Raymond Fault, seismic design for the fault must be based on empirical fault/earthquake relationships, based on a length of 12 miles, a down-dip width of 10 miles, and average slip of 1.6 to 3.3 feet. A maximum earthquake of Mw=6.7 is estimated.

Eagle Rock and San Rafael Faults

The Eagle Rock and San Rafael Faults, in the Pasadena area, have not been placed into an active category or APEQFZ Fault Zone as designated by the California Division of Mines and Geology. Existing geological maps (Lamar, 1970; Dibblee, 1989; Yerkes and Campbell, 2005; and City of Pasadena, 2002) show different locations for the Eagle Rock and San Rafael Faults. The principal difference is that Lamar's (1970) map shows the San Rafael and Eagle Rock Faults as separate features. The San Rafael Fault extends southeasterly from within the San Rafael Hills to the north edge of Grace Hill, Raymond Hill and the smaller associated knolls, essentially along the same trace as Dibblee's Eagle Rock Fault. At the eastern end Lamar splits the fault into two splays or branches; one extends through the top of Raymond Hill (south of the Pasadena Power Plant) and the other is a dotted line (that is, a subsurface fault) trending more easterly, along East Glenarm

Street, past Arroyo Parkway and into the hills north of the main trace of the Raymond Fault. Lamar maps the Eagle Rock Fault to the south of the San Rafael Fault within the knolls and projecting south of Raymond Hill. The differences between the fault mapping are not really significant from an earthquake hazard perspective, but the differences might be important for the Pasadena Power Plant projects, in that if there is only one fault (as indicated by Dibblee), the fault crosses the Power Plant, while in the case of two separate faults (as indicated by Lamar) it may be located outside of the Site. Borehole R-09-Z3B3 excavated during Caltrans study (Reference 16) encountered a significant zone of fault gouge believed to be the San Rafael Fault. The Eagle Rock and San Rafael Faults do not extend across the Raymond Fault.

Both the Eagle Rock and San Rafael Faults are considered potentially active faults, as defined above. According to the Caltrans Seismic Design Criteria (2009) fault database, the Eagle Rock Fault is estimated as having a maximum earthquake magnitude of 6.8.

Although the San Rafael Fault is not well documented, the approximate magnitude of its maximum earthquake can be estimated using empirical relationships on earthquake magnitude and fault length. According to these empirical relationships, the maximum magnitude could be about 6.0.

The so-called Eagle Rock/San Rafael Faults (San Rafael fault is the northern branch of the Eagle Rock fault at the proximity of Pasadena Power Plant, by those researchers who believes that Eagle Rock fault bifurcate at the proximity of the Pasadena Power Plant) have been discussed by numerous geoscientists over the past few decades and are shown on several geological maps, notably Lamar (1970), Crook et al. (1987), and Dibblee (1989), as well as several others (e.g. California Division of Mines and Geology, 1978). All of these investigations except CDMG (1978) were regional studies and did not really focus on the Eagle Rock/San Rafael Faults. Consequently, none of these maps show the faults in the same location. However, the CDMG (1978) categorically states that no evidence of Holocene activity has been found in any investigation. Based on the CDMG (1978) and Caltrans/Metropolitan Transportation Agency findings and on our own investigation, as discussed below, we believe that the fault is not active.

In this study the Eagle Rock and San Rafael Faults are considered as two discrete faults as shown by Lamar (1970); the southern fault is the Eagle Rock Fault, extending from the Eagle Rock area, crossing Arroyo Seco, and into the small hills and knolls west of Raymond Hill (Figure 8). The northern fault is the San Rafael Fault; this fault is basically parallel to the Eagle Rock Fault and similarly passes through Arroyo Seco, but extends to the north side of the Raymond and Grace Hills, at the proximity of the City of the Pasadena Power Plant.

Lamar shows the San Rafael Fault bifurcating near Raymond Hill with one branch cutting through the rocks at the top of Raymond Hill and the other branch under the alluvium north of the hill extending towards Blair and Allendale schools. Although in the Caltrans/Metropolitan Transportation Agency the southern branch is shown on their geological maps included in the final 710 tunnel report, they could not find any evidence of such a fault on aerial photographs or during field geological mapping or drilling.

In addition to the CDMG (1978) fault evaluation report, the Caltrans/Metropolitan Transportation Agency investigation (Reference 15), Wilson Geosciences (Diaz-Yourman and Associates, 2007, Reference 22), are investigations that treated the Eagle Rock-San Rafael Faults as their primary focus.

The only location in the area where the fault can be identified is in Arroyo Seco where the fault extends under the La Loma Bridge. The recent investigation by Wilson Geosciences (WGI) excavated a trench on the west side of Arroyo Seco and found faulting within the Tertiary-age Topanga Formation rocks. The fault was entirely within Tertiary-age rocks and did not displace the overlying Quaternary alluvium. Although the faults in their trench exposure may not represent the main branch of the fault, the location is consistent with the change in rock type contact from igneous rocks on the north to the Tertiary-age Topanga Formation on the south. The trench exposure, in conjunction with boreholes and seismic refraction data, locates the fault location quite closely to the eastern end of the bridge. This location is slightly north of the location on Lamar's map and has a slightly more easterly trend than the Lamar or Dibblee maps.

The Caltrans/Metropolitan Transportation Agency drilled several boreholes in the area. Three of the holes revealed important information relative to the San Rafael Fault (R-09-Z3B3, R09-Z3B6, and R-06EM3). The boring R09-Z3B6 is located on State Street just south of the railway and near the Pasadena Power Plant and borings R-09-Z3B3 and R06EM3 are located about 5,000 feet west of the Pasadena Power Plant along Pasadena Avenue (Figure 7).

Boring R-06EM3 was drilled in the park along Pasadena Avenue north of Arlington Drive. This boring was drilled to a depth of 201 feet and encountered alluvium to a 50 feet depth below ground surface (bgs) and Topanga Formation from 50 feet to the bottom of the hole. There was no indication of faulting; therefore the San Rafael Fault must be north of the boring. In addition, there was no indication of a southern branch as shown by Lamar.

Boring R-09-Z3B3 was drilled about 800 feet to the north of R-06EM3 in the grassy median just south of Bellefontaine Street (Reference 16). This boring was drilled to a depth of 275 feet and encountered old alluvium (Pleistocene age) to 185.5 feet bgs, and light-gray clay fault gouge from 185.5 to the bottom of the hole. This clay consisted of intensely sheared, altered, pulverized, highly plastic clay and sandy clay. Reportedly, petrographic thin-section analysis of included pebbles indicated an origin from dioritic igneous rock. The apparent great thickness of gouge (i.e. 90 feet) is interpreted by the Caltrans/Metropolitan Transportation Agency to be due to the borehole extending down a steeply dipping fault. Geometric calculations indicate about an 80 degree northerly dip; the true thickness of the zone is probably more on the order of 20 to 40 feet. In any event, this gouge places the surface projection of the fault quite close to the intersection of Hurlbut Street and Pasadena Avenue (Reference 16).

The third boring, R09-Z3B6, was on State Street just south of the railway tracks, just northeast of Raymond Hill and just west of the power plant (Reference 16). This boring extended to a depth of 326 feet bgs and encountered about 15 feet of alluvium overlying Topanga sandstone and conglomerate. This boring suggests that there is no north-dipping fault through the top of Raymond Hill as shown by Lamar and Dibblee. Furthermore, Caltrans/Metropolitan

Transportation Agency believes that the lack of any apparent faulting indicates that the northern splay of Lamar's fault must be north of the boring (within the City of Pasadena Power Plant).

A seismic-reflection line was run along Raymond Avenue from Glenarm Street to the north (Reference 16). The seismic-reflection line did not reveal any major faults, indicating that any faulting is south of Glenarm Street. Projecting the San Rafael Fault to the southeast based on these 3 borings and the seismic-reflection line places the fault directly through the Jacob Parking Lot. Groundwater was reported at depths of 51.5 and 136 feet in borings R-09-Z3B6 and R-09Z3B3 located at south and north of the San Rafael Fault respectively. A drop of 32.8 feet in groundwater elevations in the above borings is interpreted to be related to the San Rafael Fault. The lack of groundwater in boring JP-1, located at northeast corner of the Jacob Parking Lot and drilled to 60 feet below ground surface and existence of the saturated soil encountered in borings JP-2 and B-1 at depth of 50 feet below ground surface may suggest that the San Rafael Fault is located between borings JP-1 and JP-2. Further investigation is needed to confirm or refute this interpretation.

Although Hydrologue believes the San Rafael Fault may cross the Jacob Parking Lot, we recognize that the location may be somewhat imprecise. It appears to be located outside of the proposed Repowering Project GT-5 Combined Cycle. Reportedly Caltrans/Metropolitan Transportation Agency aerial-photograph analysis and geological mapping did not find any evidence of Holocene activity on the San Rafael Fault. As mapped, the fault trend crosses within Pleistocene-age alluvial deposits. The Pleistocene age is well established by numerous carbon 14 dates (Crook et al., 1987). In support of the Pleistocene age, Caltrans boreholes found weathered, oxidized alluvium with crumbly clasts and multiple pedogenic soil horizons.

Crook et al. (1987) indicate two ages of alluvium along the San Rafael Fault trend; these are less recent alluvium Qal_2 and older alluvium Qal_3 at the Site proximity. Reportedly, Caltrans/Metropolitan Transportation Agency analysis of vintage Fairchild aerial photographs (late 1920s to 1950s) did not reveal any evidence of topographic fault scarps along the trace of the San Rafael Fault in either less recent or the older Holocene alluvium indicating that the fault has not been active in latest Quaternary time. The only surficial indication of a fault is the crude alignment of the widely spaced knolls and hills (i.e. Grace Hill, Raymond Hill, etc). This type of geomorphology is typical of what geologists call a fault-line scarp. A fault-line scarp is a scarp that represents the eroded remnant of an ancient fault. Such a feature is consistent with a Pleistocene age of latest displacement on the San Rafael Fault.

Reportedly, according to the borehole data adjacent to Blair and Allendale schools, near-surface stratigraphic relationships, revealed in the shallow geotechnical borings, indicate lack of Holocene activity on the San Rafael Fault (Reference 20). These borings indicate a black, clayey soil similar to one we observed during grading operations related to the construction of GT1 and GT2 within the Pasadena Power Plant, overlie the Pleistocene alluvium (this layer was not observed during our recent investigations, References 1 & 2). This black soil is widespread throughout the area and is characteristic of a well-developed organic soil horizon on the Pleistocene alluvium. Although there are no carbon dates available for this soil, the thickness alone indicates a substantial age, perhaps several thousand years. The presence of carbonate nodules in the material supports advanced age. However, these clayey horizons are typically

"cumulative" soil horizons that are difficult to date precisely. The consistent thickness, and consistent depth of this unit across the area indicates tectonic stability, and that there has not been any Holocene fault displacement at the Site.

In conclusion, based on the above, Hydrologue believes the present data indicate that the San Rafael Fault may pass through the Jacob Parking Lot, but also it has not been active in Holocene time.

16.0 SOIL CONDITION

Fill

Man-made fill was encountered to a depth of approximately 5 to 15 feet below ground surface (bgs) in the exploratory borings. The man-made fill consists of dark brown to brown clayey, silty sand and fine to coarse gravelly sand in moist and moderately compact conditions. Deeper man-made fill may be present in unexplored areas of the Site.

Natural Ground

Subsurface lithology encountered during drilling and sampling consisted primarily of sandy silt and silty sands to the total depth explored, though many borings also contained lithology that ranged from clayey to gravelly sands. Some black, clayey soil was observed in samples collected from the various soil borings, as noted on boring logs. This black soil is widespread throughout the area and is characteristic of a well-developed organic soil horizon on the Pleistocene alluvium. Appendix A contains the complete borings logs for the current phase of work.

The Site is underlain by stream channel deposits of gravel, sand and silt (Qg) and alluvial fan outwash from major canyon grades northward into Q_a. The Site appears to be within the northern terminus of the Alhambra Wash. The Qg deposits underlying the Alhambra Wash intersect a concealed portion of the Eagle Rock Fault. According to Figure 10, the north side of the Site is covered with Holocene young Alluvial Fan Deposits, Qyf1, while the southeast of the Raymond Hills is covered with Pleistocene Alluvial Fan Deposits, Qof4gs. The contact between the two units at the proximity of the Site is not shown. Raymond Hill and Grace Hill are mapped as pre-Quaternary bedrock.

Almost adjacent to the east and west sides of the Site is alluvium Q_{of} consisting of older dissected surfacial sediments alluvial fans from the San Gabriel Mountains, according to the Geologic Map of the Pasadena Quadrangle by Thomas W. Dibblee, Jr. dated 1989 (Figure 6).

At the Site, beneath the man-made fill, brown sandy silt, gravelly sand, and silty sand in moist and moderately dense to dense conditions were encountered.

Site Groundwater

Groundwater was not encountered at the Site to the depth explored (60 feet bgs). Based on the Los Angeles County Department of Public Works (LACDPW), the closest active well near the Site is Well No. 4057H (personal communication with Miguel Osorio of LACDPW, December 17, 2009), located two blocks northeast of the Site at the intersection of Ohio Street and South Euclid Avenue. The depth to groundwater was measured at approximately 120.7 feet bgs on May 10, 2004. Ground surface elevation at this well is about 750 feet above mean sea level (MSL).

The closest inactive well near the Site is Well No. 4056C, located near the railroad tracks at the intersection of Thomas Guide Grid Lines 6 and 7 (just south of Fillmore Street). The depth to water was last measured at approximately 164.3 feet bgs on October 25, 1974. The ground surface elevation at this well is about 757.8 feet MSL.

A groundwater well was discovered beneath a concrete block and slab during the demolition activities at the vicinity of the gas turbine generators GT1 and GT2 at the Pasadena Power Plant. The demolition contractor excavated the perimeter of the well to approximately 15 feet below ground surface using a backhoe. A 12-inch steel conductor casing and a 2-inch diameter steel inner pipe was observed. The gap between the inner pipe and outer casing was filled with soil but the inner pipe casing was found open and the depth to water was measured by the contractor using a measuring tape and found to be about 85 feet below ground surface (bgs) with at least 5 feet of water. This is consistent with the depth to water reported by the LACDPW measured on May 16, 2002 from the nearby Well No. 4057H.

17.0 LABORATORY ANALYSIS

The collected soil samples were logged on requisite chain-of-custody record forms and delivered to American Scientific Laboratory (ASL), a State of California certified hazardous waste testing laboratory (Certificate # 2200), at the end of each day of field work. The selected samples were analytically tested for Semi-Volatile Organic Compounds (SVOCs) using EPA Method 8270C, Volatile Organic Compounds (VOCs) using EPA Method 8260B, Polychlorinated Biphenyls (PCBs) using EPA Method 8082, Total Lead Concentration using Method SW 6010B, total Hexavalent Chromium using Method SW 7196, Total Petroleum Hydrocarbons (TPH) Carbon Chain using EPA Method 8015M, and Total Recoverable Petroleum Hydrocarbons (TRPH) EPA Method 418.1. No soil sample was tested for soluble lead or Hexavalent Chromium concentrations for the purpose of their comparison with their respective STLC. However, it is recommended to test all stock pile soils for soluble lead prior to their off-site disposal.

The soil samples collected at the surface were analyzed for Polychlorinated Biphenyls (PCBs), lead, and hexavalent chromium,) using EPA Methods 8082, 6010B, and 7196 respectively.

The soil samples collected at a depth of 5, 10 and 15 feet below ground surface were analyzed for Semi-Volatile Organic Compounds (SVOCs), Volatile Organic Compounds (VOCs) and Total Petroleum Hydrocarbons (TPH) carbon chain using EPA Methods 8270C, 8260B and modified 8015.

All collected soil samples from the surface to a depth of 25 feet bgs were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) using EPA Method 418.1.

In addition to the requested analysis, ASL analyzed QA/QC samples which consisted of the analysis of matrix spike/matrix spike duplicates, method blanks, check samples and standards. Copies of the laboratory reports are included in Appendix B.

18.0 DISCUSSION

Table 1 through 7 summarizes the analytical testing results for soil samples collected and analytically tested during this investigation at the subject Site.

The middle distillates category TPH-DROs includes diesel fuel, kerosene, Stoddard solvent, home heating fuel, jet fuel and similar petroleum mixtures. Residual fuels TPH-ORO include heavy petroleum products such as No. 6 fuel oil (Bunker C), lubricating oils, oil and grease, waste oil and asphalts.

LEAD

Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total lead using EPA Method 6010 B. Lead was detected in all soil samples. Detected total lead concentrations vary from 0.553 to 662 mg/Kg. None of the total lead concentrations exceeds 750 mg/Kg, the clean-up level previously established for this area by Hunter-Kennedy and Associates (Reference 4).

