On-Site Training Course Description for

"Aero Package Operations / Familiarization"

A. Summary

A comprehensive training program is conducted for a selected number of customer's engineers, operations and maintenance personnel. The training will be conducted at the customer's job site. The customer's personnel assigned for training must have prior general knowledge of power plant systems operation. The Buyer shall designate a training coordinator for the project who is familiar with overall plant design and system operations. This person schedules and coordinates job site training, as well as integrates individual systems training into the overall plant operation. There is also the option to have GE provide the Training Coordinator at an additional charge. If the Buyer chooses this option, please notify the Seller 60 days in advanced before the training program begins.

B. Training Material and Related Conditions (On-Site Training)

1. Classes run daily (five days/week) and are limited to six (6) hours. The actual class time, a.m. and p.m. hours, is dictated by the availability of the equipment and the students per the normal work schedule. Each class time period should be agreed to by the customer's management and GE's instructor(s) at the beginning of the program. The six (6) hour class limitation will allow ample time for the instructor(s) to prepare the next session's work plan.
2. A maximum of fifteen (15) students per class can be accommodated.
3. English-speaking instructor(s) will be furnished for the course duration.
4. Each student will be furnished a suitable bound course instruction and reference handbook in English; shipment costs have been included in the firm price quoted herein. Any materials furnished are exclusively for the use of the customer's personnel. This material is not for resale or to be distributed to third parties, nor is it to be copied or reproduced without GE's prior written permission.
5. Any audio or video recording of GE's lecture material is prohibited unless GE grants permission in writing in advance of the training program.
6. The instructor(s) will retain all visual aids.
7. The power plant equipment should preferably be operable and available to support this course of study.

C. Training Schedule

1. After the contract has been finalized, training will be conducted during a mutually–agreeable time.

D. Course Description

1. This site-specific course is designed to enable, supervisors, operations, and maintenance personnel to operate GE designed Aeroderivative gas turbine generator units. The course develops a background in gas turbine generator support systems, and operations, which will enable participants to analyze operating problems and take the necessary corrective action. It will also detail the design and construction of the gas turbine, and generator.
2. Emphasis is placed on the detailed description of the gas turbine - generator major components, the functions of their auxiliary systems, and the operator's responsibilities with regard to systems operations, and operational data acquisition, and evaluation of anomalies thru the use of classroom instruction, and class exercises.
3. If the course is held at the customer's location it will include site visits to familiarize personnel with the physical layout of the gas turbine - generator, and the location of the various system components,

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

and provide personnel the opportunity to correlate the system piping schematics to the respective system hardware.

4. Operators are instructed in how to interpret fault annunciation and how to determine if the annunciated fault can be remedied by operator action or with the assistance of instrumentation and/or maintenance personnel.

5. The course focuses on the starting, loading, and specific operator checks of the various turbine support and auxiliary systems to ensure reliable operation of the gas turbine - generator unit, and the effect that operation has on major mechanical maintenance.

E. Content

The typical Gas Turbine-Generator Operation course covers the following areas:

1. **Introduction**

   A. Instructor background
   B. Student background and expectations
   C. Course schedule

2. **Gas Turbine**

   A. Gas Turbine Basics

      1. Principles of Operation
      2. Axial Compressors
      3. Gas Turbine Combustors
      4. Turbine Section
      5. Air/Exhaust Gas Flow Characteristics
      6. Gas Turbine Configurations

   B. Details of Construction

      1. Engine Overview
      2. Stations and Orientation
      3. Shaft and Bearing Configuration
      4. LP Compressor Section (as applicable)
      5. Fixed vs. Variable Inlet Guide Vane Assembly
      6. Frame/Support Members
      7. Variable Bypass Valve Assembly (as applicable)
      8. HP Compressor Assembly
      9. Variable Stator Vane Assembly
      10. Combustor Assembly
      11. HP Turbine Assembly
      12. LP Turbine Assembly
      13. Auxiliary Gear Box
      14. Engine Airflow
      15. Turbine Instrumentation
      16. Key Performance Features and Operating Parameters

   C. Gas turbine support systems, description, function, and operating limits (As applicable)

      1. Inlet and exhaust, and control air
      2. Inlet cooling
      3. Inter cooling
      4. Lube oil (SLO/MLO)
      5. Variable Geometry Hydraulic and control oil
      6. Fuel system(s)

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

7. Water injection
8. Ventilation and Combustion air
9. Fire protection
10. Anti-Icing
11. Starting means
12. Water wash
13. Power augmentation (steam)
14. Performance monitoring
15. Vibration Monitoring

3. **Reduction Gear (As applicable)**

   A. System Description

   B. Lubrication System

4. **Clutch (As applicable)**

   A. System Description

   B. Lubrication System

5. **Generator**

   A. Overview

      1. Machine theory
      2. Generator construction
      3. Generator arrangement
      4. Generator Instruments

   B. Operation

      1. VAR's
      2. Power factor
      3. Synchronization
      4. Online operation
      5. Offline operation

   C. Support systems, description, function, and operating limits (as applicable)

      1. Lube oil
      2. Inlet air filtration
      3. Coolers
      4. Generator Protection

   D. Excitation

      1. Equipment description
      2. Operation
      3. Alarms, trips

6. **Control System**

   A. Overview

      1. Control panel arrangement
      2. Basic control functions and operating sequences
      3. Basic protection function

   B. Operator responsibilities

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

1. Data taking and evaluation
2. Operating limits
3. Required operator action on various annunciation indications

C. Gas turbine-generator operating modes

1. Operator screens (HMI or I)
2. Startup
3. Loading
4. Shutdown
5. Cooldown
6. Trip management

7. **Unit documentation**

A. Operation and Maintenance Manuals

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

On-Site Training Course Description for

"Aero Gas Turbine Package System Maintenance"

A. Summary

A comprehensive training program is conducted for a selected number of customer's engineers, operations and maintenance personnel. The training will be conducted at the customer's job site. The customer's personnel assigned for training must have prior general knowledge of power plant systems operation. The Buyer shall designate a training coordinator for the project who is familiar with overall plant design and system operations. This person schedules and coordinates job site training, as well as integrates individual systems training into the overall plant operation. There is also the option to have GE provide the Training Coordinator at an additional charge. If the Buyer chooses this option, please notify the Seller 60 days in advanced before the training program begins.

B. Training Material and Related Conditions (On-Site Training)

1. Classes run daily (five days/week) and are limited to six (6) hours. The actual class time, a.m. and p.m. hours, is dictated by the availability of the equipment and the students per the normal work schedule. Each class time period should be agreed to by the customer's management and GE's instructor(s) at the beginning of the program. The six (6) hour class limitation will allow ample time for the instructor(s) to prepare the next session's work plan.
2. A maximum of fifteen (15) students per class can be accommodated.
3. English-speaking instructor(s) will be furnished for the course duration.
4. Each student will be furnished a suitable bound course instruction and reference handbook in English; shipment costs have been included in the firm price quoted herein. Any materials furnished are exclusively for the use of the customer's personnel. This material is not for resale or to be distributed to third parties, nor is it to be copied or reproduced without GE's prior written permission.
5. Any audio or video recording of GE's lecture material is prohibited unless GE grants permission in writing in advance of the training program.
6. The instructor(s) will retain all visual aids.
7. The power plant equipment should preferably be operable and available to support this course of study.

C. Training Schedule

1. After the contract has been finalized, training will be conducted during a mutually–agreeable time.

D. Course Description

1. This site-specific course is designed to introduce operations and maintenance personnel to the routine preventative maintenance procedures of the Aeroderivative gas turbine package support systems, and to the major mechanical maintenance required to attain high levels of availability, and reliability from the Aeroderivative gas turbine package. This course will also cover Borescope procedure introduction, troubleshooting, and a summary of the disassembly inspections required for major gas turbine generator mechanical maintenance. Operating and maintenance personnel should attend this course together to develop a working relationship regarding the maintenance requirements of the unit, and how unit operation may affect these requirements.
2. The training will include detailed descriptions of the Aeroderivative gas turbine generator package and support systems. This will include a functional description of the systems as well as the routine preventative maintenance requirements. The training will also detail the Level 1 maintenance work packages with an overview of the Hot and Cold Level 2 maintenance inspections. The course DOES

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

NOT include repair procedures for gas turbine components. If the course is held at the customer's location it will include site visits to familiarize personnel with the physical layout of the gas turbine generator, and the location of the various system components, and to allow personnel to correlate the system piping schematics to the system hardware

E. Content

The typical Aeroderivative Gas Turbine-Generator Package Systems Maintenance course covers the following topics:

1. **Introduction**

   A. Instructor background
   B. Student background and expectations
   C. Course schedule

2. **Gas Turbine Overview**

   A. Gas Turbine Basics

      1. Principles of Operation
      2. Axial Compressors
      3. Gas Turbine Combustors
      4. Turbine Section
      5. Air/Exhaust Gas Flow Characteristics
      6. Gas Turbine Configurations

   B. Details of Construction

      1. Engine Overview
      2. Stations and Orientation
      3. Shaft and Bearing Configuration
      4. LP Compressor Section (as applicable)
      5. Fixed vs. Variable Inlet Guide Vane Assembly
      6. Frame/Support Members
      7. Variable Bypass Valve Assembly (as applicable)
      8. HP Compressor Assembly
      9. Variable Stator Vane Assembly
      10. Combustor Assembly
      11. HP Turbine Assembly
      12. LP Turbine Assembly
      13. Auxiliary Gear Box
      14. Engine Airflow
      15. Turbine Instrumentation
      16. Key Performance Features and Operating Parameters

3. **Maintenance Administration**

   A. Maintenance Management
   B. Maintenance Information
   C. Operator Event Logs
   D. Equipment Logs
   E. Equipment History Logs
   F. General Maintenance Concepts
   G. Standard Practices
   H. Maintenance Work Package Development
   I. Scheduling Work
   J. Maintenance and Repair Responsibilities

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

4. **Equipment Testing**
   - A. Cleanliness
   - B. Characteristics of Metal
   - C. Preservation and De-Preservation of Gas Turbine Engines
   - D. Special Tools
   - E. Engine Trending and Analysis and Performance Data Recording
   - F. Vibration Analysis
   - G. Ultrasound and Infrared Thermal Imaging
   - H. Oil Analysis
   - I. Bearing Maintenance
   - J. Single Point Maintenance
   - K. Calibration

5. **Gas Turbine Support Systems, description and maintenance requirements (As applicable)**
   - A. Inlet and exhaust, and control air
   - B. Inlet cooling
   - C. Intercooling
   - D. Lube oil (SLO/MLO)
   - E. Variable Geometry Hydraulic and control oil
   - F. Fuel system(s)
   - G. Water injection
   - H. Ventilation and Combustion air
   - I. Fire protection
   - J. Anti-Icing
   - K. Starting means
   - L. Water wash
   - M. Power augmentation (steam)
   - N. Performance monitoring
   - O. Vibration Monitoring

6. **Major Gas Turbine Mechanical Maintenance (As applicable)**
   - A. Level 1 Maintenance Packages
   - B. Level 2 Hot/Cold Maintenance Brief

7. **Reduction Gear (As applicable)**
   - A. Maintenance Requirements
   - B. Lubrication System

8. **Clutch (As applicable)**
   - A. Maintenance Requirements
   - B. Lubrication System

9. **Generator**
   - A. Overview
     1. Generator construction
     2. Generator arrangement and load gear (if applicable)
     3. Lift Arrangements
     4. Support systems, description and maintenance requirements (As applicable)
        - a. Lube oil
        - b. Cooling air inlet
        - c. Lift/Jacking oil

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

d. Coolers
e. High Voltage Bushings and Connections (Line and Neutral)

5. Major Mechanical Maintenance (As applicable)
   a. Generator Rotor Removal Brief
   b. Turbine Generator Alignment
6. Generator Electrical Maintenance (As applicable)
   a. Periodic Inspections
   b. PMG Checks
   c. Megger Checks

10. **Borescope Basic Introduction**
    A. Required equipment
    B. Functional use
11. **Trouble-Shooting Basics**
12. **Unit Documentation**
    A. Operation and Maintenance Manuals
    B. Illustrated Parts Breakdown
    C. Specific LM GEK Manual's
    D. Product Bulletins
    E. Maintenance Video's
    F. Critical Parts Life Management
    G. Name Plate Data

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. On-Site Training Course Description for

"Aeroderivative Control Systems Operation, Maintenance & Troubleshooting (LM6K MicroNet)"

A. Summary

A comprehensive training program is conducted for a selected number of customer's engineers, operations and maintenance personnel. The training will be conducted at the customer's job site. The customer's personnel assigned for training must have prior general knowledge of power plant systems operation. The Buyer shall designate a training coordinator for the project who is familiar with overall plant design and system operations. This person schedules and coordinates job site training, as well as integrates individual systems training into the overall plant operation. There is also the option to have GE provide the Training Coordinator at an additional charge. If the Buyer chooses this option, please notify the Seller 60 days in advanced before the training program begins.

B. Training Material and Related Conditions (On-Site Training)

1. Classes run daily (five days/week) and are limited to six (6) hours. The actual class time, a.m. and p.m. hours, is dictated by the availability of the equipment and the students per the normal work schedule. Each class time period should be agreed to by the customer's management and GE's instructor(s) at the beginning of the program. The six (6) hour class limitation will allow ample time for the instructor(s) to prepare the next session's work plan.
2. A maximum of fifteen (15) students per class can be accommodated.
3. English-speaking instructor(s) will be furnished for the course duration.
4. Each student will be furnished a suitable bound course instruction and reference handbook in English; shipment costs have been included in the firm price quoted herein. Any materials furnished are exclusively for the use of the customer's personnel. This material is not for resale or to be distributed to third parties, nor is it to be copied or reproduced without GE's prior written permission.
5. Any audio or video recording of GE's lecture material is prohibited unless GE grants permission in writing in advance of the training program.
6. The instructor(s) will retain all visual aids.
7. The power plant equipment should preferably be operable and available to support this course of study.

C. Training Schedule

1. After the contract has been finalized, training will be conducted during a mutually–agreeable time.

D. Course Description

1. This site-specific course is designed to introduce operations and maintenance personnel to the routine preventative maintenance procedures of the Aeroderivative gas turbine package support systems, and to the major electrical and control system maintenance required to attain high levels of availability, and reliability from the Aeroderivative gas turbine package. This course will also cover functional sensor & actuator description, troubleshooting, and a summary of calibration and inspections required for major gas turbine generator package electrical and control system maintenance. Operating and maintenance personnel should attend this course together to develop a working relationship regarding the maintenance requirements of the unit, and how unit operation may affect these requirements.
2. The training will include detailed descriptions of the Aeroderivative gas turbine generator package and support systems from a control system perspective. This will include a functional description of

Copies of this document may not be made without prior approval.

the systems as well as the routine preventative maintenance requirements. The course DOES NOT include repair procedures for gas turbine components. If the course is held at the customer's location it will include site visits to familiarize personnel with the physical layout of the gas turbine generator package, and the location of the various system components, and to allow personnel to correlate the system electrical schematics and wiring diagrams to the system hardware.

E. Content

The typical Aeroderivative Control Systems Operation, Maintenance & Troubleshooting course for the LM6000 GTG Package with the MicroNet style control system covers the following topics:

1. **Introduction**
   - A. Instructor background
   - B. Student background and expectations
   - C. Course schedule
2. **Control Basics**
   - A. Introduction to Closed-Loop Control
   - B. Governing Control Fundamentals
   - C. Sequencing Control
   - D. System Protection
3. **System Overview**
   - A. System Block Diagram
   - B. Major Control System Components
   - C. Package Documentation
4. **Instrumentation – Theory of Operation and Practical Troubleshooting**
   - A. Sensors
   - B. Magnetic Pick-Ups
   - C. Thermocouples
   - D. RTDs
   - E. LVDTs
   - F. Servo Actuators
   - G. Electrically Actuated Valves
   - H. Pressure Transmitters
   - I. Fire Detectors
   - J. Gas Detectors
   - K. Vibration Pick-Up Devices
5. **Engine (Core) and Package Controller (Outer Ring)**
   - A. Woodward MicroNet Overview and Architecture
   - B. Woodward MicroNet Hardware
   - C. Woodward MicroNet Software Interface Tools
     1. Graphical Application Programming Software (GAP)
     2. Control Assistant Software
     3. App Manager Software
   - D. Woodward MicroNet Maintenance
   - E. Woodward MicroNet System Back-Up
6. **Vibration Monitoring System**
   - A. Bently Nevada 3500 Overview and Architecture
   - B. Bently Nevada 3500 Hardware
   - C. Bently Nevada 3500 Interface Tools

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

a. 3500 Rack Interface Software

D. Bently Nevada 3500 Maintenance

E. Bently Nevada 3500 System Back-U

7. **Fire & Gas Detection System**

A. Fire & Gas Detection System Overview and Architecture
B. Fire & Gas Detection System Hardware
C. Fire & Gas Detection System Maintenance
D. Fire & Gas Detection System Back-Up

8. **Generator Excitation Controller**

A. Brush A30 AVR Overview and Architecture
B. Brush A30 AVR System Hardware
C. Brush A30 AVR System Interface Tools
1. Brush A30 HMI Software
D. Brush A30 AVR System Maintenance
E. Brush A30 AVR System Back-Up

9. **Generator Protection System**

A. IGPS Overview and Architecture
B. IGPS System Hardware
C. IGPS System Interface Tools
D. IPScom Communication Software
E. IGPS System Maintenance
F. IGPS System Back-Up

10. **Package Application Control**

A. Review of Systems and HMI Navigation
B. Start-Up and Shutdown Sequences
C. Operation Modes
D. Individual System Sequencing
E. Turbine Control
F. Generator Control, Protection, & Switching

11. **Integrated System Topics**

A. Power Up
B. Communication Interfaces
C. HMI housekeeping

12. **Summation**

A. Review
B. Questions and Answers

This quote is submitted for evaluation by the Company and its contents are proprietary to GE Energy Learning Center in taking receipt of this document, the purchaser agrees not to reveal its contents except to those in purchaser's organization who must evaluate it. Copies of this document may not be made without prior approval.

Attachment 14.2 Training Services

Training Services

A comprehensive training program is conducted for a selected number of City's engineers, operations and maintenance personnel. The training will be conducted at the City's job site.

The City's personnel assigned for training must have general knowledge of combined cycle power plant systems operation, as well as a fundamental knowledge of plant start-up, normal operations, shutdown and abnormal operations, including safe, efficient power plant operations. In addition to operator training described herein, more specific training can be offered as optional packages in detailed areas such as controls and maintenance.

A Contractor training coordinator will be designated for the project who is knowledgeable with overall plant design and system operations. This person schedule and coordinate job site training, as well as integrate individual systems training into the overall program.

Training packages for equipment provided by Others are the responsibility of Others. A comprehensive training program can be coordinated in a combined session.

The training programs will cover the areas specified below and detailed on the following pages:

Training Material and Related Conditions (On-Site Training)

- Classes run daily (five days/week) and are limited to six (6) hours. The actual class time, a.m. and p.m. hours, is dictated by the availability of the equipment and the students per the normal work schedule. Each class time period should be agreed to by the customer's management and Contractor's instructor(s) at the beginning of the program. The six (6) hour class limitation will allow ample time for the instructor(s) to prepare the next session's work plan.
- A maximum of twenty-five (25) students per class can be accommodated.
- English-speaking instructor(s) will be furnished for the course duration.
- Each student will be furnished a suitable bound course instruction and reference handbook in English; shipment costs have been included in the firm price quoted herein. Any materials furnished are exclusively for the use of the customer's personnel. This material is not for resale or to be distributed to third parties, nor is it to be copied or reproduced without Contractor's prior written permission.
- Any audio or video recording of Contractor's lecture material is prohibited.

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

- The instructor(s) will retain all visual aids.
- The power plant equipment should preferably be operable and available to support this course of study.
- Contractor shall be responsible for the instructors' travel and living expenses during the training period.
- City will be responsible to provide a classroom facility suitable for instructing for fifteen (15) students, including LCD projector, and white board.
- Training will be done at the customer site location or other agreed suitable location.

Typical Course Content (Refer to GTG Training Descriptions)

Gas Turbine Generator Courses

Aero Package Operations / Familiarization

Aero Gas Turbine Package System Maintenance

Aeroderivative Control Systems Operation, Maintenance & Troubleshooting (LM6K MicroNet)

Basic Steam Turbine Generator Familiarization Course (2 days)

- Steam Turbine Basics
  - Principles of Operation
  - Steam turbine fundamentals
  - Steam Flow Characteristics
- Major Equipment
  - Turbine casing
  - Turbine rotating parts
  - Nozzle & Diaphragms
  - Shaft packings, bearings and standards
  - Emergency stop valve & Governor valve
  - Gear box & Turning gear
- Steam turbine support systems, description, function, and operating limits (As applicable)
  - Steam system
  - Oil system
  - Condensing & Vacuum system
  - Oil unit system

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

- Generator Basics
  - Generator fundamentals
  - Generator construction
  - Auxiliary systems
- Control System
  - Basic control functions
  - Governor control
  - HMI interface
  - Basic protection functions and devices
  - Supervisory instrumentation
  - Excitation & Synchronizing fundamentals
  - Excitation & synchronizing system and components
  - Digital generator protection

Operation and Maintenance Manuals and documentation

OTSG Familiarization Course (2 days)

- Overview & General Description of OTSG
  - General Arrangement Description
  - P & ID Overview
  - System Description
  - Description of Main Components
  - Auxiliary Component Description
- Description of OTSG Controls
  - Description of Feedwater Control
  - Description of OTSG Protection
  - Description of Attemperator Control
- Description of OTSG Commissioning Procedure
  - OTSG Hydrostatic Test Procedure
  - Recommended OTSG Cleaning Procedure
- Description of OTSG Operation Procedure
  - Precautions before OTSG Start-up
  - Start-up Procedure
  - Shutdown Procedure
  - Emergency Operation Procedure
- Inspection and Maintenance Procedure
  - Inspection Procedure
  - Maintenance Procedure

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Cooling Tower Familiarization Course (1 day)

- Cooling Tower Design and Construction
- Heat transfer sections
- Fans and Motors
- Ductwork
- Air removal Equipment
- Condensate Storage Tank
- Drain Pot and Drain pumps
- Instrumentation
- Cooling Tower Operation
  - Startup
  - Shutdown
  - Normal Operation
  - Abnormal Operation

Plant Control System (PCS) Operation Course (Optional - not included)

CEMS Course (2 days)

The continuous emission monitoring system course covers the following areas:

- Operate each of the devices at the operator workstation
- System Fundamentals
- Analysis and Analyzer Fundamentals
- System Components
- Recognize and take action on alarms
- Operate the CEMS to control process
- Use trend and trend attribute displays
- Archiving Information
- Reporting
- Operator Troubleshooting – Failed Major Components

Condensate Polisher System (2 days)

- System Fundamentals
- Operation of Equipment
- System Components
- Troubleshooting
- Equipment Maintenance

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

Combined Cycle Operations Course (5 days)

The typical Combined Cycle Operations course covers the following areas:

- Thermodynamic Review
- Systems Review and Operation
  - Gas Turbine
  - Steam Turbine
  - Steam Systems
  - Air Systems
  - Electrical Systems
  - Circulating and Cooling Water Systems
  - OTSG Operations
  - Condensate and Feed water
  - Water Treatment and Make up
  - Basic Chemistry
  - Electrical Systems
- Operating Philosophy
  - Location of Control
  - Load Control
  - Closed Loop Control
  - Pump Motor Control
  - Steam Turbine Equipment Protection
  - Automatic Sequencing
- General Operator Responsibilities
  - General Plant Safety
  - Operational Precautions
- Plant Start-up
  - Start up (integrated plant)
  - Start up of one GT and ST
  - Simple Cycle Operations
- Operations
  - Load Changes
  - Load Rejections
  - Casualty and Plant Upsets
- Shutdown
  - Combined Cycle Shutdown
  - Emergency Shutdown
  - Shutdown to Wet Lay-up
  - Shutdown to Dry Lay-up

© 2013 General Electric Company
CONFIDENTIAL INFORMATION

- Gas Turbine Trips
  - Trip Prevention
  - BOP Trips
  - Operator Errors

Course Duration

Training is given in consecutive days, six (6) hours per day, exclusive of weekends and holidays. Due to changes in course curriculum and training, material final course duration may be different than the approximate durations listed. Any Customer requested modifications to the standard training curriculum will be evaluated and may be considered as custom training, beyond the scope of this standard offering.

SECTION 260000
ELECTRICAL-MECHANICAL EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. General:

1. Specification outlines electrical requirements for Contractor supplied mechanical packages that are not primarily electrical but, due to need for single Contractor responsibility, includes electrical and instrumentation work associated with mechanical package.
2. See Mechanical Equipment Specification for more detailed requirements.

1.2 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American National Standards Institute (ANSI).
2. Factory Mutual (FM).
3. Institute of Electrical and Electronics Engineers (IEEE).
4. Insulated Cable Engineers Association (ICEA).
5. Jurisdiction In Charge (JIC).
6. National Electrical Code (NEC).
7. National Electrical Manufacturers Association (NEMA).
8. Occupational Safety and Health Administration (OSHA).
9. United Laboratories (UL).

1.3 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.4 SUBMITTALS

A. Drawings:

1. Complete customer drawing deliverables for electrical items being furnished.

2. Installation and Commissioning Manual, Operation and Maintenance Manual, General Arrangement drawings included in customer drawing deliverables and anchor bolt location drawings, and conduit interface points.
3. Electrical schematics, wiring diagrams, and other electrical documentation.
4. List of power sources to be furnished for each package. Data shall include volts, phases, maximum and normal KW and KVA. For LM6000 GTG, refer to One line diagram drawing.

PART 2 - PRODUCTS

2.1 GENERAL

A. Electrical material and equipment shall be listed or labeled by Underwriters' Laboratories, Factory Mutual, or equivalent testing laboratory for service in which it is used, and shall bear label or listing. Material and equipment not available with such label or listing shall be built in accordance with latest published standards of UL, FM, or equivalent testing laboratory.

B. Electrical equipment supplied for installation in hazardous areas shall meet requirements specified in NEC for Hazardous Area Installation.

C. Furnish prepiped and prewired, as much as practical, packaged equipment for all components necessary for complete and proper operation.

D. Equipment to be located outdoors shall be capable of operating at rated capacity at ambient temperature specified in Mechanical Equipment Specification and the General Technical Specification while exposed to sun and weather without auxiliary cooling equipment.

E. When specified in Mechanical Equipment Specification package system provide electrical heat tracing.

2.2 COMPONENTS

A. Power Source:

1. Nominal ratings of power sources available to supply packaged equipment are as follows:
   a. 480 volts, 3-phase, 3-wire, 60 Hertz (40,000 amps sym. interrupting rating minimum). Voltage variation plus or minus 10 percent with occasional momentary dips to 80 percent. Frequency will normally be within plus or minus 1 percent, but unusual fluctuation of plus or minus 1.66 percent may occur during unusual utility system conditions.
   b. 208Y/120 volts, 3-phase, 4-wire, 60 Hertz unregulated (10,000 amps sym. interrupting rating, minimum). Same voltage and frequency variation as above.
   c. 120 volts, 1-phase, 2-wire, 60 Hertz, regulated (UPS). Voltage variation plus or minus 2 percent, frequency plus or minus 0.85 percent. UPS has an automatic transfer to another regulated 120 VAC. This service is available for limited use only.

2. 125V DC (105V to 140V range): Except for instruments and controls that operate from separate sources of power, provide single power feeder for each package at one of the voltages; 480V or 208Y/120V, indicated above. Where power is to be utilized at more than one voltage level, supply transformation means in control panel.

B. Motors: In accordance with Specifications listed in supplements and in general compliance with the following:

1. Motors 1/2 HP through 200 HP: 460V, 3 Phase, 60 Hertz.
2. Motors less than 1/2 HP: 115V, single phase, 60 Hertz.
3. Select motors for critical service may be required to be 125V DC.
4. Furnish 120V AC motors with motor starters and contactors.

C. 480-Volt Motor Starters:

1. Provide motor starters in accordance with the following:

a. Combination motor starters for local mounting.
b. Full voltage, magnetic, combination circuit breaker type with individual control transformer, and 3 thermal overload relays. Interrupting rating shall be 25,000 amperes symmetrical.
c. Reversing and two-speed motor starters shall be electrically and mechanically interlocked to prevent simultaneously energizing both contactors.
d. Starter thermal overload relay shall be ambient temperature compensated, manually reset, bimetallic type, adjustable between 85 percent and 115 percent of their nominal trip rating.
e. Control Transformer:

1) Furnish fused 480-volt to 120-volt with each starter.
2) Secondary shall be grounded and fused.
3) Minimum of 20 percent capacity in excess of continuous volt ampere requirements of holding coil, with indicating lights.
4) Capable of operation with inrush current 20 percent greater than required by holding coil, and indicating lights and 50W additional capacity.

f. Control fuses shall be accessible for replacement without removing control device assemblies or disconnecting wires or cables. Primary fuses are required on control power transformers larger than 50 VA.
g. AC controls shall be suitable for operation on 120 volts. In the event that some starters require 480-volt coil, furnish interposing relay between control circuit and starter coil circuit. Starters, size 4 and larger shall include interposing relay.
h. DC controls shall be suitable for operation on 125V DC.
i. At least 2 NO and 2 NC spare auxiliary interlock contacts in addition to seal-in-contact shall be furnished on each contactor for Buyer's exclusive use. In the event that this exceeds number which can be mounted on starter, furnish auxiliary relays to obtain specified spare auxiliary switch contacts.

2. Variable Frequency Drives (VFD) shall be furnished when required by Mechanical Equipment Specification or recommended by equipment Contractor.

D. Control Circuits (For LM6000 GTG, 24 VDC and 125 VDC battery power supply systems (including battery banks and chargers) are BOP Contractor's scope of supply per DOR file provided.):

1. 120 volt AC, 60 Hertz, grounded neutral.
2. If voltages other than 120 volt AC are required for control devices or instruments, furnish necessary transformers or devices to produce such voltages.
3. In special cases where 125V DC or 120V AC critical power (UPS) is required advise Buyer/General Manager. Provide sufficient data (amps, operation duration, etc) to assist General Manager in system sizing.
4. Provide separate control transformer and distribution panel for 120-volt AC control circuits.
5. Voltage to ground on any instrument device for control and/or indication shall not exceed 120 volts.
6. Control circuits for motors shall contain only those components necessary for control of individual motor.
7. Redundant control circuits shall not allow single component failure to disable both circuits.

E. External Connections: Devices requiring external connections shall be routed to terminals in junction terminal box or control panel or on devices directly, for LM6000 GTG, refer to Interconnect cable schedule drawing 969009. All external feeders/cabling (in BOP scope of supply) will be via armored cable. Provide separate terminal boxes for the following:

1. 120-volt AC control circuits wired to a separate control terminal box (CTB).
2. 120-volt AC power circuits, including heat trace.
3. Control circuits and power circuits may be routed together to common junction box provided separate terminal blocks are used for each type of circuit.
4. Thermocouple and RTD circuits shall be wired to separate thermocouple terminal box (TTB).
5. DC analog, and digital signal or measurement circuits may occupy same instrumentation terminal box (ITB), but shall be terminated on separate terminal blocks.
6. Thermocouple and RTD, and analog and digital signals may be routed to common junction box provided separate terminal blocks for each type of circuit are used.
7. Shields shall be wired to separate terminal points.

F. Enclosures And Miscellaneous Material (For LM6000 GTG, Contractor's standard enclosures and materials for electrical equipment are provided for the project.):

1. Constructed of heavy gauge metal to assure rigidity and durability.
2. Hot-dipped galvanized steel or stainless steel with no paint or sheet steel with Contractor's standard paint and coding, epoxy-resin coated or corrosive-resistant aluminum with less than 0.4 percent copper.
3. Miscellaneous material such as channel, angle, Unistrut, hanger rods, clamps, angle clips shall be hot-dip galvanized steel. In highly corrosive areas, use special finishes or material suitable for environment.
4. Hardware:

    a. Bolts, nuts, screws, washers shall be hot-dip galvanized steel or stainless steel or other.
    b. Cadmium plating or electro-galvanizing is not acceptable.
    c. Hardware shall be heavy-duty industrial quality.

d. Items such as Korn Clamps, speed clips, scissors clips, flange clips, set screw couplings are not acceptable.

5. Outdoor junction boxes, terminal boxes, enclosures for relays, and enclosures for controls shall be properly sealed against entrance of dust and moisture and shall be equipped with breathers and drains.
6. Install space heaters or heat exchangers where required to avoid corrosion due to condensation.
7. Relay, PLC, and control cabinets shall be key lockable.
8. Enclosures for electrical equipment shall be suitable for environment in which they will be located as stated in the Mechanical Equipment Specification and General Technical Requirements and shall be as follows:

Enclosures		
Description	**Enclosure Type**	**Special**
Outdoor – General	NEMA 4 (IP54 or better for GTG)	None
Indoor – General	NEMA 12 (IP43 for GTG)	None
Class I Division I Locations	NEMA 7 (N/A for GTG)	None
Class II Division I Locations	NEMA 9 (N/A for GTG)	None

G. Control Equipment And Devices:

1. Contractor approved manufacturers and equipment types shall be provided for the Electrical Equipment and Material.
2. Control relays shall be rated 600 volts. Relay coils shall be 120 volt, 60 Hertz or, 125V DC or 24 DC (when DC is specified for specific relays). Contacts shall be rated 10 amps, minimum, continuous at rated contact voltage. When approved by Buyer, 5A rating will be acceptable. Contacts shall have both inductive and resistive interrupting ratings suitable for their service.
3. Devices such as pushbuttons, relays, terminal blocks, and the like shall be of heavy-duty, oil tight construction as per LM6000 GTG standard. Contacts for use in low energy circuits shall be gold plated or gold flashed or silver alloy type.
4. Where motors are controlled with automatic devices, control stations suitable for "Hand-Off-Automatic" operation shall be provided. Motor controls shall be grouped together in control panel where possible.
5. Controls shall be mounted on supports (racks) that will not transmit vibration to control device.
6. Where nonhazardous dust is present, use hermetically sealed contacts, if available.

H. Heating Elements:

1. Metal clad with thermal enclosures to prevent exposure of live parts.
2. 1800 Watt Rating: 120 volt, single phase.
3. Over 1800 Watt Rating: 208 volt, single phase, or 480 volt, 3 phase.

I. Wire and Cable:

Contractor provides the following types of wire in LM6000 GTG:

• Panel

Type ETFE Multi-core, 600 volt insulation, 18, 14, 12 and 10 AWG

• Skid

Type CLX, XHHW, 600 volt insulation, 14 and 16 AWG, Belden Special. Instrumentation wiring is single to multi-core with individual and overall shielding.

• Turbine/Generator Enclosure: Power, control and instrumentation: XHHW equivalent, 600 volt insulation, SS braided armor, 10, 12, 14, 16 AWG.

Instrumentation wiring is single to multi-core with individual and overall shielding.

Contractor furnishes appropriately sized copper conductors with white insulation. The ground wires are green/yellow. Other color coded insulation is not supplied.

Contractor installs a shrink-on, tubular plastic sleeve with printed terminal number identification on each end of each conductor. "Double tagging", identifying the opposite end of the wire, is not furnished.

Contractor furnishes appropriately sized copper conductors with white insulation. The ground wires are green/yellow. Other color coded insulation is not supplied

1. Types:

    a. Stranded, tinned copper.
    b. 0-600 Volt Cable, Power Service: Type XHHW, No. 12 AWG, minimum, rated for 600 volts.
    c. 120 Volt Conductor for Motor Control Circuits, Emergency Shutdown (ESD), Interlocks: 600 volt, Type XHHW, No. 14 AWG, minimum.
    d. 0-600 Volt Conductor, Lighting Service: Type THW or XHHW, No. 12 AWG, minimum.
    e. Wiring to instrument devices shall be twisted pairs and shielded.
    f. Electronic Instrument Wire:

        1) Twisted pair or triad.
        2) No. 16 AWG 7-strand copper conductor with No. 18 AWG 7-stranded tinned copper drain wire.
        3) 90 degrees C PVC primary insulation.

    g. Individual Pair Thermocouple Extension Wire:

        1) Material compatible with thermocouple and color-coded per ANSI standards.
        2) Twisted pair.
        3) No. 16 AWG solid alloy conductor.
        4) 105 degrees C PVC primary insulation.
        5) Aluminum 100 percent overall shield, 80°C PVC jacket.

    h. Control Panel Wiring (internal):

1) Single conductor.
2) No. 14 AWG, minimum.
3) 600 volt stranded, tinned copper.
4) 90 degrees C rated Type SIS or XHHW insulation.

i. Wire and cable shall have flame retardant insulation, certified as meeting requirements of UL-FR-1 Flame Test.

j. Maximum number of single-conductor wires per conduit shall be limited to 15 in 1-inch conduit, including 3 spare wires, and limited to 25 in 1-1/2-inch conduit, including 5 spare wires.

k. The following two groups of wiring when used with GENERAL MANAGER's plant control system shall be separated from each other and from all other wiring:

1) Thermocouples and RTDS.
2) 4-20 mA analog and digital contacts.

l. Small single conductor wires or small OD single or multiple pair shielded wire shall not be run in same conduit with larger OD multi-conductor cables.

2. Circuit/Wire Identification:

a. Each circuit/wire shall be identified at each end and in junction, terminal, and pull boxes with proper identifying number. Identifying labels shall be firmly attached and shall be permanently non-weathering type.

b. Individual wire shall have same assigned number at each end and at each location where it is terminated.

c. Wire Color Coding:

1) AC Power Single Phase:

a) Line: Black.
b) Neutral: White.

2) DC Circuits (Power and Control):

a) Positive Leads and Busses: Red.
b) Negative Leads and Busses: Black.

3) Thermocouple Wiring: Per ANSI Standards.
4) Insulated Grounding Conductors: Green.
5) Combination Starter Terminal Number:

a) Hot: Black.
b) Ground, X2: White.
c) Coil-Hot, 3: Red.
d) Coil-Neutral, 6: Orange.

6) Annunciation (AC or DC):

a) Signal: Orange.
b) Common: Black.

7) DC Circuits (Instruments):

a) Positive: Black.
b) Negative: White.

d. Where it is necessary to terminate 120 volt (nominal) or higher voltage circuits in control panels, terminal boxes, or other enclosures containing lower voltage conductors, isolate higher voltage conductors with insulating cover or barrier and identified with label showing voltage and service.

J. Terminal Box and Control Panel Wiring Details:

For LM6000, standard terminal box and control panel wiring are provided. Due to various configurations, percentage of spare spaces is not guaranteed.