It should be noted that total lead concentrations of three soil samples exceeded 250 mg/Kg (BH-6 @ 5-6.5', BH-7 @5-6.5' and BH-9 @4.5-6'). It should also be noted that 1,400 ppm of lead was reported for the soil sample collected at 1.5' bgs at the GP-32 location, and the extent of shallow soil contaminated with lead is defined by the lead concentration of soil samples reported for GP-31, and GP-33. Also the extent of lead-impacted soil in BH-7 is defined by lead concentrations reported for confirmation soil samples A1, B1 and C1 (Figure 5). The extent of lead impacted soil at the proximity of BH-9 is determined by the reported lead concentration of GP17 (268 @1.5' and 10.8 @ 5'ppm), GP-21(428 @ 1.5' ppm and ND @ 5'), GP22, and GP25 soil samples. In addition to these three samples, the total lead concentration of soil samples BH-2 at surface and BH-10 @ 5-6.5' exceed 50 ppm (10 times the STLC threshold for lead).

Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above mentioned locations is planned for off-Site disposal, then the excavated soil should be stock piled and a WET test should be made on stock pile soil samples to determine the soluble lead concentration of the stock piled soil for soil disposal purposes.

Chromium VI

Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total Chromium VI using Method SW 7196. Chromium VI concentrations were detected in only 5 soil samples. The detected concentrations vary from 0.51 mg/kg in BH-1@5-6' to 2.22 mg/kg in BH-10 at the surface. None of the detected Chromium VI concentrations exceed Chromium VI STLC threshold, California's Human-Exposure Based Screening Number for Residential or Commercial/Industrial sites or DTSC Preliminary Remedial Goal for Chromium VI and recommended site clean-up level for chromium VI and no further action is necessary.

Total Recoverable Petroleum Hydrocarbons TRPH

Sixty soil samples collected from the surface, 5, 10, 15, 20 and 25 feet below ground surface were tested for Total Recoverable Petroleum Hydrocarbons TRPH using EPA Method 418.1. TRPH

concentrations were detected in 23 soil samples (Table 3). The detected TRPH concentrations vary from 11.20 to 2,690 mg/kg. Detected TRPH concentrations of only three soil samples exceed 1,000 mg/kg (BH-4 @ S (1,220 mg/kg), BH-4 @ 15-16.5' (2,060 mg/kg), and BH-8 @ surface (2,690 mg/kg)).

None of the detected TRPH concentrations exceed its previously established clean-up levels for the area (References 3 & 4).

We understand that a TRPH cleanup level of 10,000 ppm was previously proposed by CH2MHILL for the City of Pasadena Power Plant and is considered acceptable by the Pasadena Fire Department, which is the regulatory oversight agency for the Site. Based on the above-mentioned analytical results, TRPH concentrations do not exceed the CH2MHILL proposed action level.

The above-mentioned TRPH concentrations are considered non-problematic based on comparison with the ESL tables for deep soil screening levels for industrial soil (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses.

If the soil at the vicinity of the locations where TRPH concentrations exceed 1000 ppm is planned for off-Site disposal then the excavated soil should be stock piled and should be analytically tested for TPH and VOCs using EPA Method 8015 M and 8260B or per soil disposal facility requirements. The horizontal extent of TRPH-impacted soil that potentially will be disposed off-site is not defined.

TPH DROs and TPH OROs

Forty soil samples collected from the surface, 5, 10 and 15 feet below ground surface were tested for TPH DROs and TPH OROs using EPA Method 8015M. TPH-DROs Extractable Range Organics C_{10}- C_{28}, TPH-OROs Heavy Extractable Range Organics TPH C_{28+} . Detected TPH DROs and TPH-OROs are shown in Tables 4 and 5, respectively.

TPH-DROs were detected in only 10 soil samples. The detected concentration varies from 12.1 mg/kg in BH-9@9.5-11' to 714 mg/kg in BH-8 at surface. TPH-OROs were detected in only 13 soil samples. The detected concentration varies from 12.1 mg/kg in BH-9@9.5-11' to 714 mg/kg in BH-8 at the surface. TPH-OROs were detected in only 13 soil samples. The detected concentration varies from 87 mg/kg in BH-1@ 5-6.5' to 840 mg/kg in BH-4@15-16.5. The detected TPH-DROs and TPH-OROs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source) of the San Francisco Water Quality Control Board. The reported concentrations are well below the soil screening level for industrial and commercial land uses and no further action is required.

Volatile Organic Compounds (VOCs)

Thirty soil samples collected from 5, 10 and 15 feet below ground surface were tested for Volatile Organic Compounds using EPA Method 8260B. Benzene was detected at 2.08 ug/kg only in soil sample BH-9@9-10.5'. Bromobenzene was detected at 2.26 and 19.5 ug/kg in soil samples BH-3@10-11. and BH-4@15-16.5', respectively. Ethylebenzene, toluene, o-Xylene and m&pXylenes

were detected in soil sample BH-4@15-16.' at concentrations of 2.00, 19.40, 2.72, and 5.50 ug/kg respectively. The above-mentioned VOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source) of the San Francisco Water Quality Control Board. The reported concentrations are well below the soil screening level for industrial and commercial land uses.

Semi Volatile Organic Compounds (SVOCs)

Thirty soil samples collected from 5, 10 and 15 feet below ground surface were tested for Semi Volatile Organic Compounds SVOCs using EPA Method 8270C. SVOCs were detected in only two soil samples: BH-2@5-6.5' and BH-9@4.5-6. Concentrations of Benzo(a)anthracene from 1,340 to 1,710 ug/kg, Benzo(a)pyrene 948 to 1,500 ug/kg, Benzo(b)fluoranthene 1,250 to 2,230 ug/kg, Benzo(k)fluoranthene 478 to 1,400 ug/kg, Chrysene 1,440 to 2,260 ug/kg, Flouranthene 1,130 to 4,610 ug/kg, Phenanthrene at from ND to 2,100 ug/kg and Pyrene 1,410 to 4,230 ug/kg. The above-mentioned SVOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source) of the San Francisco Water Quality Control Board. The reported concentrations are well below the soil screening level for industrial and commercial land uses except for Benzo(a)pyrene concentration of BH-9@4.5-6' which is at 1,500 ug/kg and is equal to screening level of SFWQCB.

PCBs

Ten soil samples collected from the surface were tested for PCBs using EPA Method 8082. No PCBs concentration was detected in any soil samples analytically tested for PCBs except for Aroclor-1254 (PCB-1254) at 78 ug/kg in soil sample BH-6@ surface.

The above-mentioned PCB concentration is considered non problematic based on comparison with DTSC Preliminary Remedial Goal (PRGs) for industrial sites. The reported PCB concentration is well below the soil screening level for industrial and commercial land uses.

TRIP AND EQUIPMENT QA/QC

No concentrations of analytes were detected in Trip Blank and Equipment Blank samples (Appendix B).

19.0 CONCLUSIONS

Based on the above-discussed data, Hydrologue recommends no further action, except for the removal of the shallow soils in the proximity of GP-32. For off-Site disposal of shallow soils in the proximity of soil boring GP-32, we recommend additional testing on the soil stockpile samples for the purpose of soil profiling for off-Site disposal.

Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above mentioned locations is planned for off-Site disposal, then the excavated soil should be stock piled and a WET test should be made on stock pile soil samples to determine the soluble lead concentration of the stock piled soil for soil disposal purposes.

21.0 LIMITATIONS

Our professional services have been performed using the degree of care and skill ordinarily exercised, under similar circumstances, by environmental consultants practicing in this or similar localities. The findings and conclusions presented herein are based primarily upon the analyses of test results from the soil samples during this study. This report has been prepared exclusively for the City of Pasadena Water and Power (CLIENT) and other authorized parties for the subject Site at a specific point in time, and hence it DOES NOT contain sufficient information for other parties or other uses (with the exception of jurisdictional regulatory agency(s). CLIENT shall be the sole beneficiary of this report, and no third party shall be an intended beneficiary unless so stated in writing. No other third party shall have the right to rely on HI's opinions rendered in connection with this report without HI's written consent. This report is also for the use and review of the jurisdictional regulatory agency(s). This report shall not create any rights or benefits to parties other than CLIENT, HI and other expressly named parties. The conclusions and recommendations included in this report are based on information contained or referenced herein, and our best judgment. No other warranty, expressed or implied, is made as to the professional advice contained in this report. No right or interest in the contract associated with this report may be assigned by either HI or CLIENT without the written permission of the other party, and any attempted assignment shall be wholly void and totally ineffective for all purposes. No delegation of any duty owed by either HI or CLIENT may be made without the written permission of the other party. This report is prepared subject to the terms and conditions in the contract related to this report and which was expressly negotiated, agreed to and acknowledged by CLIENT.

All work has been conducted in accordance with generally accepted practices in the fields of environmental engineering, geology, and hydrogeology that exist in this or similar localities at this time. No other warranty, either expressed or implied, is made. The fact that HI finds no recognized environmental conditions after performing the work described herein does not constitute a warranty by HI that this property is free of contamination. HI's opinion about the condition of this Site does not constitute a warranty of any kind. It is impossible to guarantee that any property is free from contamination without testing every square inch of the property for every conceivable hazardous substance, which would obviously be prohibitively expensive. Due to the inherent limits of time and cost, some uncertainty about Site conditions will always remain.

EXECUTIVE SUMMARY

This report presents the findings of a Limited Phase II Environmental Site Assessment for the site located at the southeast corner of the intersection of Fair Oaks Avenue and Glenarm Street in the City of Pasadena, California (hereinafter referred to as "Site") (Figure 1), in the northwestern portion of the City of Pasadena Power Plant, on the south side of Glenarm Building where the Glenarm Repowering Project (GT-5 Combined Cycle Installation) will be constructed (Figures 2 & 3).

This limited assessment consisted of collecting split soil samples during geotechnical drilling for analytical testing from June 8 through June 14, 2011. Subsurface conditions were explored by drilling 10 soil borings: three to a depth of 60 feet below ground surface (bgs) and seven to 50-feet bgs. Soil borings were placed in the vicinity of the requested boring locations by Power Engineers, Inc. A soil engineering investigation for the proposed GT-5 Combined Cycle Generator was also conducted by Hydrologue, Inc. and reported separately.

The selected samples were analytically tested for Semi-Volatile Organic Compounds (SVOCs) using EPA Method 8270C, Volatile Organic Compounds (VOCs) using EPA Method 8260B, Polychlorinated Biphenyls (PCBs) using EPA Method 8082, Total Lead Concentration using Method SW 6010B, Total Hexavalent Chromium using Method SW 7196, Total Petroleum Hydrocarbons (TPH) Carbon Chain using EPA Method 8015M, and Total Recoverable Petroleum Hydrocarbons (TRPH) EPA Method 418.1. The soil samples collected at the surface were analyzed for Polychlorinated Biphenyls (PCBs), lead, and hexavalent chromium using EPA Methods 8082, 6010B, and 7196 respectively.

The soil samples collected at depths of 5, 10 and 15 feet below ground surface were analyzed for Semi-Volatile Organic Compounds (SVOCs), Volatile Organic Compounds (VOCs) and Total Petroleum Hydrocarbons (TPH) carbon chain using EPA Methods 8270C, 8260B and modified 8015.

All collected soil samples between the surface and a depth of 25 feet bgs were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) using EPA Method 418.1.

Based on information obtained by HI during the performance of this Phase II environmental assessment, we conclude the following:

- Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total lead using EPA Method 6010B. Lead was detected in all soil samples. Detected total lead concentrations vary from 0.553 to 662 mg/Kg. None of the total lead concentrations exceeds 750 mg/Kg, the clean-up level previously established for this area (Reference 4).

  Shallow soil contamination in the area of GP32 (reported total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. In addition to the excavated soil in area of GP-32, if the soil at the vicinity of the locations where total lead concentration in excess of 50 ppm was detected is planned for off-Site disposal, then the excavated soil from these locations should be stock piled and a WET test should be made

on stock pile soil samples to determine the soluble lead concentration of the soil samples for soil disposal purposes.

- Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total Chromium VI using Method SW 7196. Chromium VI concentrations were detected in only 5 soil samples. The detected concentrations vary from 0.51 mg/kg in BH-1@5-6' to 2.22 mg/kg in BH-10 at the surface. None of the detected Chromium VI concentrations exceed its STLC threshold, California's Human-Exposure Based Screening Number for Residential or Commercial/Industrial sites or DTSC Preliminary Remedial Goal for Chromium VI.

- Sixty soil samples collected from the surface and depths of 5, 10, 15, 20 and 25 feet below ground surface were tested for Total Recoverable Petroleum Hydrocarbons TRPH using EPA Method 418.1. TRPH concentrations were detected in 23 soil samples (Table 3). The detected TRPH concentrations vary from 11.20 to 2,690 mg/kg. Detected TRPH concentrations of only three soil samples exceed 1,000 mg/kg (BH-4 @ S (1,220 mg/kg), BH-4 @ 15-16.5' (2,060 mg/kg), and BH-8 @ surface (2,690 mg/kg)).

  None of the detected TRPH concentrations exceed the previously established clean-up level for the area (References 3 & 4).

- If the soil at the vicinity of the locations where TRPH concentrations exceed 1000 ppm is planned for off-Site disposal then the excavated soil should be stock piled and should be analytically tested for TPH and VOCs using EPA Method 8015 M and 8260B or per soil disposal facility requirements. The horizontal extent of TRPH-impacted soil that potentially will be disposed off-site is not defined.

- Forty soil samples collected from the surface depths of 5, 10 and 15 feet below ground surface were tested for TPH DROs and TPH OROs using EPA Method 8015M. TPH-DROs Extractable Range Organics C_{10}- C_{28}, TPH-OROs Heavy Extractable Range Organics TPH C_{28+}

  The detected TPH-DROs and TPH-OROs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses.

- Thirty soil samples collected from depths of 5, 10 and 15 feet below ground surface were tested for Volatile Organic Compounds using EPA Method 8260B. The detected VOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses.

- Thirty soil samples collected from depths of 5, 10 and 15 feet below ground surface were tested for Semi Volatile Organic Compounds SVOCs using EPA Method 8270C. SVOCs

were detected in only two soil samples: BH-2@5-6.5' and BH-9@4.5-6. The detected SVOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses except for Benzo(a)pyrene concentration of BH-9@4.5-6' which is at 1,500 ug/kg and is equal to screening level.

- Ten soil samples collected from the surface were tested for Polychlorinated biphenyls PCBs using EPA Method 8082. No PCBs concentration was detected in any soil samples analytically tested for PCBs except for Aroclor-1254 (PCB-1254) at 78 ug/kg in soil sample BH-6@ surface.

  The above-mentioned PCB concentration is considered non-problematic based on comparison with DTSC Preliminary Remedial Goal (PRGs) for industrial sites. The reported PCBs concentration is well below the soil screening level for industrial and commercial land uses.

- Based on the above, Hydrologue recommends no further action, except for the removal of the shallow soils in the proximity of GP-32.

- Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above mentioned locations is planned for off-Site disposal, then the excavated soil should be stock piled and a WET test should be made on stock pile soil samples to determine the soluble lead concentration of the stock piled soil for soil disposal purposes.

EXECUTIVE SUMMARY

This report presents the findings of a Limited Phase II Environmental Site Assessment for the site located at the southeast corner of the intersection of Fair Oaks Avenue and Glenarm Street in the City of Pasadena, California (hereinafter referred to as "Site") (Figure 1), in the northwestern portion of the City of Pasadena Power Plant, on the south side of Glenarm Building where the Glenarm Repowering Project (GT-5 Combined Cycle Installation) will be constructed (Figures 2 & 3).

This limited assessment consisted of collecting split soil samples during geotechnical drilling for analytical testing from June 8 through June 14, 2011. Subsurface conditions were explored by drilling 10 soil borings: three to a depth of 60 feet below ground surface (bgs) and seven to 50-feet bgs. Soil borings were placed in the vicinity of the requested boring locations by Power Engineers, Inc. A soil engineering investigation for the proposed GT-5 Combined Cycle Generator was also conducted by Hydrologue, Inc. and reported separately.

The selected samples were analytically tested for Semi-Volatile Organic Compounds (SVOCs) using EPA Method 8270C, Volatile Organic Compounds (VOCs) using EPA Method 8260B, Polychlorinated Biphenyls (PCBs) using EPA Method 8082, Total Lead Concentration using Method SW 6010B, Total Hexavalent Chromium using Method SW 7196, Total Petroleum Hydrocarbons (TPH) Carbon Chain using EPA Method 8015M, and Total Recoverable Petroleum Hydrocarbons (TRPH) EPA Method 418.1. The soil samples collected at the surface were analyzed for Polychlorinated Biphenyls (PCBs), lead, and hexavalent chromium using EPA Methods 8082, 6010B, and 7196 respectively.