1. Terminate control wiring on screw type terminals using T&B Stakon insulated spade lugs.
2. Terminals shall be sized to current carrying requirements of conductor.
3. Splicing of circuits is not permitted.
4. Power terminations shall be made using insulated ring tongue or lugs on bolt type terminals.
5. Provide 10 percent, minimum, spare terminals in terminal boxes and control panels.
6. Size terminal and junction boxes per Article 370 of NEC for maximum number of terminations in box (including 10 percent spares mentioned above) and based on 2 No. 14 AWG wires per terminal. This includes internal panel wiring plus terminal allowance for external wiring normally required.
7. Wire and cable shall be neatly dressed with nylon ties and shall be free from nicks or cuts in copper conductor or insulation. Plastic wire duct or Panduit may also be used as alternate to nylon ties.
8. Control panel wiring shall be done in a neat and professional manner and shall be laced or secured in wire ways. Wiring shall be collected and gathered wherever intermixed. Self-adhesive "stick-on" wire tie bases are used where is required.
9. Thermocouple extension wiring connections to terminal blocks shall be made with thermocouple terminal blocks manufactured by Sprecher Schuh, model V7, Weidmuller, Phoenix Contact, or Contractor approved equal. Both wires shall be twisted together on one terminal.
10. Where ambient or surface temperatures require use of high-temperature insulated wire, junction box shall be provided outside high temperature zone where high-temperature wire shall be connected to standard insulated wire via terminal blocks.
11. Shields of circuits shall be made continuous by connecting drain wires on terminal point.

K. Miscellaneous Wiring Details (LM6000 GTG standard wiring is per NEC NFPA 70) :

1. Wire nuts shall not be used.
2. Splices in junction boxes (only when necessary) or at lighting fixtures shall be made with self-insulated crimp type connectors. These connections shall be waterproofed with heat shrink sleeves to prevent entrance of moisture into connector.
3. Components requiring field-soldered connections for installation or replacement shall not be used.

4. When dressing individual shielded multi-pair or triad cable at termination points, heat shrink sleeves shall be installed on stripped pairs or triads to prevent unraveling of wrapped coverings.
5. Special care shall be exercised to isolate shields from ground, except at common grounding point and to keep positive and negative signal leads close together and twisted. Wire shields to separate terminal points.
6. Wiring for AC and DC power or control circuits shall be kept segregated and shall not be mixed in same conduit or in conductors of multi-conductor cables.
7. Instrument wiring shall be in separate conduits from power wiring.
8. No open wiring or exposed live parts shall be allowed. Live parts or equipment subject to arcing shall be guarded by grounded metal enclosure.
9. Devices requiring periodic operator adjustment, i.e., timers, overloads, resets shall be accessible without having to open/enter areas containing exposed live parts.
10. Relays, fuses, and other devices shall not be installed in wire raceways, junction boxes, pull boxes, or other enclosures intended for routing and connecting wires.
11. Splices or taps shall be avoided in power, control, and shielded wires between termination points. Wire shall not be spliced in conduit under any condition.
12. A single contact of a relay or sequence timer shall not be used to control more than one motor.

L. Conduit Systems (For LM6000 GTG, Contractor's standard copper free aluminum conduit system is provided):

1. Furnish and install complete conduit system required for equipment package. Conduit system shall include, but not be limited to: conduit, conduit fittings, condulets, pull boxes, junction and terminal boxes, braces, hangers, brackets, supports, cover plates, drains, and bonding jumpers.
2. Run electrical circuits in hot-dipped galvanized steel rigid metal conduit with hot-dipped galvanized threads bearing label of metal listed by Underwriters' Laboratories.
3. Install level, plumb, and in a neat and workmanlike manner.
4. Installed either parallel with or perpendicular to structural members and grouped wherever possible.
5. Supported at spacing not to exceed the following:

    a. 3/4-Inch Through 1-Inch Conduit: 10 feet.
    b. 1-1/2-Inch Conduit: 14 feet.
    c. 2-Inch Conduit: 16 feet.
    d. 3-Inches and Above Conduit: 20 feet.

6. Conduit and pull fittings shall not be located in inaccessible places where difficulty would be experienced in wire pulling.
7. Conduit and conduit fittings shall not be welded to any pipe or structure.
8. Conduit shall not be installed within 6 inches of insulated hot lines. Line shall be considered as "hot" line when operating at temperature of 225 degree F or more.
9. Conduit used for wiring between instrumentation and junction box shall be 3/4-inch, minimum, except where 1/2-inch NPT instrument conduit is required. In such cases, 1/2-inch conduit is acceptable.

10. Conduit Fittings:

    a. C-H Form 8 with cast covers and solid neoprene gaskets.

b. Sizing of condulet bodies and boxes to accommodate splices shall be per the NEC.
c. 1-1/4-inch conduit size shall not be used.
d. Use mogul fittings, C-H type BUB, PBD, where needed for cable pulling ease.
e. Hot-dipped galvanized malleable iron or ferrous alloy.

11. Conduit Bends:

    a. Make with approved conduit bending machine or hickey. Use of pipe tool, vise, or heat for bending shall not be permitted.
    b. Radius of conduit bends shall be not less than specified in NEC or minimum conductor bending radius, whichever is greater.

12. Terminate conduit in threaded hubs or bushings designed to prevent damage to wire during pulling operation. Grounding lugs shall be provided on all conduit termination hubs and bushings.
13. Conduit Connections:

    a. Entrance into sheet metal boxes shall be made with threaded, insulated, watertight "Myers" type hubs with grounding lock-nuts.
    b. Make on side or bottom of enclosures.
    c. Top connections shall not be permitted, except in indoor applications.
    d. Unions shall be provided in conduits connecting individual device enclosures to allow easy removal.

14. There shall be no conduit in final installation that is in any way crushed, deformed, or otherwise damaged. Conduit ends shall be cut square, properly reamed, and free of any burrs or sharp edges. Joints shall be made up wrench tight with at least five full threads engaged. Threads shall be coated with Crouse-Hinds STL compound.
15. Excessive threading shall be avoided.
16. Use of running threads shall not be permitted.
17. Marks and breaks in galvanized coating of conduit, boxes, and fittings shall be touched up with zinc-rich coating. Coat threaded conduit ends that are not galvanized with a zinc-rich compound prior to application of STL compound.
18. Threaded fittings and threaded parts of enclosures shall be treated with Crouse-Hinds STL compound before being made up. Ground joints of fittings and enclosures shall receive a light coat of STL compound. Before final make-up of all enclosures, threads and joints shall be thoroughly cleaned and STL reapplied.
19. Flexible Liquid-Tight Metallic Conduit:

    a. Type UA, at devices subject to vibration, movement for belt adjustments, operational inspection and maintenance facility.
    b. Terminate at both ends using insulated, threaded, watertight connectors or hubs, Appleton type "STB" with external grounding lugs.

20. Flexible conduit connections to motors with belt drives shall be long enough and installed in such a manner as to facilitate belt tightening or replacement without distorting flexible conduit.
21. Conduit shall be installed in such a manner as to prevent collection of trapped condensation and arranged so as to be free of traps.

M. Grounding and Bonding (Contractor's standard GTG package Grounding and Bonding system is provided. Refer to Contractor's Wiring Diagram Earthing and Bonding 86990 for detail.):

1. Electrical circuits, exposed noncurrent carrying metal parts of electrical equipment, and metal structures shall be grounded in accordance with provisions of NEC.
2. Neutrals of each transformer shall be solidly grounded only at transformer. Insulated neutral bus at distribution panel shall be connected to transformer ground with insulated wire.
3. Grounding cables and wires shall be insulated to prevent corrosion.
4. Skid-mounted packaged systems shall include threaded stud connectors at each end of skid, diagonally opposite each other, sized appropriately to accept and connect No. 2/0 AWG stranded copper ground taps.
5. Electrical equipment rated 600 volts or less which is solidly mounted on metallic switch rack will be considered adequately grounded providing switch rack is solidly grounded.
6. Liquid-tight flexible metal conduit containing power circuits shall have an external bonding jumper.
7. Provide copper ground bus with necessary mechanical lugs in control and panel enclosures. This bus shall be grounded to skid steel.
8. Cases of instruments, relays, and meters in control panel shall be grounded effectively to panel frame.
9. Motors shall be grounded through conduit system and equipment grounding conductor run with phase conductors.
10. Bond together conduits entering sheet metal enclosure to provide ground continuity of conduit system.
11. Provide appropriate threaded stud connectors at medium-voltage motor bases for attachment to plant ground system.

N. Equipment Tag Numbers (Contractor's standard GTG package equipment tag numbers are provided. Refer to Nameplate Schedule 969013 drawing for detail.) :

1. Provide firmly attached nameplate for each item of electrical equipment and each control station.
2. Three-ply laminated phenolic plate engraved to show equipment device number, function and service; black-white-black and engraved through black lamination.
3. Lettering: 3/16 inch, minimum.
4. Nameplates for emergency equipment or for warning shall be red-white-red, engraved through red lamination.
5. Nameplates shall be attached with stainless steel screws.

2.3 SOURCE QUALITY CONTROL

A. Testing: (Contractor's standard GTG static testing is provided. Please refer to LM6000 STATIC TEST PROCEDURE for details.)

1. Electrical equipment furnished shall be assembled, wired, and static tested at factory.
2. Factory tests shall include, but not be limited to:

   a. DC high voltage test, where applicable.
   b. Complete functional test of components.
   c. Conductors in raceways shall be meggered before terminating.

3. Perform continuity test on electrical circuits to verify devices are installed and connected in accordance with Drawings and Specifications.

PART 3 - EXECUTION - NOT USED

PART 4 - SUPPLEMENTS

The supplements listed below, following "END OF SECTION," are a part of this Specification:

1. Electrical Equipment and Material List.

END OF SECTION 260000

SUPPLEMENT A ELECTRICAL EQUIPMENT AND MATERIAL LIST

A. Electrical items required for the package shall be from Contractor approved vendors.
   1. Circuit Breakers (Westinghouse, GE, Sq D, Siemens)
   2. Control Fuses For all applications (Bussman) (self-indicating when available)
   3. Enclosures (See Section 3.0) Control panel, operators panel (Hoffman or equal)
   4. Junction boxes (Hoffman, Killark, Crouse Hinds or equal)
   5. Control Devices

      a. Push Buttons, Oil-tight: Cutler Hammer, Allen Bradley.
      b. 120 Volt Manual Motor Starters:

         1) Crouse-Hinds Type EFS - Indoor.
         2) Crouse-Hinds Type OFC - Outdoor.

      c. Momentary contacts shall be rocker-arm type.

   6. Relays, Nontime Delay:

      a. AC:

         1) Industrial control type.
         2) Allen Bradley, Bulletin 700 Type P; Cutler Hammer, Type M-600; Westinghouse, Type AR; GE, Type CR.

      b. DC: Allen-Bradley, Bulletin 700, Type N; Westinghouse, Type ARD.

   7. Relay, Time Delay:

      a. Pneumatic Time Delay Relay:

         1) Industrial grade.
         2) Temperature compensation with plug-in headers.
         3) Agastat, Series 7000.

      b. Solid State Timing Relay:

         1) Industrial grade.
         2) Temperature compensation with plug-in headers.
         3) Agastat, Series 9000.

   8. Sequence Timers: ATC, Series 2400 Motor Driven Contact Type.
   9. 120-Volt Receptacle:

      a. NEMA grounded type.
      b. Specification grade.
      c. Hubbell.

   10. Panelboards: G.E., Westinghouse or Square D.
   11. Conduit Seals: Drain Type; Crouse-Hinds, Type EYS.
   12. Conduit, Flexible: Anaconda, Sealtite.
   13. Conduit Fittings, Condulets:

a. Crouse-Hinds Form 8, or BUB, LBD.
b. With cast covers and solid neoprene gaskets.
c. Appleton.

14. Flexible Conduit Fittings:

a. Insulated bushings.
b. External grounding lugs.
c. Appleton, OZ, Crouse-Hinds.

15. Transformers, Dry Type, 3-Phase: Westinghouse, Type EPT, 3 phase or equal.
16. Heater Wiring: Rockbestos Firezone 101 Aircraft Wire.
17. Wire Markers: Brady, all temperature.
18. Portable Cord: Heavy-duty type "SO" portable cord Okonite. Connector: C-H, type CGB.
19. Terminal Blocks: Phoenix Contact DIN Rail mount or equivalent Weidmuller terminal blocks.
20. Wire Lugs: Compression Ring Type, T&B Sta-kon.
21. Ground Lugs: Mechanical Type, Burndy.
22. 480-Volt Motor Starters Contactors: Allen-Bradley, G.E., Square D, Cutler Hammer, W

SECTION 261050
MEDIUM VOLTAGE MOTORS

PART 1 - GENERAL

1.1 GENERAL

A. This specification is for the design and supply of various sized 4000 Volt motors, defined herein. The electric motor is supplied to drive equipment specified separately per the mechanical equipment package specification.

B. If the bidder can offer alternatives that have more attractive costs and schedule these alternatives can be offered. The bidder shall clearly identify exceptions to the equipment identified herein.

1.2 BID DATA

A. Contractor shall submit with bid detailed description of its offering. The Contractor will provide the information required on the attached data sheet for each motor provided.

1.3 DESIGN DATA

A. Refer to Mechanical Equipment Specification

1.4 DESIGN OPERATING CONDITIONS

A. Refer to Mechanical Equipment Specification

1.5 EQUIPMENT AND SERVICES TO BE PROVIDED BY THE VENDOR

A. Major equipment to be furnished shall consist of: 4000 Volt motors in addition to the equipment specified under the Mechanical Equipment Specification.

1.6 EQUIPMENT TO BE PROVIDED BY OTHERS

A. Material receiving unloading and storage

1.7 CODES AND STANDARDS

A. All equipment covered by this Specification shall be designed, manufactured, installed and tested in accordance with currently approved or accepted provisions of the following Codes, Standards and Regulations as stated herein where applicable.

American National Standards Assn.	ANSI
Institute of Electrical and Electronics Engineers	IEEE
National Electric Manufacturers Assn.	NEMA
National Fire Protection Assn.	NFPA

Occupational Safety and Health Administration	OSHA
Underwriters Laboratories	UL

B. Including but not limited to:

ANSI/IEEE C37	
ANSI/IEEE C57	
Energy Conservation Standards	10CFR431.42
NEMA MG-1	
National Electrical Code	NEC
National Electric Safety Code	NESC
Uniform Building Code	UBC

1.8 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.9 DOCUMENTATION

A. Documentation shall be submitted as indicated on that attached Vendor Data sheet Table. Documentation delivery is critical to the execution of this project. Timely submittals are required.

B. In addition to other design drawings and data, Contractor shall provide a complete listing of interface connections indicating, as a minimum, description, reference drawing, size and pressure rating, design pressures and temperature, and maximum operating pressures, temperatures, and flow rates. The Contractor shall also provide allowable loads for all connections during the design phase.

1.10 SPARE PARTS

A. The Contractor shall furnish a recommended spare parts list with prices within 180 days of issuance of a Purchase Order.

1.11 TECHNICAL DIRECTION OF INSTALLATION

A. The Contractor shall quote its standard daily rates for installation and startup assistance.

1.12 GUARANTEES

A. Refer to Specification 481100 Combined Cycle Power Island Equipment

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. This specification is applicable to motors that are above NEMA frame sizes. (i.e. larger than 150 Hp at 900 rpm and 200 Hp at 1200 or 1800 rpm and all motors above 575 Volts.)

B. The motor shall be a squirrel cage induction motor having copper stator windings and rotors that are copper, brass, bronze, or aluminum. The motor shall be designed for Class B insulation temperature rise but insulated throughout with Class F or higher insulation.

C. The motor shall start and accelerate the driven equipment to rated speed with a variation in voltage of plus or minus 10% at rated frequency, a variation in frequency of plus or minus 5% with rated voltage, or a combined variation of 10% if the variation in frequency does not exceed 5%. The starting current shall not exceed 6.3 times full load current (1.0 service factor loading). The full load power factor shall be 0.85 or higher. The motor efficiency shall be at least 95% as measured using IEEE Standard 112.

D. Bearings

1. Where possible motors rated at or below 500 Hp at 3600 or 1800 rpm, 350 Hp at 1200 rpm, or 250 Hp at lower speeds be supplied with anti-friction ball or roller bearings. The minimum L_{10} life shall be 100,000 hours for direct coupled service and 40,000 hours for belt drive or chain drive service. The bearings shall be re-greasable and designed so that they may be safely lubricated while the motor is in service. The bearings shall be covered or sealed to prevent the entrance of foreign material.
2. Sleeve bearings shall be of the oil ring type. Oil rings shall be of a one piece design. Insulation shall be provided to prevent circulation of stray or shaft currents through the bearings, bearing temperature detector connections, or oil piping connections. Both ends of the shaft shall be marked to show when the rotor is at the magnetic center position and the limits of end float with a permanent reference point on the bearing housing or shaft seal.

E. Vertical Motor Thrust: Vertical motors shall have plate type upthrust and downthrust bearings and lower guide bearings.

F. Current Transformers: Relay accuracy current transformers with 5 Amp secondaries shall be furnished and mounted in the motor lead terminal box on all motors rated 2500 Hp or greater. The CTs shall be wired to a shorting type terminal strip that will accept ring tongue terminals for 10AWG wire. This terminal strip shall be installed in a terminal box separate from the motor lead terminal box.

G. Enclosure: All enclosure parts shall be made of cast iron, cast steel, sheet steel, or steel plate. Aluminum is not acceptable.

H. Nameplate: The following additional information shall be shown on the nameplate or an auxiliary nameplate or Motor datasheet.

1. Efficiency and Full Load Power Factor
2. Locked Rotor Power Factor
3. Serial Number and Date of Manufacture
4. Starting limitations, if any
5. Insulation system class
6. Design altitude and maximum ambient temperature.
7. Recommended type of bearing lubricant.

I. Soleplate: A soleplate shall be provided. There shall be sufficient open space around the motor feet that the feet and soleplate can be drilled for dowel pins.

J. Space Heaters: All motors shall have space heaters. Heat requirements of up to 720 Watts shall be met by using 240 Volt heaters on a 120 Volt circuit and increasing the rating of the heaters to compensate for the lower voltage. Requirement of over 1200 Watts shall be met by using 277 Volt heaters energized at either 208 or 240 volts as shown on the returned approval drawings. The heaters shall be adequate to prevent condensation at any temperature down to the lowest ambient temperature shown in the detailed requirements and shall not cause the motor to overheat if turned on at maximum motor load at the highest ambient temperature. The heaters shall be accessible without disassembling or removing any parts of the motor or moving the motor. The heaters shall be mounted so they do not damage any components or the motor finish.

K. Surge Capacitors: Surge capacitors shall be installed on all motors rated 2500 Hp or more.

L. Temperature Detectors: All motors with sleeve bearings shall have ungrounded platinum bearing RTDs installed and wired to terminal strips in a separate junction box. All motors rated 1000 Hp or more shall have two ungrounded platinum RTDs installed on each stator winding with leads installed and wired out to terminals in the same junction box as the bearing thermocouples. The terminal strips shall have space for individually terminating the RTD ground lead.

M. Terminal Box:

1. The minimum size for the motor lead terminal box on 2300 Volt and 4000 Volt motors through 1250 Hp is 2000 cubic inches. Motors of these voltages from 1250 through 6000 Hp shall have 5600 cubic inch boxes. The terminal box shall be split diagonally and the joint shall be gasketed. The terminal box shall be rotatable in 90° increments so that the conduit can enter from any direction. The terminal box shall not interfere with the base, soleplate, or any other box or device in any position to which it may be turned. A terminal connected to the motor frame shall be provided in the motor lead terminal box for connection to the grounding conductor. The motor leads shall have NEMA space 2-hole lugs for connection to the power cable. Where supplied the surge capacitors and current transformers shall be mounted in the motor lead terminal box.
2. Separate terminal boxes shall be provided for the current transformer and RTD leads, and for the motor heater leads.

N. The motors shall be supplied by

1. General Electric

2. Reliance
3. Siemens
4. TECO-Westinghouse
5. U.S. Motors

2.2 SPECIAL TOOLS AND DEVICES

A. One (1) complete set of special tools and lifting devices, including any metric wrenches required for operation and maintenance of the equipment furnished under this Specification, shall be furnished with the equipment in a separate container clearly identified with the name of the equipment and the Buyer's contract number. These tools and devices shall be in a new and unused condition on delivery.

2.3 TESTS

A. The systems shall be factory tested in accordance with the codes specified herein. Customer may observe testing.

2.4 NOISE EMISSIONS

A. Refer to the Combined Cycle Power Island Noise Control Performance Specification.

2.5 SHOP ASSEMBLY AND SHIPMENT

A. Equipment shall be shipped in the fewest practical number of shop fabricated and assembled sections. As applicable, all component parts of machinery or equipment shall have been formed, machined, welded, stress relieved, tested for defects, balanced, fitted and assembled in the fabricator's shops, then disassembled as necessary for shipment.

B. All items shall be identified to facilitate handling and field installation.

C. Large components or shipping containers shall be fitted with suitable skids where and as required to facilitate handling and for shipping protection. As applicable, all components shall be boxed, capped, plugged or otherwise suitably prepared in a manner that will prevent loss and protect them against dirt, rust, weather, and entrance of foreign matter or other damage during transit, pre-erection storage and field handling. Shipping protection shall be adequate for up to 3 month's outdoor field storage.

D. As a minimum, each container shall be permanently marked with an identification number, a list of its contents and the Buyer's purchase order number.

2.6 CLEANING, FINISHING, AND PAINTING

A. All surfaces, except interior surfaces of any pressure parts, shall be thoroughly cleaned of all mill scale, grease, weld spatter, slag, and other foreign matter in accordance with Contractor's standard practice. All non stainless steel equipment shall be painted in accordance with the manufacturer’s standard.

SECTION 261200
GENERATOR STEP-UP TRANSFORMER

PART 1 - GENERAL

1.1 SCOPE

A. Oil-immersed, ONAN/ONAF/ONAF three winding transformer for Generator Step-up Power application. Quantity required – one (1)

B. Final design requirements shall be coordinated with Power Island Contractor to accommodate actual generators' ratings.

1.2 CODES AND STANDARDS

A. Transformer shall conform to the applicable standards of IEEE, NEMA, and ANSI. All materials and devices shall be in accordance with the applicable requirements of the Federal "Occupational Safety and Health Administration" standards.

B. The transformer shall be designed, fabricated, and tested in accordance with the latest revision of ANSI C57 series and this specification.

C. Transformer and associated equipment shall comply with NERC requirements for Aurora Vulnerability Mitigation.

D. In case of conflict between the requirements of the various parts of these documents, the requirements of the different parts shall govern, to the extent of such conflict, in the following sequence: Mandatory governmental regulations, code, and standards; this specification; the referenced industry codes and standards.

1.3 REFERENCES

A. IEEE C57.12.00-Latest Edition – Standard General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers. (ANSI)

B. IEEE C57.116-Latest Edition – Guide for Transformers Directly Connected to Generators

C. IEEE C57.12.90-Latest Edition – Standard Test Code for Liquid-Immersed Distribution, Power, and Regulating Transformers and Guide for Short–Circuit Testing of Distribution and Power Transformers. (ANSI)

D. IEEE C57.109-Latest Edition– Guide for Liquid Immersed Transformer Through-Fault-Current Duration. (ANSI)

E. NFPA 70 – Latest edition of the National Electrical Code.

F. IEEE 693 – Recommended Practice for Seismic Design of Substations

1.4 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.5 SUBMITTALS FOR REVIEW

A. Vendor Documentation requirements shall be provided in accordance with attached Vendor Data Commitments and shall be considered as part of this technical specification.

B. Approval drawings shall include the following Refer to Attachment 11 – Drawing Schedule:

C. Drawing Requirements:

1. Each drawing title block shall include the PO number, date, revision number, revision description and project name.

1.6 SUBMITTALS FOR INFORMATION Refer to Attachment 11 – Drawing Schedule

1.7 PROJECT CLOSEOUT SUBMITTALS

A. The manufacturer shall provide the General Manager with electronic media of all drawings, manuals, and instruction books. All drawings shall be submitted as .dwg files compatible with AutoCAD 2000.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Transformer shall be delivered DDP to the rail siding at the site, freight allowed as indicated in applicable purchase order. Project site is 72E Glenarm, Pasadena, California

B. Transformer shall be shipped in an upright position (no split tank designs). Transformer shall be shipped sealed at -40F Dew Point with pressure gauge showing positive dry air pressure on depressed railroad car.

C. The transformer oil shall be shipped separately. The manufacturer shall furnish the oil by bulk shipment in truck trailers (no returnable drums) to the construction site at the time designated by the BOP Contractor.

D. The manufacturer shall mount and ship an impact recorder on the rail car or truck transporting the transformer and shall mount and ship an impact recorder on the transformer. The impact recorders shall be mounted at the factory to provide a permanent record of the magnitude of axial, transverse, and vertical forces to which the transformer was subjected while in transit. The recorder mounted on the transformer shall be removed once the transformer is set and aligned on its foundation. General Manager will remove and retain charts and return recorders to manufacturer.

1.9 MAINTENANCE MATERIALS

A. Special tools are not required.

B. The manufacturer shall furnish one (1) complete extra set of gaskets for all items removed for shipment and all items that are normally removed for inspection during installation or maintenance.

PART 2 - PRODUCTS

2.1 LIQUID-FILLED POWER TRANSFORMER – GENERAL

A. This part describes the design and construction of three phase, three-winding, pad mounted, oil immersed power transformer, outdoor locations for use in generator step-up application.

B. Equipment Tag Identification: Generator Step-up Transformer

2.2 COOLING CLASS AND TEMPERATURE RISE

A. Transformer shall be rated ONAN/ONAF/ONAF with 65° C rise above ambient conditions noted in the Section 480020 Site Conditions. Winding and hot spot temperature rise shall be per ANSI Standards.

B. The manufacturer shall install forced cooling equipment on transformer.

2.3 SERVICE CONDITIONS

A. Reference Section 480020 Site Conditions for Project environmental requirements.

2.4 RATINGS

A. Generator Step-up Transformer

1. Capacity: The transformer shall be designed to deliver the full capacity listed below at the site elevation. Transformer nameplate shall indicate site elevation.

   a. H: 57/76/95 MVA @ 65° C rise, Class ONAN/ONAF/ONAF
   b. X: 45/60/75 MVA @ 65° C rise, Class ONAN/ONAF/ONAF
   c. Y: 12/16/20 MVA @ 65° C rise, Class ONAN/ONAF/ONAF

2. High Voltage Winding: 34.5 kV 3-phase, 60 Hz, Grounded Wye connected.
3. High Voltage Taps: Two (2) 2.5% full capacity taps above nominal rated voltage; two (2) 2.5% full capacity taps below nominal rated voltage, arranged for de-energized operation.
4. Low Voltage Winding X: 13800 Volt delta (delta must be closed inside main tank).
5. Low Voltage Winding Y: 13800 Volt delta (delta must be closed inside main tank).
6. Vector Relationship: Standard phase displacement, i.e. high voltage (H1 to neutral) leading the low voltage (X1 & Y1 to neutral) by 30 degrees.
7. Voltage Classifications

   a. 13.8 kV windings – External :110 kV BIL @ 3300 ft. elevation
      Internal: 110 kV BIL

b. 34.5 kV winding – External:200 kV BIL@ 3300 ft. elevation
Internal: 200 kV BIL

8. Impedance: The positive sequence impedance shall be as indicated in the data sheets. Impedance tolerance shall be ± 10% per IEEE C57.12.00-2010, Section 9.2. The negative sequence shall be equal to the positive sequence impedance. The zero sequence impedance shall be equal to or less than the positive sequence impedance.

9. Sound Levels: NEMA TR-1

2.5 DESIGN FEATURES & CONSTRUCTION

A. Short Circuit & Overvoltage Capacity

1. Transformer shall be capable of withstanding, without damage, the mechanical and thermal stresses caused by short circuits limited only by the transformer impedance on the external terminals of any winding or windings, with 100% rated voltage maintained across the terminals of any other winding connected to an energy source. These constraints shall be subject to the following provisions:

a. The magnitude of the RMS symmetrical current in any winding of the transformer does not exceed twenty-five (25) times the base current of the winding.
b. The duration of the short circuit shall be in accordance with the latest edition IEEE C57.109, "Guide for Liquid Immersed Transformer Through-Fault-Current Duration".

2. The transformer shall be designed to be self-protecting from all through faults, three-phase, single line-to-ground, double line-to-ground, and line-to-line on any one set of terminals at a time.
3. The transformer shall be capable of operating above rated voltage or below rated frequency as required in the latest edition of IEEE C57.12.00- 4.1.6.1.

B. High Voltage Bushings [Bushings are offered in accordance with ANSI C57.19.01-1991]

1. Phase Bushings

a. High Voltage bushings shall be side wall mounted (Segment 3) with draw through leads, oil filled, porcelain clad, sky gray glaze (ANSI-70 color), with liquid level indicators, 34.5 kV class, 200 kV BIL at 3300 feet, 1800 amp, ANSI transformer type for side wall mounting. Micafil and Lapp PRC bushings are NOT ACCEPTABLE. One spare high voltage bushing shall be provided for the Project.
b. High bushing voltage bushing shall be supplied with caps having a stud with 1.5" – 12 thread-UNF-2A threaded section, with a minimum 2.0" useable thread length.
c. Bushings shall be furnished with NEMA four hole (four 9/16" holes on 1-3/4" centers), flat pad terminals for vertical take-off suitable of EHV service.
d. Each high voltage bushing shall have three (3) bushing current transformers, 2000:5 MR, C800. Ratios are subject to change.

1) The continuous thermal rating factor for the CTs shall be 2.0.

2. High Voltage Termination Compartment

a. Tank wall mounted bushings shall be enclosed in an oil-filled compartment mounted on the side of the transformer. The bottom of the compartment will be at least 84 inches above ground.

b. The compartment shall have gasketed front and top covers equipped with handles. The covers shall be large to permit works that include the installation of cable terminators and the connections between bushings and terminators. The front cover shall be hinged.
c. A total of twelve terminators shall be installed.
d. Flexible connections between bushings and terminators shall be supplied for later installation at delivery site. Do not install the connectors.
e. Nitrogen for oil preservation shall be fed with a separate control valve rated for full vacuum.

3. Neutral Bushing

a. The high voltage neutral bushing shall be top mounted (Segment 2), 25kV class, 150kV BIL 1800 amp and be equipped with a 1200/5-ampere, multi-ratio (5-terminal), C800 accuracy class current transformer. Bushing porcelain color shall be ANSI 70 gray.
b. Bushings shall be furnished with NEMA four hole (four 9/16" holes on 1-3/4" centers), flat pad, single tank terminals for vertical take-off.

C. Low Voltage Bushings (X Winding) [Bushings are offered in accordance with ANSI C57.19.01-1991]

1. Phase Bushings

a. Low voltage phase bushings shall be wall mounted (Segment 1), oil filled, porcelain clad, 15 kV class, 110 kV BIL. One spare low voltage bushing shall be provided for the Project.
b. Transformer low voltage terminals shall be furnished with enclosure flanges for connection to the customer's non-segregated phase bus duct. The low voltage bushings shall be rated for connection to bus operating at 105°C.
c. Bushings shall be furnished with NEMA four hole (four 9/16" holes on 1-3/4" centers), flat pad, terminals for horizontal take-off and shall have the same current rating as the bushing.
d. Each low voltage bushing shall have two (2) bushing current transformers, 4000:5 MR, C800.

1) The continuous thermal rating factor for the CTs shall be 2.0.

D. Low Voltage Bushings (Y Winding) [Bushings are offered in accordance with ANSI C57.19.01-1991]

1. Phase Bushings

a. Low voltage phase bushings shall be wall mounted (Segment 1), oil filled, porcelain clad, 15 kV class, 110 kV BIL. One spare low voltage bushing shall be provided for the Project.
b. Transformer low voltage terminals shall be furnished with enclosure flanges for connection to the customer's non-segregated phase bus duct. The low voltage bushings shall be rated for connection to bus operating at 105°C.
c. Bushings shall be furnished with NEMA four hole (four 9/16" holes on 1-3/4" centers), flat pad, terminals for horizontal take-off and shall have the same current rating as the bushing.
d. Each low voltage bushing shall have two (2) bushing current transformers, 1200:5 MR, C800.

1) The continuous thermal rating factor for the CTs shall be 2.0.

E. Transformer Grounding

1. Tank Ground: The manufacturer shall furnish four (4) copper faced steel grounding pads welded to the transformer base at each corner. These pads shall be NEMA drilled and tapped; i.e., two (2) ½" x 13 UNC threaded holes on 1-3/4" centers.
2. Core Ground: The core ground shall be brought through the tank wall using a 5 kV bushing of appropriate ampacity. The core ground bushing and intentional ground connection shall be enclosed in a covered housing. The H-0 bushing ground connection shall be made to a NEMA drilled and tapped, copper faced, steel ground pad located near the bushing. Manufacturer shall furnish a permanently installed ¼" x 3" copper ground bus or cable of appropriate ampacity. This bus or cable shall be installed from a grounding pad (two (2) ½" x 13 UNC threaded holes on 1-3/4" centers) on the transformer cover adjacent to the neutral grounding bushing, down the side of the tank to another identical ground pad located 6 (six) inches from the bottom of the transformer base. The bottom pad shall be drilled identical to the upper ground pad.

F. Core and Coils

1. Core and Coils shall be braced to withstand short-circuit forces limited only by the transformer impedance without damage or displacement of the coil on the core, and to withstand normal moving and handling without the use of special shipping braces.
2. Transformer coils shall be copper. The coils shall be insulated from the core and from each other with sufficient insulation to withstand the standard impulse and low frequency tests for transformer of the designed voltage class.

G. Oil Preservation System

1. The oil preservation system shall be automatic, positive pressure, inert-gas type ("Atmoseal" (COPS) will be accepted as an alternate.) All alarm contacts shall be wired to the main control cabinet.
2. Inert-gas type systems shall have a ratio of gas expansion volume to oil volume of at least 10%. The gas control cabinet shall be mounted at eyelevel on either end of the main tank, and shall include a gas-sampling valve for connection to a portable analyzer. Two standard gas storage bottles shall be supplied with the transformer.
3. The serial number of these bottles shall appear on the invoice for the transformer.
4. All tanks and enclosures subject to operating pressures of the oil preservation system shall be designed to withstand 125 percent of the maximum operating pressures, positive or negative. In addition, transformer shall be designed with sufficient bracing and strength to permit full vacuum filling with insulating liquid.
5. The nitrogen cylinder shall be equipped with two wire loop pressure transducer with a 4 to 20 ma DC output signal for input to the Qualitrol 509-ITM transformer monitor. Nitrogen cylinder and all associated equipment shall be enclosed in a weatherproof cabinet mounted on the transformer and at ground level. Nitrogen cylinder fittings shall use SAE threads for nitrogen bottles.
6. The preservation system shall have necessary pressure-vacuum bleeder, pressure-vacuum gauge, gas sample devices and gas pressure alarms for the transformer and a low-pressure alarm for the gas cylinder. Waukesha Inert Air Systems with rigid pigtail shall be provided. Waukesha data sheets shall be attached.

H. Cooling Equipment

1. Integrally mounted equipment shall be furnished to provide the cooling capacity necessary to maintain the transformer rating. Temperature control shall be provided by an assembly of devices arranged and designed to automatically vary the transformer cooling capacity in steps proportional to transformer load and temperature.

2. Cooling Fan Motors

   a. 480 volt, 3-phase, 60 Hz.
   b. All fan motors shall be totally enclosed, non-ventilated, with sealed, pre-lubricated ball bearings, and rated for all-weather outdoor operation.
   c. The motors furnished shall be designed, manufactured and routine tested shall operate in accordance with the latest applicable OSHA, NEMA, IEEE, and ANSI standards. In addition, the motors shall comply with any applicable standards and tests that may be specified herein.
   d. All motors shall operate successfully at their specified rating at the ambient temperature and altitude specified in the service conditions. The motors shall be high efficiency type.
   e. The continuous horsepower nameplate rating shall be greater than or equal to the maximum brake horsepower required by the driven equipment when the driven equipment is operating at the maximum load conditions. Service factor rating shall not be used to meet this requirement.
   f. Insulation for all motors shall equal or exceed the requirement for Class B insulation, unless otherwise approved by the General Manager.
   g. Integral horsepower motors shall have a NEMA Design B torque characteristic unless otherwise required by driven equipment.
   h. Fan guards shall be provided in accordance with latest OSHA safeguard requirements.

3. Controls

   a. The transformer cooling equipment control system shall utilize control contacts furnished in the Electronic Temperature Monitor (ETM). ETM shall be Qualitrol Corporation Model 509-ITM. This relay shall be equipped with 100 ohm platinum probe and shall be housed in a NEMA 3R (vented) UV resistant, corrosion proof fiberglass housing. The H.V. and L.V. hot-spot CT secondary outputs shall be wired into the ETM. A two pole shorting type test switch shall be provided in the hot-spot CTs secondary leads to facilitate testing.
   b. An additional top-oil temperature thermometer (Bourden Tube probe style) shall be provided with the contacts wired for parallel T.O. alarms to the ETM. This thermometer shall be mounted at eye level on the transformer.
   c. The ETM shall be set up for manually alternating the cooling fan operation sequence. Manual control switches shall be provided in the control cabinet to allow testing and maintenance of the cooling fans

4. Transformer cooling equipment shall be designed and arranged to allow individual radiators to be removed from the transformer without removing the transformer from service or draining oil from any other transformer component.
5. Manually operated shutoff valves shall be provided, as required, for cooling equipment removal. All shutoff valves shall be bolted-flange mounted, and shall have provisions for padlocking in the opening or closed position.
6. Each removable radiator shall have a top and bottom shut-off valve to allow the radiator to be removed without draining oil from any other part. Each removable radiator shall be equipped with a bottom drain plug and a top vent plug.

I. Mechanical Construction

1. All tanks, bases, radiators, covers, junction boxes when required, and any other attached compartments shall be fabricated from steel of sufficient strength to withstand normal service stresses without distortion or damage to any part. The base shall be extra heavy, suitable for rolling or skidding in any direction.

2. The transformer tank shall have the centerline and center of gravity permanently marked on all four (4) sides.
3. Two (2) manholes, a minimum of 24" in diameter in the cover for access.
4. The cover shall be domed to shed water and aid in gas collection for the gas detection relay.
5. All joints in transformer tanks, radiators, bases, etc., shall be made gas-tight and oil-tight by welding, except that the connections between oil coolers and tanks shall be provided with gasketed, bolt secured flanges.
6. Transformer shall be equipped with lifting lugs, jack bosses located not less than 15 inches above the base, pulling eyes, skids, and jacking pads to accommodate rollers such as manufactured by Hillman.
7. Four ¼ inch diameter by ¾ inch mounting studs, for customer owned impact recorders, welded to the side of the wall of the transformer tank, accessible from ground level, with vertical spacing of 9-5/8 inches and a horizontal spacing of 8-3/8 inches.
8. The tank finish shall be ANSI sky gray #70 (Munsell No. 5 OBG 7.0/0.4). The tank top (cover) shall be painted with an extra coating of paint including a non-skid medium, A grit or approved "Safety Walk" material. The interior of the transformer shall be painted white or ANSI sky gray #70.
9. The top of the transformer shall be equipped with a removal or collapsible fall protection system. When the removal system is selected, storage for the system shall be provided on top of the transformer. When the collapsible system is selected, provisions shall be provided to secure the system so that it does not vibrate during normal transformer operation. The fall protection system shall meet the requirements of current OSHA regulations.
10. The de-energized tap changer shall be located above the core and coil assembly. The operating handle shall be brought out through the side of the tank where an operator can access from grade.

J. Wiring

1. All control wiring, including CT circuits, shall be terminated with ring tongue (non-insulated) lugs.
2. Control, current transformer, auxiliary power, and alarm circuit wiring shall be 600 volt, standard copper conductor with TA, SIS or other approved insulation. All wiring shall be capable of passing the ICEA Flame Resisting Test, ICEA S-61-402, and Section 6.5. Hinge-type wiring shall be used in all connections to swinging panels. Minimum wire size for bushing current transformer secondary wires shall be #10 AWG. Minimum wire size for control, alarm & monitor wiring shall be #14 AWG.
3. All CT secondary leads shall be brought down to short-circuiting type terminal blocks located in the control cabinet (one 6-point block per CT, PENN-UNION #6006SCS or equal). Each CT shall be wired to a separate terminal block. CT polarity shall be connected to terminal #1 of each block. Terminal #6 shall be grounded.
4. To facilitate connection of the customer's field wiring, all control components, alarm contacts, cooling equipment, and accessories shall be wired to 12-point, barrier type, strap-screw terminal blocks. Terminals shall be labeled with white terminal identification marking strips. Terminal blocks shall be mounted on the sides or back wall of the transformer control cabinet, and shall be easily accessible with normal tools. Terminal block points and associated wiring shall be grouped and separated as to low voltage power, low voltage and instrumentation, low-level signal and current transformer. All terminal blocks shall have at least 20 percent spare positions for use by General Manager.
5. All metallic wiring raceways, electrical enclosures, wire ways, conduit bodies, and fittings shall be corrosion resistant (galvanized, enameled, or otherwise properly coated, inside and out.) Cut threads on conduit shall be properly re-coated to prevent oxidation.

6. All electrical wiring between permanently mounted accessories and the control cabinet shall be enclosed in a rigid steel conduit securely fastened to the transformer tank in a manner to prevent mechanical damage or vibration. All conduit joints and fittings shall be dust tight and watertight.
7. All electrical wiring between the control cabinet and the motors shall be enclosed in conduit, routed on and secured to the tank, up to close proximity points near each motor. All interconnecting cabling between the conduit end and the motors shall be flexible with a sunlight resistant jacket.

K. Seismic Withstand Requirements

1. The transformer shall be qualified according to the requirements of IEEE Std 693. The transformer shall meet the requirements of the high seismic qualification level, with supports and anchorage designed for PGA = 0.60g. Frequency modifying devices shall not be allowed.
2. Manufacturer shall submit along with drawings for approval to the City a statement attesting to compliance with the seismic requirements of this Specification. This statement of compliance shall be signed by a duly authorized representative of Manufacturer and a registered professional engineer.

2.6 AUXILIARY EQUIPMENT & ACCESSORIES

A. The transformer shall be equipped with a high voltage, no-load tap changer with external operating mechanism located on the side of the transformer tank. The tap changer handle shall have provisions for padlocking in any position, and shall provide visible indication of the tap position without unlocking.

B. A single, weatherproof control cabinet shall be provided for all customer conduit and cable connections. The cabinet shall be accessible from ground level, and shall be sized large enough to house all forced air-cooling equipment control components.

1. The control cabinet shall be supplied with thermostatically controlled space heaters to prevent condensation. Space heaters shall be rated 240 VAC, but shall be sized for a normal operating voltage of 120 VAC. Space heater circuits shall be individually protected with molded case circuit breakers.
2. Control power transformers (CPT's) shall be provided within the control cabinet to supply control equipment and space heaters. CPT's shall be protected against overload with molded case circuit breakers. Each auxiliary equipment branch circuit shall be protected by an individual molded case circuit breaker properly coordinated with the CPT breakers.
3. The control cabinet shall be provided with a 120 VAC, duplex grounding receptacle, wired to a 20 amp, molded case circuit breaker. The circuit breaker line side shall be wired to a control cabinet terminal block. The customer will supply one 120 VAC, 60Hz, 20-amp branch circuit to power the receptacle.
4. The control voltage for the sudden pressure relay, and any associated equipment shall be 125 VDC.
5. The control cabinet shall be equipped with a "Loss of DC Alarm Voltage" alarm relay, with alarm contacts wired to a terminal block in the cabinet.
6. All control relays shall have enclosed, dust tight contacts.

C. An automatic, voltage seeking transfer switch shall be provided to supply power to the transformer auxiliary equipment. The customer will supply two (2) sources of nominal 480 volt, 3-phase, 60 Hz power to feed this switch. The automatic transfer equipment shall be of sufficient capacity to transfer the total cooling equipment, control circuit and space heater load from the normal source voltage. Voltage fail-

ure relays shall be installed in order to monitor normal and emergency source voltages. Each relay shall provide a contact closure on loss of voltage. The contacts shall be wired to a terminal block in the control cabinet.

D. Transformer sudden pressure fault relay shall be provided with contacts wired to terminal blocks in the control cabinets. When the sudden pressure relay is activated it shall generate two (2) contact closures that will be maintained until manually reset by a switch located at the transformer control cabinet. One contact closure will be for alarm the other will be for use in high speed transformer protective relaying. Qualitrol Model Number 900–009-01.

E. Tank pressure relief devices shall be supplied for each oil-filled compartment. Each device shall be equipped with an alarm contact and a manual reset, mechanically operated semaphore to indicate that the relief device has operated. Alarm contacts shall be wired to a terminal block in the control cabinet. Qualitrol Model Number 910-011-06.

F. The main tank shall have one Magnetic oil-level indicator to monitor liquid level conditions. The indicator shall include a Potentiometer with a range of 0 to 15000 ohms for input to the Qualitrol 509-ITM transformer monitor. The high voltage termination compartment shall have one Magnetic oil-level indicator to monitor liquid level conditions. All indicators shall show the maximum, minimum and 25 degrees C levels on the gauge faceplate.

G. A main tank top oil temperature indicator/switch shall be located at eye level. Alarm contacts shall be wired to a terminal block in the control cabinet.

1. Dial type thermometers for indicating liquid and winding temperatures shall be mounted in wells as indicated in C57.12.00.
2. For mounting heights of 96 inches or less above the elevation of the transformer base, the face of the thermometer shall be mounted in a vertical plane. For mounting heights greater than 96", the face shall be at an angle of 30 degrees from the vertical plane.
3. The thermometer shall have a dark face dial with light markings, a light colored indicating hand, and an orange-red maximum indicating hand with provision for resetting.
4. The diameter of the dial (inside bezel) shall be 4-1/2 inches +/- 1 inch. 9.5 The dial markings shall cover a range of O degrees C to 160 degrees C.
5. The words "LIQUID TEMPERATURE" or “WINDING TEMPERATURE” shall be on the dial or on a suitable nameplate mounted adjacent to the thermometer.
6. A 10 ohm, copper RTD mounted in a well will be required for liquid temperature input to the Qualitrol Model # 509-ITM monitoring system.

H. The transformer shall be equipped with the Electronic Temperature Monitor (ETM). See paragraph 2.5-H-3-a. , located at eye level. The ETM shall be equipped with (minimum) 4 temperature inputs and 6 outputs.

I. The transformer shall be equipped with an alarm annunciator panel (Rochester or equivalent).

J. Transformer shall be equipped with the following valves and fitting:

1. Drain valve with sampling device.
2. Lower filter press valve with malleable iron (non-galvanized, typ.) pipe plug.
3. 1-1/2” IPS upper filter press valve with malleable iron pipe plug.
4. One 3-inch NPT female threaded opening in the top of the main tank located diametrically opposite to the filter pressure inlet. The pipe opening is to be used for vacuum oil filling and is to be furnished with an extra heavy capped nipple to close the opening.

5. One ½" NPT pipe coupling to be located in the tank wall at the top-oil level for General Manager's use in future installation of an online gas monitor.
6. One ½" NPT pipe coupling to be installed in the tank wall at a position six (6) inches above the bottom of the transformer tank and in the same vertical plane as item 5.

2.7 INSULATING LIQUID

A. Insulating oil shall meet all the requirements defined by ANSI/ASTM D3487-79. It shall be chemically stable, free from acidity or other corrosive ingredients, and shall contain a suitable oxidation inhibitor. Transformer nameplate shall state that the oil is inhibited. The oil shall contain less than 10-ppm water when tested in accordance with the procedures of ASTM D1533 (Karl Fischer method). The dielectric strength of the oil shall be at least 30 kV when tested in accordance with the procedures of ASTM D877, or ASTM D1816 using a 0.040-inch gap.

B. The oil shall have the following characteristics:

1.	Viscosity: (ASTM D-88)	Not less than 12 seconds, nor greater than 66 seconds Saybolt at 40°C.
2.	Flash Point: (ASTM D-92)	Not less than 145°C.
3.	Moisture Content: (ASTM D-1533)	Not higher than 15.
4.	Pour Point:	Not higher than minus 45°C.
5.	Neutralization Number: (ASTM D-974)	Not more than .03 milligram of potassium hydroxide required to neutralize 1 gram of oil.
6.	Mineral Acids: (ASTM D-878)	The oil shall show absence of Sulfur or chlorides and sulfates.
7.	Free and Corrosive: (ASTM D-1275)	The oil shall not contain free Sulfur: corrosive sulfur compounds.
8.	Interfacial Tension: (ASTM D-971)	40 Dynes/CM at 25°C.
9.	Dielectric Strength: (ASTM D-877)	Not less than 30 kV.
10.	Color: (ASTM D-1500)	Very light, 0.5 maximum.
11.	Power Factor, 60Hz: (ASTM D-924)	0.05 percent maximum at 25°C.
12.	Specific Gravity: (ASTM D-1298)	0.91 maximum at 15°C.
13.	Oxidation Stability: (ASTM D-2440)	0.15 percent maximum sludge after 72 hours; 0.5 mg of KOH maximum total acid after 72 hours.
14.	Aniline Point: (ASTM D-611)	Not higher than 75°C.
15.	Steam Emulsion: (ASTM 1935)	Not higher than 30 seconds.
16.	Inhibitor:	2,6 Ditertiary – Butyl –Paracresol – 0.2% by weight.
17.	Charge Density:	Less than 200 micro Coulombs/M^3.

C. The Contractor shall certify the oil delivered with this equipment, and any oil used in production or testing of this equipment, is classified as "PCB-free" (polychlorinated biphenyl) with contamination of less than 1 ppm (parts per million) per EPA publication 40 CFR Part 761. The General Manager will not

accept delivery of the equipment until such certification is received. Demurrage incurred due to lack of this certification will be paid by the Contractor. The Contractor is also responsible to provide the same certification as listed above for any oil supplied by sub-Contractor. The Contractor is also responsible to certify that all tankers used in the delivery of the oil are "PCB-free".

2.8 SOURCE QUALITY CONTROL

A. Transformer shall be tested in accordance with latest editions of IEEE C57.12.00 and IEEE C57.12.90. The General Manager will witness the testing of the transformer. The manufacturer shall provide a minimum of 20 days notification prior to the testing of the transformer.

B. The following tests shall be performed and certified by the manufacturer:

1. Resistance measurements on all windings. The test report shall indicate how windings were connected, either series or parallel.
2. Ratio tests on the rated voltage connection and on all tap connections.
3. Polarity and phase relation test on the rated voltage connections.
4. No load loss and exciting current at rated frequency and voltage and at maximum raise and lower tap position.
5. No load loss and exciting current at rated frequency at 90% rated voltage (0.9 p.u.)
6. No load loss and exciting current at rated frequency at 110% rated voltage (1.10 p.u.).
7. Impedance volts at rated current and at maximum raise and lower tap positions.
8. Load loss at rated current and at maximum raise and lower tap positions.
9. Temperature rise test with top-oil, winding & hot spot temperature rises reported at the transformer self-cooled kVA rating, the ONAF-1 rating & the ONAF-2 rating at rated current on each cooling stage. The temperature rises shall be corrected to 3300' elevation on the final test report. The winding hottest spot temperature and any metallic part temperature shall not exceed 110°C with operation at a constant 40°C ambient air temperature (maximum temperature in any 24hr. period 50°C). In addition, winding rise and oil rise exponents (M&N exponents) shall be reported for ALL cooling stages.
10. Applied potential test.
11. Induced potential test. With RIV reported in both pC & MicroV (5 minute intervals)
12. Lightning Impulse Test
13. Switching Impulse Test

C. The certified test report shall indicate all impedance values; positive, negative and zero sequence. Photos of the core and coil assembly shall also be included with the test report.

D. Copies of all factory power factor test or equivalents shall be furnished with certified test reports.

E. All test required by regulatory agencies shall be witnessed by an Agency Inspector unless specifically waived, in writing, by the Agency. All items tested for regulatory compliance shall be pre-tested prior to scheduling the Agency Inspector.

PART 3 - EXECUTION

A. Vendor to provide optional pricing for field assembly, vacuum oil filling, and field tests. If vendor does not offer this, vendor to include pricing for supervision of field assembly, vacuum oil filling, and field tests.

4.1 MOTOR DATA SHEET 11

SECTION 262050
LOW VOLTAGE MOTORS

PART 1 - GENERAL

1.1 SCOPE

A. This specification covers the minimum technical requirements for the design, manufacture, and testing of low voltage electric motors less than or equal to 300 horsepower. For a specific electric motor, this specification shall be used in conjunction with the data sheets for that electric motor.

1.2 ACCEPTABLE MANUFACTURERS

A. Toshiba

B. Reliance

C. Westinghouse TECO

D. General Electric

E. Baldor

F. Or Contractor-approved equivalent

1.3 STANDARDS

A. The Vendor shall consider the most recent issue of the applicable codes and standards issued by the association and approval bodies listed. American standards are listed for reference and should be followed as much as possible. Refer to the list of codes and standards in Attachment 1 for GTG that Contractor considers the applicable sections of the US and ISO Codes and Standards to be the most relevant standards for gas turbine equipment.

B. If there is, or seems to be, a conflict between this specification and a referenced document, the matter shall be referred to the General Manager in writing.

C. The following is a list of applicable codes and standards, associations and approval bodies:

1. American National Standards Institute (ANSI)
2. American Society for Testing and Materials (ASTM)
3. Anti-Friction Bearing Manufacturers Association (AFBMA)
4. Institute of Electrical and Electronics Engineers (IEEE)
5. International Electrotechnical Commission (IEC-34)
6. National Electrical Manufacturers Association (NEMA) MG1, “Motors and Generators”
7. National Fire Protection Association (NFPA) 70, “National Electrical Code”
8. Underwriters Laboratories (UL) 1004, “Motors, Electric”
9. United States Department of Labor - Occupational Safety and Health Administration (OSHA)

1.4 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.5 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

PART 2 - PRODUCTS

2.1 SCOPE

A. The electric motor required is a squirrel-cage, induction motor conforming to the requirements of NEMA MG 1. The electric motor is either supplied separately or as a component of an equipment package. All motors provided shall be consistent with equipment requirements in regards to electrical hazardous classification. LM6000 standard design motors are provided in Contractor's scope of supply in accordance to Contractor's Low Voltage Motor specification.

2.2 PERFORMANCE

A. The electric motor shall be designed for a nominal 25-year operating life.

B. The electric motor shall have a service factor as shown on the Data Sheet. A service factor of 1.0 at 1000 meters at 50°C low voltage motors are provided in GTG scope of supply

C. The electric motor shall be capable of supplying the horsepower obtained by multiplying the rated horsepower of the motor by the service factor with rated voltage and frequency applied. Motor NEMA Code Letter G or better shall be provided. The maximum motor temperature rise shall not exceed the temperature rise listed in NEMA MG 1 for a Class B insulated motor with a service factor of 1.15 (A service factor of 1.0 at 1000 meters at 50°C without exceeding NEMA standard temperature constraints for class B operation low voltage motors are provided in GTG scope of supply), when supplying the rated horsepower without infringing upon the service factor. In GTG package, for motors 15 horsepower or larger: code letter "G" is used; For Motors 3 to less than 15 horsepower: code letter "H" is used.

2.3 VOLTAGE AND FREQUENCY

A. Motors shall run successfully at the rated load and frequency with a supply voltage variation that does not exceed plus or minus 10% of the rated voltage.

B. Motors shall run successfully at the rated load and voltage with a supply frequency variation that does not exceed plus or minus 5% of the rated frequency.

C. Motors shall run successfully at the rated load with a combined variation of supply voltage and frequency that is not more than plus or minus 10% (sum of absolute values) of the rated voltage and the rated frequency provided that the 5% frequency variation is not exceeded.

D. Motors rated at 100 horsepower (HP), and above shall be capable of starting and accelerating to running speed with a load that has a torque characteristic and inertia value not exceeding that listed in NEMA MG 1, Motors and Generators, with the voltage and frequency variations specified above and maximum voltage dip of 20%, at starting. For motors in GTG, Each motor shall be capable of number of starts per NEMA MG-1 part 12.54, with additional requirement of (4) cold or (4) hot starts per hour minimum. These starts shall be permitted to be in quick succession less than 25 seconds.

E. Motors shall be capable of operating with the power supply characteristics as shown on Data Sheet.

2.4 SIZING AND CAPACITY

A. The motor nameplate horsepower shall cover the full range of the driven equipment load plus 15%. The motor shall be sufficient to start and operate connected loads at designated speeds in indicated environment, and with indicated operating sequence, without exceeding nameplate ratings. Rating shall include allowance for altitude de-rated and peak ambient temperature as required by site conditions. Motors provided within GTG scope shall have horsepower rating based on continuous operation at 1.0 load service factor at 1000 meters at 50 °C ambient without exceeding NEMA standard temperature constraints for class B operation.

2.5 MOTOR TORQUE

A. Motor torque characteristics shall conform with a standard NEMA design letter designation and shall be appropriate for the mechanical load served. Motors provided within GTG scope shall be designed to NEMA “A” or “B” torque/speed characteristics with normal starting torque and starting current for full voltage starting unless specified otherwise by Contractor.

B. The locked-rotor, breakdown, and pull-up torque (at the rated voltage and frequency) shall meet the requirements of NEMA MG 1.

2.6 MOTOR STARTING

A. Motors shall be capable of making the number of starts shown on the Data Sheet.

B. These restart requirements apply only when the moment of inertia (Wk^2) of the load, the load torque during acceleration, the applied voltage, and the method of starting, are the requirements

for which the motor is designed. No additional starts shall be made until conditions effecting operation have been investigated and the motor examined for evidence of overheating.

C. For three-phase, integral-horsepower, squirrel-cage induction motors, the locked-rotor currents at the rated motor voltage shall not exceed standard NEMA values for the required horsepower and specified insulation and temperature rise classes.

2.7 MATERIALS

A. All materials used for the motor shall be appropriate for the site conditions and the associated process mechanical equipment for which it is used. Motor materials provided within GTG scope are as below: Motor frame, end shields, inner bearing caps, fan covers, and terminal boxes shall be of cast iron. Rotor shall be of cast aluminum or copper bar as appropriate based on motor size and slip characteristics. Armature and fields shall be wound with Copper wire.

2.8 MAINTAINABILITY

A. The electric motor shall not require any maintenance other than routine cleaning of the exterior surfaces and periodic lubrication.

2.9 DESIGN AND CONSTRUCTION

A. The electric motor shall be a heavy-duty type using cast iron construction.

B. Electric Motors over 75 pounds shall be furnished with lifting eyes. The lifting eyes shall be arranged so that the lifting slings do not become entangled in any apparatus mounted on the motor. For Motors provided in GTG scope, Lifting means should be provided based on horizontal or vertical orientation of motor on motor data sheet. Shouldered eyebolts may be used but eyebolt receptacle shall be blind thread holes. Lifting eyes shall be in accordance with ASTM A 489, "Standard Specification for Carbon Steel Lifting Eyes".

C. Motor efficiency shall be provided in accordance with Premium Efficiency requirements for motors 50HP and larger. Motor efficiency shall be provided in accordance with Standard Efficiency requirements for motors smaller than 50HP. For motors provided in GTG scope of supply, All motors shall be NEMA Premium® Efficiency, or equivalent, continuous rated, single-speed, polyphase, squirrel-cage induction motor of 2, 4, or 6 pole design meeting the performance requirements of Design A or B per NEMA MG-1 part 1 unless specified otherwise on the motor data sheets in this specification. Motors shall have nominal full load efficiency not less than shown in NEMA MG-1 part 12. Motor efficiency shall be determined in accordance with method B in 6.4 of IEEE STD 112.

Low voltage motors (i.e. < 1kV) supplied under this specification shall have a CEMEP (European Committee of Manufacturers of Electrical Machines & Power Electronics) efficiency rating of IE3 preferred per IEC 60034-30. IE2 shall be permitted where IE3 is cost or design prohibitive. Mandatory introduction of minimum efficiency class IE2 will start on 16 of June 2011. Further measures will regulate the use of variable speed drives for electric speed control and of motors efficiency class IE3. The data sheet shall indicate if IE3 efficiency is mandatory for low

voltage motors. Motors specified for continuous operation shall be the high efficiency type, operating at high power factor and optimal low line current under normal conditions.

For 60 Hz motors: All 60 Hz motors shall have additional requirement to meet Conformance to (EPCA) Energy Policy and Conservation Act, as amended, 42 U.S.C. 6291-6316 and 10 CFR Part 431 "Energy Efficiency Program for Certain Commercial and Industrial Equipment, Subpart B-Electric Motors: Test Procedures, Labeling, and Certification Requirements;" shall be a requirement of this specification.

D. All vertical motors coupled to vertical turbine pumps shall be equipped with spark-resistant non-reversing ratchets. . Spark-resistant non-reversing ratchets will be attached between the pump and the motor on all GTG Turbine Lube Oil and Generator Lube Oil systems.

E. Case drip shields shall be provided for all vertical motors.

F. The vertical centrifugal and in-line pump motors shall be designed to withstand up-or-down thrust loads that may occur during pump startup or operation.

G. The electric motor shall be designed for full voltage across the line starting.

2.10 MOTOR FRAME

A. All motor enclosures shall be totally enclosed; fan-cooled (TEFC) for all locations, except motors that are 3 horsepower or less. These motors may be totally enclosed non-ventilated (TENC). All sealing parts shall be machined in high accuracy in order to minimize breathing

B. The motor frame, end brackets, fan covers, drip shields (if required), and bearing housing shall be corrosion-resistant with the motor supporting feet case as in integral part of the frame. Motor materials provided within GTG scope are as below: Motor frame, end shields, inner bearing caps, fan covers, and terminal boxes shall be of cast iron. Rotor shall be of cast aluminum or copper bar as appropriate based on motor size and slip characteristics. Armature and fields shall be wound with Copper wire.

C. Motors shall be provided with stainless steel drains and plugs. The drain holes shall be located at the low point of the motor as mounted. Drain plugs provided within GTG scope shall be of brass material. Totally enclosed vertical motor housings shall have at least one drain hole with a plug provided at each end as applicable for TEFC motors. Motors intended for horizontal use shall have at least one drain hole at each end with plugs provided.

D. Motor frames shall be drilled and tapped for a ¾ inch bolt for ground connection. On horizontal frames, the hole shall be located in the right rear motor foot (as viewed from the coupling end). On vertical frames, the hole shall be drilled in the junction box side (as viewed from the flange end). Motors provided within GTG scope shall have in addition an external stud on the motor frame. Grounding means for field wiring shall be in accordance with MG-1 part 4.20.

E. If multiple motors are provided, motor frames should be standardized to the minimum number of different frame sizes and associated mounting dimensions to allow for easy interchangeability.

2.11 SLIDING BASES (not used in GTG motors)

A. When sliding bases are required, Vendor shall provide complete dimensional drawings.

B. Base shall be fabricated from heavy steel in a single-unit construction using two adjusting bolts. The heavy-duty base shall be capable of supporting the heaviest weight and largest overhung load for its motor rating without bending, flexing, or vibrating.

C. A permanent means for identifying proper motor frames for which it is suitable shall be provided.

2.12 STATOR ASSEMBLY

A. The stator assembly shall consist of high-grade material consistent with the specified operating efficiency. The stator assembly shall be kept in alignment and held under compression by through bolts and end rings.

B. Stator insulation shall either be vacuum pressure impregnation (VPI) or multiple dips and bakes of insulating varnish. Tropicalization shall consist of additional dips and bakes of insulating varnish and either the use of special insulating materials or varnish treatment to prevent the growth of fungus and the ingress of moisture. Stator insulation materials provided in GTG scope shall be non-hygroscopic and shall be non-nutritive and/or employ appropriate fungicidal and bactericidal agents to render the motors suitable for installation and use in tropical environments

2.13 ROTOR AND SHAFT ASSEMBLIES

A. The motor shaft shall be machined corrosion resistant steel and capable of transmitting the torque produced by the motor.

B. The rotor cage may be of fabricated aluminum, or integrally die-cast aluminum. Rotors shall be epoxy- or Glyptol-coated.

C. The rotor shall be balanced in accordance with Section 2.21 herein.

D. The rotor assembly for horizontal motors shall be removable through either bell end of the motor without requiring removal of the stator assembly.

E. The rotor assembly for vertical motors shall be preferably removable from the top of the motor without requiring dismantling or removal of the motor.

2.14 WINDING INSULATION AND TEMPERATURE RISE

A. The motor windings shall be either random or form-wound coils with Class F insulation. The windings and winding terminals shall be completely insulated for an ungrounded system.

B. The temperature rise, measured by resistance of the motor windings for an ambient temperature of 40°C, shall not exceed the Class B Temperature Rise, when the motor is operated at the rat-

ed nameplate horsepower, voltage, frequency and without infringing upon the service factor. Winding insulation provided within GTG scope shall be class F type minimum with class H preferred with temperature rise due to resistance limited to class B as per NEMA MG-1 Part 1, IEEE Standard 1, or IEC 60034-1 table 7 and IEC 60085 Class B rise shall be defined as 70 °C given a motor rated for Ta = 50 °C at 1.0 SF or 80 °C with Class B rise for motors rated for Ta = 40 °C) at 1.15 SF per NEMA MG-1 12.43 (Ta= ambient temperature).

2.15 BEARINGS

A. Grease-lubricated ball bearings shall be supplied unless otherwise specified. Ball bearings shall be vacuum-degassed steel, motor quality. For vertical type motors in GTG scope, motor guide and thrust bearings shall be either ball or roller bearing type

B. The bearing and bearing housing shall be constructed and provided with slingers and seals to prevent dirt or moisture from entering the motor. Interior bearing caps shall be provided to prevent lubricant from entering the motor.

C. The bearing supports shall be integrally case as a part of the motor end bell. The end bell shall be rabbited to the stator assembly to ensure proper bearing alignment and air gap spacing.

D. The bearings shall be designed so as not to be damaged by axial rotor movement during motor startup or shutdown.

E. Double shielded bearings using high temperature greases shall be provided on motors for air cooler fan (fin fan) applications. Motors in GTG scope shall use single shielded bearings.

F. The bearings shall be of the anti-friction type and shall have a minimum rated life of 40,000 hours (AFBMA L-10, Life), in accordance with AFBMA Standard 4, Tolerance Definitions and Gauging Practices for Ball and Roller Bearings. Motors in GTG scope, Integral horsepower motor bearings shall be fully re-greaseable and sized to provide a L10 life of 26,280 hours hours under minimum V belt sheave sizes for max belt loading conditions. Bearings shall be capable of an L10 life of up to 130,000 hours when the motor is direct connected under appropriate conditions as defined by the manufacturer. Bearings shall be in compliance with ISO 281.

G. Where horizontal motors are mounted in vertical position with V-belt drive (such as in air-cooler drives), the bearing on the shaft extension end shall be sized to accommodate the radial load caused by the belt drive with the bearing life specified in Section F above.

2.16 VERTICAL MOTOR BEARINGS

A. Bearings for motors driving vertical pumps, including in-line pumps, shall be designed to carry 200% of the maximum thrust (up or down) which the pump may develop during starting or stopping or while operating at any capacity on the rated performance curve. Minimum continuous up-thrust capacity shall be equal to 30% of down-thrust at rated capacity. Bearing life shall comply with the requirement of 2.15 Section F above. Thrust bearings for in-line pump motors shall be at the upper end of the motor. Motors in GTG scope, when specified for vertical operation, motors shall be equipped with anti-friction bearings selected to meet the requirements of the internal thrust load. For vertical type motors, motor guide and thrust bearings

shall be either ball or roller bearing type. Plate and split sleeve bearings, where required by the radial and thrust load conditions, shall have prior approval of Contractor before being applied.

2.17 LUBRICATION SYSTEM

A. The motor's grease lubrication system shall be capable of operating at least 8,000 hours without requiring addition of grease or a complete change of grease. Life of the lubricant and requirement may vary due to different loads and running conditions.

B. The motor's grease lubrication system shall be provided with readily accessible grease inlet and outlet plugs in the bearing housings to enable re-greasing while the motor is in-service.

2.18 MOTOR FANS

A. All motors shall be air-cooled and equipped with an externally-mounted, non-sparking fan and fan housing.

B. Fans shall be bi-directional.

2.19 SPACE HEATERS

A. Space heaters shall be furnished for all motors sizes defined in these specifications. Space heaters shall be sized as required to maintain the motor internal temperature above the dew point when the motor is idle. Motor space heaters shall not cause winding temperatures to exceed rated limiting values or cause thermal protective device over-temperature indication when the motor is not energized. Space (anti-condensation) heaters shall be provided on motors (5) horsepower and larger in GTG scope.

B. Low surface-temperature space heaters shall be mounted inside the motor frame of motor to be mounted outside.

C. The sheath temperature at 110% of rated voltage, when operating in a 40°C ambient temperature, shall not exceed 200°C. In GTG scope, Space heater shall avoid raising the motor insulation temperature in excess of 130 °C.

D. The space heaters shall be designed to be operated at 120/230 volts, single-phase and shall be suitable for NEC Class I areas.

E. The space heaters shall maintain the temperature inside the motor at 5°C above the ambient temperature.

F. The space heater power leads for motors rated at or below 150 HP shall be routed to the main terminal box. Motors larger than 150 HP shall have a separated terminal box for the space heater leads. Motors in GTG, The termination of motor anti-condensation heaters in the main terminal box of low voltage (i.e. < 1kV) motors shall not be permitted. AC motor space heater leads shall be provided in separate terminal box with terminal lugs as a minimum, terminal blocks preferred. If NEMA frames size 143-286 cannot accommodate separate terminal box, a conduit elbow may be added off main terminal box with auxiliary junction box added to conduit elbow.

2.20 MOTOR TERMINAL BOX

A. Motors shall be equipped with a corrosion resistant terminal box.

B. Terminal box sizing shall allow for the bending radius and stiffness of motor supply cables and for terminating a grounding conductor. Terminal box size selection shall be one size larger than listed in NEMA MG 1. Motor feeders will be armored cable supplied by BOP Contractor. In GTG scope, Motor terminal boxes shall be sized and designed such that the total volume of all conductors per sizing from the data sheet does not exceed 25% of the total volume of the terminal box and in accordance with NFPA 70 Article 430.12 and in accordance with NEMA MG-1 Part 4.

C. A grounding lug shall be provided inside the motor housing conduit box to accommodate an incoming ground conductor.

D. Motor leads shall have brass or stainless steel ferrules embossed with the appropriate lead number or leads shall be imprinted with the lead number. In GTG scope, Motor winding leads, heater leads, and auxiliary leads provided at terminal boxes shall comply with NEMA standards. All leads shall have pre-crimped-on terminal lugs provided in junction boxes for termination of interconnect leads.

E. Terminal boxes shall be fitted with neoprene gaskets. In GTG scope, All terminal boxes shall be IP55 minimum per NEMA MG-1 part 6 or per IEC 60529

F. Terminal boxes shall be rotatable in 90° intervals to permit connection at any one of the four sides.

G. A motor lead seal and separator gasket shall be provided between the motor frame and terminal box on all motors. In GTG scope, Motor ingress protection shall be IP55 minimum per NEMA MG-1 part 6 or IEC 60034-5. All terminal boxes shall be IP55 minimum per NEMA MG-1 part 6 or per IEC 60529.

H. Terminal boxes with threaded conduit entrances or hubs shall be provided on all motors.

I. Motor lead insulation shall be oil resistant.

2.21 MOTOR BALANCE AND VIBRATION

A. Motor Balance: All motors shall be dynamically balanced. Balance shall be achieved by drilling out parent metal in such a manner that the structural strength of the rotor is not weakened. Chiseling or sawing is not acceptable. The use of solder or similar deposit materials to achieve balance is not acceptable. An acceptable balancing method is to use balance washers that are securely pinned in place.

B. Vibration Measurement.

1. The method of measuring vibration shall meet the requirements of NEMA MG 1.

2. With the motor running at the rated speed or any operating speed, with the shaft axis in normal position, and with the half-key in the key way, the vibration in any plane shall not exceed NEMA Standard.

2.22 IDENTIFICATION AND TAGGING

A. An embossed, stainless steel nameplate shall be securely attached with stainless steel screws or pins on the electric motor. The nameplate shall contain standard information in accordance with NEMA MG 1. The following additional information shall be provided on the same or separated nameplate:

1. Year of Manufacture
2. Type of Bearing Lubricant and Specification Number
3. Arrow Indicating Direction of Rotation, if unidirectional

B. The covers of motor terminal boxes shall be provided with a nameplate labeled, ISOLATE MAIN AND HEATER CIRCUITS BEFORE REMOVING COVER.

2.23 DOCUMENTATION REQUIREMENTS (for LM6000 GTG, refer to O&M manual, Bill of Material at the end of F&ID, and package factory test report)

A. Detailed operating and maintenance instructions for the equipment supplied.

B. Complete list of all instruments and accessories supplied, listing manufacturer, model number and operating ranges.

C. Complete documentation of all inspections and tests performed, including all logs, curves, and certificates. The documentation also shall note any replacement of equipment or components that failed during testing.

D. As-built drawings, including schematics showing mechanical, structural, instrumentation controls, and electrical details.

2.24 INSPECTION AND TESTING (Motor manufacturer's standard inspection and test procedure shall be used for LM6000 GTG).

A. No-load running current and power measurements.

B. High Potential Tests in accordance with NEMA MG 1.

C. Vibration Test in accordance with NEMA MG 1.

D. Locked-rotor current measurement.

E. Machine Noise Level Test in accordance with IEEE 85, Test Procedure for Airborne Sound Measurements on Rotating Electric Machinery.

F. Heat Run Test.

G. Percent slip measurement.

H. Breakdown torque calculation.

I. Pull-out torque measurement.

J. Starting torque measurement.

K. Efficiency and power factor measurements for 1/2, 3/4, and full-rated loads in accordance with IEEE 112, Test Method B.

L. Winding resistance measurement.

PART 3 - EXECUTION (Not Used)

PART 4 - ATTACHMENTS

4.1 MOTOR DATA SHEET

A. Motor Data Sheet shall be completed for each unique drive for the equipment provided during project execution.

SECTION 409413.22
CONTINUOUS EMISSION MONITORING SYSTEM

PART 1 - GENERAL

1.1 SUMMARY OF WORK

A. Work Included: The work shall consist of the equipment and services required for furnishing one (1) engineered, designed, assembled, certifiable, tested (factory testing accepted before shipping) and delivered fully extractive, continuous emission monitoring system (CEMS) for use on plant gas turbine generator (GTG) Emissions Control Module (ECM) stack complete with all accessories necessary to meet the requirements specified in Appendix C.

1. Probe (s), sample lines, analyzers, cabinets, sample conditioning system and enclosures as specified in Appendix C2.
2. Microprocessor based Emissions Analysis Control Units.
3. Microprocessor based data acquisition and report generating system including the capability to graph trends from the collected data in color and a printer to be located in the CEMS enclosure with the CEMS monitor. A remote CEMS HMI is required to monitor CEMS unit to be located in the control room. The CEMS microprocessor shall communicate with the remote monitoring unit via a direct fiber link from the microprocessor to the remote workstation.
4. NEMA 4 stainless steel enclosure(s) required for equipment located on the stack for operating in ambient conditions specified in the site data.
5. Associated hardware such as bolts, washers, nuts, mounting plates, gaskets, junction boxes, interconnecting cables and tubing for equipment at the stack location, sample tubing to the environmental enclosure, power distribution panel, fittings, air regulators, eductors, valves, solenoids, blowers, compressors, receivers, manifolds, required to assemble a completely operable and certifiable system.
6. Power supplies, filters, disconnects, transformers conditioning equipment required by equipment design to interface with existing 480 VAC, 60HZ, three phase power source. A 120V UPS power source will be brought to the CEMS shelter by others.
7. Operation and maintenance manuals.
8. CEMS Plan, CEMS Test Protocol, Quality Assurance and Quality Control Plan and Preliminary Monitoring Plan. Contractor shall complete and submit to General Manager: Process Flow Diagrams, Stack Diagram, CEMs Flow Schematic Diagrams, Monitored parameter Equations/Calculations, Computer Programming Logic Description, and other technical information required on SCAQMD Form ST 220 (CEMS Certification Application). General Manager will submit & pay for completed Form ST 220 to SCAQMD.
9. Special tools and devices required for operation, maintenance, and calibration.
10. Drawings for installation, wiring including electrical load data on equipment, internal and external wiring, System Flow Diagrams, General Arrangement, Elevation Drawings, and piping of equipment.
11. Commissioning and checkout aid and I&C technician training.
12. Guaranteed certification by a third party testing organization in accordance with applicable 40 CFR 60, 75 &98, South Coast AQMD Rule 218 &218.1 and South Coast AQMD Regulation 2012. Third party test organization to be approved by General Manager. Guaranteed certification of the system shall be quoted as a separate lump sum item.
13. Insulated sample tubing as specified in Appendix C2. Separate price per foot for additional length, if required shall be provided. Tube bundle shall include instrument air

and power if required at probe. Sample tubing shall be field trimmable for length on one end.

14. The CEMS system shall be required to provide totally isolated 4 to 20 mA signals and dry output contacts to and from the plant control system as specified in Appendix C4. CEMS system shall also be able to interface with plant control system via a serial link.
15. Calibration gases and enclosure to house bottles and regulators attached to outside wall of CEMS enclosure.
16. All analyzers/probe instruments shall have permanent S.S. tags attached with S.S. wire marked with the tag number, General Manager's P.O. number, and service. General Manager shall assign tag numbers.
17. An ISA style data sheet shall be provided for each instrument furnished under this specification. This data sheet shall list as a minimum the following:

    a. Tag Number
    b. Service
    c. Process Fluid
    d. Process Span
    e. Calibration
    f. Any Sizing Data
    g. Set Point
    h. Contact Rating
    i. Enclosure NEMA Rating
    j. Manufacturer
    k. Model Number
    l. Serial Number

18. A calibration sheet shall be provided for each instrument provided under this specification. This calibration sheet shall have as a minimum the following:

    a. Tag Number
    b. Service
    c. Signature & Date of Calibrator

19. Each analog instrument shall be calibrated at 0%, 25%, 50%, 75%, and 100% of span showing input and actual reading.
20. Each digital instrument shall show desired and actual setpoint.
21. The CEMS buildings shall be provided with smoke detectors that adhere to the following general requirements.

    a. Comply with UL 268; operating at 24-V dc, nominal.
    b. Detectors shall be two-wire type.
    c. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
    d. Integral Visual-Indicating Light: LED type indicating detector has operating and power-on status.
    e. Integral audible alarm.
    f. Dry contacts for connection to an external fire alarm system

22. Contractor Responsibility. The Contractor shall submit and propose to provide all necessary hardware and system software components capable of meeting all functional

system requirements in this specification including the air permit requirements in the Authority to Construct / Final Decision. The Contractor shall assume full responsibility for choosing proper equipment adequate to perform all specified tasks reliably. The Contractor shall fully understand the job to be done, and it shall be his responsibility to resolve any questions or uncertainties arising from this specification prior to the issuance of a purchase order. The Contractor's proposal shall be evaluated against criteria developed to ensure successful installation, certification, and operation of the system.