The soil samples collected at depths of 5, 10 and 15 feet below ground surface were analyzed for Semi-Volatile Organic Compounds (SVOCs), Volatile Organic Compounds (VOCs) and Total Petroleum Hydrocarbons (TPH) carbon chain using EPA Methods 8270C, 8260B and modified 8015.

All collected soil samples between the surface and a depth of 25 feet bgs were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) using EPA Method 418.1.

Based on information obtained by HI during the performance of this Phase II environmental assessment, we conclude the following:

- Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total lead using EPA Method 6010B. Lead was detected in all soil samples. Detected total lead concentrations vary from 0.553 to 662 mg/Kg. None of the total lead concentrations exceeds 750 mg/Kg, the clean-up level previously established for this area (Reference 4).

  Shallow soil contamination in the area of GP32 (reported total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. In addition to the excavated soil in area of GP-32, if the soil at the vicinity of the locations where total lead concentration in excess of 50 ppm was detected is planned for off-Site disposal, then the excavated soil from these locations should be stock piled and a WET test should be made

on stock pile soil samples to determine the soluble lead concentration of the soil samples for soil disposal purposes.

- Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total Chromium VI using Method SW 7196. Chromium VI concentrations were detected in only 5 soil samples. The detected concentrations vary from 0.51 mg/kg in BH-1@5-6' to 2.22 mg/kg in BH-10 at the surface. None of the detected Chromium VI concentrations exceed its STLC threshold, California's Human-Exposure Based Screening Number for Residential or Commercial/Industrial sites or DTSC Preliminary Remedial Goal for Chromium VI.

- Sixty soil samples collected from the surface and depths of 5, 10, 15, 20 and 25 feet below ground surface were tested for Total Recoverable Petroleum Hydrocarbons TRPH using EPA Method 418.1. TRPH concentrations were detected in 23 soil samples (Table 3). The detected TRPH concentrations vary from 11.20 to 2,690 mg/kg. Detected TRPH concentrations of only three soil samples exceed 1,000 mg/kg (BH-4 @ S (1,220 mg/kg), BH-4 @ 15-16.5' (2,060 mg/kg), and BH-8 @ surface (2,690 mg/kg)).

  None of the detected TRPH concentrations exceed the previously established clean-up level for the area (References 3 & 4).

- If the soil at the vicinity of the locations where TRPH concentrations exceed 1000 ppm is planned for off-Site disposal then the excavated soil should be stock piled and should be analytically tested for TPH and VOCs using EPA Method 8015 M and 8260B or per soil disposal facility requirements. The horizontal extent of TRPH-impacted soil that potentially will be disposed off-site is not defined.

- Forty soil samples collected from the surface depths of 5, 10 and 15 feet below ground surface were tested for TPH DROs and TPH OROs using EPA Method 8015M. TPH-DROs Extractable Range Organics C_{10}- C_{28}, TPH-OROs Heavy Extractable Range Organics TPH C_{28+}

  The detected TPH-DROs and TPH-OROs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses.

- Thirty soil samples collected from depths of 5, 10 and 15 feet below ground surface were tested for Volatile Organic Compounds using EPA Method 8260B. The detected VOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses.

- Thirty soil samples collected from depths of 5, 10 and 15 feet below ground surface were tested for Semi Volatile Organic Compounds SVOCs using EPA Method 8270C. SVOCs

were detected in only two soil samples: BH-2@5-6.5' and BH-9@4.5-6. The detected SVOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses except for Benzo(a)pyrene concentration of BH-9@4.5-6' which is at 1,500 ug/kg and is equal to screening level.

- Ten soil samples collected from the surface were tested for Polychlorinated biphenyls PCBs using EPA Method 8082. No PCBs concentration was detected in any soil samples analytically tested for PCBs except for Aroclor-1254 (PCB-1254) at 78 ug/kg in soil sample BH-6@ surface.

  The above-mentioned PCB concentration is considered non-problematic based on comparison with DTSC Preliminary Remedial Goal (PRGs) for industrial sites. The reported PCBs concentration is well below the soil screening level for industrial and commercial land uses.

- Based on the above, Hydrologue recommends no further action, except for the removal of the shallow soils in the proximity of GP-32.

- Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above mentioned locations is planned for off-Site disposal, then the excavated soil should be stock piled and a WET test should be made on stock pile soil samples to determine the soluble lead concentration of the stock piled soil for soil disposal purposes.

1.0 INTRODUCTION

Hydrologue, Inc. (HI) has been retained by the City of Pasadena to conduct a limited phase II environmental site assessment for the site located at the southeast corner of the intersection of Fair Oaks Avenue and Glenarm Street in the City of Pasadena, California (hereinafter referred to as "Site") (Figure 1), in the northwestern portion of the City of Pasadena Power Plant, the south side of the Glenarm Building where the Glenarm Repowering Project (GT-5 Combined Cycle Installation) will be constructed (Figures 2 & 3).

This limited assessment consisted of collecting split soil samples during geotechnical drilling for analytical testing. The soils engineering investigation for the proposed GT-5 Combined Cycle generator was also conducted by Hydrologue, Inc. and reported separately.

2.0 DESCRIPTION OF SITE

The Site is located at the southeast corner of the intersection of South Fair Oaks Avenue and East Glenarm Street in Pasadena, California (Figure 1). The Site was first developed in the early 20th century with the existing warehouse building in its southwest corner. The Site now contains an inactive oil-and-natural-gas-fired electric generating station used by the Pasadena Water and Power Department from 1906 through 1977.

In 1906, the Pasadena Water and Power Department constructed the original steam-plant building. The facility was demolished before construction of the tank farm in 1971. The existing non-operational steam plant (i.e. the Glenarm Building) occupies the Site's northwestern corner and currently consists of two attached buildings, including an eastern building, constructed in the early 1920s, and a western building, constructed in the early 1930s. Each of the extant buildings includes boiler and turbine generator systems. Both systems in the west building remain in place but Pasadena Water and Power Department removed the systems from the east building during the 1950s. The Pasadena Water and Power Department later installed a few machine tools in the former boiler area of the east building. Some of those machine tools remain.

The topography of the Site is relatively flat. Mixed land uses surround the Site and include a commercial building, The Metropolitan Transit Authority-owned Gold Line light rail right of way (ROW) and the City of Pasadena Water and Power's Broadway Steam Plant to the east, a Southern California Edison substation and the Water and Power Department Electrical and Maintenance shop to the south, and several commercial businesses to the west. Residential areas of Pasadena and South Pasadena are within 1,000 feet of the site to the west and south respectively.

3.0 PROPOSED DEVELOPMENT

We understand that the proposed project consists of the construction of the Glenarm Repowering Project (GT-5 Combined Cycle Installation) (Figures 2 & 3).

4.0 BACKGROUND

Two environmental investigation reports were made available to us by the City of Pasadena Department of Water and Power. These reports partially cover the present Site (Figures 4 & 5):

4.1 Summary of Additional Soil Assessment Activities (Phase III) Reference 3

The report was prepared by Pacific Environmental Group and the IT Group PEG/IT and dated September 3, 1999.

The scope of PEG/IT work included drilling forty soil borings to assess subsurface soil conditions at the Site (Figures 2 & 3). Soil borings were located in areas of concern identified in PEG/IT's Phase II Report (PEG/IT, 1999b). The Phase II Report recommended further subsurface environmental assessment to better define impact to the soils in focused areas. The report also includes a risk-based review to determine whether potential restrictions to development of the Site may be warranted due to impacted soil.

The assessment was performed primarily in the central portion of the Site, but also included a few additional locations as shown in Figures 4 & 5 of the referenced report. The locations included the area near boring B-8A, at which the Phase II investigation identified a concentration of mercury. Although mercury concentrations appeared to attenuate with depth, the Phase II investigation did not define the lateral extent. The Phase II Report also suggested further investigation for volatile organic compounds (VOCs), lead, copper, and heavy hydrocarbon impact near borings B-10A through B-10F. Although lead and copper concentrations appeared to attenuate with depth, the vertical and lateral extent of the impact was not defined to regulatory action limits. Lastly, the area near borings B-12 and B-13A required further investigation for vertical and lateral definition of lead concentrations. Lead concentrations identified by the Phase II Report in this area increased with depth.

4.1.1 Subsurface Conditions

Subsurface lithologies encountered during drilling and sampling consisted primarily of sandy silt and silty sands to the total depth explored, though many borings also contained lithologies that ranged from clays to gravelly sands. Some possible hydrocarbon was observed in samples collected from the various soil borings, as noted on boring PEG/IT logs. Appendix C contains the complete PEG/IT borings logs.

The highest PID reading recorded by PEG/IT was 70.0 parts per million by volume from the sample collected from boring GP-17 at 1.5' bgs.

The geologists noted that borings GP-39A and GP-40 contained a lithology zone that appeared impacted by hydrocarbons, based on its dark gray to black color and hydrocarbon-like odor. However, analytical results indicated that no TPH existed at any of the samples above, and laboratory reporting limits and TRPH analysis determined that only a small concentration of

TRPH existed above laboratory detection limits. This black layer of silt and clay was observed at an approximate depth of 3 to 7 feet bgs and contained sharp upper and lower contacts indicative of the presence of artificial fill material. The lateral extent of this material is not known.

4.1.2 Analytical Results for Volatile Organic Compounds (VOCs)

PEG/IT analyzed the samples collected from boring GP-10 at 5-feet bgs, boring GP-15 at 5-feet bgs, and boring GP-34 at 5-feet bgs for VOCs (Figure 4). Laboratory analyses did not detect any VOCs above method detection limits in these samples.

4.1.3 Analytical Results for Polychlorinated Biphenyls (PCBs)

PEG/IT reported that laboratory analyses did not detect concentrations of PCBs above laboratory method detection limits in samples analyzed for PCBs. The samples analyzed for PCBs were GP-40 at 1.5-feet bgs, GP-4, GP-11, GP-14, GP-19, GP-39, and GP-40 at 5-feet bgs and GP-7 at 7-feet bgs (Figures 4 & 5). Table 1 of the PEG/IT report (Appendix D) summarizes PCB data, including laboratory reporting limits.

4.1.4 Analytical Results for Total Recoverable Petroleum Hydrocarbons (TRPH) and Total Petroleum Hydrocarbons (TPH) Fuel Characterization

The laboratory detected TPH above method detection limits in 17 of the 44 samples analyzed for TPH fuel characterization. The 17 samples were collected from a total of eleven borings. Sixteen samples contained carbon22 to carbon33 (oil) range hydrocarbons, two contained carbon10 to carbon22 (diesel) range hydrocarbons, and two contained carbon6 to carbon10 (gasoline) range hydrocarbons. The detectable levels of TPH in all samples ranged from 100 mg/kg to 3,810 mg/kg, with the highest concentration (oil range) found in boring GP-14 at 7-feet bgs. The next highest concentration detected in a sample other than GP-14 (9,000 ppm TRPH @ 5' depth and 3,810 ppm oil range TPH @ 7' depth, inside present Site) occurred in the sample from boring GP-15 (outside of present Site) at 1.5-feet bgs. TPH concentrations appear to attenuate laterally to the north, east, and west. With the exception of borings GP-10 (280 ppm oil range TPH @ 7' depth, inside the Site) and B-5 (from Phase II), no TPH impact to soil was observed south of boring GP-14. In general, TPH concentrations in most borings attenuate with depth (Figure 5).

The most common fuel type detected appears to be motor oil or similar heavy hydrocarbons. Based on this determination and the apparently dark stained soils at GP-39 and GP-40 for which the laboratory detected no TPH, PEG/IT, in consultation with the Water and Power Department, requested Associated Laboratory to analyze selected samples for TRPH in an effort to confirm that no petroleum hydrocarbons existed outside the normal TPH range. Those samples with high TPH levels were also found to contain higher TRPH levels. TRPH was detected in one sample from boring GP-40 at a concentration of 44 mg/kg, well below the Site clean-up level of 10,000 ppm (Figure 5). Table 2 of the PEG/IT report (Appendix D) summarizes analytical results for TPH fuel characterization and TRPH.

4.1.5 Analytical Results for Lead

PEG/IT reported total lead concentration for 83 samples collected from 34 borings. If any total lead concentrations exceeded the 50 ppm, PEG/IT directed the laboratory to perform a soluble lead analysis on that sample for STLC comparison. Additional samples were analyzed by the California Toxicity Characteristic Leaching Procedure in order to obtain preliminary data for possible waste disposal characterization.

Detected total lead concentrations exceeded 50 ppm in 23 samples. The Laboratory analyzed each of these samples for soluble lead and found that five samples contained soluble lead at a concentration that exceeded the STLC threshold and two samples contained soluble lead at the STLC threshold. The highest soluble lead concentration was found in the sample from boring GP-19 (outside present Site) at 1.5-feet bgs (36.4 mg/kg). Most other elevated levels of total lead and soluble lead also occurred in the upper 1.5-feet bgs samples. Furthermore, at most boring locations, lead levels attenuated with depth (Figures 4 & 5). Analytical results for lead are summarized in Table 3 of the PEG/IT report (Appendix D). If the excavated soil from areas where elevated soluble lead in soil sample is reported is planned to be disposed off-site, the stock pile soil samples should be tested for soluble lead prior to its disposal.

4.1.6 Analytical Results for Copper

PEG/IT reported the total copper concentrations for 48 samples collected from 20 soil borings. All samples contained some copper concentrations, but none contained total copper exceeding the TTLC threshold for copper. Moreover, none of the samples were determined to contain copper at or more than ten times the STLC threshold. Table 4 of PEG/IT report (Appendix D) summarizes copper regulatory limits and analytical results. It should be noted that the mercury concentration of soil sample collected from boring 8A was not confirmed in confirmatory soil samples collected by PEG/IT.

4.1.7 Analytical Results for Mercury

PEG/IT reported total mercury concentrations for samples collected at GP-34 through GP-37, GP-39, and GP-40 at depths of 1.5- and 5-feet bgs. Although most samples contained low levels of mercury, no samples contained detectable mercury concentrations that exceeded TTLC (20 ppm) or ten times STLC (0.2 ppm) for mercury. Table 5 of the PEG/IT repot (Appendix D) summarizes mercury regulatory limits and analytical results.

4.1.8 Analytical Results for Title 22 Metals

Four soil samples collected at depths of 1.5 and the 5 feet bgs from borings GP-39 and GP-40 were analyzed for Title 22 Metals. The 5 feet bgs samples were collected in the center of the black stained layer. Although various metal concentrations were detected in each of the above referenced soil samples, only the total lead concentration of soil samples collected at a depth of 1.5 feet from boring GP-40 exceeded 50 ppm (75.3 mg/kg). TTLC threshold concentration for lead is 1,000 ppm. All other analytes were below the TTLC and ten times the STLC levels.

Based on known analytical data from the Phase II and the Phase III performed by PEG/IT and the risk-based review performed by Gradient (subsidiary of PEG/IT), PEG/IT required no further action at this Site.

4.2 Report of Soils Investigation, Pasadena Water and Power Plant

This report was prepared by Hunter-Kennedy and Associates, Inc., for Southwest Industries and is dated July 30, 2003 (Reference 4).

Hunter-Kennedy reported that to make way for Site improvements, soil from selected areas in the Pasadena Water and Power Plants was tested and where necessary, excavated and disposed of off-Site. This operation was conducted beginning in October 2002 and continued through March 2003. The overall activities can be broadly classified into three project areas: Marley Cooling Tower foundation adjacent acid lines, duct banks and other associated structures; Burn Tank; and East-West Tanks. Only the Marley Cooling Tower foundation partially overlaps the present Site.

As a part of the removal of the Marley Cooling Tower foundation adjacent acid lines, duct banks and other associated structures by Southwest Industries, Hunter-Kennedy performed soil sampling and analytical testing for the underlying soil. The Marley Cooling Tower was located in the western portion of the "Glenarm power plant". The Hunter-Kennedy testing found that the soil beneath the Marley Cooling Tower was contaminated to a depth of 10 feet with varying degrees of petroleum related hydrocarbons and lead. Uncovered during the testing excavation was: (1) an area to the south of the tower (hereafter referred to as the "Oil Pit") which contained contaminated soil to a depth of 22 feet, and (2) a "tank ring" which appeared to be an old tank foundation at a depth of 10 feet near the south east corner of the tower. This tank ring area was contaminated to a depth of 12 feet. The soil underlying the duct banks, acid line and other associated structures generally did not contain levels of contaminants above the specified action levels for this project.

Soil underneath the Marley Cooling tower that contained varying concentration of petroleum hydrocarbons and lead was excavated to a depth of 10 feet at the southern end of the cooling tower and 5 feet at the northern end, 22 feet at the Oil Pit location, and 12 feet at the tank ring location (see figure 5). Excavated soil was placed in stockpiles and tested for profiling purposes for off-site disposal.