23. CEMS building shall include electrical HVAC systems to maintain a controlled environment in the CEMS building to prevent electrical equipment failure due to excessive heat or condensation.
24. RTU capable of producing a printout of the stored data in color.
25. Electronic recorder that receives data independent of the RTU and serves as an independent tool for verifying data archived in the RTU or sent to the SCAQMD central NOx station.
26. Pollutant analyzers shall have a dual range so that an analyzer will be capable of monitoring both controlled emission and uncontrolled emission concentration.
27. Each span gas shall meet 40 CFR 60 & 75, SCAQMD Regulation XX, Rule 218 &218.1 and other applicable regulations.
28. A sample conditioning system.
29. Paperless Chart Recorder. Recorder shall be tamper-proof type, installed independently of the analyzer, and shall collect data for two years minimum. See Appendix D for detailed SCAQMD requirements.

B. Work Not Included

1. Stack platforms and access.
2. Receiving, unloading and storage
3. Oil-free instrument grade air at 125 psig
4. Equipment mounting, installation and interconnection of Contractor supplied cable/tubing.
5. Stack stub-outs for sample ports as specified in Appendix B2.

1.2 RELATED SPECIFICATIONS

1. 260000 Electrical Specification for Mechanical Equipment
2. 262050 Low Voltage Motors
3. 480020 Site Conditions
4. 481100 Combined Cycle Power Island
5. 485413 Once Through Steam Generator

1.3 APPLICABLE CODES, STANDARDS, AND REGULATIONS

A. The stack monitoring system is being purchased to satisfy the requirements contained in the applicable federal, State of California, and SCAQMD Authority to Construct / Final Decision.

B. The following listed Standards and Codes, in effect, as of the date of the contract, shall govern design and selections of equipment and material supplied. If there is any conflict between the requirements of these documents, or a conflict between any of them and these specifications,

then that requirement which the General Manager considers most appropriate shall take precedence.

1. ANSI American National Standards Institute
2. ASME American Society of Mechanical Engineers
3. EPA Environmental Protection Agency
4. IEEE Institute of Electrical and Electronics Engineers
5. ISA Instrument Society of America
6. NEC National Electrical Code
7. NEMA National Electrical Manufacturers Association
8. NFPA National Fire Protection Association
9. OSHA Occupation Safety and Health Administration
10. CAL/OSHA California Occupational Safety and Health Administration
11. UL Underwriters Laboratories
12. EPA Region IX
13. ARB California Air Resources Board
14. SCAQMD South Coast Air Quality Management District
15. All applicable local, state, county or municipal codes, laws, and ordinances.

1.4 MARKINGS, NAMEPLATES, SHIPMENT

A. If analyzer cabinets are used in lieu of open racks, interior of cabinets shall be cleaned primed and painted white. Exterior of the control cabinet shall be cleaned, primed, and painted per manufacturer's standard. Exterior of CEMS enclosure shall be painted according to the paint specification in C2. All other equipment to be per manufacturer's standard.

B. Equipment shall be shipped as completely assembled as practicable in the least number of factory fabricated and assembled sections.

C. All equipment and components shall be identified and/or match marked to assist field assembly and erection. All items shipped shall be accompanied by instructions for storing and protecting.

D. All spare parts and special tools, whether specified herein or ordered later, shall be in packages or boxes separate from equipment shipments. Spare parts and special tools, which are too large for packaging, shall be identified with permanent metal tags securely attached.

1.5 GUARANTEE AND WARRANTY

A. A three-year warranty covering performance, parts, workmanship and instrument characteristics shall commence with the date at which the CEMS is certified by the third party testing organization.

B. The Contractor shall guarantee that the installed system shall pass all applicable Performance Specification Tests as defined in the applicable federal, state of California, the South Coast Air Quality Management District and the Construct /Final Decision All actions required to correct systems which do not fully pass performance tests and all re-tests shall be paid for by the Contractor.

C. The Contractor shall guarantee that the system shall successfully pass the calibration requirements within 15 Calendar days after initial operation.

D. Performance audits performed by the General Manager on a quarterly basis, the unit annual performance certification test, and RATA tests will be used to ascertain the proper functioning of the CEMS. If the CEMS fails to meet the performance audit requirements the contractor shall be responsible for carrying out the required repairs/modifications to the system at his own expense.

E. In the event Federal, EPA, State, or Local regulatory authorities challenge emissions data the Contractor shall be required to have their maintenance personnel testify on the General Manager's behalf to the proper maintenance and operation of the equipment and to the accuracy of data generated by the reporting system.

F. Recertification test and report for any part of the system if maintenance is so extensive that test is required for continued uninterrupted operation of the plant.

PART 2 - PRODUCTS

2.1 TECHNICAL REQUIREMENTS

A. The CEMS system shall comply with all applicable USEPA, State of California and South Coast Air Quality Management District monitoring and reporting requirements as delineated under the amended Clean Air Act. The CEMS shall comply with all USEPA requirements of 40 CFR 60, 75 and 40 CFR 98 under the Clean Air Act Amendments of 1990 and the CEMS system shall meet all the Clean Air Act Amendments of 1990 certification requirements as listed in 40 CFR Parts 60 and 75, in addition, State of California AB 32, and SCAQMD Regulation XX, SCAQMD Rule 218 & 218.1. Contractor shall note that the gas turbine will be regulated as a SCAQMD major source of NOx under Regulation XX and the criteria pollutants are subjected to the best available control technology requirements (lowest achievable Emissions Reduction technology requirement under EPA regulations) under either SCAQMD Regulation XIII or XX. Exhaust flow and O2 monitoring must also be in compliance with the cited regulations and rules. This specification should be used as a guideline for establishing basic minimum requirements for the system. If for any reason, due to improper performance of the CEMS equipment, the supplied CEMS fails any part of the USEPA and/or the applicable State of California and the SCAQMD acceptance qualifications, the CEMS Contractor shall incur all costs to change and/or modify the CEMS and re-certify such system, thus guaranteeing ultimate acceptance of the CEMS for General Manager.

B. The system shall contain a probe, a sample line, monitoring and conditioning equipment to dry and sense gas concentrations, and a method of dynamically calibrating the system. The dynamic calibration shall use span gases that are injected in the system at the probe junction into the sample transport line. Span gases shall follow the same path within the monitor as incoming stack gas. Provisions shall be made to remove particulate from the probe in the stack by an automatic backflush system without requiring personnel to climb up the stack.

C. Before installing the probe, a stratification test will be conducted and the probe will be located so that a representative sample will be supplied to the analyzers in accordance with 40 CFR 60, 75, & 98, state of California and SCAQMD Regulation XX SCAQMD Rule 218 & 218.1.

D. Automatic calibration and verification of drift tolerance shall be initiated daily by the system.

E. A method of zero checking the analyzers shall be provided.

F. The system shall be capable of zero and automatic span checks at fixed preselected intervals with override for manual calibration. The instrumentation shall be designed for rapid zero and span checks. Federal and local requirements are for daily zero and span checks. These system checks shall appear as part of the emission record. The system shall be designed to allow ninety days between normal maintenance periods. Zero and span gas shall meet all applicable federal, State of California, and SCAQMD regulations.

G. Gas concentration sensing devices shall not show an interference caused by a two-order-of-magnitude concentration change of any material in the gas stream other than the monitored gas. The sensing devices shall respond to a change of two (2) percent of the concentration of the specific gas being monitored.

H. Electrochemical type fuel cells are not acceptable.

I. All exposed parts that are subject to high operating temperatures or are energized electrically, and all moving parts that might constitute a hazard to operating personnel, shall be insulated, fully enclosed, and/or guarded.

J. Contractor shall ensure that vibrations common to power plant stacks do not affect the equipment's ability to meet all functional requirements.

K. Equipment may be subjected to large transient voltages and currents due to lightning striking the stack. Contractor shall make recommendations to minimize equipment damage from such occurrences.

L. The General Manager will furnish a 480 volt 3 phase supply source. The Contractor shall be responsible for supplying all transformers and/or power supplies, power distribution and disconnects for his equipment to utilize this power source.

M. A 120 VAC UPS power source will be brought to the CEMS shelter by others for back-up of critical equipment.

N. The CEMS shelter will be provided with R30 insulation on the roof and R19 or better insulation on the walls.

O. The CEMS shelter will be provided with integral HVAC units to meet requirements of the site conditions. Contractor to perform calculations to size HVAC to provide adequate heating and cooling.

P. The system will be integrated with the plant control system (DCS) via hardwire connections and/or serial interface. The Contractor will provide any software and hardware upgrades that may be required to the CEMS in order to accomplish this objective.

Q. Data Acquisition and Handling System (DAHS) The DAHS shall be microprocessor based and use a Windows 2008 Server or Windows XP operating system with a web based operator interface. It shall be coordinated with the control system to provide the following:

1. The software for the DAHS shall be designed so that the preparation of daily, monthly, quarterly, semi-annual, and annual reports per SCAQMD Rule 2012, Rule 218, & 40 CFR Part 75 regulation is automated to the fullest extent possible. Data used in the reports shall be retained in the DAHS for the entire calendar quarter of interest, and at least 45 days into the new quarter to allow the operator time to prepare the final report. (Retention of data from Day 1 is desired) Report formats shall be designed to supply the following information concerning excess emissions in accordance with the standard reporting format as specified by the governing department.

    a. The magnitude of excess emissions computed in accordance with 40 CFR 60 & 75, State of California AB 32, and SCAQMD Regulation XX, SCAQMD Rule 218 & 218.1, any conversion factor(s) used, and the data and time of commencement and completion of each time period of excess emissions.
    b. Specific identification of each period of excess emissions that occurs during startups, shutdown, and malfunctions of the affected facility. The nature and cause of any malfunction (if known), the corrective action taken or preventative measures adopted.
    c. Time and date identifying each period during which the continuous monitoring system was inoperative except for zero and span checks and the nature of the system repairs or adjustments.
    d. Each period of excessive emissions shall be specifically identified with starting time and date, and ending time and date. The absolute value of the excessive emission is to be given, along with a reason code description. The reason code is used to identify the cause of the excessive emission, such as startup, shutdown, or malfunctions. The reason code shall be entered from the keyboard by a "user friendly" protocol. At any time up to final report generation, the reason code can be changed, comment space (up to 120 characters) shall be allowed for each period of excessive emissions; to describe corrective action taken. These comments will be retained in the database and can be added/modified at any time up to final report generation.
    e. In a similar fashion, periods of "CEMS out of service" are to be chronologically reported on a quarterly basis. Each occurrence shall be explicitly time tagged, identified as a parameter, and at least 120 characters of comment space allowed for operator statements.
    f. Reports shall be designed to compactly provide all data reduction on a daily format. Raw average resolution for gasses shall be in accordance with 40 CFR 75 and any applicable State of California and SCAQMD rules. The sample rate of the DAHS shall be at least once every 10 seconds. All status flags such as maintenance fault, calibration, etc. shall be recorded in real time alongside the data values. All other parameter and constants used to convert the emission parameter to units of the Standard shall be printed for each hour. Flags shall highlight emission violations that will appear in the quarterly report format described above.

2. A method shall be employed to archive on magnetic media or equivalent, the database used to generate the above reports. At a later time, the archive copies can be restored to the system and hard copy reports generated. The archive is required to be automatically performed at the end of each day, so that the user is protected against a system failure that would destroy the database. Also, the operator must be able to obtain archive copies of the database upon command.
3. The system shall include battery backup with power-fail-auto-restart circuitry, and a real time clock. Spare board slots shall be available for future system expansion. The Signal

Conversion hardware shall provide differential inputs of at least 16-bit resolution for each signal input. Contact closure sensing inputs shall be provided for instrument status signals - fault, zero calibration, and span calibration as a minimum. Signal Conversion hardware shall also be expandable.

4. The DAHS shall employ hard disks for non-volatile storage of the database in a RAID 5 configuration. The program is to be prepared such that accumulated data on the hard disk is retained and available for use in the event of a "cold start" after a failure. The storage capability shall be one hundred and twenty (120) gigabytes or larger. It shall be sufficient for any required program overlays, for a complete system and CEMS configuration file, and for retaining the stack's data and comments for the entire present and last completed calendar quarter, so that flexibility in editing a final quarterly report is achieved. A CD-RW drive and USB port shall be provided for loading programs and diagnostics, and for extracting and restoring archives of the database. A minimum of a 17" flat panel LCD display, keyboard for operator interface, and laser-jet printer shall also be supplied.
5. The analog outputs to the plant control system shall hold last value during the calibration cycle and return to real time only after a true, stable reading has been established.
6. The CEMS computer shall have integral fault monitors to detect malfunctions of system equipment and both visually and audibly notify control room operations personnel and the General Manager of existing abnormal conditions.
7. The DAHS shall be capable of displaying real time data on the workstation and on reports that any applicable rules require.
8. Communications between the DCS and CEMS shall be via Modbus RTU over **TCP/IP**.
9. CEMS Supplier shall provide a DAHS workstation, monitor and report printer and remote CEMS DAHS monitor in the plant control room which will be tied to the CEMS controllers via a dedicated fiber link for each CEMS unit.
10. The data acquisition unit is designed around a central processing unit which is an IBM compatible desktop computer. The computer consists of the following components:

    a. Speed: Dual Core 2.2 GHz minimum
    b. RAM: 2 GB RDRAM
    c. Hard disk: 160GB minimum
    d. Monitor: 17in LCD
    e. System: Windows 2008 Server or Windows XP
    f. Modem 56kbps
    g. B/U Hard Drive: dual 250GB

11. DAHS shall substitute missing data in accordance with 40 CFR 60, 75 & 98, California AB 32, and SCAQMD Regulation XX SCAQMD Rule 218 & 218.1.
12. DAHS shall communicate and report certain data daily by 5:00pm the next day to the SCAQMD Central Station per Rule 2012 chapter 7.
13. At a minimum, DAHS shall generate and record CO, NH3, NOx concentration and mass rate, O2, stack gas flow rate, fuel flow rate and fuel type data points for each successive 15 minute period on the hour and at equally spaced intervals thereafter.
14. The probe shall be located at a location which meets the “Guidelines for Construction of Sampling and Testing Facilities in the SCAQMD” Source Test Manual. 40 CFR parts 60, 75 & 98.
15. Each CEMs and component thereof shall be capable of completing a minimum of one cycle of operation (sampling, analyzing and data recording) for each successive 15-minute interval.

16. DAHS shall be fully accessible remotely at multiple stations either through VPN/Remote Connection or a web site.
17. DAHS shall provide CEMs status in accordance with SCAQMD rule 2012.

R. The Sample System

1. Probe

   a. The Contractor shall provide a multi-point probe by *M&C (Mac-Products)* or 4 multipoint probes tubes approximately 56 inches in length, each with 4 drilled sample orifices or approved equivalent and related equipment as required to extract gas samples continuously from the stack specified in Appendix B2. The Multipoint probe arrangement shall be installed in the stack and the one single port probe upstream of SCR catalyst.
   b. Probes shall be furnished with an amorphous silica coating, Silco or approved equivalent.
   c. Probes shall be equipped with a particulate filtering element as required to remove entrained particulates from the sample.
   d. In cases of high risk of sample line contamination, the probes and associated filter assembly shall be designed such that cleaning can be achieved by compressed air blowback at programmed intervals. The source of compressed air for blowback shall only be available near the analyzer cabinet. Compressed air will be available at 60 to 80 psig.
   e. Probe shall be designed such that it may be easily removed from the gas stream for service and/or cleaning.
   f. The Contractor shall provide companion flange complete with bolts, gaskets and all necessary hardware for the mounting of the probe assembly. Probe assembly, bolts, and flanges exposed to flue gases shall be made out of corrosion resistant material designed for this kind of service.
   g. Probe shall be constructed of 316 stainless steel.

2. Sample Line

   a. Per SCAQMD Rule 2012 Chapter 2 B. 15, the Contractor shall provide either self-regulating heated sample lines or temperature controllers, capable of maintaining the sample temperature above the dew point of the sample. Heated sample lines are not required for dilution probe systems where no sample condensation occurs.
   b. The sample lines shall consist of TFE or 316 stainless steel tubing for sample, TFE for calibration gases, polypropylene or equal for blowback air lines, and heating elements, insulation, electrical wiring, and a scuff-resistant jacket.
   c. Tubing shall be sized by the system supplier to ensure an adequate sample is supplied to the analyzers and to minimize pressure loss, however, it shall not be less than 1/4" diameter.
   d. The Contractor shall provide automatic air blowback of sample tubing,
   e. The Contractor shall supply the exact amount of sample line required as specified in Appendix C2. Sample line fittings shall comply with materials specified.
   f. All valves in contact with wet sample gas either before or after any sample conditioning shall be Teflon lined or approved equal. Valves shall be the sealed type to prevent any non-Teflon component from being wetted by the gas. All Teflon lined valves used to control instrument air over 10 psi must have a 316 SS valve upstream on the instrument air operating in conjunction with the Teflon lined

valve to prevent the Teflon line valve from having to seal against the instrument air pressure.

g. A thermocouple shall be included, located approximately 50 feet from power end of the line, used for sample line temperature control and alarming. Temperature controller shall be included in the CEMS enclosure designed to control the sample line and heated probe filter box temperature. A high/low temperature alarm shall be provided in the DAHS data logger.

3. Sample Conditioning System

a. The Contractor shall provide a sample conditioning system as necessary to extract a continuous gas sample. As a minimum, the system shall protect the monitoring system components from particulate and moisture caused by condensation.

b. The sample conditioning system include all necessary tubing, valves, fittings, pumps, coolers, drains, dryer, filters, etc., required to efficiently condition the raw sample to a state suitable for the gas analyzers. The design of the conditioning system shall maintain sample integrity and shall minimize sample degradation by chemical reaction. In addition, sample conditioning system shall control pressure and volumetric flow rate of the sample and distribute it to the individual analyzers. Pressure regulators with gauges and flow meters with control valves shall be provided so that flow rates to individual analyzers can be controlled and monitored from the front panel.

c. Tubing, fittings, valves, pump components, miscellaneous hardware etc., in contact with the sample gas, prior to drying, shall be heated to maintain the sample gas temperature above its dew point and shall be constructed of material compatible to the service, or Teflon coated.

d. Extraction motive force shall be provided by a dual-head positive displacement diaphragm type pump with Teflon diaphragms or eductor. All wetted surfaces of the pump shall be Teflon lined or Stainless Steel. Single head pump is acceptable for the inlet NOx system.

e. An electronic refrigerant gas compressor type sample cooler, M&C or equivalent, shall be included with peristaltic pumps to dry samples below 4°C. The sample shall be dried to a dew point below the interference level. Glass impinger shall be provided. Sample residence time with condensate shall be minimized to prevent absorption of the gasses to be measured. The sample outlet temperature will be measured and recorded per SCAQMD regulations.

f. An integral moisture sensor alarm and secondary filter shall be provided downstream of the sample conditioner. The secondary filter shall remove 99% of the particles down to 2 microns. Filter material shall not absorb gasses of interest. Moisture sensor alarm shall be wired back to the CEMs controller. An automatic relay shall be provided that will shut down the vacuum pump in the event of moisture alarm.

g. NH3 scrubber must be used before analyzers in CEMs to prevent ammonia bisulfate salts from accumulating in the analyzer. For SCR application which have ammonia slip present in the sample, ammonia scrubber desiccant shall be provided downstream of the sample conditioner. The ammonia scrubber will remove ammonia slip from the sample gasses so as to not contaminate downstream analyzer equipment. A moisture drain shall be provided and plumbed to the shelter drain.

h. An automatic and manual system shall be provided to inject calibration gasses at the instrument directly (local calibration) or through the probe (stack calibration).

Calibration control and monitoring functions shall be performed by the DAHS PLC. Electronic solenoid valves shall be provided for each separate calibration gas cylinder for daily gasses and quarterly audit gasses. Two stage stainless steel calibration gas bottle regulators shall be provided for all daily and quarterly calibration cylinders. Brackets shall be mounted to the exterior of the shelter for securing the calibration gas cylinders in accordance with OSHA regulations. Calibration gas cylinders shall be located so as to be accessible to plant personnel for replacement. Included pressure transducers and transmitters for daily calibration gasses.

S. Analyzer Cabinet

1. Meter readouts to indicate the instantaneous value of the analyzed gases as listed in Appendix C2 in PPM or percent as measured in pounds per million Btu shall be furnished.
2. The ability to control the verification cycle shall be furnished. One (1) dry form C contact output shall be provided for each measured gas to indicate when the instrument is in a verification cycle. The contacts shall open to indicate verification and shall be rated not less than 0.5 amperes at 120 VAC.
3. Fault monitors to detect malfunctions of system equipment. One (1) dry form C contact output (0.5 amp at 120 VAC) shall be provided for General Manager's use.

T. The Contractor shall supply all necessary documentation in accordance with this specification.

2.2 TOOLS

Contractor shall provide special tools and device required for operation, maintenance, and calibration of the system.

PART 3 - EXECUTION

3.1 TRAINING, SUPERVISION

A. The Contractor shall provide at least five (5) days on site installation/start up supervision/assistance of a qualified field engineer for reporting/control system and analyzers. This shall not include time required to institute software changes and debugging of the Contractor’s equipment.

B. Should the Contractor need any information or clarification from any permitting or regulatory agency or from any major equipment Contractor (e.g. gas turbine generator, etc.) such request shall be made, in writing, to Design Engineer. There shall be no direct correspondence between the Contractor and any agency or equipment Contractor regarding the Authority to Construct / Final Decision or scope of this specification, without permission of the General Manager.

C. The Contractor shall provide 6 hard copies of manuals for the DAHS.

D. The Contractor shall conduct on site hands-on training for a minimum of 3 days or more as necessary. This may not be necessary for the selected Contractor that has an identical or very similar CEMs/DAHS that already exists at the facility.

3.2 TESTS, INSPECTIONS, REPORTS

A. The Contractor shall perform all factory and field test including alignments and adjustments required by applicable EPA, State of California and SCAQMD regulations including, but not limited to, the applicable requirements of 40 CFR 60,75 & 98, SCAQMD Rule 2012, SCAQMD Rule 218 & 218.1 and all pertinent federal, state and local air quality regulations.

B. The Contractor shall notify the General Manager thirty (30) days prior to the performance of a factory or field tests. EPA Performance Specification Tests shall be coordinated with the General Manager and allow sufficient time for any prior notifications to agencies if required.

C. Should the General Manager elect not to be present during factory test, contractor shall conduct the tests and shall furnish the General Manager with test reports. Data shall be reported as taken during testing and converted to EPA requested units and tables. Decision by General Manager not to witness tests shall in no way relieve the Contractor from furnishing a complete and certifiable system.

D. The Contractor shall prepare and submit to the General Manager six (6) hard copies and an electronic copy of all factory and field test reports required by the EPA. Test reports shall be submitted within thirty (30) calendar days of test completion. Final test reports shall be submitted within 5 calendar days of receiving final comments by the General Manager.

E. Factory Tests:

1. The Contractor shall conduct all standard factory tests including factory calibrations and DAHS verification.
2. The Contractor shall perform a factory operational test of the assembled gas monitoring system including, but not limited to, the following:

    a. Test all wiring for grounding, open circuits and proper continuity.
    b. Test the control schemes for complete and proper operation of all switching, relaying, lights and interlocks.
    c. Test all tubing, fittings and connections for leaks at two (2) times the operating pressure.
    d. These tests shall be subject to witness by the Customer's engineer. The Contractor shall notify the General Manager at least twenty (20) days in advance of the tests.
    e. Test emission equations, reports, missing data substitution, alarms, reason codes and verification of input and output parameters.

F. Field Tests:

1. The Contractor shall prepare for and perform the Performance Specification Test Procedures outlined in applicable Sections of 40 CFR part 60, 75 and part 98, State of California and the SCAQMD Rule 2012. The Contractor shall provide personnel to remain on site throughout the duration of the Relative Accuracy Test Period.

2. The equipment will be tested by an independent third party testing organization retained by Contractor to verify its proper performance. Testing is to be in accordance with 40 CFR 60, 75, 98, SCAQMD Regulation XX, SCAQMD Rule 218 & 218.1 and the Permit to Construct / Final Decision. Equipment failing the tests shall be promptly modified, repaired, or replaced at the Contractor's sole expense. Subsequent re-testing shall be at Contractor's sole expense.
3. Start up support shall include the following as a minimum:

    a. An installation checklist shall be reviewed and a walk-down performed to ensure that all equipment is ready for activation
    b. Power up the system and perform a thorough test of all system functions per a site specific checklist.
    c. Monitor on-line operation and calibration over a two day period.
    d. Check DAHS software to ensure proper data reduction, calculations, substitution, alarm, display and reporting functions. Checking DAHS software shall include test with simulated input data.

APPENDIX A – INFORMATION, DRAWING REQUIREMENTS FROM CONTRACTOR - REFER TO ATTACHMENT 11 – DRAWING SCHEDULE

APPENDIX B – PROJECT SPECIFIC DATA

B1 Estimated emission concentration & stack gas flow rates depending on gas turbine model
All concentrations are based on ppmvd @15% O_2

Normal Operation 50% to 100% load

	LM 6000
Turbine Exhaust	
NOx	25
CO	9-37
Stack	
NOx	2
CO	2
NH3	5
Flue gas Flow Rate	1150000 lb/hr @882.1°F

Start-Up

	LM 6000
Turbine Exhaust & Stack	
NOx	25-87
CO	7-156
NH3	0-5

Shut – Down

	LM 6000
Stack	
NOx	2-6
CO	0.5-7.2
NH3	0-5

B2 STACK PHYSICAL DATA

Four (4) EPA sampling ports will be provided on the stack for acceptance and source testing and shall consist of 4-inch 150# RF flange and 4-inch blind flange. A sampling platform or other means of providing safe access to the sampling ports will be installed.

An additional 4-inch 150# RF flanged port will be made available for the CEMS sample probe.

Exhaust Stack Parameters (Estimated- numbers):

Parameter

Stack Height (ft)	125
Stack Inside Diameter (ft)	10.17
Exit Gas Flow (1000 lb/h))	1,161
Exit Gas Temperature (ºF)	882.1°F (LM6000)
Water Vapor Concentration	12.3% or 13.1% by volume (no water droplets present)

B3 SCR INLET PHYSICAL DATA

A 4-inch 150# RF flange ahead of the OTSG SCR will be provided for the CEMS sample probe.

B4 PARAMETERS APPLICABLE TO EMISSIONS

Refer to Section 480020 - Site Conditions

APPENDIX C – PERFORMANCE DATA

C1 WORK SCOPE REQUIREMENTS

The work shall meet the monitoring and reporting requirements of the Permit to Construct / Final Decision, as it applies to CEMS, and these Specifications. The monitoring system shall comply with all applicable provisions of 40 CFR 60, 75 & 98, California Air Resources, California GHG mandatory reporting requirements, South Coast Air Quality Management District's Regulation 2000, SCAQMD Rule 218 & 218.1, Rule 2011 and Rule 2012.

Analyzers shall continuously monitor NOx, CO, O_2, NH3 concentrations, fuel flow rate, gross MW (combined output of the gas turbine and steam turbine), water injection rate, NH3 injection rate, SCR inlet temperature, SCR inlet NOx concentration, differential SCR pressure, & differential CO oxidation catalyst with performance specifications that meet or exceed specifications in 40 CFR 60 and 40 CFR75.
Continuous emission monitoring of Volatile Organic Compounds (VOC), SOx, CO_2, and PM10 is not required. The CEMS computer shall calculate ROC, SOx, CO_2, and PM10 from derived emission factors and report in lb/hr, lb/day, and tons/yr. The CEMS computer shall calculate stack volumetric flow in dscfm. Calculations shall be corrected to 15% O_2 (dry).

An analog signal (4-20 mADC) will be provided from the plant control system for recording the flow of natural gas. An analog value of megawatt production will be provided from the plant control system for reporting and calculations.

C2 ANALYZERS AND ENCLOSURES

PROBE ASSEMBLY - Two (2) probe assemblies with coarse filter at sample port. Refer to attached General Arrangement drawing to estimate the appropriate probe lengths. Probes are further defined in section 2.1.R

ANALYZERS

1. One (1) Stack Gas Carbon Monoxide (CO) Monitor (dual range)

   The CO monitor shall respond to concentrations in the range consistent with applicable regulations as stated in 40 CFR 75 and SCAQMD Rule 218 and Rule 2012, specific to the requirements for instrument ranges.

   Range 0-10/2000 ppm. Normal expected reading 5-10 ppm on gas.

2. One (1) Stack Gas Oxides of Nitrogen (NOx) Monitor (dual range)

   The NOx monitor shall respond to concentrations in the range consistent with applicable regulations as stated in 40 CFR 75 and SCAQMD Rule 2012, specific to the requirements for instrument ranges.

   Range 0-10/100 ppm. Normal expected reading 1-3 ppm.

3. One (1) Stack Gas Oxygen (O_2) Monitor

   The O_2 monitor shall respond to concentrations in the range of 0 to 25%.

4. One (1) SCR inlet Gas Oxides of Nitrogen (NOx) Monitor (dual range)

   The NOx monitor shall respond to concentrations in the range consistent with applicable regulations as stated in 40 CFR 75 and SCAQMD Rule 2012, specific to the requirements for instrument ranges.

   Range 0-100 ppm. Normal expected reading < 25 ppm.

5. One (1) Ammonia to NOx converter analyzer (0-10/100, dual range)

   Stack NOx monitor *(item 2*) will be used in conjunction *with this analyzer* for the NH3 slip calculation. NH3 slip will be calculated per the following:
   NH3 slip. ppm = NOx ppm (converted) – NOx ppm, (total, unconverted)

   One (1) Analyzer Cabinets — including sampling pumps, sample conditioning systems (moisture removal and fine filters), analyzers for NOx, CO, O_2, and moisture or moisture sensors and calibration systems.

   ENCLOSURE

   Free-standing environmental enclosures, prewired and pre-piped to house analyzer cabinets, local calibration assembly, rotameters, PLC and DAHS. Enclosure shall include redundant electrical HVAC as required for ambient conditions listed in site data. A 10 ft. x 12 ft. area will be provided near each stack.

   SAMPLE TUBING

   (TBD, length of sample tubing will be determined later) feet of heat traced and insulated sample tubing from the CEMS enclosure to the stack port. Minimum temp per Site design criteria is 17 degrees F. Approximately (TBD, length of tubing to be determined later) feet of heat traced and insulated sample tubing from the CEMS enclosure to the SCR inlet sample port.

C3 Microprocessor based report generating system to be located in the CEMS shelter with a remote unit in the control room for CEMS unit. The printer, monitor, keyboard, and microprocessor shall be rack mounted. In addition, CEMS data, report generating capability, and other functions shall be accessible by the Engineer of Environmental Programs via VPN/Remote Connection.

C4 EMISSIONS ANALYSIS MICROPROCESSOR-BASED CONTROL UNIT I/O

Analog Input (from the plant control system to the CEMS Microprocessor Unit): 4-20 mADC

1. Gas Turbine stack volumetric gas flow.
2. Gas Turbine Generator Gross Megawatts.
3. Steam Turbine Generator Gross Megawatts.

Analog Outputs (to the plant control system from the CEMS Microprocessor Unit): 4-20 mADC

1. Stack NOx@15% O2 concentration.
2. Stack CO@15% O2 concentration.
3. Stack NH3@15% O2 concentration.
4. Stack O2.
5. SCR Inlet NOx concentration.
6. Stack moisture. (if required)
7. Ambient temperature. (if required)
8. SCR inlet temperature
9. Stack Ammonia concentration (calculated)
10. Fuel flow
11. CO2 mass emission rate
12. Flue gas flow rate

Digital Outputs (to the plant control system from the CEMS Microprocessor Unit): dry contact outputs

1. Stack CEMS is in calibration.
2. SCR inlet CEMS is in calibration.
3. Stack CEMS is valid.
4. SCR inlet CEMS is valid.
5. Stack CEMS Excess Emissions.
6. CEMS Common Alarm.
7. DAHS Common Alarm.
8. Stack CEMS Fault.
9. SCR inlet CEMS Fault.
10. Fuel type: Natural Gas
11. Unit status: Commissioning
12. Unit Status: Cold Start-up
13. Unit Status: Warm Start-up
14. Unit Status: Shut Down

Digital Input (to the plant control system from the CEMS Microprocessor Unit): dry contact input.

1. Unit Status : Turbine Start-up
2. Unit Status: Turbine Shut Down
3. Unit Status: Turbine On-Line

Soft Datalink Input (from the plant control system)

1. Water or steam injection rate.
2. Ammonia injection rate.
3. SCR differential pressure.
4. Oxidation Catalyst differential pressure.
5. Other parameters required by the air quality regulatory agencies.

Soft Datalink Output (to plant control system)

1. NOx Lbs/Hr.
2. CO Lbs/Hr.
3. Stack NOx@15% O2 average to monitor permit condition.
4. Stack CO@15% O2 average to monitor permit condition.
5. Stack NH3@15% O2 average to monitor permit condition.
6. Other emissions required to monitor permit conditions.

Contractor shall wire all outputs to terminal blocks for connection to plant control system. General Manager will wire inputs to contractor's terminal blocks.

Contractor shall supply 10% spare I/O and terminal block capacity.

Any calibration gas shall be NIST/EPA approved standard reference material, certified reference materials or shall be certified in accordance with the latest EPA Traceability protocol for Assay and Certification of Gaseous Calibration Standard and /or any other applicable regulatory requirements.

ADDITIONAL FEATURES AND TRAINING TO BE INCLUDED

1. CEMS remote operator terminal for each GTG and printer located in main control room. This is in addition to the local operator terminal and printer in each CEMS enclosure.

2. The Contractor shall provide a classroom type training course and instructional materials/manuals for a minimum of ten (10) people at the plant in the principles of operation, programming, and maintenance of the system. Upon training completion, General Manager's personnel shall be familiar with procedures to change software or hardware, initialize and load software into reporting system, known maintenance and preventative maintenance procedures, and run diagnostics on all system equipment to locate faulty components.

3. CEMS will have a capability to download WATERS report from the SCAQMD website, generate a report shown in Attachment 1 and then generate a hybrid report (see Attachment II) from the WATERS report and the Attachment I report and QA/QC the hybrid report for monthly reporting of RECLAIM NOx emissions.

APPENDIX D – PAPERLESS CHART RECORDER – SCAQMD REQUIREMENTS

1. The paperless chart recorder (PCR) shall record data at the same or greater frequency as the DAHS takes in raw data from the analyzer or monitor, if that frequency is greater than once per minute, then the PCR shall record data at once every minute.
2. The PCR shall be installed in the same configuration as the original paper chart recorder. (not applicable to new applications)
3. The PCR shall continuously archive the data on either directly to a "write once-read many" medium (e.g. CD-R), or in encrypted format to non-volatile data storage. Encrypted means that the data cannot be read except by the use of decryption software. Non-volatile data storage means that the data will not be lost if a power outage occurs.
4. Encrypted files shall be such that they cannot be changed without destroying the files or leaving signs of tampering.
5. Decryption software shall be a commercially available product, not custom software written only for this application.
6. The decryption software shall be provided (at no cost) to the AQMD. Decryption software enables the user to view the data on a PC as if it were a strip chart and to print the chart (equivalent to a paper strip chart) to a standard PC printer.
7. Conversion software shall be provided (at no cost) to the AQMD. Conversion software enables the user to convert the graphical data to numeric data in a standard output such as ASCII or Excel, to facilitate calculations
8. The data shall be viewable on the PCR in the same manner as if it were a paper strip chart recorder (i.e. it must have a screen w/reasonable resolution).
9. The PCR shall have an integrated real-time clock accurate to within one minute, and each data point shall include a "date and time stamp" and any printout of a chart shall include time stamps periodically, including the month, day, year and time of day (hr, min, sec) in local time.
10. The facility shall be able to create a chart printout, and encrypted file, or a converted file (Excel, ASCII, etc.) of any past data, up to and including data collected for the current day upon request without more than a 30 minute wait.
11. Any printout of a chart shall include (and identify) the parameters on the chart.
12. Archived digital data shall be stored and protected in a manner at least equivalent to paper chart storage, and shall store in an environment compatible with the archival storage medium chosen.
13. The PCR shall record all configuration changes and when they occurred.
14. The facility shall have set protocol that must be approved by District of how & when to archive to media from internal memory, and if removable media is used for archiving, how staff is alerted to replace media when it is full.
15. The PCR shall have chart annotation capability and all annotations shall be recorded in the archived data files and displayed when data files are viewed as charts.
16. The PCR shall have auto-recovery from power failures (no need to re-boot) without loss of data, and automatically log the time and length of power failure.

SECTION 480020
SITE DESIGN CONDITIONS

PART 1 - GENERAL INFORMATION

PURPOSE

A. All equipment and system design shall comply with the following site design conditions.

PROJECT LOCATION

B. The Project is located within the existing Glenarm Power Plant Site, which is located at 72 East Glenarm Street, in Pasadena, California. The new Unit GT-5, CTG/STG/OTSG, will be located on the west side of the existing GT-1 and GT-2 turbine/generators and south of the existing Glenarm Building. The new Unit GT-5, CTG/STG/OTSG, will replace the existing B-3 Boiler/STG in the adjacent Broadway Power Plant.

C. The GT-5 Site consists of predominately disturbed native soil. The property is relatively flat. The elevation of the property is approximately 751' above mean sea level (AMSL).

D. Site improvements related to the Project are limited to ~2 acres. The designated temporary construction areas are limited to ~4.1 acres.

LOCAL CLIMATE

E. Pasadena is an urban city in the Los Angeles area of Southern California. Precipitation occurs primarily from mid-fall to mid-spring. Summers are long and hot; winters are typically mild. Equipment and system design shall be suitable for the hot, dry and dusty environment.

PART 2 - AMBIENT CONDITIONS

WEATHER STATIONS

A. LA USC Downtown Cam (USAF: 722874, WBAN: 93134)

ELEVATION

B. The approximate site elevation is 751 FT AMSL

TEMPERATURE

C. Ambient temperatures and corresponding relative humidity are summarized below:

1. Annual Average: 64° F / 61% RH
2. Design Condition: 75° F / 50% RH
3. Summer Normal High: 97° F / 42% RH
4. Winter Normal Low: 32° F / 70% RH
5. Summer Extreme High: 113° F / 16% RH

6. Winter Extreme Low: 17° F / 71% RH

D. Monthly average temperatures and corresponding relative humidity:

1.	January	58.6°F / 51.8% RH
2.	February	58.6°F / 56.2% RH
3.	March	61.1°F / 57.0% RH
4.	April	62.7°F / 58.5% RH
5.	May	66.7°F / 61.8% RH
6.	June	69.9°F / 63.9% RH
7.	July	73.9°F / 63.1% RH
8.	August	74.0°F / 61.6% RH
9.	September	72.5°F / 59.7% RH
10.	October	68.4°F / 57.4% RH
11.	November	63.0°F / 52.5% RH
12.	December	57.7°F / 52.0% RH

PRECIPITATION

E. Annual average precipitation for the area is 14.77 IN.

F. The rainy season is from December to January.

G. The 24-hour storm events are: 25-Year 6.41”-8.8”, 50-Year 9.01”-12”.

WIND

H. Prevailing winds are summarized below:

1. Wind Direction: From the WSW
2. Wind Average Speed: 1.2 MPH
3. Wind design conditions are specified below 0

EVAPORATION

I. Estimated annual average pan evaporation rate is 78”.

J. Estimated annual average solar insulation is 5.5 kWh/m^2/day (average)

DUST

K. Occasional windblown dust concentrations from ground level exceeding equipment height. Outdoor filter systems and enclosures shall be suitable for the blown dusty environment.

PART 3 - DESIGN CONDITIONS

OPERATING AMBIENT

A. The plant shall be capable of operation over the load range with permitted emissions levels within the following operating ambient temperature and humidity conditions without any reduction in design performance or reliability:

1. Annual Average: 64° F / 61% RH
2. Design Condition: 75° F / 50% RH
3. Operating Summer Normal High: 97° F / 42% RH
4. Operating Winter Normal Low: 32° F / 70% RH

DESIGN AMBIENT

B. The equipment shall be designed to withstand and operate within the following ambient temperature and humidity conditions without damage or life degradation:

1. Summer Design High: 113° F / 16% RH
2. Winter Design Low: 39° F / 50% RH

SITE INVESTIGATION

C. The project shall be designed under the California seismic codes and standards based upon the following factors:

Site Coefficients	**Reference**
S_S = 255.1% S_1 = 60%	2010 CBC, USGS Seismic Curves
Site Class = D	2010 CBC, Table 1613.5.2
F_a = 1.0 F_v = 1.5	2010 CBC, Tables 1613.5.3(1) and (2)
$S_{MS} = F_a S_S$ = 255.1%	2010 CBC, Equation 16-37
$S_{M1} = F_v S_1$ = 127.5%	2010 CBC, Equation 16-38
$S_{DS} = 2/3\ S_{MS}$ = 170%	2010 CBC, Equation 16-39
$S_{D1} = 2/3\ S_{M1}$ = 85%	2010 CBC, Equation 16-40
Occupancy Category = III	2010 CBC Table 1604.5
Seismic Design Category = D	2010 CBC, Tables 1613.5.6(1) and (2)
I or I_E = 1.25 (non-hazardous material) I or I_E = 1.50 (hazardous material)	ASCE/SEI 7-05 Table 11.5-1

D. Structural calculations for all tank and equipment support and anchorage systems, structural framing systems, pipe support systems and any and all other items subject to seismic support requirements in accordance with the applicable building and structural codes shall be performed and stamped by a Registered California Structural Engineer.

E. The geotechnical investigation recommends supporting heavy structures on mat foundations.

F. Ground water was not encountered during geotechnical investigations summarized in the Hydrologue Soils Engineering Investigation report dated August 1, 2011.

G. Geotechnical Report:

1. Firm: Hydrologue, Inc., Contact: Seyed M. Mortazavi, Ph.D., 626-585-9696
2. Report: Soils Engineering Investigation, Proposed Glenarm Repowering Project (Unit GT-5 Combined Cycle Installation), Pasadena, California, August 1, 2011, Project No. 3626-04-01

H. Site Survey:

1. Coory Engineering Project 05-S-0139, Phone: 714-202-8700

I. Live Loads:

1. Elevated Floors, Platforms, walkways, and stairs:

a. Uniform Load, 100 pounds per square foot.
b. Concentrated Load, 2,000 pounds on 2.5-foot square floor area (without uniform load).
c. Concentrated Load, 1,000 pounds on support beams (without uniform load).
d. Equipment, storage, or lay down weight (without uniform load).

WIND

J. The project wind design conditions are summarized below:

1. Category: 85 MPH (3 second gust wind speed)
2. Exposure: C
3. Factors: Iw = 1.15

ELECTRICAL EQUIPMENT

K. Transformers shall be designed for a 24-hour average ambient temperature of 40˚C and maximum temperature of 50˚C. Transformers shall have required capacity based upon the 55˚C winding temperature rise rating.

L. Transformer seismic qualification is HIGH.

HVAC

M. HVAC systems shall be N+1 redundant. HVAC systems for enclosed spaces shall be packaged units installed at ground level. HVAC systems shall be suitable for the occasional heavy windblown dust concentrations.

N. Controlled Temperature:

1. Occupied: 75° F Summer, 70° F Winter, +/- 3° F Variance
2. Unoccupied (workshop): 80° F Summer, 65° F Winter, +/- 5° F Variance
3. Electrical Module: Summer 75° F, Winter 65° F, +/- 5° F Variance
4. Battery Room: 75° F Summer, 65° F Winter, +/- 5° F Variance

O. Controlled Humidity:

1. Occupied: Maximum 50% RH, all other spaces no control

P. Electrical panels containing electronic devices located external to environmentally controlled areas shall be equipped with N+1 redundant conditioning equipment.

NOISE

Q. Refer to Section 480031 Combined Cycle Power Island Noise Control Performance detailed noise requirements.

AIR EMISSIONS

R. Treated gas turbine exhaust emissions to air shall be guaranteed not exceed the concentrations defined in the table below during normal operation or the total annual emissions set by the SCAQMD air permit. For guarantees, refer to Attachment 6 - Performance Guarantees.

Constituent	**Value**	**Units**
NOx	2.0	ppmvd (at 15% O2, 1 hr rolling average)
CO	2.0	ppmvd (at 15% O2, 1 hr rolling average)
VOC	2.0	ppmvd (at 15% O2, 1 hr rolling average)
SOx (Assumes 0.5 grains per 100 scf)	<1.0	lb/hr
PM10	5.0	ppmvd (at 15% O2, 1 hr rolling average)
NH3 Slip	5.0	ppmvd (at 15% O2, 1 hr rolling average)

PART 4 - INTERFACE PARAMETERS

NATURAL GAS

A. The project is permitted to operate on pipe line quality natural gas only. The fuel source is supplied by Southern California Gas Company (SEMPRA) and has the following composition based on a volatile organic analysis for C1 to C15 performed by AccuLabs, Inc.:

Analyte			**Analysis Results**	
Methane	94.4	vol %	Total Hydrocar-bons%	96.9
Ethane	2.17	vol %	Total Mol. Wgt.	17.02
Propane	0.130	vol %	SG (relative to air)	.5878
iso-Butane	0.064	vol %	HHV, Btu / scf	1,012
n-Butane	0.063	vol %	LHV, Btu / scf	912
iso-Pentane	0.019	vol %	LHV, Btu / lb	20,246
n-Pentane	0.015	vol %	HHV, Btu / lb	22,468
Hexane & Isomers	0.021	vol %		
Heptane & Isomers	208	ppmv		
Octane & Isomers	93	ppmv		
Nonane & Isomers	90.5	ppmv	Temperature	77°F
Decane	<10	ppmv		
C11	<10	ppmv		
C12	<10	ppmv		
C13	<10	ppmv		
C14	<10	ppmv		
C15	<10	ppmv		

B. Fuel gas supply pressure at the site terminal point is approximately 150 PSIG.

C. The project will have a continuous maximum fuel supply demand of approximately 587 MMBTU/HR.

D. The project equipment (GTG) has a minimum fuel gas pressure requirement of 725 psia.

E. Gas fuel for GTG must meet MID-TD-0000-1 in Attachment 10.

RAW WATER

F. Raw water will be used for cooling tower make-up and reverse osmosis system feed.

G. The project raw water source* is City potable water from Pasadena Water & Power and has the following composition **ranges and average values**:

Constituents	Range	Average	Units
Total Hardness	84-300	237	mg/l
Calcium	49-71	57	mg/l
Magnesium	20-28	23	mg/l
Sodium	83-98	89	mg/l
Alkalinity	63-130	107	mg/l
Sulfate	160-250	194	mg/l
Chloride	84-94	88	mg/l
Nitrate (NO3)	ND-1.8	1.4	mg/l
Fluoride	0-7-1.0	0.9	mg/l
Silica	N/A	12.0	mg/l
Total Dissolved Solids	470-630	532	mg/l
Specific Conductivity	460-1000	889	µS/cm
pH	7.6-8.6	7.9	
Color	N/A	1	
Odor	N/A	2	
Turbidity	0.03-0.06	0.05	NTU
Aluminum	ND-0.20	0.11	ppm
Arsenic	ND-2.7	1.9	ppb
Barium	ND-0.13	0.11	ppm
Chromium	0.04-0.10	0.06	ppb
Copper	N/A	ND	ug/l
Lead	N/A	ND	ug/l
Zinc	N/A	ND	ug/l
Perchlorate	N/A	ND	ug/l

* Raw Water Analysis based on Pasadena Water & Power's Water Quality Test Data 2010 for MWD Weymouth Plant Treated Surface Water Data as well as recent raw water source tests (5/03/2012).

TREATED WATER

H. Treated water will be used for ion-exchange system feed.

I. The station water treatment system supplies treated water through a reverse osmosis process with the following historical quality:

1. Reverse Osmosis Permeate

Constituents	Analysis Results
Silica	0.009 mg/l
Conductivity	2.36 µS/cm
Sodium	No analysis available
TDS	0 mg/l

DEMINERALIZED WATER

J. Demineralized water will be used for steam cycle make-up, NOx injection and performance augmentation. Demineralized water for NOx injection and performance augmentation shall meet Contractor's specification MID-TD-0000-3 in Attachment 10.

K. The existing station water treatment system supplies demineralized water through an ion-exchange process with the following historical quality:

1. Demineralized Water

Constituents	Analysis Results
Silica	0 mg/l
Conductivity	2.5 µS/cm
Sodium	56 mg/l
Sulfate	1.21 mg/l
Hardness	5 mg/l
TDS	2.0 mg/l
ORP	349 mV
pH	6.74
TOC	1.10 mg/l

CONDENSATE

L. The boiler water and feedwater will be maintained within the recommendations of the American Boiler Manufacturers Association (ABMA) "Boiler Water Limits and Steam Purity Recommendations for Water Tube Boilers", 1995 Fourth Edition and the American Society of Mechanical Engineers (ASME) "Consensus on Operating Practices for the Control of Feedwater and Boiler Water Quality in Modern Industrial Boilers", ASME, 1979.

STEAM

M. The OTSG shall be designed to ensure high purity steam is forwarded to the turbine at all times. The steam purity shall be maintained at the lowest practical level of contaminants and shall not exceed the following:

1. Steam Purity

Constituents	Analysis Results
Sodium	0.005 ppm
Conductivity	0.30 µS/cm
Silica	0.01 ppm

N. Under normal operating conditions, the dissolved oxygen in the condensate will not exceed 0.005 cc/liter (7 ppb).

COOLING WATER SYSTEM

O. The station cooling water system is based upon a wet counter-flow cooling tower with the following expected cold water temperatures:

Ambient Dry Bulb, F	Ambient RH, %	Ambient Wet Bulb, F	Cooling Water, F
32	70	29.1	51
59	60	51.4	65
64	61	56.0	68
97	42	77.3	83
Cooling Tower Capacity is 145.6 MMBTU/HR (12,400 gpm at 20 F range)			
Condenser Cooling Demand is < 112.2 MMBTU/HR (10,790 at 20 F range)			

P. The station cooling water system will be used for steam cycle equipment cooling as well as lube oil cooling for the CTG and STG, TEWAC generator cooling, and fuel gas compressor cooling (lube oil and compressed gas discharge), and any auxiliary equipment that requires off-skid cooling. If a chiller is supplied for inlet air conditioning, the heat from the compressors will be rejected back to the same cooling tower.

1. Auxiliary Cooling Water Capacity: 8.03 MMBTU/HR maximum available (803 gpm at 20˚F range)
2. Auxiliary Cooling Water Cold Temperature: 68˚F (at 64˚F ambient design case)

Q. The treatment program for the cooling water system includes the following:

Control	Product	Limits
Phosphate	CL-4830	125 ppm Product, 5 -8 ppm phosphate
Corrosion Inhibitor	CL-4830	125 ppm Product, 4 -6 ppm TTA
Dispersant	CL-4830	125 ppm Product, 10 - 15 ppm dispersant
Acid	H2SO4	7.5-7.7 pH
Bleach	Sodium Hypochlorite	0.2-0.4 ppm free
Non-Oxidizing Biocide	ChemTreat CL 2156 & CL 2030	Batch Feed
Raw Water Make-up Softening	TBD	TBD
Cooling Tower Cycles of Concentration: 7.0		
Conductivity: 4000-4500 umhos/cm		

PART 5 - CODES & STANDARDS

GENERAL REQUIREMENTS

A. The project shall be designed and constructed in accordance with all Federal, State and Local laws, ordinances, regulations and standards.

B. The project design shall comply with the requirements as set forth in the CEQA conditions and air permit constraints.

C. The project shall comply with the applicable parts of 2010 California Code of Regulations Title 24 Building Codes.

D. The project shall comply with the electrical interconnection requirements of NERC and WECC.

APPLICABLE LAWS, ORDINANCES, REGULATIONS, AND STANDARDS (LORS)

E. The following list of LORS applicable to the project design and construction methods is not meant to be all encompassing or relieve the contracted entity in any way of the responsibility to research and comply with all applicable codes and standards. Design specifications and construction of the Project shall be in accordance with (1) applicable laws, regulations, codes and standards of the Federal Government and State of California, as set forth below and, (2) and applicable local (including county and city) laws, regulations, codes and ordinances, as set forth below. In the event of any change in applicable laws, regulations, codes and standards, or any applicable laws, regulations, codes and standards not set forth below, the Parties shall use the provisions in Article 15 in the Contract to make any adjustments if necessary.

SECTION 480020
SITE DESIGN CONDITIONS

1. General

Jurisdiction	LORS
Federal	Federal Code of Regulations (CFR) - 40 CFR 60/75
State	California Code of Regulations (CCR) Title 24 (Building Codes)
State	California Code of Regulations (CCR) Title 8 (Cal OSHA)
State	California Accidental Release Program (Cal ARP)
State	California Public Utilities Commission General Orders
State	Business and Professions Code

5. LM6000 GTG codes and standards

Contractor considers the applicable sections of the following US and ISO Codes and Standards to be the most relevant standards for gas turbine equipment. Our designs and procedures are generally compliant with applicable sections of the following:

ANSI A58.1	Minimum Design Loads for Buildings and Other Structures
ANSI B1.1	Unified Inch Screw Threads
ANSI B1.20.1	Pipe Threads
ANSI B16.5	Steel Pipe Flanges and Flanged Fittings
ANSI B16.9	Factory-Made Wrought Steel Butt Welding Fittings

ANSI B16.21	Non-Metallic Flat Gaskets for Pipe Flanges. (Spiral-wound gaskets per API 601 may be used, particularly in turbine compartment piping)
ANSI B31.1	Pressure Piping and Gas Turbine Piping Systems Comply
ANSI B133.2	Basic Gas Turbine
ANSI B133.3	Gas Turbine Auxiliary Equipment
ANSI B133.4	Gas Turbine Controls and Protection Systems
ANSI B133.5	Gas Turbine Electrical Equipment
ANSI B133.8	Gas Turbine Installation Sound Emissions
ANSI/NAFPA 12	Carbon Dioxide Extinguishing Systems
ANSI/NFPA 70	National Electrical Code
ANSI/IEEE C37.90	Standard for Relays and Relay Systems Associated with Electrical Power Apparatus
ANSI C37.90A/ EEE-472	Guide for Surge Withstand Capability (SWC) Tests
ANSI C50.10	General Requirements for Synchronous Machines
ANSI C50.14	Requirements for Combustion Gas Turbine Driven Cylindrical Rotor Synchronous Generators
ANSI C57.94	American Standard, Guide for Installation and Maintenance of Dry Type Transformers
ANSI C83.16	Relays Associated with Electrical Power Apparatus
ANSI/IEEE 100	IEEE Standard Dictionary of Electrical and Electronic Terms
ANSI/NEMA MG1	Motors and Generators
ANSI/NEMA MG2	Safety Standard for Construction and Guide for Selection, Installation and Use of Electric Motor and Generators
ANSI S1.2	Method for the Physical Measurement of Sound
ANSI S1.4	Method for the Measurement of Sound Pressure Levels
ANSI S1.13	Specification for Sound Level Meters
ANSI S6.1/ SAE/J184A	Qualifying a Sound Data Acquisition System
AGMA 6011	Standard Practice for High Speed Helical and Herringbone Gear Units
API 613	Special Purpose Gear Units for Petroleum, Chemical, and Gas Industry
API 614	Lubrication, Shaft Sealing, and Control - Oil Systems for Special Purpose Applications
API 616	Gas Turbine for Refinery Services
API 650	Welded Steel Tanks for Oil Storage
API 670	Vibration Monitoring System
API 671	Special Purpose Couplings for Petroleum, Chemical and Gas Industry Services
API 678	Accelerometer Based Vibration Monitoring Systems
API RP11PGT	Packaging Combustion Gas Turbines
ASME PTC22	Gas Turbine Power Plants - Performance Test Codes
ASME SECTION VIII	ASME Boiler and Pressure Vessel Code
ASME SECTION IX	ASME Boiler and Pressure Vessel Code
ANSI IEEE C37.2	Electrical Power System Device Function Numbers (Contractor complies with respect to device designations except that in a few

	case device number had to be modified or added to fit Contractor's needs).
IBC 2009	International Building Code
IEEE STD 421	IEEE Standard Criteria and Definitions for Excitation Systems for Synchronous Motors
EIA RS-232	Interface between Data Terminal Equipment and Data Communication Equipment Employing Serial Binary Interchange
EN 61010-1	Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use, Part 1: General Requirements
CAN/CSA 22.2 No. 1010.1-92	Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use, Part 1: General Requirements
ANSI/ISA S82.02.01 1999	Safety Standard for Electrical and Electronic Test, Measuring, Controlling, and Related Equipment - General Requirements
UL 796	Printed Circuit Boards
ANSI IPC Guidelines	
ANSI IPC/EIA Guidelines	
EN 55081-2	General Emission Standard
EN 50082-2	Generic Immunity Industrial Environment
EN 55011	Radiated and Conducted Emissions
IEC 61000-4-2	Electrostatic Discharge Susceptibility
IEC 61000-4-3	Radiated RF Immunity
IEC 61000-4-4	Electrical Fast Transit Susceptibility
IEC 61000-4-5	Surge Immunity
IEC 61000-4-6	Conducted RF Immunity
IEC61000-4-11	Voltage Variation, Dips & Interruptions
ANSI/IEEE C37.90.1	Surge
EN 50021 Electrical	Apparatus for Potentially Explosive Atmospheres
CAAA	Clean Air Act and Amendments Comprehensive Environmental Response, Compensation and Liability Act of 1980.
CFR	Code of Federal Regulations
Title 29,	Code of Federal Regulations (CFR), Part 1910 Occupational Safety and Health Standards
EPA	Environmental Protection Agency
FERC	Federal Energy Regulatory Commission
FAA	Federal Aviation Administration Regulations
NERC	North American Electric Reliability Corporation (Reference to generator and excitation system only)
Cal/OSHA	Title 8, Ladders, Platforms & walkways.

CALTRANS State of California Department of Transportation, Standard Specifications and applicable Special Provisions and Reference Specifications, as last Revised

CBC California Building Code, 2010 Edition, (Including Title 24 – Requirements for California PE Stamped Finite Element Anal-ysis)

CCRs California Code of Regulations

- Business and Professions Code Section 6704, et seq.; Section 6730 and 6736. (Requires state registration to practice as a Civil Engineer or Structural Engineer in California).
- Vehicle Code Section 35780, et. Seq. (Requires a permit for Cal-trans to transport heavy loads on state roads).

Contractor's Gas Turbine Drafting Standards are based on the following Standards as appropriate to the gas turbine. Please note that in several instances, symbols, etc. have been devised for Contractor's special needs (such as flow dividers and manifolds:

ANSI Y14.15B	Electrical and Electronics Diagrams (On base gas turbine and accessory base equipment)
ANSI Y14.17	Fluid Power Diagrams
ANSI Y14.36	Surface Texture Symbols
ANSI 299/IEEE 315	Graphic Symbols for Electrical and Electronics Diagrams
ANSI Y32.10	Graphical Symbols for Fluid Power Diagram
ANSI Y32.11	Graphical Symbols for Process Flow Diagram
ANSI Z32.2.3	Graphical Symbols for Pipe Fittings, Valves & Piping
AWS A2.0-68	Welding Symbols

PART 7 EXHIBITS 20

PART 1 - SUMMARY OF REQUIREMENTS

1.1 GENERAL

Noise affecting the community is a critical issue for the Glenarm Repowering Project (GT-5 Combined Cycle Installation). The total noise levels occurring during the operation of all GT-5 Combined Cycle equipment operating as a composite noise producing system whether on, off, at full load, or any partial load during start-up, shutdown and continuous operation are limited to maximum noise levels both inside and outside the plant. Sensitive receptor locations outside the plant have been selected and a maximum noise level determined for each location. In addition, the GT-5 Combined Cycle equipment operating as a composite noise producing system shall not exceed an average noise level of 85 dBA inside the plant when measured at a standard distance of three feet from noise producing equipment and five feet above the ground. Any noise produced during an Emergency Shut-Down of the system shall not be required to meet the noise performance requirements inside the plant (near field locations) or outside the plant (far field locations).

1.2 GUARANTEED NOISE LEVEL LOCATIONS

The guaranteed noise levels inside the plant shall be an equipment package average as described in Section 4.2A at a standard distance of three feet from all new noise producing equipment in this contract when measured five feet above ground. The guaranteed noise levels outside the plant shall be met at each of fourteen locations around the plant as depicted on Exhibit A of this specification. The guaranteed noise levels shall be in accordance with the procedures described throughout PART 4 of this specification.

1.3 BACKGROUND NOISE (PRE EXISTING PLANT NOISE AND COMMUNITY NOISE)

Pre-existing plant noise sources shall not be included in the noise performance of the GT-5 Combined Cycle power generation system. Corrections for the background noise and balance of plant equipment noise within the plant shall be treated as described in Section 4.7 of this specification. Corrections for the background noise and balance of plant equipment noise outside the plant shall be treated as de-scribed in Section 4.8 of this specification.

1.4 NOISE PERFORMANCE ACCEPTANCE TESTS

After completion of construction and start-up of the GT-5 Combined Cycle power generation system, Noise Performance Acceptance Test(s) as described throughout PART 4 will be conducted to deter-mine if the Contractor has met all the requirements of the noise guarantee and noise control specifications contained herein. The City will hire and pay for the services of a consultant to conduct the initial Noise Performance Acceptance Test no later than 15 days following completion of the GT-5 power generation performance and air emissions tests. The noise measurement procedures will be as de-scribed throughout this specification. All measurement data and calculation results gathered or developed for the acceptance

tests will be compiled into a single report. Copies of that report will be pro-vided to the Contractor within 2 weeks after test completion. Contractor comments on the results of the Noise Performance Acceptance Test shall be submitted to the City no later than two weeks after receipt of the test report. The City and Contractor shall provide their own authorized representatives to witness all noise level measurements. No measurement will be recorded without the City's and Contractor's representatives in attendance.

1.5 CORRECTIVE WORK

Refer to the Contract terms.

PART 2 - GUARANTEED NOISE LEVELS

2.1 IN-PLANT LOCATIONS

The package of equipment shall be Warranted and Guaranteed by the Contractor not to exceed the Maximum Sound Pressure Level Average (L_{EQ}), shown in the Contract, Attachment 6 – Performance Guarantees, when measured at 3 feet from the equipment and five feet above ground as described in Section 4.2. The guaranteed noise level shall be a composite of all noise sources included in this con-tract operating simultaneously. The guaranteed noise level shall be a simple arithmetic average of all measurement locations evenly spaced around all equipment, and shall not be more than 15 feet apart nor less than 8 feet apart. The guaranteed noise level during normal power production at base load operation shall not exceed an average of 85 dBA.

2.2 COMMUNITY LOCATIONS OUTSIDE THE PLANT

When operating as a composite system, all components in this contract shall be warranted and guaranteed by the Contractor not to exceed the maximum sound pressure level average (L_{EQ}) at each location listed in the Contract, Attachment 6 – Performance Guarantees. The receptor locations listed on these submittal forms are mapped on Exhibit A. The guaranteed level at all locations outside the plant shall be a composite of all noise sources included in this contract, but shall not include community background noise or any *pre-existing plant noise*. In addition, the noise produced by the equipment in this contract shall not create audible tones that last more than 30 seconds at any community location outside the plant as described in Sections 4.4E and 4.5E.

PART 3 - OBLIGATION TO PERFORM, LIQUIDATED DAMAGES, AND PENALTIES

Refer to the Contract terms.

PART 4 - NOISE CONTROL PERFORMANCE AND TESTING PROCEEDURES

4.1 GENERAL SUMMARY

The GT-5 Power Island System (Power Island) shall meet the noise level performance requirements as specified hereinafter. All noise levels described in the proceeding sections shall be the sound pressure level (or SPL) of the equipment noise emissions. The sound pressure levels used hereafter shall have a *reference pressure* of 20 micropascals. The term "noise level" shall be interchangeable with the terms, "sound level," or "sound pressure level." All noise levels shall be A-weighted (unless specified otherwise) and shall utilize the slow response on a metering system with a three-decibel *exchange rate*. *Italicized* words and acronyms are defined in PART 6 of this specification.

Compliance shall be demonstrated through a series of noise measurements conducted as part of the *Noise Performance Acceptance Tests*, according to the procedures specified hereinafter. The *Guaranteed Noise Performance* shall apply to all noise producing components in the Power Island as a composite noise (as opposed to individual requirements for each component). The composite noise shall be referred to as the *Power Island Noise*. The noise level performance requirements and measurement procedures shall apply as follows:

A. In-Plant Noise Level Performance:

The *Power Island Noise* shall not exceed a sound pressure level average (L_{EQ}) specified in the proceeding sections during normal base load operation. Except where specified, the in-plant measurement distance shall be 3 feet to the side of the overall equipment package and 5 feet above the ground level. The *Noise Performance Acceptance Tests* in the plant shall be conducted for base load operation only. All normally operating equipment associated with GT-5, referred to as the *Total System Noise,* shall be operating during the noise measurements at each location within the plant. Existing power plant equipment shall not be operating during the *Noise Performance Acceptance Tests* for GT-5. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and the *balance of plant equipment noise* shall be removed from the measured levels of the *Total System Noise* by mathematical calculation using the methods described in Section 4.7. No adjustments or exceptions shall be allowed for contributions from multiple noise sources associated with the Power Island. The *Contractor* shall guarantee and be responsible for meeting their *Power Island Noise* level guarantees according to the Contract, Attachment 6 – Performance Guarantees for in-plant measurement locations. The *Guaranteed Noise Performance* shall be demonstrated in the *Noise Performance Acceptance Tests.*

B. Community Noise Level Performance:

The *Power Island Noise* shall not exceed a maximum sound pressure level average (L_{EQ}) at any location in the surrounding community while the system is operating under any load condition. The *Power Island Noise* shall not contain audible tones at any community location as described in Sections **Error! Reference source not found.**~~4.4E~~ and 4.4E~~4.5E~~. The *Noise Performance Acceptance Tests* in the community shall include separate tests for the following three stages of operation: (1) normal system start-up, (2) normal production operation of the system at the *worst-case load condition*, and (3) normal system shutdown. All normally operating equipment associated with GT-5, referred to as the *Total System Noise*, shall be operating during the noise measurements at all test locations outside the

plant. Existing power plant equipment shall not be operating during the *Noise Performance Acceptance Tests* for GT-5. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and the *balance of plant equipment noise* shall be removed from the measured levels of the *Total System Noise* by mathematical calculation using the methods described in Section 4.8. No adjustments or exceptions shall be allowed for contributions from multiple noise sources associated with the Power Island. The *Contractor* shall guarantee and be responsible for meeting their *Power Island Noise* level guarantees according to the Contract, Attachment 6 – Performance Guarantees. The *Guaranteed Noise Performance* shall be demonstrated in the *Noise Performance Acceptance Tests*. The in-plant noise performance requirements described in Section 4.2 shall not take precedence over but shall be in addition to the community noise level performance requirements.

4.2 IN-PLANT NOISE LEVEL PERFORMANCE DURING NORMAL PRODUCTION

A. Maximum Noise Limits:

The PIE system shall not exceed a sound pressure level average (L_{EQ}) of 85 dBA, while operating at base load, and when measured at a distance of 3 feet from the overall equipment package of the system. The guaranteed noise level shall be an average of all measurements locations as specified in Section 4.2B. The noise shall be measured as an energy-averaged L_{EQ} at each measurement point with a 3-decibel exchange rate on an integrating sound level meter. All valid measurements shall be recorded around each piece of equipment and shall be average together using a simple arithmetic average to determine compliance with the 85 dBA noise limit. All measured levels below 72 dBA shall be considered invalid and discarded from the tabulation of measurements, and therefore not included in the overall average noise level of the power island equipment. No adjustments or exceptions shall be allowed for contributions from multiple noise sources associated with the Power Island.

B. Measurement Locations:

The averaged 85 dBA limit shall apply at an imaginary perimeter around the overall equipment package at a distance of 3 feet from major noise-producing surfaces along the package perimeter, spaced not more than 15 feet apart nor less than 8 feet apart, and 5 feet above the ground level at the perimeter. If the equipment is located in an enclosure intended to reduce the noise, the measurement shall be taken outside the enclosure at a distance of 3 feet. All measurement locations shall be diagramed with respect to the noise source and the noise level tabulated for each position.

C. Measurement Duration:

The duration of the noise measurement at each measurement position shall be between 15 and 40 seconds if the noise is relatively steady state (i.e., the level and pitch do not change by more than 3 dB over time). If the noise source is not steady state (i.e., is intermittent or changes in level or pitch by more than 3 dB over time), the measurement time shall be increased as required to adequately capture the changing state of the noise level.

D. Measurement Conditions:

The GT-5 *total system noise* shall be measured while operating at base load. P*re-existing plant noise* from existing power generation systems shall not be present during the measurements of the GT-5 normal production noise. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and the *balance of plant equipment noise* shall be measured together at each location both before and after the GT-5 *Total System Noise* measurements, and shall be used to correct the measurements of the Power Island as described in Section 4.7. Noise measurements shall not be permitted if the constant wind speed exceeds 7 mph at any measurement location.

4.3 COMMUNITY NOISE LEVEL PERFORMANCE DURING IMPULSIVE VENT NOISE AT START-UP AND SHUTDOWN

A. Maximum Noise Limits:

The *Power Island Noise* produced during natural gas venting that typically occurs during start-up and shutdown, shall not exceed the guaranteed impulse sound pressure level (*LIMP*) shown in the Contract, Attachment 6 – Performance Guarantees at two (2) locations in the community. The vent noise shall be measured on a Sound Level Meter using the Impulse response setting and the A-Weighting. A minimum of (2) vent impulse noises during two separate start-ups and (2) vent impulse noises during two separate shutdowns shall be measured. The highest of these shall be reported as the final result for the vent noise performance. The guaranteed noise limits for vent noise shown in the Contract, Attachment 6 – Performance Guarantees, are based solely on the *Power Island Vent Noise* and shall not include *pre-existing plant noise, background noise,* or *balance of plant equipment noise.* If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and *balance of plant equipment noise* shall be measured together for two to three minutes using the *LIMP* noise metric at the two test locations both before and after the GT-5 vent noise measurements, and shall be used to correct the measured vent noise as described in Section 4.8.

B. Measurement Locations and Times:

Two locations shall be measured for the vent noise, C08 west of Fair Oaks Avenue, and the center of State Street at a point due South of the Glenarm Building Reference Point as shown on Exhibit A. The measurement height shall be 5 feet above the ground surface at the measurement location, and a minimum of 25 feet from any large, flat, sound reflective surface such as buildings or walls whenever practical. The measurements shall be between the hours of 2 AM and 4 AM at both test locations. Late night measurements may need to be conducted over more than one nighttime period to complete these and other tests associated with the GT-5 noise performance.

C. Measurement Duration:

The duration of the noise measurement at the two measurement positions shall be as required to adequately capture the highest level of the impulsive vent noise during start-up and shutdown. The duration of the vent noise shall also be noted and reported.

D. Measurement Conditions:

P*re-existing plant noise* from existing power generation systems shall not be present during the measurements of the GT-5 system start-up and shutdown noise. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and the *balance of plant equipment noise* shall be measured together at each location both before and after the GT-5 start-up and shutdown vent noise measurements, and shall be used to correct the measurements of the noise as described in Section 4.8. Passing street vehicles closer than 50 feet to the microphone shall not be included in any measurement outside the plant. Measurements shall not be conducted if continuous wind speeds are greater than 5 mph at any measurement location. Two vent noise events shall be measured during two separate start-ups and two events during two separate shutdowns. The highest impulse level L_{IMP}, of the four measured events shall be reported as the final result for the vent noise performance.

4.4 COMMUNITY NOISE LEVEL PERFORMANCE DURING NORMAL SYSTEM START-UP AND SHUTDOWN

A. Maximum Noise Limits:

The *Power Island Noise* produced during start-up and shutdown consisting of noise from intermittent or occasional noise sources such as gas venting, steam bypass, auxiliary start-up equipment, or any other noise that typically occurs during start-up or shutdown, shall not exceed the maximum sound pressure level averages (L_{EQ}) shown in the Contract, Attachment 6 – Performance Guarantees at fourteen locations in the community. The fourteen locations are mapped on Exhibit A, and consist of residential and commercial land uses. The noise limits shown in the Contract, Attachment 6 – Performance Guarantees are based entirely on contributions from the *Power Island Noise* and shall not include *pre-existing plant noise, background noise,* or *balance of plant equipment noise.* The noise shall be measured as an energy-averaged L_{EQ} with a 3-decibel exchange rate on an integrating sound level meter. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and *balance of plant equipment noise* shall be measured together at each location both before and after the GT-5 start-up and shutdown noise measurements, and shall be used to correct the measured noise as described in Section 4.8. No adjustments or exceptions shall be allowed for contributions from multiple noise sources associated with the Power Island.

B. Measurement Locations and Times:

A maximum of five measurement positions will be selected by the City from the fourteen possible locations in the surrounding community as shown on Exhibit A. The measurement height shall be 5 feet above the ground surface at the measurement location, and a minimum of 50 feet from any large, flat, sound reflective surface such as buildings or walls at measurement locations C01, C03, C04, C09, C11, C12, and C14. At measurement locations C02, C05, C06, C07, C08, C10, and C13, the measurement microphone shall not be less than 25 feet from large reflective surfaces other than the ground surface. The system start-up noise shall be measured at the five "selected" positions to determine the noise performance and compliance. The measurements shall be between the hours of 2 AM and 4 AM at all

five test locations. Late night measurements may need to be conducted over more than one nighttime period to complete all measurement locations.

C. Measurement Duration:

The duration of the noise measurement at each measurement position shall be between 1 and 15 minutes. If the measurement location is: (a) not near one of the busier streets; and (b) passing vehicle noise is not dominant, and (c) the overall noise is reasonably steady state (i.e., the minimum and maximum levels do not vary from each other by more than 15 decibels over the measurement period), a measurement between 1 and 5 minutes can be performed. If street traffic noise is dominant and the overall noise is not reasonably steady state (i.e., is intermittent or the minimum and maximum levels vary from each other by more than 15 decibels over the measurement period), a 5 to 15 minute measurement must be performed as required to adequately capture the changing state of the noise level.

D. Measurement Conditions:

P*re-existing plant noise* from existing power generation systems shall not be present during the measurements of the GT-5 system start-up noise. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and the *balance of plant equipment noise* shall be measured together at each location both before and after the GT-5 start-up and shutdown noise measurements, and shall be used to correct the measurements of the noise as described in Section 4.8. Passing street vehicles closer than 50 feet to the microphone shall not be included in any measurement outside the plant. This can be accomplished by pausing the measurement if necessary when a passing street vehicle is anticipated. Measurements shall not be conducted if continuous wind speeds are greater than 5 mph at any measurement location. A separate system start-up and shutdown shall be repeated at each measurement location in the community to demonstrate the noise performance and compliance at each of the five selected locations outside the plant.

E. Audible Tones:

During normal system start-up and shutdown, the Power Island equipment shall not produce noise that contains *dominant tonal characteristics* that can be detected at any location in the surrounding community for *more* than 30 seconds. A dominant tonal characteristic shall be determined when <u>both</u> of the following conditions are found present at any location in the surrounding community outside the power plant: (1) the average *Power Island Noise* level (L_{EQ}, un-weighted) in any one-third octave band from 125 Hz and lower exceeds the noise level in both of the adjacent one-third octave bands by an average of fifteen or more decibels, or exceeds the noise level by an average of eight or more decibels in the adjacent bands from 160 Hz and higher; and (2) the overall average A-weighted noise level (L_{EQ}) of the *Total System Noise* at the measurement location in the community is within nine decibels (below) the *background noise*, or higher. The *Power Island Noise* shall not contain such tonal characteristics at any location in the community. If dominant tonal noise is determined to be present based on the two conditions above, the third-octave band *background noise* and *balance of plant equipment noise* shall be checked to see if tonal noise is present. If tonal noise is present in the isolated measurement of the *background noise* and *balance of plant equipment noise* alone, appropriate calculations shall then

be performed and reported to determine if the *power island noise* contains tonal noise. If the overall average A-weighted noise level of the *Total System Noise* is ten or more decibels below the *background noise* at a particular location outside the plant, audible tones shall not be a factor in determining noise compliance at that location.

4.5 COMMUNITY NOISE LEVEL PERFORMANCE DURING NORMAL PRODUCTION

A. Maximum Noise Limits:

The Power *Island Noise* level shall not exceed the maximum sound pressure level averages (L_{EQ}) at the locations listed in the Contract, Attachment 6 – Performance Guarantees and mapped on Exhibit A, while operating under the *worst-case load condition* that produces the highest noise level. The *Power Island Noise* shall be measured as an energy-averaged L_{EQ} with a 3-decibel exchange rate on an integrating sound level meter. Existing power plant equipment shall not be operating during the *Noise Performance Acceptance Tests* for GT-5. If there is any unavoidable *pre-existing plant noise* present during the *Noise Performance Acceptance Tests*, it shall be removed in a post-measurement calculation. The *background noise* and the *balance of plant equipment noise* shall be measured together at each location both before and after the GT-5 production noise measurements, and shall be used to correct the measurements of the production noise as described in Section 4.8. No adjustments or exceptions shall be allowed for contributions from multiple noise sources associated with the Power Island.