Sample locations were determined based upon the specified collection of one sample per 50 foot grid. A total of 25 samples were initially collected at depths of 1 and 5 feet below the surface (after the foundation was removed).

4.2.1 Cooling Tower

4.2.1.1 Initial Investigation (Figure 1a of the Hunter-Kennedy report, Appendix G)

The initial sample (PPPI) was collected ahead of the scheduled grid sampling when discolored soil was discovered after demolition of a small utility building located just southeast of the

cooling tower. This sample was analyzed for CAM metals and STLC lead. The results were below action levels.

On October 7 through October 16, 2002, soil samples were collected from 13 locations (samples A 1-1 through C 15-5) from depths of 1 and 5 feet.

At 9 locations, the laboratory analysis did not detect contaminant levels above the limits established for the project. However, at the remaining locations, petroleum hydrocarbon levels in excess of 10,000 mg/kg in three samples (A5-5, B5-5 and C5-5) and metal concentrations exceeding the STLC limit in 17 samples were detected.

4.2.1.2 Additional Investigation (Figure 1b of the Hunter-Kennedy report, Appendix G)

Based upon these results, additional samples were collected on January 15 and 20, 2003, in a 15-foot grid pattern at depths of 9 feet (wall/face samples) and 10 feet (bottom). These samples were analyzed for Petroleum hydrocarbons in the C10-20 and C20-30 ranges and soluble lead (STLC). Petroleum hydrocarbon levels detected in these samples were below the action levels. Laboratory results reported one sample with STLC levels above the action levels. A confirmation sample (LCS) collected March 3, 2003 did not find detectable levels of STLC lead.

4.2.1.3 Tank Ring (Figure 1c of the Hunter-Kennedy report, Appendix G)

As the excavation of the soil near the southeast portion of the cooling tower area was extended to a depth of 10 feet, a "tank ring" was discovered. The ring was a three-foot wide concrete ribbon, approximately 30 feet in diameter. The soil within the ring was discolored (black). The visually discolored soil was removed to a depth of 12 feet. One sample contained petroleum hydrocarbon levels above the action level. Three samples were collected at the 12-foot level and analyzed for petroleum hydrocarbons C10-20 and C20-30 and soluble lead (STLC). None of the results exceeded action levels.

4.2.1.3 New Storm Drain Trench (Figure 1c of the Hunter-Kennedy report, Appendix G)

While excavating a trench for the installation of a new storm drain under the former cooling tower location, a discolored area at an approximate depth of 12 feet was observed. Three samples were collected; two from the bottom at a depth of 12 feet and one from the wall face at a depth of 10 feet. Petroleum hydrocarbon levels in the samples were below action levels.

4.2.1.4 Conclusion

Contamination, primarily petroleum hydrocarbons or soluble lead, was detected to depths of 5 feet under the former Marley Cooling Tower (excavated 10 feet); 10 feet at the tank ring (excavated 12 feet); and 19 feet at the oil pit (excavated 22 feet). Elevated results reported in the soil below the "pipeline" were not confirmed by the follow-up tests.

Soil underlying the Burn Tank had elevated concentration of petroleum hydrocarbons and soluble lead detected to depths of 8 feet. The burn tank area was excavated to a depth of 10 feet below ground surface. Soil underneath the Marley Cooling tower that contained varying concentration of

petroleum hydrocarbons and lead was excavated to a depth of 10 feet at the southern end of the cooling tower and 5 feet at the northern end, 22 feet at the Oil Pit location, and 12 feet at the tank ring location (see figure 5). Excavated soil was properly disposed off-Site.

No chemical of concerns were detected at or above action levels in the soil underlying the East-West Tanks.

5.0 PRE-DRILLING

Prior to drilling activities, a Site visit was conducted by HI staff and Principal Geologists. The locations of the proposed borings were discussed with the City of Pasadena Project Managers and adjusted to avoid buried obstacles identified in a previous geophysical survey of the Site. Due to the existence of underground pipes and utilities, several adjustments were necessary. A Site-specific Health and Safety Plan was prepared and followed during field activities. Health and safety issues related to the Site conditions and drilling activities were discussed with the drilling crew.

6.0 FIELD EXPLORATION

Subsurface conditions were explored by drilling 10 soil borings; 3 to a depth of 60 feet below ground surface (bgs), and seven to 50-feet bgs. Soil borings were placed in the vicinity of the requested boring locations by Power Engineers, Inc. Soil borings were drilled by R & C Drilling using a drilling rig equipped with hollow-stem augers to observe and sample the materials potentially affected by the previous Site operation (Figures 2 & 3). Soil samples were collected at 5 foot intervals from each boring using six 2½-inch diameter by 1-inch long and two 2½-inch diameter by 3-inch long brass tubes mounted within a 2½-inch inside diameter Modified California split-spoon drive sampler. A Hydrologue geologist supervised drilling operations and logged all soil borings in accordance with the Unified Soil Classification System (Appendix A). Additionally, a Standard Penetration Test was performed at each sampling interval using a Standard Split Spoon Sampler. All drilling equipments were steam-cleaned prior to being used.

All sampling equipment was cleaned prior to drilling at each boring location. Following sample collection, all sampling equipment, including the brass rings, were brushed clean in a solution of non-phosphate cleanser and rinsed with tap and distilled water and then shaken to remove excess moisture.

The sampler was attached to sampling rods, lowered to the sampling depth, and then was driven 18-inches into the formation. Blow counts per last 12-inches of penetration of the sampler were recorded to evaluate the consistency of the formation. No groundwater was encountered during drilling.

After sample recovery, the ends of the lowest 3-inch long brass tube were covered with Teflon sheets and plastic caps and secured with silicon tape.

Additionally, samples planned to be analytically tested for Volatile Organic Compounds (VOCs) were prepared using the EPA SW5035 Method from the bottom sampling ring as described below. The sampling and preservation protocols use the ESS Lock N' Load 5035 Soil Syringe Sampler. The Soil Syringe Sampler is a one-time use tool which collects approximately 5 grams of soil. The soil collected from the Soil Syringe Sampler is then transferred into pre-weighed 40-mL vials with appropriate preservatives.

Method 5035 requirements for sampling and preserving soil followed as detailed below:

- VOA vial prepared with sodium bisulfate preservative (5ml of de-ionized ultrapure water and 1 gram of Sodium Bisulfate preservative) – low level volatiles. In the field, HI staff measured 5 grams of soil using a Soil Syringe Sampler and added it to the VOA vial. Since the entire sample is consumed during each test, HI used two VOA vials per soil sample.
- VOA vial prepared with methanol preservative (10 ml of methanol (MeOH)) – high level volatiles. In the field, HI staff measured 10 grams of soil using a Soil Syringe Sampler and added it to the VOA vial. Each methanol sample can be analyzed more than once; therefore, only one method VOA was needed. The methanol solution becomes the actual representation of the soil sample being submitted. Since the MeOH virtually "masks" the low-level analytes, only volatiles with concentrations exceeding 200 ppb appear when analyzed.
- Standard boring sleeve followed by preservation in the lab – both high and low level volatiles.

The soil samples were labeled with the sample identification, date and time of sampling and the HI project number, and delivered to an off-Site state certified laboratory for hazardous waste testing. Prior to use, all the tubes were washed in a non-phosphate cleanser solution rinsed with tap water and then distilled water.

For each sampling interval within the borings, the soil contained in the second 3-inch long sleeve from the tip of the sampler was used for headspace analysis to determine if volatile hydrocarbon vapors were emanating directly from the soil using a photoionization detector (PID) MiniRAE 2000 Portable VOC Monitor, calibrated against an isobutylene gas standard. Each sample was placed in an airtight Ziploc™ plastic bag. The Ziploc plastic bags were placed in the sun for approximately 5 minutes and the headspace in each bag was analyzed using a PID. The headspace readings were recorded on the boring logs (Appendix A).

The soil samples were logged on requisite chain-of-custody record forms (Appendix B) and immediately delivered to American Scientific Laboratory (ASL), a State of California Certified Hazardous Waste Testing Laboratory (Certificate # 2200). The soil samples were labeled with the sample identification, date and time of sampling and the HI project number.

7.0 EQUIPMENT DECONTAMINATION

All hollow stem augers were steam-cleaned prior to being used. Following sample collection, all sampling equipment, including the brass rings, were brushed clean in a solution of non-phosphate cleanser and rinsed with tap and distilled water and then shaken to remove excess moisture.

8.0 FIELD QAULITY ASSURANCE/QUALITY CONTROL

For field quality assurance/quality control (QA/QC) purposes, field/equipment blanks and trip blanks were prepared daily, along with the collected soil samples. The field/equipment blanks are used to demonstrate whether the sampling procedures have any positive interference on the analytical results. The field/equipment blanks were prepared by flushing the decontaminated sampling equipment with purified water and collecting the water in sample containers. The trip blanks were supplied by ASL and are used to provide a measure of the potential positive interference introduced by sample preservation, transportation, and storage. The aforementioned QA/QC blanks were handled and processed in exactly the same manner as other samples, as described above. In addition to the requested analysis, ASL analyzed QA/QC samples which consisted of the analysis of matrix spike/matrix spike duplicates, method blanks, check samples and standards. Copies of the laboratory reports are included in Appendix B.

9.0 PHYSICAL SITE LOCATION

The coordinates of the Site are approximately 118.1494° west longitude, 34.1268° north latitudes. The Site is located at an elevation of approximately 752 feet above Mean Sea Level (MSL). The local surface drainage and topographic pattern is generally to the southeast and locally to the east, with a local topographic gradient of approximately 0.01 foot/foot, toward the east (Figure 1).

10.0 GEOLOGIC SETTING

The City of Pasadena Power Plant (Site) is located along the northeastern side of the Raymond Hills and eastern side of Grace Hill at the terminus of the Alhambra Wash in the southern portion of the City of Pasadena and Raymond Basin, a structurally elevated low relief surface lying to the northwest of the prominent San Gabriel Basin. The Raymond Basin is a triangular shaped alluvial plain that abuts the steep and high San Gabriel Mountains to the north and the moderate relief San Rafael Hills to the west. The active Raymond Fault forms the south-southeast boundary and separates the Raymond and San Gabriel Basins.

The Pasadena/Altadena/Sierra Madre areas are considered seismically active, where moderate sized earthquakes occur infrequently and active and potentially active faults abound. The east-west trending San Gabriel Mountains raise more than one mile above the basin floor with the steep southerly flank of the range, representing a recessed fault scarp of the Sierra Madre fault zone. The north side of the San Gabriel Mountains is bounded by the active San Andreas Fault and represents the main boundary between the North American and Pacific tectonic plates. The Raymond fault is trending east-northeast, a branch, and closely related to the Sierra Madre Fault that separates the Raymond and San Gabriel Basins. All of these faults have ruptured historically and have produced moderate to major earthquakes.

As a result of the continued movement between the plate boundaries, major north to south compressive forces are created across the region. These have resulted in uplift of mountains and

chains of hills and depressing adjoining basins shaping a sequence of east-west trending uplands which collectively form the Transverse Ranges Physiographic Provence of Southern California. The adjacent basin floors are filled as a result of the uplands erosion and transport of sedimentary deposits. In the vicinity of the Site, alluvium of Pleistocene and Holocene age was deposited by rivers and streams flowing south from the San Gabriel Mountain and San Rafael Hills. The San Rafael Hills are characterized by small- and medium-sized rounded hills and intervening valleys.

These drainages migrated back and forth, forming broad coalescing alluvial fans. Today the Raymond Basin is filled with several hundred feet of alluvial materials. Underlying the alluvium is a thick sequence of Tertiary age sedimentary rocks and below that is basement rock composed of granitic intrusive rocks of Mesozoic age and pre-Cambrian (?) metasediments. The depth to basement rock varies from a few feet near the mountain and hill fronts to nearly 2,000 feet in the southerly portion of the basin.

A major geomorphic feature in the area is the Arroyo Seco, which extends through Pasadena down the west-central part of the area and veers southwesterly near the Pasadena/South Pasadena city boundary. The Arroyo Seco is a steep-walled, flat-floored ravine about 500 to 1,000 feet wide and 50 feet deep. The arroyo widens into a relatively flat plain in South Pasadena. This change in relief is related to the Raymond Fault scarp, which crosses the area on the southern side of Raymond Hill. This scarp is a result of vertical fault displacement. Relief across the scarp is about 40 or 50 feet, but has been highly modified by urban development.

The San Gabriel Valley, which encompasses the southeastern side of Raymond Basin, is essentially a flat, gently south-sloping surface consisting of ancient (Pleistocene age) alluvial fans, flood plain, and basin fill alluvium. Elevations in the northern part of the Valley are in the 800- to 900-foot range, whereas in the south, elevations are in the 400- to 500-foot range. The flatness of the San Gabriel Valley surface is interrupted by several small hills and knolls which are outliers of the Repetto and San Rafael Hills. The largest of these hills is Raymond Hill, which is about 90 feet high. A smaller knoll just northwest of Raymond Hill is called Grace Hill. The other knolls are not named and are relatively subtle features that go largely unnoticed by the general public. Although subtle, these small knolls are important for understanding the geology of the region because they are bedrock exposures that reveal information regarding the surrounding subsurface geology.

11.0 STRATIGRAPHY

The majority of rocks in the area consist of Tertiary age (16 million years old) marine sedimentary rocks of the Topanga Formation. It is important to recognize that the geologic profile in Figure 9 is idealized and simplified to represent the entire zone. The south of the area (Figure 6) consists primarily of rock formations, whereas the east, west and north sides of the area have thick alluvial deposits over the rock formations.

Quaternary-age alluvium occurs at the Site proximity to a depth of approximately 200 feet (190 feet at R-09Z3B3), and at the south side of the Pasadena Power Plant where it is much thinner and on the order of 0 to 50 feet (43 feet at R-09-Z3B6). Alluvium at the proximity of the Site consists

of clay, silt, and sand with a major component of gravel and cobbles and some boulders, all composed of igneous and metamorphic rocks.

The principal formation in the southernmost portion of area (Figure 7) is the Fernando Formation which consists of soft and weak massive claystone and siltstone. The Fernando Formation overlies the Puente Formation in the southern part of the area (Figure 7). The contact is sharp and possibly unconformable (Dibblee, 1992).

The sedimentary rock at the proximity of the Site is composed of the Topanga Formation and includes a wide variety of rock types ranging from coarse-grained rocks such as breccia, conglomerate, and sandstone to fine-grained sandstone and siltstone with minor claystone (mudstone). The part of the Topanga Formation north of the Raymond Fault is predominantly sandstone, conglomerate, and breccia. The Topanga Formation also has intrusive volcanic rocks. For example, a 10-foot-thick zone of hard volcanic rock was encountered in a previous Caltrans study within boring EMI-2, immediately south of the Raymond Fault.

The bedrock northern side of the Site, north of the San Rafael Fault, consists of the Cretaceous age (approximately 120 to 160 million years ago) basement complex that is generally mapped in exposures of the San Rafael Hills as Wilson Diorite or Quartz Diorite (Dibblee, 1989c; Lamar, 1970).

12.0 GROUNDWATER CONDITIONS WITHIN RAYMOND BASIN

The Raymond Basin and San Gabriel Basin, to the southeast, have been extensively utilized for groundwater resources. Water wells drilled in both basins have produced good aquifer data for the groundwater depth and flow direction. Groundwater is resupplied to the Raymond Basin from surface runoff in the San Gabriel Mountains. The Raymond Fault to the south forms a very effective groundwater barrier causing groundwater to cascade over the fault and fall about 200 feet.

The groundwater surface elevation ranges from about 1,400-feet near the mountain front in the north to 450-feet near the Raymond Fault. In the past, springs and small ponds have formed to the south of the Raymond Fault scarp. The groundwater in the basin is unconfined and has a southeast gradient of 0.02 to 0.06 -foot per foot. Perched groundwater was not encountered to the depth explored at the Site (60 feet bgs). Reported highest groundwater depth at the Site proximity was about 50 feet bgs. Reported groundwater depth by the Caltrans consultant on the south side of the Site (south of San Rafael Fault in boring R-09-Z3B6) was 51.2 and on the north side of the Site was 136 feet (north of San Rafael Fault in boring R-09Z3B3). Both borings were converted to pizometers after drilling.