B. Measurement Locations and Times:

A maximum of five measurement positions will be selected by the City from fourteen possible locations in the surrounding community as shown on Exhibit A. The measurement height shall be 5 feet above the ground surface at the measurement location, and a minimum of 50 feet from any large, flat, sound reflective surface such as buildings or walls at measurement locations C01, C03, C04, C09, C11, C12, and C14. At measurement locations C02, C05, C06, C07, C08, C10, and C13, the measurement microphone shall not be less than 25 feet from large reflective surfaces other than the ground surface. The *Power Island Noise* shall be measured at the five selected positions to determine the noise performance and compliance. The measurements shall be between the hours of 2 AM and 4 AM at all five test locations. Late night measurements may need to be conducted over more than one nighttime period to complete all measurement locations.

C. Measurement Duration:

The duration of the noise measurement at each measurement position shall be between 1 and 15 minutes. If the measurement location is: (a) not near one of the busier streets; and (b) passing vehicle noise is not dominant, and (c) the overall noise is reasonably steady state (i.e., the minimum and maximum levels do not vary from each other by more than 15 decibels over the measurement period), a measurement between 1 and 5 minutes can be performed. If street traffic noise is dominant and the overall noise is not reasonably steady state (i.e., is intermittent or the minimum and maximum levels vary from each other by more than 15 decibels over the measurement period), a 5 to 15 minute measurement must be performed as required to adequately capture the changing state of the noise level.

D. Measurement Conditions:

Pre-existing *plant noise* from existing power generation systems shall not be in operation during the measurements of the GT-5 *Power Island Noise*. The *background noise* and the *balance of plant equipment noise* shall be measured together at each location both before and after the GT-5 production noise measurements, and shall be used to correct the measurements of the production noise as described in Section 4.8. Passing street vehicles closer than 50 feet to the microphone shall not be included in the measurement. This can be accomplished by pausing the measurement if necessary when a passing street vehicle is anticipated. Measurements shall not be conducted if continuous wind speeds are greater than 5 mph at any measurement location. To determine the load condition that produces the highest noise level, a series of noise measurements shall be conducted at receptor C07 shown on Exhibit A, and at a location in the center of State Street due south of the Glenarm Building reference point. The operating load shall be varied in increments of 10 MW between the minimum and maximum loads of the system. The A-weighted noise level shall be recorded at each 10 MW increment for the two locations. When measuring the noise level at guaranteed locations west of the plant (C01 through C10), the load condition creating the highest measured A-weighted noise level at receptor C07 shall be the *worst-case load condition*. When measuring the noise level at guaranteed locations south of the plant (C11 through C14), the load condition creating the highest measured A-weighted noise level at the State Street location shall be the *worst-case load condition.*

E. Audible Tones:

While operating under any load condition, the Power Island equipment shall not produce noise that contains *dominant tonal characteristics* that can be detected at any location in the surrounding community for *more* than 30 seconds. A dominant tonal characteristic shall be determined when <u>both</u> of the following conditions are found present at any location in the surrounding community outside the power plant: (1) the average *Power Island Noise* level (L_{EQ}, un-weighted) in any one-third octave band from 125 Hz and lower exceeds the noise level in both of the adjacent one-third octave bands by an average of fifteen or more decibels, or exceeds the noise level by an average of eight or more decibels in the adjacent bands from 160 Hz and higher; and (2) the overall average A-weighted noise level (L_{EQ}) of the *Total System Noise* at the measurement location in the community is within nine decibels (below) the *background noise*, or higher. The *Power Island Noise* shall not contain such tonal characteristics at any location in the community. If dominant tonal noise is determined to be present based on the two conditions above, the third-octave band *background noise* and *balance of plant equipment noise* shall be checked to see if tonal noise is present. If tonal noise is present in the isolated measurement of the *background noise* and *balance of plant equipment noise* alone, appropriate calculations shall then be performed and reported to determine if the *power island noise* contains tonal noise. If the overall average A-weighted noise level of the *Total System Noise* is ten or more decibels below the *background noise* at a particular location outside the plant, audible tones shall not be a factor in determining noise compliance at that location.

4.6 NOISE MEASUREMENT SYSTEM REQUIREMENTS

The *Noise Performance Acceptance Tests* shall be conducted using an ANSI S1.43-1997 (R2007) Type 1 integrating *RTA* sound level meter and microphone system, or an IEC 60804 (2000) Integrating-averaging Sound Level Meters, or an integrating sound level meter meeting IEC 61672-1 (2003) Electroacoustics, Sound Level Meters, Specifications. The tests shall be conducted by an approved noise specialist with a minimum of 7 years of experience specifically in the environmental and/or industrial noise measurement and analysis fields. The measurements as described herein shall be conducted to determine compliance with the noise performance requirements of the GT-5 power generation system. All measured sound pressure levels shall have a reference quantity of 20 micropascals. The sound level meter shall be equipped with the following:

A. a random-incidence microphone (or random incidence corrected free-field microphone) and preamplifier system;
B. a 3.5-inch diameter microphone windscreen;
C. a one-third octave-band filter set from 25 Hz to 20 kHz;
D. selectable A and Linear weighting networks;
E. exchange rate setting of 3 decibels;
F. capable of measuring the average noise level (L_{EQ});
G. capable of measuring the impulse response noise level (L_{IMP}) and
H. capable of measuring six statistical noise levels simultaneously (L_{01} through L_{99}, L_{MAX}, and L_{MIN}).

A manufacturer's approved windscreen shall be used during all measurements. The sound level meter shall be certified with NIST traceability according to the manufacturer's calibration standards within a 12-month period prior to the *Noise Performance Acceptance Tests*. Alternatively, an annual calibration certificate for a laboratory reference standard instrument can be supplied if reciprocity with the field measurement system used in these test measurements can be demonstrated. In no case shall a field measurement system be used which has not undergone laboratory calibration by the manufacturer within a three-year period. The instrument shall be calibrated in the field using an acoustic calibrator with NIST traceability before and after each series of measurements. Instrument drift shall be noted for each series of measurements. A series of measurements with a field calibration drift of more than 0.4 dB shall be considered invalid and shall be repeated, if the results affect the pass/fail status of the measurements at those locations. No corrections shall be made for measurements with a calibration drift of 0.1 dB or less. All measured values of the overall A-weighted noise within a series of measurements which have a calibration drift between 0.2 to 0.4 dB shall be corrected with one-half of the drift value (e.g., if the field calibration after a series of measurements shows 0.4 dB higher than the calibrated level before the series of measurements, all A-weighted levels in that series shall be corrected by -0.2 dB). The overall measured levels shall be A-weighted and shall include the following noise metrics: L_{EQ}, L_{IMP}, L_{MAX}, L_{01}, L_{10}, L_{25}, L_{50}, L_{90}, L_{99}, and L_{MIN}. Measurements shall also include one-third octave-band filtered levels from 25 Hz to 20 kHz with no weighting applied (linear frequency weighting). Calibration drift corrections shall not be applied to the one-third octave-band data. All measurement results shall be reported as described in Section 4.12 of this specification and shall include a record of the manufacturer's calibration certificates and a record of field calibration data. The temperature, wind speed, wind direction, and percent relative humidity shall be recorded at all measurement locations outside the plant using an appropriate hand-

held or portable meteorological measurement device. Noise measurements shall not be permitted at any location inside or outside the plant if the constant wind speed exceeds 5 mph at that location.

4.7 NOISE CORRECTIONS FOR MEASUREMENTS INSIDE THE PLANT

While operating at the *base load operating condition*, the *Total System Noise* (TSN) measurements at all locations inside the plant will contain noise contributions from: (1) the *background noise* (BGN); (2) the *balance of plant equipment noise* (BOP); and (3) the *Power Island Noise* (PIN). The BGN and BOP noise shall be measured together both before and after the TSN measurements at all locations in the plant. If the difference between the before and after measurements is more than 3 dB at any one location, the measurement shall be considered invalid, and the *Total System Noise* measurement shall be repeated at that location with a new set of before and after measurements. If the before and after measurements are valid, they shall be averaged as shown below. When the measured BGN and BOP noise is more than 17 decibels below the measured TSN noise at any location, no correction is necessary for that measurement location. Otherwise, the measured TSN noise levels shall be corrected using the formulas below so that the *background noise* and *balance of plant equipment noise* is removed by calculation:

$$L_{BGNBOP}AVG = (L_{BGNBOP}BEFORE + L_{BGNBOP}AFTER) \div N, \quad \text{in dBA}$$

$$L_{PIN}CORR = 10 \times LOG_{10}(10^{(L_{TSN}MEAS/10)} - 10^{(L_{BGNBOP}AVG/10)}), \quad \text{in dBA}$$

Where:

$L_{BGNBOP}AVG$ = the linear average of the before and after measurements of the *background noise* and *balance of plant equipment noise* at a location within the plant.

$L_{BGNBOP}BEFORE$ = the before measurement of the *background noise* together with the *balance of plant equipment noise* at a location within the plant.

$L_{BGNBOP}AFTER$ = the after measurement of the *background noise* together with the *balance of plant equipment noise* at a location within the plant.

N = the number of measurements to be averaged at a particular location, in this case, 2.

$L_{PIN}CORR$ = the corrected *Power Island Noise* level at a location within the plant with the *background noise* and the *balance of plant equipment noise* removed by calculation. The $L_{PIN}CORR$ has the same definition as the *Power Island Noise* level and must comply with the requirements in Sections 4.1A, 4.2, and the guaranteed noise levels shown in the Contract, Attachment 6 – Performance Guarantees.

$L_{TSN}MEAS$ = the measured GT-5 *Total System Noise* level at a location within the plant with the *balance of plant equipment noise* and *background noise* included.

LOG_{10} = the common logarithm (base 10).

dBA = the abbreviation for decibels, A-weighted.

All calculated values of $L_{PIN}CORR$ for normal production noise at the *base load operating condition* that are below 72 dBA shall be considered invalid and discarded from the tabulation of measurements. Invalid values shall not be included in the overall average of noise levels for normal production noise. The final noise level shall be calculated by taking a simple arithmetic average of the $L_{PIN}CORR$ values for each measurement location. A final noise level shall be calculated for normal production noise at the *base load operating condition.*

Example 1:

$L_{BGNBOP}BEFORE$ = 76.5 dBA

$L_{BGNBOP}AFTER$ = 78.5 dBA *(before and after measurements are within 3 dB of each other; therefore, valid)*

$L_{BGNBOP}AVG$ = $(76.5 + 78.5) \div 2$

$L_{BGNBOP}AVG$ = <u>77.5 dBA</u>

$L_{TSN}MEAS$ = 83.0 dBA

$L_{PIN}CORR$ = $10 \times LOG_{10}(10^{(83.0/10)} - 10^{(77.5/10)})$

$L_{PIN}CORR$ = <u>81.6 dBA</u> *(corrected Power Island Noise with balance of plant equipment noise and background noise removed by calculation)*

Example 2:

$L_{BGNBOP}BEFORE$ = 63.5 dBA

$L_{BGNBOP}AFTER$ = 65.5 dBA *(before and after measurements are within 3 dB of each other; therefore, valid)*

$L_{BGNBOP}AVG$ = $(63.5 + 65.5) \div 2$

$L_{BGNBOP}AVG$ = <u>64.5 dBA</u> *(more than 17 dB below the corrected Power Island Noise, $L_{PIN}CORR$)*

$L_{TSN}MEAS$ = 82.0 dBA

$L_{PIN}CORR$ = $10 \times LOG_{10}(10^{(82.0/10)} - 10^{(64.5/10)})$

$L_{PIN}CORR$ = <u>81.9 dBA</u> *(no correction was needed since this is less than one-tenth of a decibel from the measured value of the Total System Noise of 82.0 dBA; in other words, the background noise and the balance of plant equipment noise do not contribute significantly to the Power Island Noise at this location)*

4.8 NOISE CORRECTIONS FOR MEASUREMENTS OUTSIDE THE PLANT

While operating at the *worst case load condition*, the *Total System Noise* (TSN) measurements at all locations in the community will contain noise contributions from: (1) the *background noise* (BGN); (2) the *balance of plant equipment noise* (BOP); and (3) the *Power Island Noise* (PIN). The BGN and BOP noise shall be measured together both before and after the TSN measurements at all locations in the community. If the difference between the before and after measurements is more than 3 dB at a particular location, the measurements shall be considered invalid, and the *Total System Noise* measurement shall be repeated with a new set of before and after measurements for that location. If the before and after measurements are valid, they shall be averaged as shown below. The measured TSN noise levels shall be corrected using the formulas below so that the *background noise* and *balance of plant equipment noise* is

removed by calculation (background noise measurement corrections for vent noise using the *LIMP* metric are similar to procedures shown below):

$L_{BGNBOP}AVG = (L_{BGNBOP}BEFORE + L_{BGNBOP}AFTER) \div N$, in dBA
$L_{PIN}CORR = 10 \times LOG_{10}(10^{(L_{TSN}MEAS/10)} - 10^{(L_{BGNBOP}AVG/10)})$, in dBA

Where:

$L_{BGNBOP}AVG$ = the linear average of the before and after measurements of the *background noise* and *balance of plant equipment noise* at a location outside the plant.
$L_{BGNBOP}BEFORE$ = the before measurement of the *background noise* together with the *balance of plant equipment noise* at a location outside the plant.
$L_{BGNBOP}AFTER$ = the after measurement of the *background noise* together with the *balance of plant equipment noise* at a location outside the plant.
N = the number of measurements to be averaged at a particular location, in this case, 2.
$L_{PIN}CORR$ = the corrected *Power Island Noise* level at a location outside the plant with the *background noise* and the *balance of plant equipment noise* removed by calculation. The $L_{PIN}CORR$ has the same definition as the *Power Island Noise* level and must comply with the requirements in Sections 4.1B, 4.3, 4.4~~4.5~~, and the guaranteed noise levels shown in the Contract, Attachment 6 - Performance Guarantees.
$L_{TSN}MEAS$ = the measured GT-5 *Total System Noise* level at a location outside the plant with the *balance of plant equipment noise* and *background noise* included.
LOG_{10} = the common logarithm (base 10).
dBA = the abbreviation for decibels, A-weighted.

Example 1:

$L_{BGNBOP}BEFORE$ = 56.4 dBA

$L_{BGNBOP}AFTER$ = 58.4 dBA *(before and after measurements are within 3 dB of each other; therefore, valid)*

$L_{BGNBOP}AVG$ = $(56.4 + 58.4) \div 2$

$L_{BGNBOP}AVG$ = 57.4 dBA

$L_{TSN}MEAS$ = 58.3 dBA

$L_{PIN}CORR$ = $10 \times LOG_{10}(10^{(58.3/10)} - 10^{(57.4/10)})$

$L_{PIN}CORR$ = 51.0 dBA *(corrected Power Island Noise with balance of plant equipment noise and background noise removed by calculation)*

Example 2:

$L_{BGNBOP}BEFORE$ = 65.4 dBA

$L_{BGNBOP}AFTER$ = 66.6 dBA *(before and after measurements are within 3 dB of each other; therefore, valid)*

$L_{BGNBOP}AVG = (65.4 + 66.6) \div 2$

$L_{BGNBOP}AVG$ = <u>66.0 dBA</u>

$L_{TSN}MEAS$ = 67.1 dBA

$L_{PIN}CORR = 10 \times LOG_{10}(10^{(67.1/10)} - 10^{(66.0/10)})$

$L_{PIN}CORR$ = <u>60.6 dBA</u> *(corrected Power Island Noise with balance of plant equipment noise and background noise removed by calculation)*

4.9 GUARANTEED NOISE PERFORMANCE AT IN-PLANT LOCATIONS

The *Guaranteed Noise Performance* shall include a composite noise level average as measured around the overall Power Island package inclusive of the following equipment:

- ☐ Gas Turbine Combustion Air Intakes
- ☐ Generator Enclosure
- ☐ Generator Cooling Air Duct
- ☐ Generator Ventilation Air Inlet Vent
- ☐ Generator Ventilation Air Exhaust Vent
- ☐ Generator Enclosure Access Doors and Door Seals
- ☐ Combustion Air Duct
- ☐ Gas Turbine Cooling Air Duct
- ☐ Gas Turbine Enclosure
- ☐ Turbine Enclosure Access Doors and Door Seals
- ☐ Turbine Enclosure Vent
- ☐ Gas Turbine Variable Bypass Vent
- ☐ Expansion Joint between Turbine Enclosure and OTSG
- ☐ Once Through Steam Generator (OTSG)
- ☐ OTSG Stack
- ☐ OTSG Chemical Feed Skid
- ☐ Chiller Package
- ☐ Steam Turbine Generator
- ☐ STG Condenser
- ☐ GSU Transformers
- ☐ Cooling Tower
- ☐ Circulating Water Pumps
- ☐ Boiler Feedwater Pumps
- ☐ Condensate Pumps
- ☐ Ammonia Flow Control Unit
- ☐ Gas Turbine NOX Water Injection System
- ☐ Noise producing start-up and shutdown equipment (incl. gas venting, and steam bypass sources)
- ☐ Fuel Gas Compressor Skid
- ☐ Air Compressor and Receiver
- ☐ Other noise producing sources in Power Island package

The *Guaranteed Near Field Noise Performance* is provided in the Contract, Attachment 6 – Performance Guarantees.

4.10 GUARANTEED NOISE PERFORMANCE AT COMMUNITY LOCATIONS

The *Contractor* guaranteed Far Field Noise performance is provided in the Contract, Attachment 6 – Performance Guarantees. The southwest corner of the "Glenarm Building" has been selected as a common reference point within the plant from which the distance to each of the fourteen receptors shown on Exhibit "A" has been determined. Distances to each receptor location and the ground elevations at each receptor are shown in the Contract, Attachment 6 – Performance Guarantees for informational purposes.

The specific site conditions that exist at the fourteen receptor locations shall be considered a valid, inclusive part of the guaranteed noise levels and measurement results. The effects from terrain features, building structure attenuations and reflections, ground absorption and reflections, and other anomalies specific to the existing site conditions at each test site shall be considered a valid part of the test measurements and the Contractor's noise guarantee. Each of these effects are to be included in the guaranteed noise levels and measurement results. No additional corrections shall be permitted to normalize the results to a standardized "flat-world" test site, other than those listed below.

The other site conditions (not listed above) may have a significant effect on the measurement results and shall be corrected with appropriate post-measurement adjustments or avoided during the measurements. These site conditions include the following:

1. existing background noise from the power plant and/or community;
2. large reflective surfaces other than the ground surface that are closer than 50 feet to the measurement microphone at locations C01, C03, C04, C09, C11, C12, and C14;
3. large reflective surfaces other than the ground surface that are closer than 25 feet to the measurement microphone at locations C02, C05, C06, C07, C08, C10, and C13; and
4. atmospheric conditions such as temperature, wind, humidity, inversions layers and temperature lapses.

The above site conditions shall not be included in the Contractor's guarantee or the measurement results if the effects are considered significant

4.11 TOLERANCE FOR TEST MEASUREMENTS

All test measurement results shall be rounded up or down to the nearest whole decibel value after all corrections are applied according to the procedures listed in these specifications. The resulting decibel level after rounding shall be the used to determine compliance with the guaranteed noise levels shown in Attachment 6 of the Contract, at near-field (in plant) and far-field (community) locations.

4.12 NOISE PERFORMANCE ACCEPTANCE TEST REPORT

A performance acceptance test report shall be submitted to the Contractor not more than two (2) weeks after completion of the tests which summarizes the results of the test measurements for the GT-5 Power Island. The report shall include the following:

a. a description of all measurement instrumentation and settings used;
b. measurement forms with field calibration records and instrument drift;
c. date, time of day, and duration of measurement for all measurements (in-plant and community);
d. approximate duration of start-up and shutdown noise sources such as gas venting or steam bypass;
e. drawing or sketch showing measurement locations inside the plant;

f. aerial map showing measurement locations in the surrounding community;
g. photos of measurement positions (in-plant and community);
h. background and balance of plant noise measurement results (in-plant and community);
i. GT-5 system start-up and shutdown noise measurement results (community) showing corrections applied for background and balance of plant noise;
j. GT-5 system production noise measurement results (in-plant and community) showing corrections applied for background and balance of plant noise;
k. operating load of GT-5 during all measurements (in-plant and community);
l. record of temperature, wind direction, wind speed, and percent relative humidity at all measurement locations outside the plant in the surrounding community;
m. a statement of compliance or non-compliance for each measurement location; and
n. annual calibration certificates for microphones and meters used for the tests.

PART 5 - REFERENCE STANDARDS AND PROCEDURES

The referenced standards and procedures listed below shall be used for general definitions and guidelines, but shall not supersede the noise performance evaluation and measurement procedures listed in these specifications. The *Contractor's* design shall reference current editions of the relevant standards listed below (or the most current versions at the date of notice to proceed). In the event of a discrepancy, conflict, or variance between the performance evaluation and measurement procedures described in these specifications and other standards or procedures external to these specifications, the procedures listed in these specifications shall prevail. Where conflicts exist between the standards listed below, the more stringent requirements shall prevail. Deviations from relevant standards shall only be implemented with the written approval of the City.

1. American National Standards Institute (ANSI)

   a. ANSI S1.4 (R2001) – American National Standard Specification for Sound Level Meters
   b. ANSI S1.13 (R2010) – American National Standard Methods for Measurement of Sound Pressure Levels in Air
   c. ANSI S1.40 (R2011) – Specifications and Verification Procedures for Sound Calibrators (For the use of sound level calibrators manufactured on or after 2006 – latest, preferred)
   d. ANSI S1.40 (1984) - Specifications and Verification Procedures for Sound Calibrators (For the use of sound level calibrators manufactured before 2006)

2. American Society for Testing and Materials (ASTM)

   a. ASTM C634 – Standard Terminology Relating to Building and Environmental Acoustics
   b. ASTM E1686 – Standard Guide for Applying Environmental Noise Measurement Methods and Criteria
   c. ASTM E1014 – Standard Guide for Measurement of Outdoor A-Weighted Sound Levels
   d. ASTM E1124 – Standard Test Method for Field Measurement of Sound Power Level by the Two Surface Method
   e. ASTM E1779 – Standard Guide for Preparing a Measurement Plan for Conducting Outdoor Sound Measurements

f. ASTM E1780 – Standard Guide for Measuring Outdoor Sound Received from a Nearby Fixed Source

3. National Institute of Standards and Technology (NIST)

4. American Society of Mechanical Engineers (ASME)

   a. ANSI/ASME PTC 36 (2004) – Measurement of Industrial Sound

   b. ASME B133.8 (2011) – Gas Turbine Installation Sound Emissions

5. International Electrotechnical Commission (IEC)

   a. IEC 60651 (1979 or 1993) – Sound Level Meters (For the use of sound level meters manufactured before 2003)
   b. IEC 60804 (2000) – Specifications for Integrating-Averaging Sound Level Meters (For the use of integrating sound level meters manufactured before 2003.)
   c. IEC 61672-1 (2003) – Electroacoustics. Sound Level Meters, Specifications (For the use of integrating and non-integrating sound level meters manufactured on or after 2003 – latest, preferred.)
   d. IEC 60942 (2003) – Electroacoustics. Sound Calibrators (Referenced by IEC 61672-1 (2003) – preferred)
   e. IEC 60942 (1997) - Electroacoustics. Sound Calibrators (For the use of sound level calibrators manufactured before 2003)

PART 6 - ABBREVIATIONS, ACRONYMS, AND DEFINITIONS

ANSI. American National Standards Institute.

ASME. American Society of Mechanical Engineers.

ASTM. American Society for Testing and Materials.

Audible Tones. See *Dominant Tonal Characteristics*.

A-Weighted Decibels. Decibels are a unit of measure for sound pressure level. A standard reference quantity of 20 micropascals is used for all noise levels or sound pressure levels used in the noise control performance specifications. The A-weighting is an electronic filter or correction that is applied by the sound level meter to approximate the sensitivity of the human hearing system; it is abbreviated dBA when used in these noise control performance specifications.

Background Noise. The measured background noise level at a particular location inside or outside the plant with all *pre-existing plant noise* and the new GT-5 *total system noise* inoperative. The measured background noise levels shall only be used to determine the GT-5 equipment noise levels alone with the background noise and *balance of plant equipment noise* removed by mathematical calculation. The background noise shall include distant surface and air traffic noise and other existing mechanical noises from the community. Measurements of the background noise shall be averaged (L_{EQ}) over a period of 1 to 15 minutes (depending on the statistical results) and shall include noises from both near and far, but shall not include unusual transient noises that significantly affect the measurement results. Examples of unusual transient noises include street vehicle or rail vehicle passbys closer than 50 feet to the measurement microphone, lawn mowing, garbage truck pickups, construction noise, low flying helicopter or aircraft flights directly overhead, nearby dog barking, and nearby human conversation. If a transient noise is anticipated, the measurement shall be paused until the event passes and then resumed. The background noise measurements shall be repeated at a particular loca-

tion if the following statistical results are not met at that location: the *L10* shall be between 2 and 5 decibels higher than the LEQ for the measurement period; and the *LMAX* shall not be more than 15 decibels higher than the LEQ for the measurement period. The duration of the measurement can be increased if the two conditions are not being met.

Base Load Operating Condition. The base load for power generation shall mean the design load that produces the maximum output power of GT-5 that is guaranteed by the Contractor.

Balance of Plant Equipment Noise. Noise producing equipment associated with the GT-5 power generation system excluding all noise generated by equipment in the Power Island contract. Noise generating equipment in the balance of plant contract includes: auxiliary transformers; demineralized water pumps, and possibly steam piping and valves. The balance of plant noise shall not include *pre-existing plant noise*.

BGN. Background Noise.

BOP. Balance of Plant equipment.

City. The City of Pasadena, California; the equipment purchaser and owner.

Contractor. The party chosen by the City to provide materials and services for the Power Island Equipment.

dB or dBA. dB is the abbreviation for decibel; dBA is the abbreviation for A-Weighted decibels.

Dominant Tonal Characteristics. Noise which contains audible tones. Noise whose tonal quality can be characterized as having dominant tones such as a whine, a pitch, a buzz, a hum, a squeal, etc. A dominant tonal characteristic shall be determined when <u>both</u> of the following conditions are found present at any location in the surrounding community outside the power plant: (1) the average *Power Island Noise* level (*LEQ,* un-weighted) in any one-third octave band from 125 Hz and lower exceeds the noise level in both of the adjacent one-third octave bands by an average of fifteen or more decibels, or exceeds the noise level by an average of eight or more decibels in the adjacent bands from 160 Hz and higher; and (2) the overall A-weighted noise level of the *Total System Noise* at the measurement location in the community is within nine decibels (below) the *background noise*, or higher.

Exchange Rate. The rate of integration of the sound level over time when calculating noise exposure limits. A 3-decibel exchange rate permits the noise exposure time to double with each 3-decibel decrease in noise level. Conversely, the allowable exposure time halves with each 3-decibel increase in the noise level.

Gleanarm Building Reference Point. An established point of reference located at the southwest corner of the historical Glenarm Building, which is just south of Glenarm Street and just east of Fair Oaks Avenue. The reference point is shown on Exhibit A in PART 8 of these specifications.

Ground Level. Ground level is a measurement position that is on the finished grade where the PIE is to be located for this project. It shall not include elevated areas such as accessible walkways, catwalks, crows nests, or platforms.

Guaranteed Noise Performance. The *Contractor* shall be responsible for submitting noise level guarantees at locations inside the plant near the equipment, and outside the plant at selected receptor locations. The noise performance of the GT-5 Power Island will be measured at each of the locations to demonstrate compliance with the guaranteed noise levels. The noise level guarantee shall be based on all equipment included in the GT-5 Power Island contract creating a composite or combined noise level. For all noise measurements inside the plant and outside the plant, the *balance of plant equipment noise* and *background noise* shall be mathematically subtracted from noise measurements of the GT-5 Power Island by the methods described in Sections 4.7 and 4.8.

IEC. International Electrotechnical Commission.

L10. A statistical rating of the overall sound pressure levels occurring during a measurement period at a specified location, expressed in decibels, and shall be A-weighted. The number following the "L" (10

in this case) indicates the percentage of time that the noise level was higher than the resulting decibel value during the measurement period. Other statistical levels such as L_{01}, L_{25}, L_{50}, L_{90}, and L_{99} are similar.

LEQ. The energy-averaged overall sound pressure level in decibels at a specified location, using a 3-decibel exchange rate in the measurement of the level unless otherwise stated. The overall LEQ shall be A-weighted. LEQs shall also be used for one-third octave band levels, but without any weighting applied.

LMAX. The overall maximum sound pressure level in decibels that occurs during a measurement period at a specified location, expressed in decibels, and shall be A-weighted using the slow response setting on a sound level meter.

LIMP. The overall impulse sound pressure level in decibels that occurs during a measurement period at a specified location, expressed in decibels, and shall be A-weighted using the impulse response setting on a sound level meter.

LMIN. The overall minimum sound pressure level in decibels that occurs during a measurement period at a specified location, expressed in decibels, and shall be A-weighted using the slow response setting on a sound level meter.

NIST. National Institute of Standards and Technology.

Noise Performance Acceptance Tests. A series of noise measurements conducted during the operation of the GT-5 Power Island. The results of the measurements shall determine the system's compliance with the requirements of the noise performance specifications as described herein.

PIE. Power Island Equipment or Equipment Package.

PIN. Power Island Noise.

Power Island Noise. The combined or composite noise of all noise producing equipment included in the GT-5 Power Island contract only while operating at the base load operating condition for measurements inside the plant, and the *worst-case load condition* for measurements outside the plant. Noise generating equipment in the Power Island contract includes the components listed in Section 4.9. The Power Island Noise shall not include noise from the *pre-existing plant noise* sources. For all noise measurements inside the plant and outside the plant, the *balance of plant equipment noise* and *background noise* shall be mathematically subtracted from noise measurements of the GT-5 Power Island by the methods described in Sections 4.7 and 4.8.

Power Island Vent Noise. An impulsive noise event caused by the release of natural gas during system start-up and shutdown. There is usually one impulsive noise event during each start-up and one event during shutdown. The vent noise level is to be measured with a specially designed vent noise silencer installed so that the impulsive noise created by the gas venting is minimized.

Pre-Existing Plant Noise. All existing power plant noise at the project installation site, which is part of the existing noise environment prior to the installation of the GT-5 Power Generation System. Pre-existing plant noise includes noise from existing power plant equipment only (B3, GT1, GT2, GT3, and GT4 power generation systems). The pre-existing plant noise shall not include surface and air traffic noise, existing community noise, the GT-5 *Power Island Noise*, or the *balance of plant equipment noise* associated with the GT-5 Power Generation System.

RTA. Real Time Analyzer. A sound analyzer that is capable of analyzing the complete sound spectrum in all frequency bands simultaneously in real time. The analyzer shall be equipped with a one-third octave-band filter set from 25 Hz to 20 kHz.

Reference Pressure. Pertaining to sound pressure and sound pressure level. The reference pressure is a predetermined sound pressure in which sound pressures are referenced to in order to determine the sound pressure level, in decibels. The reference pressure used throughout these specifications is 20 micropascals.

Sound Pressure Level or SPL. The term "sound pressure level" shall be interchangeable with the terms, "sound level," or "noise level," expressed in decibels (dB or dBA). All sound pressure levels shall be an RMS (root-mean-squared) value based on a *reference pressure* of 20 micropascals, and shall utilize both slow and impulse response settings on a metering system with a 3-decible *exchange rate*, unless otherwise noted. Noise levels measured with octave-band filtering shall be linear weighted (or no weighting), and overall broadband noise levels shall utilize the A-weighting.

Sound Power Level or PWL. The term "sound power level" shall be interchangeable with the terms, "PWL," or "power level," expressed in decibels (dB). All sound power levels shall be based on a *reference power* of 1 picowatt. All power levels expressed as the overall broadband level or as octave-band levels shall be linear weighted (or no weighting).

Total System Noise. The combined or composite noise of all noise producing equipment from the Power Island and the balance of plant equipment associated with the GT-5 Power Generation System while operating at the base load operating condition for measurements inside the plant, and at the *worst-case load condition* for measurements outside the plant. The Total System Noise shall not include *pre-existing plant noise*.

TSN. Total System Noise.

Worst-Case Load Condition. The operating load of the GT-5 Power Generation System which produces the highest noise level when measured at: (1) receptor C07 shown on Exhibit A, and (2) at the center of State Street due south of the *Glenarm Building Reference Point*. The operating load of GT-5 shall vary in increments of 10 MW between the minimum and maximum loads of the system. The A-weighted noise level shall be recorded at the two measurement locations for each 10 MW increment. When measuring the noise level at any location inside the plant or at guaranteed locations outside of and west of the plant (C01 through C10), the load condition creating the highest measured A-weighted noise level at receptor C07 shall be the *worst-case load condition*. When measuring the noise level at guaranteed locations outside and south of the plant (C11 through C14), the load condition creating the highest measured A-weighted noise level at the State Street location shall be the *worst-case load condition.*.

SECTION 480032
POWER ISLAND PERFORMANCE

PART 1 - GENERAL

1.1 SUMMARY

A. This section and Attachment 6 - Performance Guarantees describes the requirements for verification of the power island performance to meet contract guarantees for net heat rate, total plant net output, air emissions, water consumption and discharge, and noise emissions.

B. The Contractor shall have single source responsibility for all equipment and services furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall provide the following equipment and services for performance testing, including but not limited to the following:

1. TAs for performance testing and to witness performance tests
2. Local gauges, instruments, data loggers, etc. required for the performance test
3. Special tools required for the performance test
4. Performance test schedule of test activities
5. Performance correction curves from ambient to 75°F, 50% humidity.
6. Training of the General Manager's personnel appointed to operate the equipment and involved in commissioning and performance testing
7. Summary performance testing report

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Performance test schedule and site coordination of test activities
2. Plant operators, electricians, mechanics, laborers, and other crafts and labor supervision necessary to assist with performance testing.
3. Rigging/hoisting equipment, man lifts and scaffold
4. Unloading and storage of equipment at jobsite
5. Calibrated station instruments as part of normal operating control system
6. Power supply and temporary lighting
7. Field wiring, cable and conduit connecting Contractor supplied components
8. Compressed air supply to Contractor's connections
9. Fill of all lubrication and control oils, gases, and water

1.4 RELATED SECTIONS

A. Section 480020, Site Conditions

B. Section 480031, Combined Cycle Power Island Noise Control Performance

C. Section 481100, Combined Cycle Power Island

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific services supplied under this Section.

1. American Society for Mechanical Engineers (ASME)

a. PTC 1: General Instructions
b. PTC 4.4: Gas Turbine Heat Recovery Steam Generators
c. PTC 6/6.2: Steam Turbines / Steam Turbines in Combined Cycle
d. PTC 12.2:Steam Surface Condenser
e. PTC 19.1: Test Uncertainty
f. PTC 19.2: Pressure Measurement
g. PTC 19.3: Temperature Measurement
h. PTC 22: Gas Turbines (with Contractor comments)
i. PTC 23: Atmospheric Water Cooling Equipment
j. PTC 46: Overall Plant Performance

2. Cooling Technology Institute (CTI)

a. ATC-105: Acceptance Test Code for Water Cooling Towers
b. ATC-107R: Characteristic Curve for use with ATC-105
c. ATC-128: Code for Measurement of Sound from Water Cooling Towers
d. STD-201: Certification Standard

3. International Organization for Standardization (ISO)

a. ISO 2314: Gas turbines - Acceptance tests (with Contractor comments)
b. ISO 3977: Gas Turbines - Procurement - Part 2: Standard Reference Conditions and Ratings

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

A. Installation and Commissioning Plan

1. The Contractor shall support the BOP Contractor's preparation of the detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 6 months prior to the commencement of site testing.
2. Commissioning plan shall include as a minimum:

a. All tests to be performed by Contractor, referencing the appropriate testing codes and standards including those listed in this Section and equipment specific Sections. Tests to be performed shall be derived from the minimum requirements of the testing codes listed and any additional testing deemed necessary by Contractor in order to prove the equipment to be compliant with the performance requirements specified in the contract documents.
b. Sample data collection sheets listing expected values and having provisions for measured values as defined in the appropriate testing codes listed shall be incorporated into the ICS manuals described.
c. A testing schedule which shall be sufficiently accurate and detailed to facilitate incorporation into the balance of plant construction schedule. The testing schedule shall be submitted in two phases: 1) Preliminary schedule no later than 3 months following contract award, 2) Project-specific schedule submitted with the commissioning plan, no later than 6 months prior to commencement of site testing. The schedule shall detail at a minimum, individual equipment testing and anticipated durations. The schedule shall be constructed using appropriate logic with predecessors and successors assigned to activities to prevent out-of-sequence work and impractical resource loading.
d. Installation and Commissioning Manual, described in subpart 3.1D.
e. Curriculum vitae of any and all proposed Installation and Commissioning Managers, stating their respective experience and qualifications.

B. Test Results

1. A Summary performance test report which contains the plant performance testing results as detailed herein as well as completed equipment performance test data tables, as detailed in the individual equipment specifications under the respective "Instrumentation and Controls" sections. Equipment performance test data tables are found at the back of the respective equipment specification. Plant performance test report for power and heat rate testing shall be made available two weeks after fuel sample analysis is received from the City.

2. Certified copies of test results shall be submitted to the General Manager for acceptance before performance testing is considered complete.

1.8 QUALITY ASSURANCE

A. Refer to Section 481100 Combined Cycle Power Island for general quality assurance requirements.

1.9 SITE CONDITIONS

A. Refer to Section 480020 Site Conditions.

1.10 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

A. Not used

PART 3 - EXECUTION

3.1 COMMISSIONING

A. General

1. The Contractor shall provide onsite commissioning and testing of the Power Island Equipment.
2. The Contractor shall allow for training of the General Manager's personnel appointed to operate the equipment and involved in commissioning and testing.
3. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the right to remove and take away from site such commissioning and test equipment upon acceptance of the performance testing by General Manager. Any and all such instrumentation shall have valid calibration certification, performed within 12 months of the use of the instrumentation. Where instrumentation does not have proof of calibration certification, Contractor shall furnish the services of a qualified instrument technician to field calibrate and certify the instrumentation.

B. Chemical Cleaning and Steam Blows

1. The Contractor shall support final cleaning and steam blow of boiler and steam piping prior to startup completed per the Contractor's standard procedure.

C. Installation and Commissioning Plan Scope

1. The base scope of the installation and commissioning plan shall provide:

a. Demonstration of advance knowledge of project schedules, completion dates, and key event dates.
b. General definition of manpower and material resources required.
c. Demonstration of the means of verifying that all critical calibrations, both mechanical and electrical, have been checked.
d. In addition to the documentation that makes up the base scope the Contractor shall include the services of an Installation and Commissioning Manager to monitor and continuously update the plan during the installation and commissioning period. Proposed Installation and Commissioning Managers shall have sufficient qualifications and experience in the practice of power plant commissioning. If the Installation and Commissioning Manager is deemed incapable, irresponsible or otherwise unfit during the course of commissioning, General Manager shall have the authority to direct his or her removal from the project and direct Contractor to provide a replacement Installation and Commissioning Manager.

D. Installation Commissioning and Startup (ICS) Manual

1. The ICS Manual shall be an integral part of the Installation and Commissioning plan. Each activity in the ICS manual shall be detailed and documented in the Activities Manual and step-by-step instructions provided for carrying out each activity.
2. Contractor shall generator an ICS manual for each major piece of equipment to be tested. Standard GTG Installation and Commissioning manuals are provided.
3. Each activity sheet shall identify as a minimum:

a. The equipment on which the activity is to be carried out
b. Any and all drawings necessary to facilitate commissioning including but not limited to: electrical drawings, wiring schematics, and mechanical drawings.
c. Relevant engineering standards against which the testing is being carried out
d. Special tools required
e. Torque and alignment specifications
f. Piping connection information and drawing identification codes
g. Wiring junction box locations and terminal designations
h. Copies of all calibration reports for gas fuel flow meter on GTG and require PIE vendors to submit calibration reports for instruments they are providing

4. Log sheets shall be provided for recording any and all critical information (alignments, clearances, calibration points achieved etc.) generated during each activity. Log sheets shall include expected values or those ranges required and or permitted by the relevant testing code.
5. Each activity sheet shall also provide signature blocks for the Contractor and General Manager to sign off, thereby verifying the activity was completed to both their satisfaction.

3.2 PERFORMANCE TESTING

A. General

1. The Contractor shall be responsible for demonstrating that all systems in the scope of supply meet design requirements and the complete Power Island System meets performance guarantees.

2. The performance test will be carried out to the equipment manufacturer's standards in general accordance with internationally recognized standards.
3. In general, the method to determine plant heat rate, net output, and noise and air emissions shall be derived from the performance test codes of the relevant International Standards of each component of the equipment, which also provides the criteria for the comparison between the guaranteed and test measured values.

B. Correction to Guarantee Basis Conditions

1. The Contractor shall supply to the City, all correction curves and formulae for the equipment performance parameters which may be required to correct the as-run test values to the specified guarantee values.
2. The tests results recorded during the performance test shall be corrected, as applicable, to those which would have been achieved had the test been carried out at the guarantee basis conditions by using the correction curves and/or formulae.
3. The correction curves and formulae shall be provided in the performance test procedure. A full set of final Correction Curves shall be provided by the Contractor at least 60 days prior to the start of performance testing.
4. The correction curves and/or formulae will include, but may not necessarily be limited to:

    a. ambient temperature
    b. ambient relative humidity
    c. barometric pressure and altitude
    d. fuel gas heating value
    e. fired hours
    f. power factor
    g. gas turbine exhaust back pressure
    h. gas turbine inlet pressure
    i. instrumentation tolerance

C. Performance Test Program

1. The performance test program shall consist of several separate tests. The Contractor shall assure the systems and equipment within the Power Island properly supports each test.

    a. Equipment Operational and Performance Tests

        1) The procedure shall include demonstration of all major equipment trips
        2) Test procedures provided by the equipment Contractor shall be performed to establish a baseline for the General Manager to reference for future periodic performance testing.
        3) Refer to Section 481100, Combined Cycle Power Island for the Contractor's role in testing of individual equipment.

    b. Control System Tests

        1) Demonstrate full capability of the control system.

    c. Power Island Performance Tests

1) Demonstrate ability to meet guarantees for net MW output, net heat rate, auxiliary loads, ramp rates, equipment trips, noise tests, water consumption, ammonia injection rates, etc.

d. Plant Emissions Tests

1) Verify Power Island Equipment meets all guarantee and permitted requirements for air and noise emissions at the required operating loads.
2) Source testing shall be coordinated by the Contractor to be done with CEMS certification.

e. Noise Emissions Tests

1) Refer to 480031 Combined Cycle Power Island Noise Control Performance for noise emission and testing requirements.

D. Remedial Action (refer to Contract terms)

SECTION 481100
COMBINED CYCLE POWER ISLAND

PART 1 - GENERAL

The City of Pasadena proposes to complete a new 1 x 1 combined cycle power plant utilizing two primary contracts. The first is the Combined Cycle Power Island Equipment (PIE) contract which will include the supply and delivery of the major plant equipment. The second contract will be a separate future Balance of Plant (BOP) contract performed by the BOP Contractor which will include the detailed engineering scope of work for the power plant, procurement of equipment not supplied under the Combined Cycle Power Island Equipment contract, along with the construction, installation and commissioning of the new plant.

The plant shall be capable of being operated from the BOP Contractor supplied Power Distribution Center (PDC), as well as the new Control Building Control Room. The turbine control panel equipment, supplied by the PIE Contractor, shall be located in the PDC along with the BOP Contractor supplied Plant Control System (PCS). The PIE Contractor shall supply the Human Machine Interface (HMI) in both the PDC, and remotely in the Control Building Control Room for operating the GTG equipment. The PIE Contractor shall coordinate with the BOP Contractor so that the entire scope of equipment provided under this Section may be operated from the PCS in either location. Plant control system integration is by the BOP Contractor.

The plant needs to have the capability to operate in islanding mode for an indefinite period of time. The proposed equipment described within this specification needs to be equipped to operate in this condition. Islanding mode is defined as a condition where the City of Pasadena's 34.5kV system is disconnected from Southern California Edison, and the Pasadena Water and Power generators continue to operate, responding as necessary, to changes in load. Depending on current operating scenarios, this may mean some of the plant's generators will need to start and come up to load or if already in operation, continue to operate as necessary, responding to changes in load, frequency and voltage. Automatic isochronous load sharing function with other generators in the power plant is not provided by the Contractor. Islanding/droop mode MW setpoint is by operator via GTG HMI or PCS. A black start generator is not a requirement of this specification.

The PIE Equipment shall be designed to accommodate a future auxiliary boiler to maintain temperature of the STG and associated piping systems in warm stand-by mode.

Site plans have been provided for the contractor to be aware of the limited project area available. The site is constrained by the Glenarm Building to the north, the existing GT 3 & 4 gas turbines to the south and existing GT1 & 2 gas turbines to the east. Equipment sizes and configurations proposed by the PIE prospective contractor shall not significantly deviate from the provided site plans.

1.1 SUMMARY

A. This specification including datasheets, appendices, and references identifies requirements for design, shipment, installation, testing, and performance of a complete Combined Cycle Power Island within the scope boundaries provided. The installation of the specified equipment, which is part of the GT5 Combined Cycle installation, will be performed by the BOP Contractor under a separate contract.

B. Equipment supplied shall be new and unused. Refurbished or used equipment is not acceptable. Major equipment shall be sourced from original equipment manufacturers (OEMs).

C. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

D. It is not the intent to specify completely herein all details of design and construction of the equipment/systems. However, the equipment and systems shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall furnish, design, fabricate and test the specified equipment and accessories, including but not limited to the following:

1. Gas Turbine Generator (GTG) and accessories
2. Gas Turbine Inlet Conditioning Equipment (if required for performance)
3. Once-Through Steam Generator (OTSG) with exhaust ductwork, stack, and emissions monitoring connections including expansion joint between GTG and OTSG.
4. 2x100 Tempering Air Fans per OTSG.
5. Steam Turbine Generator (STG) including weather/ sound enclosure
6. ST Steam bypass to condenser valves
7. Platforms and stairs as defined by the detailed equipment specifications. All guard rails and handrails will be three pipe design with toe plate. No angle iron handrail or guard rail will be permitted.
8. Water cooled condenser
9. Wet Cooling Tower and Circulating Water Pumps for STG Condenser Cooling Water
10. Condensate Hotwell Pumps
11. Boiler Feedwater Pumps
12. GTG Emissions control system for NOx and CO to meet air quality permit conditions and applicable federal, state, and local regulations.
13. Continuous Emissions Monitoring System (CEMS) and Data Acquisition & Handling System (DAHS) to meet applicable EPA, state, and SCAQMD regulations including permit conditions
14. Generator Step-up Transformer (one three-winding GSU for both the GTG and STG)
15. 100% Steam Turbine Bypass Valves to Steam Surface Condenser (for sustained operation in bypass mode) along with feedwater desuperheating control valves
16. 2x100% Fuel gas compressors with acoustic enclosure(s)
17. Fuel gas filtration, conditioning, and pressure control to meet Contractor's gas turbine supply requirements
18. Condensate Polisher
19. Microprocessor based control system with one local and four remote HMIs (operator stations) including GTG control system configuration and graphics programming
20. Fire protection within Contractor supplied enclosures compatible with local requirements (excluding STG / Condenser acoustical enclosure, which will be a wet system by the BOP contractor)
21. Lighting and electrical outlets in Contractor supplied enclosures
22. Supervisory instrumentation and protective devices within the Contractor's supply boundaries including terminal connections in the GTG control system panels for wiring connection between GTG/ STG instruments/ control system and BOP control system.

23. Isolation and control valves within the Contractor's supply boundaries
24. Instrument air piping, and actuators within Contractor's scope of supply
25. Compressed, filtered & dried instrument air supply
26. Motors for all motor driven equipment furnished under this specification
27. Couplings, coupling bolts (turbine/generator rotors), and coupling guards
28. Sizing drawings and information (in English units) for all concrete embedments necessary for all equipment or skids furnished, including anchor bolts and conduit
29. Shear lugs normally supplied with engineered equipment.
30. Cleaning and finishing prior to shipment
31. Contractor's standard gray (RAL 7038) and white (RAL 9010) painting for GTG. OTSG will be primer painted only.
32. Startup spares and special tools
33. Engine Performance testing at factory and test reports of results
34. Drawings to support facility design, construction and maintenance
35. Inspection certificates and quality control documentation listed in this Section
36. Complete set of component cut sheets
37. Operating, commissioning, installation and maintenance manuals for the supplied equipment.
38. Priced list of recommended spare parts for two years of operation
39. Special tools and lifting devices required for assembly, operation, maintenance and disassembly of equipment furnished under this specification.
40. Packing and shipping DDP to the Glenarm Power Plant jobsite or alternate location to be identified by the General Manager in the city of Pasadena, CA or other nearby city.
41. Technical advisory services for installation, commissioning and performance testing activities. The PIE Contractor shall provide an on-site project manager and support staff to coordinate technical issues during the installation phase of the project. The project manager will schedule the various sub-vendor technical advisors with the BOP Contractor. The project manager will interface with the BOP Contractor and General Manager for equipment deliveries, assist BOP Contractor warehousing equipment parts, attend weekly project meetings, act as liaison to resolve technical discrepancies with PIE vendor home offices, witness installations, ensure installation manuals are being completed to support turnover and commissioning efforts, etc. The on-site project manager will develop monthly reports for the scope of work he is responsible for. The PIE Contractor should expect to have this manager at the project site from approximately one month prior to the first major equipment shipment through commissioning of the plant. The PIE Contractor will also provide pre-placement on-site inspection of the major foundations, if requested by the General Manager.
42. Operations training
43. Mechanical, electrical and instrumentation maintenance training
44. A full set (5 hard copies and 2 electronic copies) of integrated operations and maintenance procedure manuals of the major equipment provided under the equipment specifications supplied under this Section.
45. Repair and maintenance program pricing for scope of gas turbine services described in this Section

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. All interconnecting mechanical, electrical, and structural materials between Contractor-supplied items (pipe, pipe rack, pipe supports, tubing, fittings, piping accessories, etc.).
2. Balance of Plant Distributed Control System and control system integration
3. Black start emergency diesel generator
4. Auxiliary cooling water pumps
5. Boiler water monitoring and chemical treatment
6. Motor Control Centers (MCC) for Contractor supplied equipment (Power Island Contractor shall furnish all necessary motor and load information to enable the Balance of Plant Contractor to purchase MCC's meeting the requirements of the Power Island Contractor's requirements.)
7. 24 VDC and 125 VDC battery systems and chargers
8. Site grounding grid and lightning protection
9. Water storage tanks for demineralized water, fire protection, and boiler makeup
10. Drains tanks for GTG water wash, boiler blowdown, steam drains, turbine drains
11. Oily water separator(s)
12. Water treatment for boiler makeup and process discharge
13. Chemical receiving and storage equipment
14. Ammonia storage and forwarding system for NOx control
15. Plant lighting and FAA warning lights (if required)
16. Uninterruptible power supply (UPS) system
17. Plant fire protection system (Gas turbine fire protection by Power Island vendor)
18. Foundations and anchor bolts
19. Initial fill of lubricants and chemicals for Contractor supplied equipment
20. All control room furniture required for Contractor supplied terminals, keyboards and printers
21. Bus duct between the generator, generator circuit breaker, line side cubicle and step-up transformer
22. Current transformers (CTs) and voltage transformers (VTs) not integral to generator and terminal compartment
23. Field wiring, cable and conduit connecting Contractor supplied components
24. Finish painting of all enclosures, ducting, stacks and inlet filter house
25. Receipt and off-loading at site
26. Onsite installation labor and equipment
27. Material lay-down area defined by the General Manager
28. Balance of plant control system configuration and graphics programming
29. Electrical, instrumentation and controls wiring up to Contractor's connection points
30. Field labor and plant operator support of Contractor's commissioning and testing engineers

1.5 CODE AND STANDARDS

A. The Contractor's design shall comply with the current editions, at the date of notice to proceed, of relevant national and internationally recognized codes, standards and regulations and all applicable codes, standards, and regulations for the Site as described in Section 480020 Site Conditions. Where conflicts exist between standards, the more stringent requirements shall prevail. Deviations from relevant standards shall only be implemented with the written approval of the General Manager. Listed below are the minimum standards organizations and standards to be observed. Individual equipment specifications may refer to additional applicable standards not cited under this Section. Refer to Codes and Standards section in GTG scope of supply that Contractor considers the applicable sections of the US and ISO Codes and Standards to be the most relevant standards for gas turbine equipment.

1. California Code of Regulations Title 24

   a. Part 1 - California Building Standard Administrative Code
   b. Part 2, Volumes 1 and 2 - California Building Code
   c. Part 2.5 - California Residential Code
   d. Part 3 - California Electrical Code
   e. Part 4 - California Mechanical Code
   f. Part 5 - California Plumbing Code
   g. Part 6 - California Energy Code
   h. Part 8 - State Historical Building Code

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements:

1. The Combined Cycle Power Island shall be designed for outdoor installation and anticipated plant operational life of 30 years subject to the required maintenance, component replacements due to wear and tear, and other factors such as economics and environmental regulation. The expected wear life of expendable, consumable and wear parts will be consistent with good design practice for the following operating profile – Refer to Attachment 1 – Scope of Supply, General Plant Description.

OPERATING PROFILE (FOR PERMITTING PURPOSES ONLY)	
Annual	
Operating Hours	8,760
Total Startup/ Shutdown Cycles	750
Cold Starts (shutdown ≥ 24 hrs)*	365 (one per day) **
Warm Starts (≥ 8 and < 24 hrs)*	365
Hot Starts (< 8 hrs)*	20
**since previous shutdown*	** Contractor notes that since it takes 24 hours for the plant to cool, it is not possible to start cold more than 200 times per year.
Daily	
Startup/ Shutdown Cycles	5 Maximum
Commissioning Hours	200
Black Start Capability	Required (A Black Start Generator is not part of the Power Island Scope)

2. All equipment shall be designed for continuous 24 hour per day outdoor operation with ability to cycle daily from off-line to full load.
3. No single failure of an auxiliary component or system (lube oil pump, Enclosure fans, etc.) shall result in major equipment damage. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.
4. Equipment supplied under this specification shall include additional features recommended by the manufacturer for reliable operation in the ambient conditions described in Section 480020 Site Conditions. This may include but is not limited to gas turbine inlet deicing, enclosure space heaters, etc.
5. Seismic and Wind Loading Design: All major equipment supplied under this specification, as well as auxiliary system equipment and their enclosures, are to be designed, as a minimum, to meet the seismic and wind requirements detailed in Section 480020 Site Conditions.

B. Performance Requirements:

The Power Island shall be guaranteed to meet the following performance requirements:

1. The Gross Electrical Output, or electrical output of the combined cycle plant at the generator terminals, cannot exceed 71 MW on a 64°F day with 61% relative humidity.

2. The gas turbine generator must have a 10 minute start capability with prior established system purge credit . A 10 minutes start is defined as a cold start to full power in 10 minutes or less. There shall be no additional maintenance penalty associated with a 10 minute start.
3. The gas turbine generator in conjunction with the single pressure heat recovery steam generator or Once Through Steam Generator (OTSG) must be capable of operating dry for unlimited periods during start-up and shutdown and emergency trips. That is with no water flow through the tubing, even though the gas turbine is at full or part load for unlimited periods during start-up and shut down of the combined cycle plant. The steam cycle shall be able to startup while the gas turbine is in operation at full load.
4. The CO and NOx catalyst shall be capable of performing without risk of damage or adverse effect on life cycle guarantee in the dry OTSG operating mode. The Contractor shall define how this will be achieved in the Combined Cycle Power Island Proposal.
5. The plant will implement evaporative cooling for steam cycle heat rejection by use of a cooling tower. The cooling tower is to be sufficiently sized to reject all the heat from the steam cycle, auxiliary equipment cooling, and continuous full steam bypass to the surface condenser as well as a mechanical chiller if used for combustion turbine inlet cooling.
6. The Contractor shall provide correction curves or computer software that will permit the General Manager to establish accurate Power Island performance when varying operating parameters; for example:

    a. Ambient air temperature, specific humidity, and barometric pressure
    b. Gas turbine inlet air temperature and relative humidity
    c. Gas turbine and steam turbine load
    d. Power factor
    e. The new plant gross electrical output will be limited at the generator terminals.
    f. The GTG will be required to be designated as an Advanced Turbine Technology under the SCAQMD.
    g. Fired hours on GTG
    h. GTG Inlet pressure drop
    i. GTG exhaust pressure
    j. GTG evaporative cooling water injection or other inlet air treatments
    k. Condenser cooling circulation water temperature and pressure drop
    l. Steam enthalpy (entering condenser, UEEP) characteristic curves vs. exhaust steam flow entering condenser at different vacuum in the condenser (1.5”, 2”, 2.5”, 3” Hg abs)

7. Emissions:

    a. Maximum permissible emission levels which are to be met at the exhaust gas stack within the continuous operating range. The Contractor shall guarantee these emissions limits for a minimum of five years. Refer to Attachment 6 – Performance Guarantees.

8. Noise

    a. The Power Island Equipment must comply with the noise requirements as outlined in Section 480031, Combined Cycle Power Island Noise Control Performance.

9. Reliability Guarantee

    a. Contractor shall guarantee that the Equipment will achieve a reliability factor of at least ninety-eight percent (98%) for a rolling 14 consecutive days during the performance of a reliability test.

1.8 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

A. Information required after Contract Award:

1. After the award of contract, the following data and drawings shall be submitted to the General Manager in accordance with the submittal schedule (Refer to Attachment 11 – Drawing Schedule):

B. Quality Assurance/Control Submittals

1. Submit qualification, inspection and testing procedures for review. GTG quality plan shall be provided. Quality related submittals may include:

    a. Design Data
    b. Test Reports
    c. Certificates
    d. Manufacturer's Instructions
    e. Manufacturer's Field Reports

C. Installation, Operation, Maintenance, and Training Manuals

1. Contractor shall submit for General Manager's review Field Erection Manuals (refer to standard Installation and Commissioning manuals for GTG) and Operation & Maintenance Manuals prepared for the specific equipment furnished under this specification. The manuals shall be an integrated set consisting of information for all the individual pieces of equipment. Where general or standard instructions are used, inapplicable data sheets shall be removed.
2. The Field Erection Manual shall include:

    a. Complete and detailed description of all procedures to be followed to install the equipment and ready it for initial commissioning.
    b. Drawings required for installation

3. Product Operational and Maintenance Manuals shall include:

    a. Five full sets of Operation and Maintenance documentation and two sets of electronic manuals. Electronic manuals shall follow the hard copy format and shall be indexed with the same table of contents to the extent that it is practical.

Electronic manuals shall be searchable pdf format, there will be no exceptions granted to this requirement.

b. Detailed description of all equipment, components, and systems furnished under this Section
c. Installation, Operating and Maintenance Procedures
d. Drawings required for operation, maintenance and repair. Reproducible 11" x 17" prints of wiring diagrams and schematics as required under the electrical and instrumentation portion of these specifications.
e. Descriptive system literature
f. Special shipping, handling, and storage instructions
g. Recommended maintenance frequency and listing of suggested spare parts
h. Maintenance and repair instructions, including procedures and tolerances
i. Special tool as per Attachment 15
j. Bill of materials
k. Parts Lists (commissioning spares, start up spares, two-year spares, complete parts lists)
l. Settings: settings of valves, equipment-protection devices, relays and alarm contact settings for proper operation and/ or as left following factory testing.
m. Text of the manuals with drawings, illustrations, and diagrams shall be in English. They shall refer specifically to the equipment supplied and will be specifically prepared for this project.
n. In addition to operation and maintenance information, the manuals shall also include all necessary information required for the installation of the equipment including but not limited to hoisting, setting on equipment foundations and leveling procedures.
o. Operating instructions shall include all normal startup, running, emergency trip, shut down procedures, emergency troubleshooting and operating procedures, restart following a trip, forced cooling, and precautions recommended to prevent plant deterioration during periods of non-operation and emergency trip.

4. Operations and Maintenance Manuals must be furnished by the Contractor prior to conducting training.
5. Operations and Maintenance manuals shall include literature on all instruments and devices furnished with the equipment.

D. Noise Data

1. Refer to Section 480031, Combined Cycle Power Island Noise Control Performance in the specification for technical requirements.

E. Project Closeout Submittals

1. Contractor shall provide the General Manager with electronic media of all drawings, manuals, and instruction books. All project closeout drawings shall be submitted as .dwg files compatible with AutoCAD.

F. Manufacturers' Warranties refer to Article 13 in the Contract

1.9 QUALITY ASSURANCE

A. General:

1. Contractor shall submit its quality plan to the General Manager within 30 days of Notice to Proceed. This program shall include procedures for quality assurance of all manufacturing activities. As a minimum, it shall address the following:

   a. Responsibilities and authorities
   b. Document control
   c. Design verifications
   d. Subcontractor assessment and control
   e. Calibration requirements
   f. Traceability
   g. Non-conformance control
   h. Inspection and test plans
   i. Internal audits
   j. Records

2. On request Contractor shall submit actual data of quality control inspections results from the Contractor's manufacturing facility.
3. Equipment specified is subject to surveillance during manufacture by the General Manager.
4. The General Manager reserves the right to review any procedures referred to in the Quality Plan.
5. The Contractor shall submit for review by the General Manager the measures to be taken for storage and maintenance of equipment and materials prior to installation, during installation, as well as for the period between the completion of the installation and the time that the equipment is placed in service.

B. Subcontractors

1. The Contractor's sub-suppliers may be subject to quality audit by the General Manager. The Contractor shall include in all orders to sub-suppliers a notice indicating all materials and equipment is subject to inspection by the General Manager as determined by the Quality Plan.

C. Non-Destructive Examinations

1. NDE methods, acceptance criteria, and additional general requirements shall be in accordance with the applicable fabrication code and this specification. GTG Package structural welding and fabrication is performed in accordance with AWS D1.1 to include inspections. GTG package Contractor's quality assurance weld inspection specification meets or exceeds all requirements stated in AWS D1.1 for all NDE methods, including visual. All visual weld inspections are performed by AWS certified weld inspectors.

   Contractor's weld program complies with ASME IX and Contractor's policies require sub-suppliers to comply as well.
2. Visual examination shall be by personnel certified to AWS QC1 requirements. All other NDE shall be by personnel qualified to Level II or Level III requirements of SNT-TC-1A of the American Society for Non Destructive Testing.
3. Visual examination shall be performed before other NDE.

4. Radiographic examinations required shall be done in accordance with the requirements of the appropriate fabrication code or this specification.

D. Testing

1. General Manager reserves the right to witness all factory tests. Contractor shall notify General Manager of scheduled tests 10 working days prior to such tests.
2. Signoff reports of all shop tests shall be submitted to the General Manager for review.
3. General Manager may request for additional or repeat test at City's expense, as deemed necessary by General Manager, in order to declare the equipment in compliance with specification(s).
4. All tests required by regulatory agencies shall be witnessed by an Agency inspector unless specifically waived, in writing, by the Agency. All items tested for regulatory compliance shall be pre-tested prior to scheduling the agency inspector.

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Packaging, Storage, and Handling (for LM6000 GTG, Contractor's standard packaging, delivery, storage and handling procedures are applied to the project.)

1. Packing shall be accomplished in accordance with acceptable commercial practices and at a minimum, the prescribed shipping methods in the original equipment manufacturers' literature.
2. Where the physical size and arrangement permit, equipment shall be shipped completely shop assembled.
3. Shipments to include detailed packing lists. Packing lists shall detail by number, items consigned with each separate shipment.
4. Fabricated pieces shall be blocked, strapped, or otherwise held in position during shipment and shall be further separated by dunnage as necessary to prevent damage. Temporary bracing must be painted yellow for identification.
5. Instrumentation and piping which cannot be adequately protected if attached to the vessel during shipment shall be shipped loose with the vessel. Items shipped loose shall be packed in durable boxes or containers to protect items during shipment. Containers shall be numbered and the container numbers shall be included on the accompanying invoice or shipping bill.
6. Lifting and support points shall be clearly identified.
7. Packages shall be identified with items and serial numbers, purchase order number, and items description. Identifying tags shall be corrosion and weather resistant.
8. The General Manager reserves the right to inspect equipment prior to shipment. Contractor shall notify the General Manager of pending shipment 15 days before shipping date.
9. All equipment shipped by rail shall be supplied with impact recorders (hump meters) mounted securely on the equipment with the car sealed at the factory.
10. Piece marks shall be clearly identified with weather proof enclosures.
11. Vessel nozzle flanges and other connections shall be protected for shipment by securely attaching covers, plugs or other protection to the connections. Blanking flanges shall utilize at least four bolts. Covers shall be constructed of wood, metal or other suitably durable materials and shall be attached with stainless steel tie wire or other suitable fasteners.
12. Unpainted surfaces shall be protected from the weather with weatherproof covers. Machined surfaces shall be coated with a heavy grease or similar material before covering.

13. Weld-ends shall be protected with a consumable rust preventive coating such as Deox-aluminite or equal, and shall be capped prior to shipment.
14. Equipment to be completely free of water prior to packaging for delivery.
15. Where applicable, space heaters furnished as an integral part of any equipment described in these specifications or component thereof shall be designed to operate during equipment storage and after equipment installation, using temporary power prior to installation of permanent power. Such operation of the space heaters on temporary power shall not void the equipment or component warranty. Space heater wiring connections or terminations shall be readily accessible for this purpose.

B. Delivery

1. The packaging, load out, and protection of all equipment to be furnished and delivered by Contractor under the Power Island Equipment contract shall be the full responsibility of the Contractor.
2. Contractor shall be responsible for shipment of all equipment under the Power Island Equipment contract to Glenarm Plant or a place to be identified by the General Manager in Pasadena, California, or a nearby City. The delivery point for equipment will be identified and given to Contractor at least a month prior to start of equipment delivery.
3. The General Manager and/or the BOP Contractor shall be responsible for receiving all Power Island Equipment. In the event the delivered item has an apparent damage, the General Manager and/or BOP Contractor will inform the equipment carrier and Contractor of such apparent damage for further action.
4. Contractor shall replace items damaged in shipment unless the repair scope and procedure has been approved by the General Manager.
5. The unloading of Contractor-furnished Power Island Equipment at the point of delivery specified in subpart 1.10B.2 above will be the responsibility of the BOP contractor under a separate contract.
6. Any special tools for lifting or rigging shall be provided by the Contractor.
7. Contractor shall coordinate major equipment deliveries with the BOP Contractor. Adequate notice shall be provided to the site for mobilization of heavy lifting equipment. Contractor shall not ship weather sensitive equipment without prior coordination with the BOP Contractor.
8. The delivery of all Power Island Equipment shall be done in a span of 16 months. If necessary, equipment shall be temporarily stored at the equipment manufacture's facility or other storage place until ready for shipment. The temporary storage of any equipment prior to shipment to General Manager's designated delivery point shall be at the expense of the Contractor.
9. The transfer of Title and Risk on any Contractor-furnished equipment shall occur at the point of delivery specified in subpart 1.10B.2 above.

C. Contractor shall replace items damaged in shipment unless the repair scope and procedure has been approved by the General Manager.

1.11 FUEL QUALITY

A. Refer to Section 480020 Site Conditions for fuel composition. Fuel to be used for GTG shall meet GE natural gas fuel specification MID-TD-0000-1

1.12 SERVICE/PROCESS UTILITIES

Fire Water	City Water
Potable Water	City Water
Service Water	City Water, GTG water wash water shall meet GE specification MID-TD-0000-4.
Demineralized Water	Existing Demineralizer on the Broadway Site, Water for NOx suppression and SPRINT injection into gas turbine engines shall meet GE specification MID-TD-0000-3.
Instrument Air	80 psig to 125 psig
Service Air	80 psig to 100 psig
Aqueous Ammonia	19% Concentration

1.13 WARRANTY refer to Article 13 in the Contract

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Materials of Construction:

1. Products which contain asbestos are prohibited. This prohibition includes items such as packings or gaskets even though the item is encapsulated or the asbestos fibers are impregnated with binder material.
2. Materials shall be identified with the applicable AISI, ASTM, ASME or SAE number, including material grade on pump data sheets.
3. If the Contractor recommends any materials that are superior to or alternate to the materials specified, the materials shall be listed as an alternate on the data sheets submitted with the Contractor's proposal.
4. Minor parts not identified shall have corrosion resistance equal to that of specified parts in the same environment.
5. Mating parts, such as studs and nuts, constructed of carbon steel, 18-8 stainless steel or of materials having similar galling tendencies shall be lubricated with an anti-seize compound as required by Contractor.
6. Materials of construction for fabrication are as per Contractors' standard.
7. Welding between stainless and carbon steel shall not be permitted.

B. Insulation

1. Vessels, piping and valves shall be insulated for heat conservation as per Contractor's requirements.
2. Contractor shall supply and install external tank insulation including insulating materials, insulation supports as required, insulation cements if required, and insulation jacketing and banding.
3. Insulation materials that meet Contractor's spec are provided. Contractor utilizes winterization consisting of heat tracing and insulation resulting in suitability of the unit for the ambient temperature of the project.
   Any Steam Turbine thermal insulation in Contractor's scope will be in accordance with manufacturer's standard procedure.
4. Insulating Cement shall be the requirements of ASTM C474.

C. Welding:

1. Personnel performing or supervising the visual examination of welds, including ASME Boiler and Pressure Vessel equipment, shall be qualified or Certified Welding Inspectors in accordance with the American Welding Society, AWS QC-1.
2. All welds shall receive 100% visual examination in accordance with AWS Dl.1 or ASME codes. Records of these examinations shall be created and documented.
3. All welding on pressure containing components shall be performed in accordance with ASME BPV Section IX "Welding and Brazing Qualifications".
4. Welding procedures shall be qualified in accordance with ASME BPV Code Section IX. Welders shall be qualified in accordance with ASME BPV Code Section IX. Welding procedures and welder qualification records shall be made available to the General Manager upon request.
5. Welding on non-pressure containing structural components such as vessel supports may be performed in accordance with AWS D1.1 "Structural Welding Code".
6. General Manager will provide the services of an independent testing laboratory for field nondestructive examination. Any defective weld shall be removed, rewelded, and retested at Contractor's expense.
7. Nondestructive examination procedures shall be submitted. All nondestructive examinations shall be documented in accordance with the applicable code.
8. For the Steam Turbine, all welding for internal parts will be in accordance with manufacturer's standard procedure except the high pressure parts such as turbine casing and equipment with ASME U Stamp.
9. GTG Package structural welding and fabrication is performed in accordance with AWS D1.1 to include inspections. GTG package Contractor's quality assurance weld inspection specification meets or exceeds all requirements stated in AWS D1.1 for all NDE methods, including visual. All visual weld inspections are performed by AWS certified weld inspectors. Contractor's weld program complies with ASME IX and Contractor's policies require sub-suppliers to comply as well.

2.2 ACCESSORIES

A. Valves

1. All fuel gas isolation valves and bypass valves shall be ball type valves with Class VI shutoff. Instrument valves shall be ball type. All valves shall be located and positioned such that they are manually operable within five feet, measured vertically from the adja-

cent working grade or platform surface. Where placement of a valve for manual operation is not practical or possible, valve shall be furnished with a complete means of remote operation including but not limited to, chain wheel operator and chain or operating rod extension shaft with associated mounting bracket and hardware.

2. All valves shall be API 607 "fire safe" certified or meet the requirements of API-6FA
3. Globe valves shall be ANSI forged steel, butt or socket welded unless otherwise specified.
4. Ball or plug valves shall be ANSI cast steel with raised face flanges.
5. Valves used in GTG packages and BOP equipment skids are as per Contractor's standard design.

B. Skid Mounting

1. When equipment is provided as part of a skid mounted system, the skid base shall be fabricated of structural steel welded to provide a complete base. The base shall contain lifting lugs or trunnions so skid can be moved and positioned with conventional lifting equipment. The base shall be provided with anchor bolt holes for bolting onto a foundation. The size and location of these holes shall be specified on the Vendor's outline drawing.
2. Where more than one heater is provided on a single skid, isolation valves shall be supplied to permit removal of one heater from service while the others are operating.
3. Where more than one piece of equipment is provided on a single skid, the control panel shall be designed and fabricated to permit the complete electrical isolation of one piece of equipment and still have the capability to run the other piece of equipment.
4. Skids shall be designed to facilitate the capture of leaks and furnished with a drain port, designed to allow for the complete drainage of any and all liquid entrapped by the skid structure and/or the skid surface. Such a surface shall be designed with appropriate sloping to permit all liquid to drain to a low point. Steam Turbine skid decks will not be sloped to permit drainage.
5. If a skid is fabricated with a deck or flooring surface, the surface shall be have a minimum of two penetrations per structural steel cell to allow for the simultaneous placement and venting of grout.
6. Control panels and their associated electrical equipment furnished as part of skid-mounted equipment shall be designed and fabricated with appropriate protection from the elements including but not limited to exposure to direct sunlight. Means of protection include protective sun shields and coverings and cabinet heating and cooling systems.
7. Regular maintenance of any and all serviceable elements on an equipment skid shall not require the disassembly or disconnection of any process piping, electrical feeds or control and instrumentation feeds.

C. Marking of Equipment

1. The Contractor shall provide a nameplate for the equipment showing the data required by the ASME BPV Code. All pressure vessels rated higher than 15psig are built to ASME Pressure Vessel Code Section VIII and bear U stamp. Pressure Vessels have ASME U1-A nameplate and data report with National Board registration will be provided.
2. Equipment shall be provided with permanently attached stainless steel nameplates and data shall be stamped or engraved on nameplates. The nameplate material shall be compatible with material to which it is attached to prevent galvanic corrosion. Nameplates shall not be attached to pressure containing surfaces with mechanical fasteners.
3. All equipment nameplates shall be in English.

4. Legends for equipment identification nameplates shall be submitted with drawings.
5. Instrument tags shall also be stainless steel with data engraved or stamped on the tags. The tags shall be securely wired to the supplied instrument

2.3 INSTRUMENTATION AND CONTROLS (Contractor's standard instrumentation and controls are provided for LM6000 GTG)

General

1. The Power Island shall be equipped with all necessary controls configured for complete start-up, automatic or manual synchronizing, loading, operation and shutdown from the General Manager's main control room and from a Contractor furnished local operator interface located in the self-contained control compartment of the Electrical/Control Package. The self-contained control compartment (provided by Others) shall be climate conditioned and contain Contractor furnished vibration monitoring equipment, GTG and STG protective relay and meter control panel, auxiliary panels (as required), motor control centers (provided by Others), battery packs and chargers (provided by Others) for DC powered equipment, and one of the operator interface workstation or HMI. Contractor to furnish the electrical support interface requirements and loads imposed on the foundation. All equipment furnished under this scope of work shall be able to interface with the plant control system via Modbus TCP.
2. Remote operator interface workstations or HMI for (Four for GTG and one for STG) shall also be provided by the Contractor for installation in the General Manager's main control room for remote operations of the gas turbine and steam turbine generators. Main control room furniture for Contractor-supplied controls components will be supplied by Others.

Limit Switches

1. Limit switches, when required, shall be factory mounted on the valves with provisions for adjusting the limit switch +/- 12mm (0.5 inches) along the axis of the valve stem.
2. All control valves not specified to be equipped with a position transmitter on the respective control valve data sheet shall be provided with fully opened and fully closed limit switches.
3. In general, limit switches and/or electrical connections shall be weather tight inside NEMA 4 approved enclosures with readily accessible terminal blocks in accordance with Section 260000 Electrical-Mechanical Equipment.

C. General Transmitters

1. Transmitters shall be rated for installation in the hazardous area classification listed in the attached data sheets.
2. All transmitters shall meet the following minimum requirements:

D.C. Voltage Level	Between 12 to 42 volts
Signal current	Between 4 to 20 mA
Accuracy (of signal current with respect to measured variable) of instrument	From 1% to 2.5% according to the measurement range and type of instrument

Linearity	0.1% of span
Repeatability	0.1% of span
Stability	0.1% of nominal input range per annum
Dead Band	Not exceeding 0.1% of span
Hysteresis	Less than 0.2% of output span
Maximum permissible effect on output for vibration between 5 and 300 Hz at $10m/s^2$ (1g)	+/- 1.0% of output span
Maximum shock without permanent damage	$1000\ m/sec^2$ (100g) in any plane
Relative Humidity range	5 - 95%
Ambient temp. range	-18˚C - 80˚C (0˚F - 175˚F)
Ambient temp. effect	Not exceeding 0.5% of maximum span per 10˚C change
Design pressure rating	Not less than 200% of maximum process static pressure

3. Pressure Transmitters

   a. Rosemount Pressure or equal Transmitters shall be “Smart” and support 2-wire, 4-20mA signal with HART protocol communications for device calibration, configuration, and testing, communication of HART variables to the control system via HART is not required. Transmitter shall allow range change on site by re-programming via HART communicator. HART communicator is not provided in Contractor’s scope of supply.
   b. Pressure transmitters shall be capable of continuous operation at the maximum pressure rating of the line or vessel.
   c. Transmitters shall be furnished with an inline block-and-bleed valve.
   d. Transmitters shall be wired out to junction box for connection to turbine control system.
   e. Transmitters shall be completely factory calibrated and configured as appropriate for design conditions.
   f. BOP Equipment skid pressure transmitters are per manufacturer’s standard.

4. Temperature Transmitters

   a. Temperature transmitters shall be used to provide 4-20mA temperature signals to the Contractor’s Control System.

b. Transmitters shall be fitted with a local indicator factory configured to display temperature in ˚F where possible.
c. Temperature element may be dual element probes.
d. Thermowell shall be provided appropriately sized for design conditions.
e. Transmitters shall be completely factory calibrated and configured as appropriate for design conditions.
f. Temperature transmitters and element assemblies shall be provided with weatherproof terminal heads and shall be installed so as to totally prevent ingress of foreign material.