13.0 TECTONIC SETTING

Tectonic processes (faulting and earthquakes) are very active in the Site region. Figures 6 to 9 show the Site location relative to known active and potentially active faults. Obviously, the closer

a site is to an active fault, the greater potential there is for surface rupture and high earthquake ground motions. The Site does not lie close to any known active fault capable of surface fault rupture. However, the queried and buried trace of the San Rafael Fault is shown to cross or skirt the extreme corner of Jacob Parking Lot, east of Old Power Plant Building (Figures 6 to 9). It should be noted that in Figure 6 the fault is shown to cross through the Pasadena Power Plant entering from the west and exiting from the southeast corner along the Alhambra Wash. The nomenclature Eagle Rock or San Rafael faults were kept identical to their referenced sources in the figures 6 to 8.

The faults that trend mostly to the east-west are those associated with the Transverse Ranges. They produce mostly reverse (thrust) movement along north dipping planes which trend along southerly facing upland flanks. The active thrusts in the region include the Sierra Madre, Cucamonga, Raymond, and Santa Monica-Hollywood Faults. Another type of thrust fault is a blind thrust. These faults also are associated with the same process that elevated the Transverse Ranges, but the fault has remained buried and undetectable unless it produces an earthquake. The Raymond Fault, projecting along the south side of the Raymond Basin, at one time, may have been a blind thrust but because of continued activity it ruptured the ground surface.

The dominant fault system in the region is associated with the San Andreas Fault Zone. The system moves in a right lateral northwest trending direction with locally some vertical movement. The San Jacinto, Whittier-Elsinore, Newport-Inglewood, Palos Verdes and Mojave Desert Faults are coupled with the San Andreas (plate boundary) system. All of these faults have ruptured historically and produced moderate to major sized earthquakes.

14.0 STRUCTURAL GEOLOGY

As shown in Figure 9, the geologic strata are deformed into a series of folds and faults. Most of the folds and faults are continuations of geologic structures in the Santa Monica Mountains and the Elysian Hills to the southwest. These structures trend southeasterly through the Repetto Hills and continue below the flat-lying Quaternary alluvium of the San Gabriel Valley. The major folds are the Elysian Park Anticline and the South Pasadena Anticline.

The folding shown in Figure 9 is generalized and simplified. In reality, there are numerous small-scale folds within the larger fold trends. Frequent changes in bedding orientation due both to folding and faulting should be expected at depth.

Many of the faults are intra-formational features, meaning that the faults offset rocks of the same type. However, some of the faults could comprise highly fractured or clayey gouge zones.

15.0 LOCAL AND REGIONAL FAULTING

The potentially active Sierra Madre Fault Zone is over 60-miles long and is located just about 5.6 miles to the north of the Site. The fault displays dominantly reverse (vertical) movement and forms a very irregular and deeply incised scarp which, in places, may be several hundred feet

high. The fault zone strikes roughly east-west and locally dips northward at 18 to 70 degrees beneath the San Gabriel Mountains. Locally, at the foot of the range, the fault has been mapped most notably with basement rock thrust southward over older alluvium. A potentially active fault is one that has ruptured in the last two million years, but no evidence has been found to suggest rupture in the last 10,000-years. This infers that the fault has a relatively long recurrence interval.

The Sierra Madre Fault, in the Pasadena, Altadena and Sierra Madre areas, has not been placed into an active category or an Alquist-Priolo Earthquake Fault Zone as designated by the California Division of Mines and Geology. The potential for direct surface fault rupture through the subject Site is judged to be nil based on available geologic and fault related technical data. The upper bound (moment magnitude) earthquake assigned to the Sierra Madre Fault is M6.7 and the calculated slip rate is 3.0 mm per year. The fault is assigned to a Type B category. The entire Raymond Basin lies in Seismic Zone 4. Because of the proximity of this potentially active fault, it may produce significant ground motion effects should it rupture in the area closest to the Site and produce a major earthquake.

The faults of most interest to the proposed Power Plant project are the active faults that might result in ground rupture and displacement during an earthquake, and faults that might generate strong shaking of project facilities. The faults of most interest to the project are the Raymond Fault, the San Rafael Fault, and the Eagle Rock Fault.

The faults of greatest significance to the project are described in detail below. The locations of these faults are shown in Figures 6 to 8, and in the representative geologic profiles (Figures 9). These faults represent earthquake shaking hazards, but only the Raymond and Alhambra Wash faults located outside of the Site are identified as Alquist-Priolo Earthquake Fault Zones (APEQFZ), which implies a surface rupture potential. Such a designation indicates the fault is well known and its location is well defined. Other potentially active faults may not be identified as APEQFZ because their locations are not well defined and/or they have not generated earthquakes in historical times. The City of Pasadena Safety Element (City of Pasadena, 2003) has designated a "fault hazard management zone" for the Eagle Rock Fault, which means that geological studies are required for determining the potential for fault rupture before development occurs within the zone.

The active Raymond Fault Trace strikes east-northeast, 1.0 mile south of the Site, along the south boundary of the Raymond Basin. The fault is 12 to 15.5 miles long depending upon which interpretation is accepted, dips to the north beneath the basin at generally a high angle, and has produced lateral and vertical displacements. A well-developed scarp to 100-feet high along with sag ponds, offset drainages, back tilted surfaces, springs, a groundwater barrier and pressure ridges suggest its surface rupture is relatively young. Carbon dating gave movement within the last 2,500-years. The fault has been assigned to a Type B Category with an upper bound (moment) magnitude earthquake of 6.5, and a slip rate of 0.1 to 0.4 mm per year.

The State of California (CGS) has established an APEQFZ along the Raymond Fault from the San Gabriel Mountains in the east to near the intersection of Avenue 50 and York Boulevard in the west. The Raymond Fault extends southwesterly from the Sierra Madre Fault Zone at the base of the San Gabriel Mountains through the communities of Monrovia, Arcadia, San Marino, and

Pasadena to the Raymond Hill area of South Pasadena, where the Raymond Fault trends more westerly through the communities of South Pasadena, Highland Park, and possibly into Los Angeles. The fault forms a gentle arc, convex toward the south across the alluvial deposits of the San Gabriel Valley. The fault is best expressed in the San Marino to South Pasadena area, where if forms a prominent escarpment up to about 150 feet high.

A prominent linear gravity anomaly extending easterly from the southern margin of the Santa Monica Mountains, under the Los Angeles River plain, and into the Repetto Hills indicates that the Hollywood fault may extend easterly into the Repetto Hills, and has led to the interpretation by some that the Hollywood and Raymond Faults may be interconnected. Others (Dolan, Reference 15) have postulated that the Raymond Fault is directly connected with the Hollywood Fault and other faults within the southern frontal fault system of the Transverse Ranges. The westerly continuation of the Raymond Fault into the Los Angeles River floodplain is uncertain. For the purposes of this study, it is assumed that the Raymond and Hollywood Faults are independent features.

The most recent major rupture on the Raymond Fault occurred in the Holocene time, about 1,000 to 2,000 years ago (Crook et al., 1987; Weaver and Dolan, 2000, Reference 15). The largest earthquake within the project area in historical times was the 1988 Pasadena Earthquake with a magnitude (ML) of 5.0; this shock was interpreted by Jones et al. (1990) to have occurred on the Raymond Fault.

Currently, most geoscientists consider the Raymond Fault to be a left-lateral reverse-oblique fault that dips steeply (approximately 80 degrees) to the north. Geological trenching studies across the fault scarp indicate average rates of fault slip between 0.1 and 0.4 millimeters per year (mm/yr). More recently, the rate of slip has been estimated to be about 1.5 mm/yr and the recurrence interval at 3,300 years (Dolan et al., 2000; Cao et al., 2003; Weaver and Dolan, 2000, Reference 15). The maximum earthquake estimated by the CGS is in the range of M_w= 6.0 to 7.0.

The nature of potential surface displacements on the Raymond Fault is poorly known. Due to the lack of earthquake history on the Raymond Fault, seismic design for the fault must be based on empirical fault/earthquake relationships, based on a length of 12 miles, a down-dip width of 10 miles, and average slip of 1.6 to 3.3 feet. A maximum earthquake of Mw=6.7 is estimated.

Eagle Rock and San Rafael Faults

The Eagle Rock and San Rafael Faults, in the Pasadena area, have not been placed into an active category or APEQFZ Fault Zone as designated by the California Division of Mines and Geology. Existing geological maps (Lamar, 1970; Dibblee, 1989; Yerkes and Campbell, 2005; and City of Pasadena, 2002) show different locations for the Eagle Rock and San Rafael Faults. The principal difference is that Lamar's (1970) map shows the San Rafael and Eagle Rock Faults as separate features. The San Rafael Fault extends southeasterly from within the San Rafael Hills to the north edge of Grace Hill, Raymond Hill and the smaller associated knolls, essentially along the same trace as Dibblee's Eagle Rock Fault. At the eastern end Lamar splits the fault into two splays or branches; one extends through the top of Raymond Hill (south of the Pasadena Power Plant) and the other is a dotted line (that is, a subsurface fault) trending more easterly, along East Glenarm

Street, past Arroyo Parkway and into the hills north of the main trace of the Raymond Fault. Lamar maps the Eagle Rock Fault to the south of the San Rafael Fault within the knolls and projecting south of Raymond Hill. The differences between the fault mapping are not really significant from an earthquake hazard perspective, but the differences might be important for the Pasadena Power Plant projects, in that if there is only one fault (as indicated by Dibblee), the fault crosses the Power Plant, while in the case of two separate faults (as indicated by Lamar) it may be located outside of the Site. Borehole R-09-Z3B3 excavated during Caltrans study (Reference 16) encountered a significant zone of fault gouge believed to be the San Rafael Fault. The Eagle Rock and San Rafael Faults do not extend across the Raymond Fault.

Both the Eagle Rock and San Rafael Faults are considered potentially active faults, as defined above. According to the Caltrans Seismic Design Criteria (2009) fault database, the Eagle Rock Fault is estimated as having a maximum earthquake magnitude of 6.8.

Although the San Rafael Fault is not well documented, the approximate magnitude of its maximum earthquake can be estimated using empirical relationships on earthquake magnitude and fault length. According to these empirical relationships, the maximum magnitude could be about 6.0.

The so-called Eagle Rock/San Rafael Faults (San Rafael fault is the northern branch of the Eagle Rock fault at the proximity of Pasadena Power Plant, by those researchers who believes that Eagle Rock fault bifurcate at the proximity of the Pasadena Power Plant) have been discussed by numerous geoscientists over the past few decades and are shown on several geological maps, notably Lamar (1970), Crook et al. (1987), and Dibblee (1989), as well as several others (e.g. California Division of Mines and Geology, 1978). All of these investigations except CDMG (1978) were regional studies and did not really focus on the Eagle Rock/San Rafael Faults. Consequently, none of these maps show the faults in the same location. However, the CDMG (1978) categorically states that no evidence of Holocene activity has been found in any investigation. Based on the CDMG (1978) and Caltrans/Metropolitan Transportation Agency findings and on our own investigation, as discussed below, we believe that the fault is not active.

In this study the Eagle Rock and San Rafael Faults are considered as two discrete faults as shown by Lamar (1970); the southern fault is the Eagle Rock Fault, extending from the Eagle Rock area, crossing Arroyo Seco, and into the small hills and knolls west of Raymond Hill (Figure 8). The northern fault is the San Rafael Fault; this fault is basically parallel to the Eagle Rock Fault and similarly passes through Arroyo Seco, but extends to the north side of the Raymond and Grace Hills, at the proximity of the City of the Pasadena Power Plant.

Lamar shows the San Rafael Fault bifurcating near Raymond Hill with one branch cutting through the rocks at the top of Raymond Hill and the other branch under the alluvium north of the hill extending towards Blair and Allendale schools. Although in the Caltrans/Metropolitan Transportation Agency the southern branch is shown on their geological maps included in the final 710 tunnel report, they could not find any evidence of such a fault on aerial photographs or during field geological mapping or drilling.

In addition to the CDMG (1978) fault evaluation report, the Caltrans/Metropolitan Transportation Agency investigation (Reference 15), Wilson Geosciences (Diaz-Yourman and Associates, 2007, Reference 22), are investigations that treated the Eagle Rock-San Rafael Faults as their primary focus.

The only location in the area where the fault can be identified is in Arroyo Seco where the fault extends under the La Loma Bridge. The recent investigation by Wilson Geosciences (WGI) excavated a trench on the west side of Arroyo Seco and found faulting within the Tertiary-age Topanga Formation rocks. The fault was entirely within Tertiary-age rocks and did not displace the overlying Quaternary alluvium. Although the faults in their trench exposure may not represent the main branch of the fault, the location is consistent with the change in rock type contact from igneous rocks on the north to the Tertiary-age Topanga Formation on the south. The trench exposure, in conjunction with boreholes and seismic refraction data, locates the fault location quite closely to the eastern end of the bridge. This location is slightly north of the location on Lamar's map and has a slightly more easterly trend than the Lamar or Dibblee maps.

The Caltrans/Metropolitan Transportation Agency drilled several boreholes in the area. Three of the holes revealed important information relative to the San Rafael Fault (R-09-Z3B3, R09-Z3B6, and R-06EM3). The boring R09-Z3B6 is located on State Street just south of the railway and near the Pasadena Power Plant and borings R-09-Z3B3 and R06EM3 are located about 5,000 feet west of the Pasadena Power Plant along Pasadena Avenue (Figure 7).

Boring R-06EM3 was drilled in the park along Pasadena Avenue north of Arlington Drive. This boring was drilled to a depth of 201 feet and encountered alluvium to a 50 feet depth below ground surface (bgs) and Topanga Formation from 50 feet to the bottom of the hole. There was no indication of faulting; therefore the San Rafael Fault must be north of the boring. In addition, there was no indication of a southern branch as shown by Lamar.

Boring R-09-Z3B3 was drilled about 800 feet to the north of R-06EM3 in the grassy median just south of Bellefontaine Street (Reference 16). This boring was drilled to a depth of 275 feet and encountered old alluvium (Pleistocene age) to 185.5 feet bgs, and light-gray clay fault gouge from 185.5 to the bottom of the hole. This clay consisted of intensely sheared, altered, pulverized, highly plastic clay and sandy clay. Reportedly, petrographic thin-section analysis of included pebbles indicated an origin from dioritic igneous rock. The apparent great thickness of gouge (i.e. 90 feet) is interpreted by the Caltrans/Metropolitan Transportation Agency to be due to the borehole extending down a steeply dipping fault. Geometric calculations indicate about an 80 degree northerly dip; the true thickness of the zone is probably more on the order of 20 to 40 feet. In any event, this gouge places the surface projection of the fault quite close to the intersection of Hurlbut Street and Pasadena Avenue (Reference 16).

The third boring, R09-Z3B6, was on State Street just south of the railway tracks, just northeast of Raymond Hill and just west of the power plant (Reference 16). This boring extended to a depth of 326 feet bgs and encountered about 15 feet of alluvium overlying Topanga sandstone and conglomerate. This boring suggests that there is no north-dipping fault through the top of Raymond Hill as shown by Lamar and Dibblee. Furthermore, Caltrans/Metropolitan

Transportation Agency believes that the lack of any apparent faulting indicates that the northern splay of Lamar's fault must be north of the boring (within the City of Pasadena Power Plant).

A seismic-reflection line was run along Raymond Avenue from Glenarm Street to the north (Reference 16). The seismic-reflection line did not reveal any major faults, indicating that any faulting is south of Glenarm Street. Projecting the San Rafael Fault to the southeast based on these 3 borings and the seismic-reflection line places the fault directly through the Jacob Parking Lot. Groundwater was reported at depths of 51.5 and 136 feet in borings R-09-Z3B6 and R-09Z3B3 located at south and north of the San Rafael Fault respectively. A drop of 32.8 feet in groundwater elevations in the above borings is interpreted to be related to the San Rafael Fault. The lack of groundwater in boring JP-1, located at northeast corner of the Jacob Parking Lot and drilled to 60 feet below ground surface and existence of the saturated soil encountered in borings JP-2 and B-1 at depth of 50 feet below ground surface may suggest that the San Rafael Fault is located between borings JP-1 and JP-2. Further investigation is needed to confirm or refute this interpretation.

Although Hydrologue believes the San Rafael Fault may cross the Jacob Parking Lot, we recognize that the location may be somewhat imprecise. It appears to be located outside of the proposed Repowering Project GT-5 Combined Cycle. Reportedly Caltrans/Metropolitan Transportation Agency aerial-photograph analysis and geological mapping did not find any evidence of Holocene activity on the San Rafael Fault. As mapped, the fault trend crosses within Pleistocene-age alluvial deposits. The Pleistocene age is well established by numerous carbon 14 dates (Crook et al., 1987). In support of the Pleistocene age, Caltrans boreholes found weathered, oxidized alluvium with crumbly clasts and multiple pedogenic soil horizons.

Crook et al. (1987) indicate two ages of alluvium along the San Rafael Fault trend; these are less recent alluvium Qal_2 and older alluvium Qal_3 at the Site proximity. Reportedly, Caltrans/Metropolitan Transportation Agency analysis of vintage Fairchild aerial photographs (late 1920s to 1950s) did not reveal any evidence of topographic fault scarps along the trace of the San Rafael Fault in either less recent or the older Holocene alluvium indicating that the fault has not been active in latest Quaternary time. The only surficial indication of a fault is the crude alignment of the widely spaced knolls and hills (i.e. Grace Hill, Raymond Hill, etc). This type of geomorphology is typical of what geologists call a fault-line scarp. A fault-line scarp is a scarp that represents the eroded remnant of an ancient fault. Such a feature is consistent with a Pleistocene age of latest displacement on the San Rafael Fault.

Reportedly, according to the borehole data adjacent to Blair and Allendale schools, near-surface stratigraphic relationships, revealed in the shallow geotechnical borings, indicate lack of Holocene activity on the San Rafael Fault (Reference 20). These borings indicate a black, clayey soil similar to one we observed during grading operations related to the construction of GT1 and GT2 within the Pasadena Power Plant, overlie the Pleistocene alluvium (this layer was not observed during our recent investigations, References 1 & 2). This black soil is widespread throughout the area and is characteristic of a well-developed organic soil horizon on the Pleistocene alluvium. Although there are no carbon dates available for this soil, the thickness alone indicates a substantial age, perhaps several thousand years. The presence of carbonate nodules in the material supports advanced age. However, these clayey horizons are typically

"cumulative" soil horizons that are difficult to date precisely. The consistent thickness, and consistent depth of this unit across the area indicates tectonic stability, and that there has not been any Holocene fault displacement at the Site.

In conclusion, based on the above, Hydrologue believes the present data indicate that the San Rafael Fault may pass through the Jacob Parking Lot, but also it has not been active in Holocene time.

16.0 SOIL CONDITION

Fill

Man-made fill was encountered to a depth of approximately 5 to 15 feet below ground surface (bgs) in the exploratory borings. The man-made fill consists of dark brown to brown clayey, silty sand and fine to coarse gravelly sand in moist and moderately compact conditions. Deeper man-made fill may be present in unexplored areas of the Site.

Natural Ground

Subsurface lithology encountered during drilling and sampling consisted primarily of sandy silt and silty sands to the total depth explored, though many borings also contained lithology that ranged from clayey to gravelly sands. Some black, clayey soil was observed in samples collected from the various soil borings, as noted on boring logs. This black soil is widespread throughout the area and is characteristic of a well-developed organic soil horizon on the Pleistocene alluvium. Appendix A contains the complete borings logs for the current phase of work.

The Site is underlain by stream channel deposits of gravel, sand and silt (Qg) and alluvial fan outwash from major canyon grades northward into Q_a. The Site appears to be within the northern terminus of the Alhambra Wash. The Qg deposits underlying the Alhambra Wash intersect a concealed portion of the Eagle Rock Fault. According to Figure 10, the north side of the Site is covered with Holocene young Alluvial Fan Deposits, Qyf1, while the southeast of the Raymond Hills is covered with Pleistocene Alluvial Fan Deposits, Qof4gs. The contact between the two units at the proximity of the Site is not shown. Raymond Hill and Grace Hill are mapped as pre-Quaternary bedrock.

Almost adjacent to the east and west sides of the Site is alluvium Q_{of} consisting of older dissected surfacial sediments alluvial fans from the San Gabriel Mountains, according to the Geologic Map of the Pasadena Quadrangle by Thomas W. Dibblee, Jr. dated 1989 (Figure 6).

At the Site, beneath the man-made fill, brown sandy silt, gravelly sand, and silty sand in moist and moderately dense to dense conditions were encountered.

Site Groundwater

Groundwater was not encountered at the Site to the depth explored (60 feet bgs). Based on the Los Angeles County Department of Public Works (LACDPW), the closest active well near the Site is Well No. 4057H (personal communication with Miguel Osorio of LACDPW, December 17, 2009), located two blocks northeast of the Site at the intersection of Ohio Street and South Euclid Avenue. The depth to groundwater was measured at approximately 120.7 feet bgs on May 10, 2004. Ground surface elevation at this well is about 750 feet above mean sea level (MSL).

The closest inactive well near the Site is Well No. 4056C, located near the railroad tracks at the intersection of Thomas Guide Grid Lines 6 and 7 (just south of Fillmore Street). The depth to water was last measured at approximately 164.3 feet bgs on October 25, 1974. The ground surface elevation at this well is about 757.8 feet MSL.

A groundwater well was discovered beneath a concrete block and slab during the demolition activities at the vicinity of the gas turbine generators GT1 and GT2 at the Pasadena Power Plant. The demolition contractor excavated the perimeter of the well to approximately 15 feet below ground surface using a backhoe. A 12-inch steel conductor casing and a 2-inch diameter steel inner pipe was observed. The gap between the inner pipe and outer casing was filled with soil but the inner pipe casing was found open and the depth to water was measured by the contractor using a measuring tape and found to be about 85 feet below ground surface (bgs) with at least 5 feet of water. This is consistent with the depth to water reported by the LACDPW measured on May 16, 2002 from the nearby Well No. 4057H.

17.0 LABORATORY ANALYSIS

The collected soil samples were logged on requisite chain-of-custody record forms and delivered to American Scientific Laboratory (ASL), a State of California certified hazardous waste testing laboratory (Certificate # 2200), at the end of each day of field work. The selected samples were analytically tested for Semi-Volatile Organic Compounds (SVOCs) using EPA Method 8270C, Volatile Organic Compounds (VOCs) using EPA Method 8260B, Polychlorinated Biphenyls (PCBs) using EPA Method 8082, Total Lead Concentration using Method SW 6010B, total Hexavalent Chromium using Method SW 7196, Total Petroleum Hydrocarbons (TPH) Carbon Chain using EPA Method 8015M, and Total Recoverable Petroleum Hydrocarbons (TRPH) EPA Method 418.1. No soil sample was tested for soluble lead or Hexavalent Chromium concentrations for the purpose of their comparison with their respective STLC. However, it is recommended to test all stock pile soils for soluble lead prior to their off-site disposal.

The soil samples collected at the surface were analyzed for Polychlorinated Biphenyls (PCBs), lead, and hexavalent chromium,) using EPA Methods 8082, 6010B, and 7196 respectively.

The soil samples collected at a depth of 5, 10 and 15 feet below ground surface were analyzed for Semi-Volatile Organic Compounds (SVOCs), Volatile Organic Compounds (VOCs) and Total Petroleum Hydrocarbons (TPH) carbon chain using EPA Methods 8270C, 8260B and modified 8015.

All collected soil samples from the surface to a depth of 25 feet bgs were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) using EPA Method 418.1.

In addition to the requested analysis, ASL analyzed QA/QC samples which consisted of the analysis of matrix spike/matrix spike duplicates, method blanks, check samples and standards. Copies of the laboratory reports are included in Appendix B.

18.0 DISCUSSION

Table 1 through 7 summarizes the analytical testing results for soil samples collected and analytically tested during this investigation at the subject Site.

LEAD

Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total lead using EPA Method 6010 B. Lead was detected in all soil samples. Detected total lead concentrations vary from 0.553 to 662 mg/Kg. None of the total lead concentrations exceeds 750 mg/Kg, the clean-up level previously established for this area by Hunter-Kennedy and Associates (Reference 4).

It should be noted that total lead concentrations of three soil samples exceeded 250 mg/Kg (BH-6 @ 5-6.5', BH-7 @5-6.5' and BH-9 @4.5-6'). It should also be noted that 1,400 ppm of lead was reported for the soil sample collected at 1.5' bgs at the GP-32 location, and the extent of shallow soil contaminated with lead is defined by the lead concentration of soil samples reported for GP-31, and GP-33. Also the extent of lead-impacted soil in BH-7 is defined by lead concentrations reported for confirmation soil samples A1, B1 and C1 (Figure 5). The extent of lead impacted soil at the proximity of BH-9 is determined by the reported lead concentration of GP17 (268 @1.5' and 10.8 @ 5'ppm), GP-21(428 @ 1.5' ppm and ND @ 5'), GP22, and GP25 soil samples. In addition to these three samples, the total lead concentration of soil samples BH-2 at surface and BH-10 @ 5-6.5' exceed 50 ppm (10 times the STLC threshold for lead).

Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above mentioned locations is planned for off-Site disposal, then the excavated soil should be stock piled and a WET test should be made on stock pile soil samples to determine the soluble lead concentration of the stock piled soil for soil disposal purposes.

Chromium VI

Forty soil samples collected from the surface and depths of 5, 10 and 15 feet below ground surface were tested for total Chromium VI using Method SW 7196. Chromium VI concentrations were detected in only 5 soil samples. The detected concentrations vary from 0.51 mg/kg in BH-1@5-6' to 2.22 mg/kg in BH-10 at the surface. None of the detected Chromium VI concentrations exceed Chromium VI STLC threshold, California's Human-Exposure Based Screening Number for Residential or Commercial/Industrial sites or DTSC Preliminary Remedial Goal for Chromium VI and recommended site clean-up level for chromium VI and no further action is necessary.

Total Recoverable Petroleum Hydrocarbons TRPH

Sixty soil samples collected from the surface, 5, 10, 15, 20 and 25 feet below ground surface were tested for Total Recoverable Petroleum Hydrocarbons TRPH using EPA Method 418.1. TRPH concentrations were detected in 23 soil samples (Table 3). The detected TRPH concentrations vary from 11.20 to 2,690 mg/kg. Detected TRPH concentrations of only three soil samples exceed 1,000 mg/kg (BH-4 @ S (1,220 mg/kg), BH-4 @ 15-16.5' (2,060 mg/kg), and BH-8 @ surface (2,690 mg/kg)).

None of the detected TRPH concentrations exceed its previously established clean-up levels for the area (References 3 & 4).

We understand that a TRPH cleanup level of 10,000 ppm was previously proposed by CH2MHILL for the City of Pasadena Power Plant and is considered acceptable by the Pasadena Fire Department, which is the regulatory oversight agency for the Site. Based on the above-mentioned analytical results, TRPH concentrations do not exceed the CH2MHILL proposed action level.

The above-mentioned TRPH concentrations are considered non-problematic based on comparison with the ESL tables for deep soil screening levels for industrial soil (when groundwater is the drinking water source). The reported concentrations are well below the soil screening level for industrial and commercial land uses.

If the soil at the vicinity of the locations where TRPH concentrations exceed 1000 ppm is planned for off-Site disposal then the excavated soil should be stock piled and should be analytically tested for TPH and VOCs using EPA Method 8015 M and 8260B or per soil disposal facility requirements. The horizontal extent of TRPH-impacted soil that potentially will be disposed off-site is not defined.

TPH DROs and TPH OROs

Forty soil samples collected from the surface, 5, 10 and 15 feet below ground surface were tested for TPH DROs and TPH OROs using EPA Method 8015M. TPH-DROs Extractable Range Organics C_{10}- C_{28}, TPH-OROs Heavy Extractable Range Organics TPH C_{28+} . Detected TPH DROs and TPH-OROs are shown in Tables 4 and 5, respectively.

TPH-DROs were detected in only 10 soil samples. The detected concentration varies from 12.1 mg/kg in BH-9@9.5-11' to 714 mg/kg in BH-8 at surface. TPH-OROs were detected in only 13 soil samples. The detected concentration varies from 12.1 mg/kg in BH-9@9.5-11' to 714 mg/kg in BH-8 at the surface. TPH-OROs were detected in only 13 soil samples. The detected concentration varies from 87 mg/kg in BH-1@ 5-6.5' to 840 mg/kg in BH-4@15-16.5. The detected TPH-DROs and TPH-OROs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source) of the San Francisco Water Quality Control Board. The reported concentrations are well below the soil screening level for industrial and commercial land uses and no further action is required.

Volatile Organic Compounds (VOCs)

Thirty soil samples collected from 5, 10 and 15 feet below ground surface were tested for Volatile Organic Compounds using EPA Method 8260B. Benzene was detected at 2.08 ug/kg only in soil sample BH-9@9-10.5'. Bromobenzene was detected at 2.26 and 19.5 ug/kg in soil samples BH-3@10-11. and BH-4@15-16.5', respectively. Ethylebenzene, toluene, o-Xylene and m&pXylenes were detected in soil sample BH-4@15-16.' at concentrations of 2.00, 19.40, 2.72, and 5.50 ug/kg respectively. The above-mentioned VOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source) of the San Francisco Water Quality Control Board. The reported concentrations are well below the soil screening level for industrial and commercial land uses.

Semi Volatile Organic Compounds (SVOCs)

Thirty soil samples collected from 5, 10 and 15 feet below ground surface were tested for Semi Volatile Organic Compounds SVOCs using EPA Method 8270C. SVOCs were detected in only two soil samples: BH-2@5-6.5' and BH-9@4.5-6. Concentrations of Benzo(a)anthracene from 1,340 to 1,710 ug/kg, Benzo(a)pyrene 948 to 1,500 ug/kg, Benzo(b)fluoranthene 1,250 to 2,230 ug/kg, Benzo(k)fluoranthene 478 to 1,400 ug/kg, Chrysene 1,440 to 2,260 ug/kg, Flouranthene 1,130 to 4,610 ug/kg, Phenanthrene at from ND to 2,100 ug/kg and Pyrene 1,410 to 4,230 ug/kg. The above-mentioned SVOCs concentrations are considered non-problematic based on comparison with the deep soil screening levels for industrial sites (when groundwater is the drinking water source) of the San Francisco Water Quality Control Board. The reported concentrations are well below the soil screening level for industrial and commercial land uses except for Benzo(a)pyrene concentration of BH-9@4.5-6' which is at 1,500 ug/kg and is equal to screening level of SFWQCB.

PCBs

Ten soil samples collected from the surface were tested for PCBs using EPA Method 8082. No PCBs concentration was detected in any soil samples analytically tested for PCBs except for Aroclor-1254 (PCB-1254) at 78 ug/kg in soil sample BH-6@ surface.

The above-mentioned PCB concentration is considered non problematic based on comparison with DTSC Preliminary Remedial Goal (PRGs) for industrial sites. The reported PCB concentration is well below the soil screening level for industrial and commercial land uses.

TRIP AND EQUIPMENT QA/QC

No concentrations of analytes were detected in Trip Blank and Equipment Blank samples (Appendix B).

19.0 CONCLUSIONS

Based on the above-discussed data, Hydrologue recommends no further action, except for the removal of the shallow soils in the proximity of GP-32. For off-Site disposal of shallow soils in the proximity of soil boring GP-32, we recommend additional testing on the soil stockpile samples for the purpose of soil profiling for off-Site disposal.

Shallow soil contamination at the proximity of GP32 (total lead concentration of 1,400 ppm at 1.5 feet bgs) should be excavated and disposed of off-Site. The lateral extent of the remedial excavation may extend to GP-31, GP-33, and BH-7. The vertical extent of remedial excavation is anticipated to be less than 5 feet. In addition, if the soil at the vicinity of the above mentioned locations is planned for off-Site disposal, then the excavated soil should be stock piled and a WET test should be made on stock pile soil samples to determine the soluble lead concentration of the stock piled soil for soil disposal purposes.

Geotechnical Report for the Route 7 Freeway Corridor, from Route 10 to 210 In and Near the Cities of Los Angeles, South Pasadena, Pasadena and Alhambra, Report No. 625.732, Prepared by Materials and Environmental Investigation Section of the Engineering Branch, District 7, California Department of Transportation, dated January 1974.
17. Preliminary Geologic Hazards Evaluation for Pasadena Unified School District, San Rafael, Elementary School, 1090 Nithsdale Road, Pasadena, California, 91105, Hydrologue Report No. 3866-01, dated September 2, 2009.
18. Geotechnical Investigation, Proposed New Classroom Buildings, Blair Middle school, SEC of South Marengo Avenue and Allendale Road, Pasadena, California, report prepared by Geotechnical Professionals Inc., dated March 31, 2009.
19. Response to Engineering Geology and Seismology Review, Blair IB Magnet School, 1200 South Marengo Avenue, Pasadena, California, prepared by Geotechnical Professionals, Inc., dated November 23, 2009.
20. Eagle Rock-San Rafael Fault, report prepared by Schell Geological Consulting CO., dated November 19, 2009.
21. Earthquake Hazards Associated with the Verdugo-Eagle Rock and Benedict Canyon Fault Zones, Los Angeles County, California, DMG open file report 80-10.
22. Preliminary Engineering Geology Investigation of the La Loma Bridge Site, City of Pasadena, California prepared by Wilson Geosciences Inc. Altadena, California 91001-2117, dated November 2004.
23. Quaternary Geology and Seismic Hazard of the Sierra Madre and Associated Faults, Western San Gabriel Mountain, California by R. Crook, Jr. et al, dated December 1978.
24. USGS Professional Paper 1339.
25. California Division of Mine & Geology, Geology of Southern Half of the Azusa Quadrangle, D.M. Morton 1973.
26. Blake, T.F., 2002, EQSEARCH, Computer Program for Estimation Prediction of Peak Horizontal Acceleration from California Earthquake Catalogs, Unpublished Private Programs, Fault and Earthquake data base updated 1999.
27. Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, by California Regional Water Quality Control Board, San Francisco Bay Region, Interim Final – November 2007 (revised May 2008)

21.0 LIMITATIONS

Our professional services have been performed using the degree of care and skill ordinarily exercised, under similar circumstances, by environmental consultants practicing in this or similar localities. The findings and conclusions presented herein are based primarily upon the analyses of test results from the soil samples during this study. This report has been prepared exclusively for the City of Pasadena Water and Power (CLIENT) and other authorized parties for the subject Site at a specific point in time, and hence it DOES NOT contain sufficient information for other parties or other uses (with the exception of jurisdictional regulatory agency(s). CLIENT shall be the sole beneficiary of this report, and no third party shall be an intended beneficiary unless so stated in writing. No other third party shall have the right to rely on HI's opinions rendered in connection with this report without HI's written consent. This report is also for the use and review of the jurisdictional regulatory agency(s). This report shall not create any rights or benefits to parties other than CLIENT, HI and other expressly named parties. The conclusions and recommendations included in this report are based on information contained or referenced herein, and our best judgment. No other warranty, expressed or implied, is made as to the professional advice contained in this report. No right or interest in the contract associated with this report may be assigned by either HI or CLIENT without the written permission of the other party, and any attempted assignment shall be wholly void and totally ineffective for all purposes. No delegation of any duty owed by either HI or CLIENT may be made without the written permission of the other party. This report is prepared subject to the terms and conditions in the contract related to this report and which was expressly negotiated, agreed to and acknowledged by CLIENT.

All work has been conducted in accordance with generally accepted practices in the fields of environmental engineering, geology, and hydrogeology that exist in this or similar localities at this time. No other warranty, either expressed or implied, is made. The fact that HI finds no recognized environmental conditions after performing the work described herein does not constitute a warranty by HI that this property is free of contamination. HI's opinion about the condition of this Site does not constitute a warranty of any kind. It is impossible to guarantee that any property is free from contamination without testing every square inch of the property for every conceivable hazardous substance, which would obviously be prohibitively expensive. Due to the inherent limits of time and cost, some uncertainty about Site conditions will always remain.

DRILLED May 6, 1982 WITH Rotary Bucket
DIAMETER OF DRILL HOLE IN INCHES 18
LOGGED BY EWF

DH-3
STA. 65+40

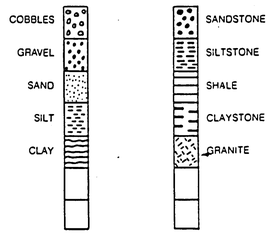
SURFACE ELEVATION IN FEET 751 DATUM

GEOLOGICAL CLASSIFICATION DESCRIPTION	ELEVATION IN FEET	DEPTH IN FEET	SYMBOL	SAMPLES	ENGINEERING CLASSIFICATION AND DESCRIPTION	TEST DATA M — D — 0 (RC)
FILL	750				8 inches asphalt surfacing.	
					SILTY SAND (SM), yellow-brown, moist, medium dense.	
ALLUVIUM		5			SANDY CLAY (CL), dark brown, moist, medium firm.	
Invert	745				SAND (SP) with gravel and cobbles, light gray turning yellow-brown at 4 feet, moist, dense, fine to coarse grained, cobbles to 8 ins. Layer of clayey silt with fine sand at 9 to 10½ feet, orange-brown.	
		10				
	740				Bottom of drill hole at 11 feet. No water; no caving. Drill hole backfilled, tamped, and patched with asphalt.	

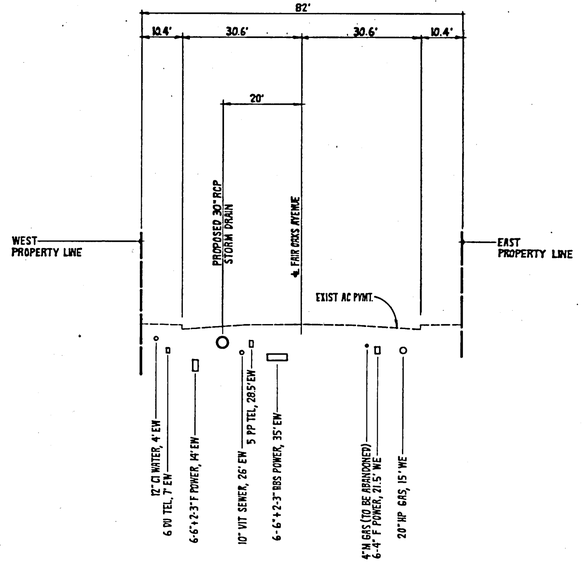
THE STRATIFICATION LINES REPRESENT THE APPROXIMATE BOUNDARY BETWEEN SOIL TYPES AND THE TRANSITION MAY BE GRADUAL

LEGEND TO LOGS

GEOLOGICAL CLASSIFICATION DESCRIPTION — CONVENTIONAL TERMINOLOGY



ENGINEERING CLASSIFICATION AND DESCRIPTION — SOIL - UNIFIED SOIL CLASSIFICATION SYSTEM WITH LETTER SYMBOL IN PARENTHESIS. ROCK - CONVENTIONAL TERMINOLOGY WITH (R) FOR ROCK



SYMBOLS
- WATER LEVEL
- WATER SEEPAGE
- HEAVY CAVING
- LIGHT CAVING
- SAMPLES AND CORES
  - UNDISTURBED
  - DISTURBED
  - UNSUCCESSFUL SAMPLING ATTEMPT
  - CORING RUN
  - P - PUSH
  - BLOW COUNT FOR 12 INCH SAMPLER PENETRATION (O.D. = 32 INCHES, 12 INCH DROP)
  - 7 — 2650 LBS. (DRIVING WEIGHTS)

GEOLOGIC STRUCTURE
- STRIKE AND DIP
  - B N.75 W 50 S (B = BEDDING)
  - CN 15E 75W (C = CONTACT)
  - J N 45W 85E (J = JOINT)
  - S N30E 45W (S = SHEAR)
  - F N 15E 20W (F = FOLIATION)
- (3)
- (6)
- (4)
- (5)

TEST DATA M — D — 0 (RC)
- MOISTURE CONTENT — PERCENT OF DRY WEIGHT. "S" INDICATES COMPLETE SATURATION
- DRY DENSITY — POUNDS PER CUBIC FOOT
- OTHER TESTS PERFORMED
  - DS = DIRECT SHEAR TEST
  - UC = UNCONFINED COMPRESSION TEST
  - TC = TRIAXIAL COMPRESSION TEST
  - CN = CONSOLIDATION TEST
  - EX = EXPANSION TEST
  - CP = COMPACTION TEST
  - GS = GRAIN SIZE DETERMINATION
  - PM = PERMEABILITY TEST
  - SE = SAND EQUIVALENT DETERMINATION
  - AL (45/10 = ATTERBERG LIMITS (LIQUID LIMIT/PLASTICITY INDEX)
- RELATIVE COMPACTION — PERCENT OF MAXIMUM DRY DENSITY OBTAINED BY LABORATORY COMPACTION TEST ON REPRESENTATIVE SAMPLE

SYMBOLS FOR EARTH MATERIALS

NOTES

1. ALL CONFLICTING STRIPING AND PAVEMENT MARKINGS OUTSIDE THE PAVING LIMITS SHALL BE REMOVED BY "WET SANDBLASTING" JUST PRIOR TO THE INSTALLATION OF THE PROPOSED CHANNELIZATION UNLESS OTHERWISE DIRECTED BY THE ENGINEER. SANDBLAST REMOVALS AND OPERATIONS SHALL CONFORM TO SECTION 10 OF THE SPECIAL SPECIFICATIONS.
2. THE INSTALLATION OF ALL PROPOSED STRIPING, PAVEMENT MARKINGS, AND PAINTED CURB ZONES SHALL CONFORM TO THE CONTRACT PLANS, SPECIFICATIONS, AND STANDARD DRAWINGS T-366, T-367, T-393, T-395, T-397, T-398 AND T-335.
3. BEFORE THE PERMANENT STRIPING IS INSTALLED, THE ENGINEER SHALL APPROVE THE LAY-OUT ("CAT-TRACKING").
4. RAISED PAVEMENT MARKERS SHALL BE INSTALLED ON ALL PROPOSED STRIPING (LANE LINES, BARRIER STRIPES, CENTER LINES) ON FAIR OAKS AVENUE AND ON ALL OTHER STREETS WHERE THE EXISTING PAVEMENT MARKERS ARE REMOVED DUE TO THE PAVING WORK. RAISED PAVEMENT MARKER MATERIALS, STORAGE, AND INSTALLATION SHALL CONFORM TO SECTION 10 OF THE SPECIAL SPECIFICATIONS.
5. REPAINT ALL EXISTING "RED CURB" ZONES SHOWN ON THESE CONTRACT PLANS. STENCIL ALL PROPOSED AND REPAINTED RED CURB ZONES "PPWD" IN WHITE LETTERS. OBTAIN THE STENCIL FROM THE ENGINEER FROM THE PUBLIC WORKS DEPARTMENT YARDS.

OIL-WATER SEPARATOR, ITEM # 274—MANUFACTURER'S INFORMATION

- MANUFACTURER: FLOW TREND SYSTEMS, INC

- MODEL NO.: TPL-50

(See also Dwg. # 20001-274-M & Dwg. #20001-274-2-M enclosed with the facility plans)

TPL PHASE³
OIL / WATER SEPARATOR

The **PHASE³ Oil/Water Separator** provides optimum efficiency in gravity separation between two immiscible liquid fractions. The horizontal orientation of the **PHASE³** modules provide a uniform and non-clogging flow through the coalescing tubes. The rectangular openings in its tubular construction allow for settling solids to pass through the coalescing medium. The design versatility of the **PHASE³** also eliminates the staging that is necessary with other incline and horizontal coalescing plates.

MODEL TPL - 150

APPLICATIONS:

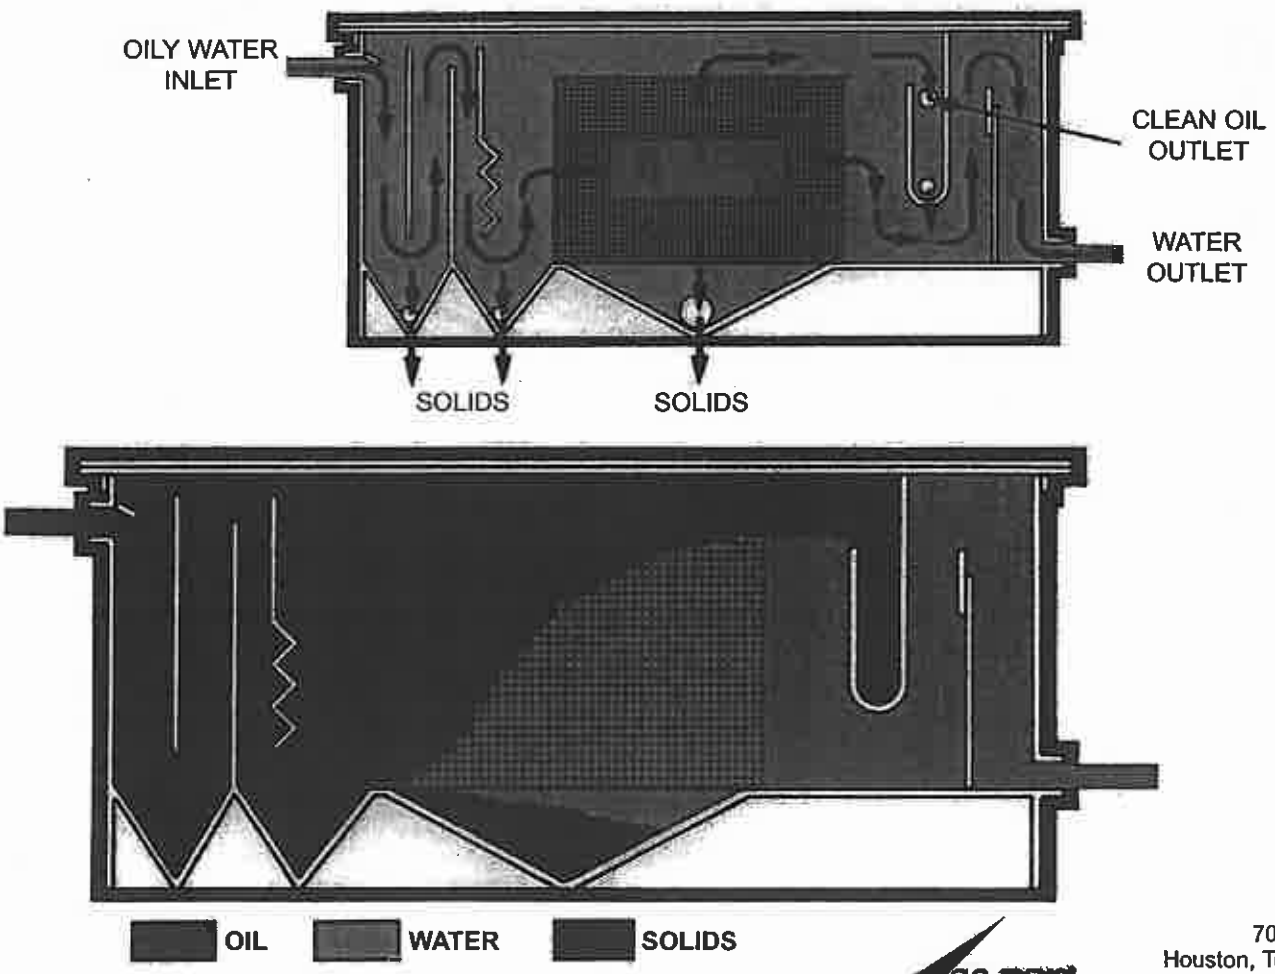
- Aviation
- Chemical Processing
- Machine Tools
- Metal Processing
- Oil Production
- Petrochemical
- Plastics
- Power Plants
- Processing Plants
- Steel Mills
- Storm Water Run-Off
- Transportation
- Utilities
- Vehicle Washes
- Water Treatment Plants

MODEL TPL - 150
with slotted tube coalescing medium in place.

Sotted tube **polypropylene coalescing medium. Efficient, fast separation.**

FLO TREND SYSTEMS, INC

TPL PHASE³
OIL / WATER SEPARATOR



SOLUTIONS TO LIQUID/LIQUID SEPARATION PROBLEMS.

The **FTS PHASE³ Oil/Water Separator** is of a gravity accelerator design with coalescing slotted tube arrangements for processing both high oil and high solids content. The inlet baffles reduce the oil/water mixture feed to laminar flow. The liquid then enters the coalescing tubes under laminar conditions. The oleiphilic surfaces of the coalescing tubes attract small oil droplets which in turn, combine to form larger droplets for easier flotation. The oil rises to a collection point while the water continues through the medium to the water outlets.

FEATURES:

- No pretreatment.
- High efficiency separation due to high surface area coalescing medium.
- No moving parts
- Easy cleaning; minimal maintenance.
- All steel vessel construction.
- Large solids settling area.

PHASE 3 OIL WATER SEPARATOR

The Flo Trend® Systems' Phase 3 Oil / Water Separator uses coalescing tubes for the optimum separation of oil from water. A series of baffles and weirs in the vessel reduces turbulent flow and promotes laminar even flow through the vessel.

TPL-Phase 3 Oil Water Separator

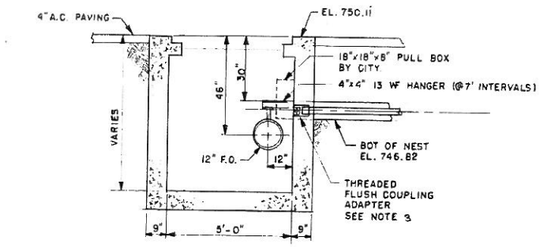
Model TPL-50

Click Images For Larger View

It provides optimum efficiency in gravity separation between two immiscible liquid fractions. The horizontal orientation of the Phase 3 modules provides a uniform and non-clogging flow through the coalescing tubes. The rectangular openings in its tubular construction allow for settling solids to pass through the coalescing media. The design versatility of the Phase 3 also eliminates the staging that is necessary with other incline and horizontal coalescing plates.

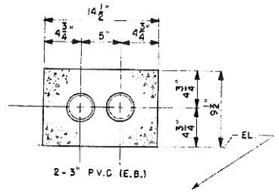
Features:

- No pre-treatment.
- High efficiency separation due to high surface area coalescing media.
- No moving parts. (On standard units)
- Easy cleaning.
- Minimal maintenance.
- All steel vessel construction.
- Large solids settling area.



Applications:

- Aviation.
- Chemical Processing.
- Machine Tools.
- Marine Terminals.
- Metal Processing.
- Oil Production.
- Petrochemical.



- Plastics.
- Power Plants.
- Processing Plants.
- Steel Mills.
- Storm Water Run-Off.
- Transportation.
- Utilities.
- Vehicle Washes.
- Water Treatment Plants.

August 10, 2011 Project No. 3626-04-01

Dan Angeles
City of Pasadena
Water and Power Department
85 East State Street
Pasadena, California 91105-3418

DRAFT

Re: Soil Thermal Resistivity
Pasadena Power Plant
Glenarm Repowering Project (GT-5 Combined Cycle Installation)

Dear Mr. Angeles:

The laboratory tests have been completed for the subject project. The purpose of the laboratory testing was to determine thermal resistivity of the on-Site soil with varying moisture content and density. Thermal soil resistivities are provided as 'data only' in order to aid Geovision complete their investigation.

We understand that the proposed project consists of the construction of the Glenarm Repowering Project (GT-5 Combined Cycle Installation).

The Site is located at the southeast corner of Fair Oaks Avenue and Glenarm Street in the City of Pasadena, California (hereinafter referred to as "Site") (Figures 1 and 3), in the northwestern portion of the City of Pasadena Power Plant, the south side of old Power Plant Building.

The scope of this study is limited to a determination of on-Site soil thermal resistivity at varying density and moisture content.

Undisturbed and bulk samples of the on-Site soils were used in this study. Bulk samples of the on-site soils were compacted to various densities and moisture content. The dry density and moisture content of the bulk samples were determined using ASTM D 2216. After measuring the thermal resistivity of the soil samples, they were saturated for 24 hours. Thermal resistivity and moisture content of the saturated samples once again were determined.

Dry density and moisture content of the undisturbed on-Site soils were determined in accordance with ASTM D 2216. After measuring the thermal resistivity of the soil samples, they were saturated for 24 hours. Thermal resistivity and moisture content of the saturated samples once again were determined.

Thermal resistivity testing was performed using a Decagon KD2 portable meter. The KD2 Pro portable meter works in accordance with ASTM D 5334-08 by providing a linear heat source and temperature measuring element. Calibration in accordance with ASTM D 5334-08 was performed using a Glycerol calibration standard. ASTM D5334-08 references a published thermal conductivity for Glycerol of 0.292 Wm*1 K*1 at 25 °C. The calibration results for the KD2 meter are in the attached laboratory data sheets.

Our services have been performed with usual thoroughness and competence of the engineering profession. No other warranty or representation, either expressed or implied, is included or intended.

This opportunity to be of service is sincerely appreciated. If you have any questions concerning this report, please do not hesitate to contact this office.

Very Truly Yours,
HYDROLOGUE, INC.

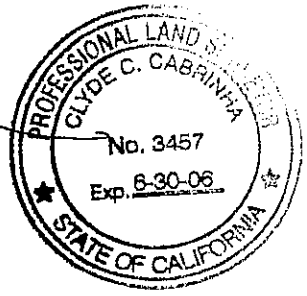
PARCEL A
GLENARM POWER PLANT SITE

All that certain real property situate in the City of Pasadena, County of Los Angeles, State of California and being portions of Lots 5 through 11 of G. E. Smith's Subdivision as recorded in Book 14 at page 93 of Miscellaneous Records of Los Angeles County; said property being more particularly described as follows:



That portion of the Northerly 186.55 feet of said G. E. Smith's Subdivision lying Easterly of the existing Easterly right of way line of Fair Oaks Avenue (82 feet wide) and Westerly of the following described line: Beginning at a point on the Northerly line of said subdivision, being also the existing Southerly right-of-way line of Glenarm Street distant thereon N 89° 36' 00" E 342.17 feet from the Northwest corner of lot 7 of said "G. E. Smith's Subdivision"; thence leaving said northerly subdivision line and perpendicular thereto S 0° 24' 00" E 186.55 feet to the Southerly line of said Northerly 186.55 feet of G. E. Smith's Subdivision, said portion containing 68,330 square feet of land, more or less.

EXCEPTING therefrom the following described future Street widening parcels:

Parcel 1: Beginning at a point on the Northerly line of said subdivision, being also the existing Southerly right-of-way line of Glenarm Street distant thereon N 89° 36' 00" E 342.17 feet from the Northwest corner of lot 7 of said "G. E. Smith's Subdivision"; thence leaving said northerly subdivision line and perpendicular thereto S 0° 24' 00" E 20.20 feet to the general southerly Street widening line; thence along said widening line the following courses: S 89° 36' 00" W 12.75 feet, N 0° 24' 00" W 13.68 feet, N 89° 22' 12" W 233.79 feet and N 0° 01' 54" W 2.55 feet to said existing Southerly right-of-way line of Glenarm Street, thence along last said right-of-way line N 89° 36' 00" E 246.48 feet to the point of Beginning and containing an area of 1,365 square feet.

Parcel 2: Beginning at the intersection of said Southerly right-of-way line of Glenarm Street with said Easterly right-of-way line of Fair Oaks Avenue, thence along said Southerly line of Glenarm Street N 89° 36' 00" E 24.97 feet to a point of cusp; thence tangent to the previous course Southwesterly along the arc of a curve concave Southeasterly having a radius of 25 feet and a central angle of 89° 56' 37" an arc length of 39.25 feet to said Easterly line of Fair Oaks Avenue and a point of cusp; thence tangent to said curve along last said Easterly line N 0° 20' 37" W to the point of beginning and containing an area of 130 square feet.

UNDERGROUND MATERIAL

PIPE: 4" TO 12" CLASS 51 DUCTILE IRON PER ANSI/AWWA C151/A21.51 WITH CEMENT LINED AND ASPHALTIC COATING

FITTINGS 4" TO 12" CLASS 350 MJ DUCTILE IRON WITH CEMENT LINED AND ASPHALTIC COATING

FITTINGS 4" TO 12" CLASS 350 MJ BOLTING ALL HEAVEY HEX HEAD MACHINE BOLTS WITH HEAVY HEX NUTS, GALVANIZED, ASTM A307 GR.B

BRANCH CONNECTION ALL USE TEES

GATE VALVE 4" TO 12" 250 PSI WP MJ RESILIENT WEDGE GATE VALVE, UL LISTED AND FM APPROVED. MFG. AMERICAN FLOW SERIES 2500 OR EQUAL.

FIRE HYDRANTS TO BE # 865 CLOW WITH TWO 4" CONNECTIONS AND ONE 2½" CONNECTION, PER FIRE DEPARTMENTS REQUIREMENTS.

GENERAL NOTES

. 2 NEW FIRE HYDRANTS TO PROVIDE 5000 GPM FLOWING AT 20 PSI FOR ON SITE FIRE FLOW
. ALL UNDERGROUND PIPE, FITTINGS, AND THRUSTBLOCKS TO BE PER NFPA. UL LISTED AND FM APPROVED, FOR MATERIAL SPECIFICATIONS SEE CHEMIC ENGINEERS MATERIAL LIST ABOVE.
. ALL UNDERGROUNDING PIPE AND FITTINGS TO BE M. J.
. ALL UNDERGROUND TO MAINTAIN 3½' MIN. BURY. TO COVER.
. PLANS TO BE APPROVED BY PASADENA FIRE DEPARTMENT.

PLEASE NOTE: THAT THE USE OF RETAINER GLANDS ON ALL MECH. JOINTS, CAN BE USED INLEIU OF CONCRETE THRUST BLOCKS.

- HYDRANTS ARE TO BE CHROME YELLOW WITH GREEN CAPS AND 3 OUTLET
- EACH HYDRANT IS TO BE CLEARLY IDENTIFIED WITH BLUE REFLECTORS (APPROVED LOCATION IN THE ROADWAY.

CONTROL NOTE:

POINT 100 IS A FOUND C–NAIL IN A CRACK IN CONCRETE.

POINT 101 IS A FOUND LEAD AND BRASS TACK IN CONCRETE.

POINTS 200–210 AND 215–222 ARE SET MAG NAIL AND ALUMINUM WASHER STAMPED "D. WOOLLEY & ASSOC CONTROL PT." (ALSO STAMPED WITH CORRESPONDING POINT NUMBER).

POINTS 211–213 ARE 2"X2" WOOD HUBS WITH BRASS TACKS AND WASHERS STAMPED "D WOOLLEY & ASSOC" (ALSO STAMPED WITH CORRESPONDING POINT NUMBER).

POINT 214 IS A SCRIBED "+" IN CONCRETE.

NOTE:

SEE SHEET 2 FOR BUILDING ELEVATION CALLOUTS.

SEE SHEET 3 FOR BUILDING ELEVATION CALLOUTS.

SEE SHEET 4 FOR NORTHEAST AND SOUTHWEST BUILDING ISOMETRIC VIEWS.

SEE SHEET 5 FOR NORTHWEST AND SOUTHEAST BUILDING ISOMETRIC VIEWS.

BASIS OF BEARINGS & DATUM STATEMENT:

(PURSUANT TO THE CALIFORNIA PUBLIC RESOURCE CODE, SECTIONS 8811, 8813.1, 8813.3, 8815.1 & 8857)

THE BEARINGS AND HORIZONTAL COORDINATES SHOWN HEREIN ARE BASED ON THE CALIFORNIA COORDINATE SYSTEM (CCS83), ZONE 5, 2007.00 EPOCH AND WERE DETERMINED BY GLOBAL POSITIONING SYSTEM (G.P.S.) TIES TO TWO CALIFORNIA SPATIAL REFERENCE NETWORK (C.S.R.N.) STATIONS REFERRED TO AS CIT1 AND OXYC. PUBLISHED HORIZONTAL ACCURACIES ON THESE STATIONS MEET OR EXCEED FEDERAL GEOGRAPHIC DATA COMMITTEE (F.G.D.C.) 5–MILLIMETER ACCURACY CLASSIFICATION PER FGDC–STD–007.2–1998. SAID C.S.R.N. POSITIONS WERE HELD "FIXED" HORIZONTALLY IN THIS SURVEY.

THE CCS83 GRID BEARING BETWEEN C.S.R.N. STATIONS CIT1 AND OXYC BEING N83°19'42"E, AS DERIVED FROM THE POSITIONS FOR SAID STATIONS, IN SAID EPOCH, PUBLISHED BY THE CALIFORNIA SPATIAL REFERENCE CENTER (C.S.R.C.) ON JANUARY 18, 2007, WAS USED AS THE BASIS OF BEARINGS FOR THIS SURVEY.

THE ORTHOMETRIC ELEVATIONS SHOWN HEREIN ARE BASED ON THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD 1988) AND WERE DETERMINED BY GPS TIES TO THE ABOVE LISTED CGPS ALONG WITH THE APPLICATION OF THE NGS GEOID HEIGHT MODEL "GEOID99".

SURVEYOR'S STATEMENT:

THIS MAP CORRECTLY REPRESENTS A SURVEY MADE BY ME OR UNDER MY DIRECTION IN CONFORMANCE WITH THE REQUIREMENTS OF THE PROFESSIONAL LAND SURVEYORS' ACT AT THE REQUEST OF COORY ENGINEERING IN AUGUST, 2011.

NOTES

1. THE INTENT OF THIS DRAWING IS TO ILLUSTRATE FOR THE BOP CONTRACTOR THE APPROXIMATE LOCATION OF EXISTING UNDERGROUND PIPING TUNNELS IN RELATION TO THE NEW PROPOSED EQUIPMENT LOCATIONS. BOP CONTRACTOR SHALL FIELD VERIFY THE LOCATION OF THESE UNDERGROUND STRUCTURES PRIOR TO START OF EXCAVATION AND DEMOLITION. COORDINATE WITH THE GENERAL MANAGER PRIOR TO DEMOLISHING ANY EXISTING INSTALLATIONS.
2. REFER TO DEMO DRAWINGS 1 THROUGH 6 FOR TUNNEL DETAILS.

3110	OTSG Drain & Vent Valves	PIE	PIE	PIE	BOP	
3120	Start-up Vent Valves & Silencers	PIE	PIE	PIE	BOP	Support from OTSG steel by BOP
3130	OTSG Safety Valves & Silencers	PIE	PIE	PIE	BOP	Support from OTSG steel by BOP
3140	Piping and Supports for Silencers (start-up and safety valves) Indoor OTSG	PIE	PIE	PIE	BOP	Piping designed & furnished by OTSG. Supports designed by PIE from load data supplied by OTSG. Piping and supports supplied and installed by BOP.
3150	HP Steam Attemperators & Valves	ENG	PIE	PIE	BOP	
3160	Stack	ENG	PIE	PIE	BOP	Two 360 degree platforms for accessing PIE supplied stack damper and CEMS ports
3170	Stack Emissions Testing/Monitoring Ports Incl.	ENG	PIE	PIE	BOP	Per specification
3180	FAA Warning Lights	-	-	-	-	Not Required
3190	Stack Lightning Protection	BOP	BOP	BOP	BOP	
3200	Expansion Joint @ GTG Exhaust End	PIE	PIE	PIE	BOP	
3210	Stack Closure Damper	ENG	PIE	PIE	BOP	
3220	SCR Catalyst & CO Catalyst	ENG	PIE	PIE	BOP	
3230	SCR Ammonia Injection Grid	ENG	PIE	PIE	BOP	
3240	SCR Ammonia Injection Skid (Incl. Vaporizers and all Instrumentation)	ENG	PIE	PIE	BOP	Scope of supply includes blowers PIE Contractor to supply funtional control logic. BOP Contractor to integrate functional control logic into Plant Control System.
3250	Ammonia Storage Tank & Unloading System	-	-	-	-	Use existing tank. Piping modifications by BOP
3260	Ammonia Interconnecting Piping from Injection Skid to Injection Grid	PIE	PIE	BOP	BOP	
3270	Ammonia Interconnecting Piping & Valves- Tank to Injection Skid	BOP	BOP	BOP	BOP	New pump at existing tank area will be supplied.
3280	Sole plates and slides	PIE	PIE	PIE	BOP	
3290	Burner Management System and Gas Control Logic	-	-	-	-	Not Required
3300	Control Logic Diagrams and Description	PIE	PIE	PIE	PIE	PIE Contractor will include preparation of functional requirements of the OTSG in order for the BOP plant control system designer to furnish control system design. Logic drawings are not included.

Division of Responsibility

Item Number	Item Description	Concept Engineering	Detail Design	Supply of Equip., Mat'l or	Field Install/ Erect	Comments / Clarifications
54080	Comprehensive General Liability Insurance	-	-	Each his own	-	By vehicle owner
54090	Insurance of Temporary Facilities, Tools, Construction Equipment, Etc.	-	-	BOP	-	
54100	Builder's All Risk Insurance Coverage	-	-	PWP	-	
54110	Federal Permits, Licenses and Approvals	-	-	PWP	-	
54120	Environmental Assessment	-	-	PWP	-	
54130	Modification or Obtaining New Water Discharge Permit(s)	-	-	PWP	-	
54140	Coordination for Compliance with City's Noise Ordinance	-	-	BOP	-	
54150	Zoning Board Approvals	-	-	PWP	-	
54160	Building & Construction Permits	-	-	PWP	-	BOP will supply necessary documents for PWP to facilitate construction permitting.
54170	Coordination of the County Inspector's Site	-	-	BOP	-	
54180	Maintaining & Guarding Facilities, Equipment & Materials up to time agreed in Construction	-	-	BOP	-	
54190	Construction Equipment, Tools, Instruments & Aids	-	-	BOP	-	
54200	Construction and Erection Tests, Third Party Testing Services			BOP	-	BOP contractor will provide the services of a third party testing agency for soils compaction verification, concrete and grout compression testing, x-ray, stress relief, etc. Contractor will provide daily reports and test reports from these entities and will permit PWP to contact to discuss issues as needed. Hold points for inspection will be identified in the contractors site-specific
54210	Technical Advisors (TAs)	-	-	PIE/BOP	-	As required to complete the project.
54220	Supervision, Labor and Site Safety Reporting	-	-	Each his own	-	PIE Contractor provides technical advice only.
54230	Construction Overall Safety Program		PWP	BOP		
55000	**START-UP AND COMMISSIONING:**	PIE/BOP	PIE/BOP	PIE/BOP	PIE/BOP	BOP leads commissioning with technical assistance from PIE for own supplied equipment
56000	**PLANT PERFORMANCE, EMISSIONS, AND NOISE TESTS:**