5. Position Transmitters

a. Valve position transmitters shall be provided for all modulating control valves and shall be either integral to valve positioner or factory mounted on the valve. Position transmitter feedback to the Contractor's Control System may be via analog 4-20mA analog signal. Position transmitters shall be reliably coupled to the valve shaft and shall provide position indication with repeatable accuracy of within 1% at all times. The positioner transmitter shall be housed in weather tight; NEMA approved enclosures in accordance with Section 260000 Electrical-Mechanical Equipment. Transmitters shall have a temperature rating of 80˚C (175˚F). Transmitters shall be factory calibrated and capable of calibration in place in the field.
b. Analog 4-20mA type position transmitters shall transmit valve position to the Plant Control System (PCS) via Modbus TCP/IP communication link.

D. Positioners

1. Positioner shall be designed for a control signal input range of 4-20 mA. Positioner shall not be provided with bypasses.
2. All positioners shall be equipped with 40 micron filter/regulator air supply sets mounted on the valve yokes. If the positioner can accept the maximum air supply pressure, a 40 micron air filter only shall be provided. All air venting enclosure ports shall have stainless steel screens with goose neck vents to protect from direct exposure to water or dirt. Digital positioners shall be used.

E. Solenoid Valves

a. Valves shall be selected to incorporate body construction, trim materials, and internal arrangements suitable to the application. Solenoid enclosures shall be housed in weather tight; NEMA approved enclosures in accordance with Section 260000 Electrical-Mechanical Equipment. Solenoid coils shall be Class H (High Temperature/Heavy Duty) construction and shall be suitable for continuous duty.
b. Solenoid valves shall be rated for 8.6 barg (125 psig) air supply pressure.
c. Solenoid valves shall be the three-way type and four-way type depending upon application, with trip reset and manual operators for auto-controlled valves.

F. Level Gauges

1. Reflex glass or magnetic level gauges will be used. Level gauges for high pressure service will have suitable personnel protection. Gauge glasses used in conjunction with lev-

el instruments will cover a range that includes the highest and lowest trip/alarm set points.

G. Gauge Glasses

1. A protected liquid level gauge glass shall be provided with necessary gauge valves as required. The visible section of the gauge glass shall span the full operational range with an additional 38mm (1.5") above and below the highest and lowest range levels.

H. Pressure Gauges

1. Pressure gauges shall be white background with black text. Normal operating pressure should fall within 30 – 70% of the gauge span.
2. Ashcroft type 1279 pressure gauges or equal shall be supplied for visual monitoring of gas pressures. All pressure gauges shall be 115 mm (4-1/2") in size, and liquid filled with Phenolic cases.
3. The gauges shall be isolated from the line by a root valve and rear blowout type.

I. Level Switches

1. All Level switches shall be isolated by flanged ball valves. The liquid level switches shall be rated so that the internal floats will float in fluids with a specific gravity of 0.500 or higher.
2. Switches and electrical shall be furnished with explosion proof housings. Switch contacts will have a dual form "C" configuration.
3. Type: External cage displacer
4. Switches: 5A@125 VDC or 24 VDC

J. Automatic Liquid Level Controllers and Drain Valves

1. Where liquid accumulation is expected to be frequent, the drains system for each vessel shall include one externally caged differential gap liquid level controller complete with flanged isolating ball valves, and one (1) pneumatically actuated 25 mm (1") automatic drain valves (fail closed), globe type, RF flange ends with 25 mm (1") SW ends isolating ball valves and 25 mm (1") SW ends globe bypass valve. The drain valve will use air for actuation. Control valves shall be supplied with actuators, positioners, regulators, and other accessories to provide an operable system.

K. Temperature Gauges

1. Temperature gauges shall have at least 1% accuracy.
2. Ashcroft type 50EL42E or equivalent with 5 inch dials and every-angle stems shall be used. The normal operating temperature shall be at least 50% of the full scale.
3. All temperature gauges shall use thermowells appropriately sized for design conditions.

L. Instrumentation Tubing and Valves

1. All gages shall be provided with isolation valves. All instrumentation fittings are to be Swagelok. Instrument valves shall be stainless steel ball, needle, or globe as required.
2. Instrument tubing shall be 12mm (0.5") O.D. stainless steel. Tubing is to be properly supported at no less than 1 m (3 ft) intervals and shall not support weight of valves and

instruments. Sensing lines shall be sloped downward toward the process a minimum of 2%.

3. All gas or vapor process connections to instruments shall have 6" long drip legs with drain valves at the instrument connection point to permit the periodic drainage of accumulated condensation.
4. All instrumentation capable of being read directly shall be mounted such that they are visible during normal operation of equipment. Where instrumentation is located in areas that may not be occupied during operation of equipment, provisions shall be made for the reading of instruments in those locations by means of remote indication. Examples of instruments that require observation but are not accessible during equipment operation may include jacking oil filter differential pressure within the generator enclosure and compressor oil level in the chiller module.
5. For GTG scope, All tubing and piping shall be adequately supported with sufficient separation/clearance to prevent rubbing or chafing. Tubing shall be seamless stainless steel per ASTM A269.

2.4 ELECTRICAL

A. General

1. All electrical components shall meet appropriate requirements for hazardous classified locations. Wiring shall run through conduit suitable for hazardous area classification given on the attached data sheet.
2. The complete electrical installation of the scrubber skid shall comply with the requirements of the National Electrical Code.
3. All the electrical devices shall be wired and connected in the Contractor's factory as much as possible. All wiring, which requires connections external to the skid, shall be brought out to a junction box with terminal boards or directly connected to the devices. The junction box shall be located at the edge of the skid base.
4. All terminals in the junction box shall be identified and wiring shall be run in rigid steel conduit. Terminal boxes on all electrical devices pull boxes, and other conduit fittings shall be watertight and all conduit threads shall be sealed. Conduit shall be adequately supported. All conduit shall be RGS and all cut threads shall be touched up / re-coated to prevent oxidation.
5. See Section 260000 Electrical Mechanical Equipment for specific requirements of supplied electrical equipment.

B. Generator Rating

a. Electrical generators shall be capable of delivering rated load at any set voltage within plus or minus 5% of the nominal voltage. The minimum generator MW rating is specified in 480020 Site Conditions.
b. Electrical generators shall be fully capable of operation within the power factor range specified in 480020 Site Conditions under all conditions without limitation by any device such as the under excitation limiter or over excitation limiter. The only allowable exception to this is due to coordination with steady-state stability limits in which case calculations shall be provided by the Contractor to show that is required.

c. Electrical generators shall be capable of sustaining 130% of rated armature current for one minute and 125% of rated field current for one minute without damaging the unit.
d. Electrical generators shall be able to withstand a 20% overspeed for one minute without damage to itself and shall be braced for full short circuit 3 phase fault at terminals for ten seconds, according to IEEE C50.13, latest revision.
e. Electrical generators shall be capable of synchronizing and parallel operation without excessive harmonic and circulating currents. The Contractor shall submit maximum levels for these currents.
f. Electrical generators shall comply with the following IEEE standards:

1) C50.10 General Requirements for Synchronous Machines
2) C50.13 Requirements for Cylindrical Rotor Synchronous Generators
3) C50.14 Gas Turbine Driven Cylindrical Rotor Synchronous Generators

C. Grounding

1. Two ground cable connector pads shall be supplied and mounted on opposite corners of the base of every skid supplied, refer to Contractor's earthing and bonding drawing for GTG scope.

2.5 CIVIL AND STRUCTURAL (refer to installation footprint drawing 969224 for GTG scope)

A. General: The Contractor shall specify all foundation requirements including normal, wind, seismic, and transient loads for major equipment and accessories (e.g., size and number of anchor bolts, grouting requirements).

B. Platforms and Stairs

1. Platforms and caged ladder(s) shall be furnished to provide adequate access for maintenance of the inlet air filter system. All permanent platforms, ladders and handrails shall be in full compliance with OSHA standards. Handrails and guardrails shall be three-rail with toe plates. The location of ladder(s) shall be coordinated with the General Manager to avoid possible interferences.
2. Where space permits, platforms shall be a minimum of 3' - 0" wide and overhead clearance for personnel shall be a minimum of 7' - 0". In any case, platforms are to meet OSHA and CalOSHA standards.

C. All structural and miscellaneous steel design shall be in accordance with the requirements of AISC "Specification for the Design, Fabrication and Erection of Structural Steel for Buildings.

1. If, by calculation, shear lugs are required to transfer shear loads from a column to the foundation, the Contractor shall provide shear lugs welded to the bottom of the baseplate.
2. Full provision shall be made so that each component can expand and contract under the operating cycle of temperatures without damage. Expansion joints, guides, braces, stiffeners, etc. shall be provided as required so thermal movement can be accommodated in a conservative manner without deleterious side effects.
3. All structural components shall be stiffened and braced to prevent detrimental distortion, deformation or excessive vibration. Stress analysis shall consider the most severe load combinations.

4. Structures, equipment, buildings, acoustical enclosures and the top surface of horizontal ducts shall be designed so that the surfaces are self-draining.
5. Shop connections shall be either welded or high strength bolted. Size, location, and type of field welds shall be identified on appropriate drawings.
6. All structural joints using high-strength steel bolts shall be slip-critical connections when required by AISC. All bearing connections shall be designed with threads in the shear plane.
7. All structural steel welding shall be in accordance with AWS D1.1

D. Loads: Equipment shall be designed structurally for the following load conditions:

1. Dead Loads (DL): Dead load shall consist of the weight of all permanent construction including, but not limited to, fixed equipment, framing, piping, floors, walls, roofs, partitions, insulation, stair, handrail, ductwork, siding, cable trays and other structures and the contents of all tanks. However, the contents shall not be considered in resisting column uplift loads.
2. Live Loads (LL): Live loads shall be considered as loading not permanently fixed to the structure and occurring over areas not occupied by equipment.
3. Equipment laydown loads shall be considered as live loads. However, no live load reduction will be permitted in areas where laydown loads are considered.
4. Wind Loads (WL): Wind pressure and shape factors to be applied to all outdoor system components and exposed equipment shall be determined in accordance with the governing building code(s).

    a. Allowance shall not be made for the effect of shielding by other non-Contractor supplied plant structures within the plant site.
    b. The overturning moment calculated from wind pressure shall not exceed two-thirds of the dead load resisting moment.
    c. The uplift forces calculated from the wind pressure shall not exceed two-thirds of the resisting dead loads.
    d. For determining stresses, all vertical design loads, except roof live loads and crane loads (both vertical and horizontal), shall be considered to be acting simultaneously with the wind pressure.

5. Seismic Loads (SL): Seismic and snow loads shall be applied to all system components as applicable in accordance with the governing building code(s). No credit for friction shall be taken in designing anchor systems to resist lateral loads.
6. Thermal Loads (TL): All components and equipment shall be designed with due consideration to the forces due to contraction or expansion resulting from temperature changes, shrinkage, moisture changes, creep in components materials, or combinations thereof.
7. Load Combinations: Most severe of the following load combinations shall be used in the design of buildings and structures excepting reinforced concrete structures.

    a. Dead plus Live Loads
    b. Dead plus Wind or Seismic Loads (with appropriate load reductions)
    c. Dead plus Live plus Wind or Seismic Loads (with appropriate load reductions)

8. Deflection Limits: In general, member deflections shall be limited to ensure good structural performance. Deflection of primary structural framing members, including beams supporting platforms and other working surfaces, shall not exceed 1/240 of their span. Deflection of secondary member shall not exceed 1/180 of their span.

E. Materials: All materials shall be new and provided in accordance with the material standards listed in this Section. Structural steel members shall be blast cleaned and primed in accordance with Contractor's paint specification for GTG scope.

1. The following materials shall be used for structural steel members unless prior authorization is approved by the General Manager.

a. Structural Steel: ASTM A36 or ASTM A572 Gr. 50
b. Ladder(s): ASTM A36
c. High Strength Steel: ASTM A572, Gr. 50
d. Structural Tubing: ASTM A500 Gr. B
e. High Strength Bolts ASTM A325, Type 1
f. High Strength Nuts/Washers: ASTM A563 Gr. DH/ASTM F436
g. Common Bolts: ASTM A307 Gr. B
h. Pipe Handrail: 1 1/2 in. Schedule 40, ASTM A53 Type E or Type S, Gr. B or ASTM A500 Gr. B
i. Safety Chain, 1/4 in. diameter with 1 1/4 in. links: ASTM A413, Class PC.
j. Steel Floor Grating and Stair Treads: ASTM A569
k. Checkered Floor Plate ASTM A786, Pattern No. 4
l. Miscellaneous Structural Catwalk and Stair Tower: Steel shall be hot-dipped galvanized excluding the internal SCR catalyst access platforms and ladders

2. High Strength Bolting:

a. Obtain and submit certifications that bolts, nuts, and washers comply with all of appropriate requirements of applicable specifications. Provide complete manufacturer's test reports to document that the chemical and mechanical requirements of applicable specifications are achieved. For acceptance of fasteners, lot numbers must appear on product containers and correspond to lot identification numbers on test reports. Verify manufacturer's symbol and grade markings appear on all bolts and nuts.
b. Complete and submit representative sample tests for bolt tightening per AISC Specification for Structural Joints for approval prior to installing any bolts.
c. High-strength bolting inspections, tests, test and inspection acceptance standards, and remedial procedures for slip-critical type connections: AISC "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts," except as specified herein.
d. Randomly inspect 10% of all high strength bolted slip-critical type connections for each bolt size as follows:

1) Inspect bolts tightened using the turn of the nut method: Specification 9(b) of AISC Specification for Structural Joints.
2) Bolts tightened using direct tension indicator washers: Feeler gauge to acceptance requirements in ASTM F959.

e. Method of sampling for high-strength bolts: "Production Lot Method", ASTM A 325.

2.6 FABRICATION

A. Shop Assembly

1. Skid mounted systems shall be fully assembled for functional checks in the Contractor's facility prior to shipment. Skids may be partially disassembled if necessary for shipment.

B. Shop/Factory Finishing

1. Cleaning

a. Surfaces of the base shall be cleaned of all scale, rust, grease and other foreign matter. Contractor supplied pre-painted items; stainless steel tubing and any other non-carbon steel items shall be solvent cleaned.

2. Painting

a. After cleaning, the base and the exposed non-stainless steel piping shall be painted. Prior to shipment of skid mounted systems, the entire skid including the base, exposed piping, pre-painted Contractor items, tubing and all other non-stainless steel items shall be painted.
b. Color scheme for painting will be specified by the Contractor and applied per Contractor's standard procedures.
c. Structural and Miscellaneous Carbon Steel

1) The following requirements shall apply for all exposed structural and miscellaneous carbon steel shapes, plates, stiffening or support elements extending through insulation that are not hot-dipped galvanized.
2) Surfaces shall only be primed. General Manager will apply the finish paint. Surfaces to be primed shall be blast cleaned in accordance with Contractor's paint specification for GTG scope.
3) One of the following painting systems, or Contractor approved equivalent, shall be used:
   a) Ameron Dimecote 9HS
   b) Carboline Carbo Zinc 11HS
   c) Tnemec Co., Inc 90E-92 Treme-Zinc
   d) USC Ameron PSX700 or Contractor Standard.

3. Cleanliness and Workmanship:

a. All parts, components and assemblies shall be thoroughly cleaned prior to and after assembly and test, including removal of all loose, spattered or excess soldering or welding materials, burrs and sharp edges. All openings are to be securely covered against entry of foreign material after cleaning.
b. All hydrocarbon based preservatives and/or compounds must be flushed out of the vessel prior to hydro testing.
c. Hydro testing shall be performed with demineralized water containing non-hydrocarbon based corrosion inhibitor.
d. At the completion of the hydro testing, the vessel shall be drained and internally air-dried with 200^{o}F fan forced dry hot air for a minimum of 4 hours and then protected by the application of a corrosion inhibitor.

2.7 SOURCE QUALITY CONTROL

GE Aero is ISO 9001:2008 certified facility. The Quality Management system is applicable to design, manufacturing, factory repair/refurbishment, and project management of installation and commissioning of Aeroderivative gas turbine generators.

Contractor shall supply the GTG equipment in accordance with its Quality Procedures.

A. Tests and Inspections

1. Inspection and testing shall be in accordance with the codes specified.
2. Instruments shall be protected during hydro testing.
3. Wiring shall be checked for continuity and insulation integrity.
4. Control system IO shall be loop checked.
5. Filters shall be removed for hydro test of filter housing.
6. Full information describing the tests which are included in the bid price shall be included with the Proposal.
7. Certified copies of all the minimum test results detailed below and identified in equipment specific Sections shall be submitted for acceptance before shipment of the equipment is made.
8. As a minimum, the following tests shall be performed:

    a. Hydro Test in accordance with the requirements of the ASME Boiler Pressure Vessel Code, Section VIII, Division I or ASME B 31.1
    b. Electrical Wiring Check-Out
    c. Equipment Performance Test

9. All tests required by regulatory agencies shall be witnessed by an Agency Inspector unless specifically waived, in writing, by the Agency. All items tested for regulatory compliance shall be pre-tested prior to scheduling the Agency Inspector.

B. Verification of Performance

1. Certified copies of test results shall be submitted for acceptance before shipment of the equipment is made.
2. Copies of the ASME U-1 reports, test, and inspection results shall be furnished to the General Manager.

C. Contractor shall give General Manager at least three weeks prior notice in writing of the date on and the place at which any Works shall be ready for inspection and testing.

D. The General Manager shall have the right to reject equipment or equipment components if found not to conform to the specifications.

E. The Contractor shall establish an inspection plan for the equipment that will include observation by the General Manager of pertinent manufacture and test operations. The Contractor shall cooperate with, and assist as necessary, the General Manager’s inspectors and provide reasonable access to the Contractor's facilities to observe tests and make inspections in accordance with the Contract.

F. Weld inspection, examination and testing

1. Personnel performing or supervising the visual examination of welds, including ASME Boiler and Pressure Vessel equipment, shall be qualified or Certified Welding Inspectors in accordance with the American Welding Society, AWS QC-1.
2. All welds shall receive 100% visual examination in accordance with AWS Dl.1 or ASME codes. Records of these examinations shall be created and documented.
3. General Manager will provide the services of an independent testing laboratory for field nondestructive examination. Any defective shop weld shall be removed, re-welded, and retested at Contractor's expense.
4. Nondestructive examination procedures shall be submitted. All nondestructive examinations shall be documented in accordance with the applicable code.

G. Instrument Calibration

1. Calibration reports shall be provided for any and all instruments furnished as part of the equipment listed in these specifications. It is recommended that the Contractor be especially mindful of this requirement.
2. Calibration reports shall be provided by the Contractor for instrumentation calibrated by the Contractor at the Contractor's works, instrumentation that is purchased by the Contractor "factory calibrated" from an instrumentation manufacturer and instrumentation supplied as part of a packaged skid purchased by the Contractor from a third party. In any case where instrument calibration reports are not available for any equipment listed in these specifications, Contractor shall, at own expense, perform field calibration and provide a field calibration report to satisfy this requirement.
3. Performance of such field calibration of instruments shall not void any equipment warranty.

H. The Contractor shall prepare a test report for each shop test. The test report shall indicate as a minimum, actual measured values, required values, manufacturer's accepted values (where requirements are not specifically identified as part of these specifications), what procedure was used to perform the test, the date of the test and personnel who performed and witnessed the test.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Painting (Contractor's standard painting system for GTG shall be provided)

1. Structural and Miscellaneous Carbon Steel

a. The following requirements shall apply for all exposed structural and miscellaneous carbon steel shapes, plates, stiffening or support elements extending through insulation that are not hot-dipped galvanized.
b. Surfaces shall only be primed. General Manager will apply the finish paint. Surfaces to be primed shall be blast cleaned in accordance with SSPC-SP6, "Commercial Blast Cleaning."

c. One of the following painting systems, or General Manager approved equivalent, shall be used:

1) Ameron Dimecote 9HS
2) Carboline Carbo Zinc 11HS
3) Tnemec Co., Inc 90E-92 Treme-Zinc

d. All painting for STG will be in accordance with manufacturer's standard painting procedure.
e. All painting for Air Compressor, Inlet Chiller, Gas Compressor and CEMS will be in accordance with manufacturer's standards panting procedure.
f. OTSG will be prime painted only.

3.2 FIELD QUALITY CONTROL

A. Field Testing

1. The field testing scope of the combined cycle plant comprises two major components; individual equipment commissioning and plant performance testing. Individual equipment commissioning requirements are described in this Section and the respective equipment specifications. Plant performance testing requirements are described in Section 480032 Power Island Performance.
2. The Power Island Equipment Contractor (Contractor) shall be responsible for successfully completing the individual equipment commissioning to the satisfaction of the General Manager. The Contractor will be performing these duties under the direction and supervision of General Manager's BOP Contractor, who shall have ultimate responsibility for scheduling, coordinating and supervising individual equipment commissioning as well as plant performance testing.
3. The BOP Contractor shall also be responsible for collecting and organizing test documentation for submittal to General Manager. Contractor shall be responsible for validating all equipment commissioning and plant performance test results data against the requirements of the specifications and verifying that the performance criteria were met prior to furnishing test data to the BOP Contractor.
4. Contractor shall cooperate fully with the BOP Contractor in the performance of testing responsibilities, which includes but is not limited to prompt and responsive scheduling of field technicians, making available manufacturers' factory technical agents for trouble-shooting assistance, finalizing and furnishing test records and general support of BOP Contractor in all aspects as needed to facilitate testing.

B. Field Acceptance Tests

1. In the event that the plant does not meet performance guarantees, Contractor to test individual plant components as required to locate the deficient equipment.
2. The entire expense of the field tests required indicating the effect of such deficiencies and remedial alteration and modifications shall be borne by the Contractor. The "entire expense" shall be interpreted as all expenses incurred during the field testing other than the normal operating staff of the General Manager.
3. The Contractor shall prepare a certified test report for each field test. The test report shall indicate as a minimum, actual measured values, required values, manufacturer's accepted values (where requirements are not specifically identified as part of these specifications),

what procedure was used to perform the test, the date of the test and personnel who performed and witnessed the test.

4. Certified copies of test results shall be submitted for acceptance before field testing is considered complete.

C. Performance Tests

1. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Contractor shall accommodate this objective in the design of their equipment and Contractor shall furnish any and all transmitting instrumentation required to observe and record the process conditions listed in the attached datasheets.
2. Performance testing instruments shall be furnished regardless of whether or not they are required by Contractor's control system for ordinary equipment operation. These instruments shall be furnished and calibrated in accordance with the requirements listed in this Section.
3. The performance data sheets shall then be completed and submitted as part of the plant performance testing described in Section 480032, Power Island Performance Testing.
4. Plant performance testing shall only be performed following successful completion of all individual equipment and unit system commissioning.

3.3 COMMISSIONING

A. Refer to 480032 Power Island Performance for Power Island commissioning and performance test requirements.

3.4 TRAINING

A. Operation and maintenance training shall be provided during 3 different shifts for up to 25 end user operation and maintenance personnel (not including travel and accommodations) and shall include the following topics:

1. Minor mechanical and electrical maintenance
2. Controls and instrumentation
3. Specialist training

B. The training program shall be appropriate for the end user's staff including Engineers, Supervisors, Operators, and Technicians.

C. The training program shall be conducted at the General Manager's facility unless there is a need to visit equipment at the manufacturer's facility or an operating site with similar equipment.

D. Training for particular equipment shall be based on the site specific Operations and Maintenance manuals provided by the Contractor.

3.5 SPARE PARTS

A. Contractor shall furnish with the equipment a set of spare parts and consumables required for startup and commissioning.

3.6 REPAIR AND MAINTENANCE PROGRAM PRICING refer to Attachment 16 in the Contract

SECTION 485122.11
STEAM BYPASS VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. This specification details the minimal technical requirements for the design, manufacture, testing, and furnishing of steam bypass control valves, actuators, and instrumentation. It is not the intent to specify completely herein, all details of design and construction of the equipment/systems. However, the equipment/system shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. Steam turbine bypass to condenser with steam conditioning equipment
2. Feedwater control valves for desuperheating
3. Automated valve heating arrangements for bypass valve bodies
4. Special tools required for maintenance and adjustments of the valves, actuators, and accessories.
5. One set of blow through kits per valve with the base valve order to support the valve-commissioning program.
6. Hydro kit for each bypass valve type and size
7. Shop testing and inspection of the fully assembled valves
8. Cleaning and shop painting of all valves, actuators, and accessories
9. Drawings and design data to support facility design, construction and maintenance
10. Inspection certificates and quality control documentation listed in this Section
11. Complete set of component cut sheets
12. Operating, commissioning, installation and maintenance manuals for the supplied equipment
13. Priced list of recommended spare parts for two years of operation
14. Valve trim sets shall be shipped separately.
15. Packing and shipment FOB to the Glenarm Power Plant jobsite or alternate location to be identified by the General Manager in the city of Pasadena, CA or other nearby city.

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be include the following:

1. Receipt, off-loading, storage, protection of equipment at General Manager's designated delivery point, and erection of equipment at the plant site
2. Installation, commissioning, and field performance testing
3. Hydrotesting of steam lines and steam blowout operation. Install the final trim and commission the valves under the supervision of the steam bypass valve supplier
4. Plant control system (PCS) configuration and graphics programming
5. Instrumentation and controls wiring
6. Quick opening steam isolation block valves at the upstream of steam bypass valve
7. Pipe insulation
8. Steam bypass piping to and from surface condenser and once-through steam generator (OTSG).

1.4 RELATED SECTIONS

A. Section 480020 - Site Conditions

B. Section 480031 - Combined Cycle Power Island Noise Control Performance

C. Section 480032 - Power Island Performance

D. Section 481100 - Combined Cycle Power Island

E. Section 485221 - Steam Turbine and TEWAC Generator

F. Section 485413 - Once-Through Steam Generator

G. Section 485432 - Steam Surface Condenser

1.5 CODES AND STANDARDS

A. Refer to 481100, Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. American National Standards Institute (ANSI/ISA)

a. ANSI FCI 70-2 – Control Valve Seat Leakage
b. ANSI/ISA-77.13.01- Fossil Fuel Power Plant Steam Turbine Bypass System

2. American Society of Mechanical Engineers (ASME)

a. ASME B31.1 – Power Piping
b. ASME Boiler and Pressure Vessel Code – Section VIII
c. ASME PTC-36- Measurement of Industrial Sound

3. International Electrotechnical Commission (IEC)

a. IEC 60534-8-3 - Control Valve Standard, Part 8: Noise Considerations - Section 3: Control Valve Aerodynamic Noise prediction Method (1995).

4. Instrumentation, Systems, and Automation Society (ISA)

a. ISA-75.01 Through ISA-75.25 - Control Valves

5. Manufacturer's Standardization Society of the Valve and Fitting Industry (MSS)

a. MSS SP-61 – Pressure Testing of Steel Valves

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. Each bypass valve shall fulfill the following requirements:

a. Control the pressure of the main steam header during unit startup.
b. Control the pressure of the main steam bypassing the turbine.
c. Control the flow and temperature (flow and temperature limits set by condenser sparger) of the steam dumped into the condenser.
d. During transient operation, help prevent lifting of OTSG safety valves while operating within the limits of the bypass system.
e. The Contractor shall supply and coordinate the sizing of integral steam conditioning valve (desuperheater, coordinated spray water control valve, and spray water block valve) to function together and also to achieve a full range of coordinated operating parameters of pressure, temperature and flow. The spray water shall be introduced after pressure reduction stage.

2. Characteristics:

a. The bypass control valves supplied shall be suitable for outdoor installation and service under the conditions described in Section 480020 Site Conditions.

b. The design, construction and choice of materials shall be suitable to resist mechanical, thermal and fluid induced wear and shall take into account all operational deviations including pressure surge and thermal shock.

3. When the bypass is not in the operation, piping downstream of the bypass valve will be under vacuum. Bidder shall give their recommendations for stem vacuum sealing.

B. Performance Requirements

1. Steam is produced in a single pressure OTSG by gas turbine exhaust heat recovery and will flow from the superheater steam outlet lines through the main steam header to the turbine stop valve.
2. The steam turbine bypass systems will be designed to accommodate the steam generated in the OTSG during startup of the gas turbine before steam turbine admission, and the steam generated following a steam turbine trip. The bypass system shall be sized to allow continuous full-load operation of the OTSG with 100% gas turbine load heat input.
3. Startup Operation:

a. After establishing the gland steam, the vacuum pumps will be put into service and the bypass valves will be set at 1.72-3.44 barg (25-50 psig) higher than header pressure. The steam header pressure is measured and compared to a setpoint; this difference is used to regulate the bypass control valves. The steam pressure set point is limited within the minimum and maximum value and ramped smoothly. The bypass valve(s) are not permitted to open if the desuperheater spray water pressure is insufficient or if the block valve is not fully open. With bypass operation and steam dumping in the condenser, the steam parameters in the system are ramped up in a controlled manner.

4. Abnormal Operation:

a. In the event the steam turbine or generator trips when the plant is at full base load, the steam turbine trip signal will send a quick opening signal to the bypass valves to open to a preset value and then will go into a modulation mode to regulate the quantity of steam dumped to the condenser. Any excess steam not handled by the bypass system will escape through OTSG safety valves. It is preferable not to lift safety valves during upset conditions.
b. Control system will override bypass demand and close the control and attemperation block valve in the event of condenser pressure high, condenser temperature high, hotwell very high or attemperation spray water pressure low. The condenser pressure high trip set point during a steam turbine coast down will be automatically adjusted per Manufacture's recommendation based upon turbine speed.
c. The bypass system shall be intended to provide for cold startup, warm start, hot restart, load rejection and unit trips. The bypass valves shall provide a means of controlling the pressure, temperature and flow of steam around and through the turbine.

5. Noise and Sound Control Requirements

a. The noise levels and controls shall meet the requirements of Section 480031, Combined Cycle Power Island Noise Control Performance.

C. Reliability: Bidder shall provide control valves that are suitable for daily cycling and a long service life of 30 years. The expected wear life of expendable, consumable and wear parts shall be consistent with good design practice for the particular service and fluid handled.

D. System Improvement

1. Bidder may provide design enhancements to maximize equipment service life in cycling and peaking plant applications with the proposal and highlighted in the bid documents.
2. Bidder can provide recommendations for the improvement in system design, such as thermal heat tracing to avoid thermal shock, design to avoid water hammer in the downstream lines, any material upgrades etc.

1.8 SUBMITTALS REFER TO ATTACHMENT 11 – DRAWING SCHEDULE

1.9 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 481100, Combined Cycle Power Island for general Packaging, Delivery, Storage, and Handling requirements.

1.11 SITE CONDITIONS

A. Reference Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Valve body materials shall generally be one of the following specifications:

Carbon Steel (Spray Attemperation Block Valve)	Cast	ASTM A216 Grade WCB
	Forged	ASTM A105
Chrome-Moly Steel (Steam Bypass Valve and Attemperation Spray Control valves)	Cast	ASTM A 216 Gr WCB
	Forged	ASTM A105

B. All materials shall be in accordance with the latest ASTM standards or materials listed in ASME B31.1.

C. All castings shall meet the requirements of MSS-SP-55 internally and externally after machining.

D. All control valves shall have stems, guide bushings, cages, plugs, seat rings, stem lock, pins, stuffing box parts, and other trim, all made of stainless steel. Valve plugs, guides, cages, and seat rings shall be hardened materials for valves where required for proper operation.

E. Welding for all components and repair welding for all weld defects shall be in accordance with the requirements of ASME B31.1, ASME BPVC Section I (as applicable).

2.2 EQUIPMENT

A. The Steam Bypass Valve shall fulfill the following requirements:

1. Control the pressure of the main steam header during unit startup.
2. Control the pressure and temperature of the main steam bypassing to condenser
3. During transient operation, to help prevent lifting of OTSG safety valves while operating within the limits of the bypass system.
4. The valve supplier shall coordinate the sizing of integral desuperheater, spray water control valve and spray water block valve to function together and also to achieve a full range of coordinated operating parameters of pressure, temperature and flow. The spray water shall be introduced in the turbulent zone at the discharge of the pressure reduction stage.
5. The Steam Bypass Valve shall be provided with an automated valve heating arrangement, with a temperature control valve to modulate the steam flows and to reduce the energy losses.
6. The Steam Bypass Valve shall be CCI Drag, Fisher TBX, or equivalent valve with integral desuperheater

    a. Block type shutoff per class V.
    b. Performance as per process conditions defined by the Contractor
    c. Design conditions as defined in by the Contractor
    d. Minimum Turndown to 10:1 based on rated Cv

7. Bidder shall furnish guidelines for the bypass valve location with respect to straight lengths, temperature and pressure tap points for proper functioning of the bypass valve.

2.3 COMPONENTS

A. Attemperation Spray Water Valve:

1. ANSI Class V Leakage
2. Open/Close time of less than 4 seconds thru the positioner
3. Performance as per process conditions defined by the Contractor
4. Design conditions as defined by the Contractor
5. Continuous operation at turndown of 20:1 minimum based on Rated Cv to achieve the flows defined on process data sheets
6. Trim exit fluid velocity shall be limited to 75 ft/sec for cavitation, flashing and erosive application

B. Valve Construction Features

1. Valves shall have a mechanical means to indicate valve position.
2. The direction of flow shall be indicated on the valve body by a permanently attached stainless steel arrow, or with a marking that is cast or stamped into the valve body.
3. Plugs shall be removable from the top of the valve (toward the actuator).

C. Valve Sizing:

1. Globe type control valves used for modulating service shall be selected such that equal percentage control valves operate between 15% and 85%, and linear control valves operate between 10% and 90% of full open travel over the required control/modulating range of the system. In no case shall a control valve be selected for continuous operation below 10% of full open travel.
2. Each control valve shall be sized using the methods and equations described in the standard ISA-75.01. Each control valve shall be sized and selected, including trim and plug design, actuators, valve materials, and valve accessories to properly satisfy all operating and design conditions of each application as listed in the Data Sheets.
3. Pipeline sizes listed in the Data Sheets do not include reducers that may be required adjacent to the valve body.
4. The valve body size shall not be less than two pipe sizes smaller than the nominal inlet pipeline size, unless otherwise specified.
5. Shutoff leakage for each valve shall not exceed the appropriate leakage class as defined in ANSI/FCI 70-2 and as specified on the Data Sheets.

D. Valve Trim

1. Sliding Stem Type Bodies: Unless otherwise noted, trim shall include a seat ring that is held in place by a cage and the body bonnet in a “quick change” arrangement. Seat rings shall not be welded or threaded into the valve body. Plugs shall be guided by the cage directly or by heavy-duty stem guides. Diffusers in the valve shall not be welded to the valve body and should be removable from the top.
2. Trim type, characteristic, and materials shall be as required by the specified design conditions and as specified on the Data Sheets.
3. Where cavitation damage is predicted by an analysis of specified valve design conditions, special trim or other features shall be provided to eliminate the cavitation (by dividing the total pressure drop into a series of smaller drops) or to direct the location of the bubble collapse away from the body or trim surfaces. Use of harder valve body or trim materials

may be used in addition to the special trim, but such use of hard materials as the sole or primary means of cavitation protection is not acceptable. Sufficient number of discrete pressure drop stages shall be offered to maintain the trim exit velocity below 75 ft/sec for cavitation, flashing & erosive services

4. Noise reduction trim or other features as required shall be provided to meet the limits specified as listed on the attached Control Valve Data Sheets.
5. Valves susceptible to flashing at any point in the operational range of the valve shall be provided with suitable protection. As a minimum, this is to include the use of metal seats, but could require hardened trim materials, an angle-style valve body, or a more erosive resistant body material. Sufficient number of discrete pressure drop stages shall be offered to maintain the trim exit velocity below 75 ft/sec for cavitation, flashing & erosive services

E. Valve Bodies:

1. Valve body style and material shall be selected as appropriate for the intended service and provided under Section 481100, Combined Cycle Power Island Equipment.
2. Valve inlet and outlet sections shall be equipped with 1" socket weld connections and an automatic warming valve for warming purposes if required.

F. End Connections

1. Valve end connections shall be prepared and welded as appropriate for the intended service and provided under Section 481100, Combined Cycle Power Island Equipment unless end connection type is specified otherwise.
2. All welding connections for valves 2-1/2 inches and larger in nominal size shall be butt-welded. All welding connections for valves 2 inches and smaller in nominal size shall be socket welded. All welding ends shall be in accordance with ASME B16.34 and B16.25. Weld backing rings are not permitted and therefore, all butt-welded ends shall be machined according to ASME B16.25 Figure 2(a), 3(a), 4, 5, or 6 as appropriate.

G. End Extensions and Reducers:

1. If the size of a welded end valve is different than the field pipe size, the valve shall be furnished with shop welded concentric reducers matching the upstream and downstream pipe size, material and wall thickness.
2. Shop welded end extensions shall be provided for the turbine bypass valves with body material that is different than the field piping material (such as alloy valve bodies to be welded into carbon steel pipelines or vice versa) or for valves with different end connection size than the piping.
3. End extensions shall be a pipe section at least 6 inches long.
4. End extensions and reducers shall be factory installed on the valve body and stress relieved in accordance with ASME B31.1. End extensions and reducers shall be shown on the valve drawing and included in the shop end-to-end or center-to-face dimensions.

H. Valve Actuators

1. All control valves shall be furnished with the type of actuator shown on the Data Sheets.
2. Valve actuators with valve action "fail open" or "fail closed", shall be provided with a mechanical spring or a trip valve and volume tank to fully open or close the valve as ap-

plicable on loss of air pressure. Steam valves include pneumatic piston actuators. 'Fail position' is achieved using volume tank and not using springs.

3. Valve actuators and stems shall be adequate to maintain desired process control at 110 percent of the unbalanced forces occurring under the normal operating flow conditions. The valve manufacturer shall include this factor in their calculations when selecting an actuator. Actuators shall be designed to function with instrument air pressure ranging from 60 to 125 psig. All actuator tubing shall be a minimum of 3/8" AISI 316 stainless steel. Tubing fittings shall be Swagelok compression type.
4. HART smart valve positioners shall cause the control valves to operate over their full stroke by means of a HART 4-20mA signal. Pneumatic actuators and drive units shall automatically return to the rest position upon loss of 4-20 mA signal and/or air supply failure unless "process control" or the Technical Specification requirements dictate for "fail fixed" response. The primary HART variable shall be valve position.
5. Actuators shall be sized for at least 1.5 times the breakout torque required to open and close the valve based on the specified operating conditions.

I. Pneumatic Actuators:

1. Pneumatic actuators shall cause the valve or driven unit to operate over its full stroke, from a 3.0 to 15 psig signal by means of any of the following:

   a. Electronic signal to electro pneumatic converter.
   b. Electrical signal to solenoid pilot valve.

2. Pneumatic actuators and drive units shall automatically return to the rest position upon signal and/or air supply failure unless "process control" or the Technical Specification requirements dictate for "fail fixed" response.
3. Where "lock up" devices are provided on those services requiring the actuator to remain in the position prevailing immediately before an operating medium failure ("fail fixed"), the following two methods of "freezing" are acceptable:

   a. The pneumatic system may be locked, but equipment used for this purpose shall always be installed between a positioner output and an actuator input.
   b. The final regulator may be locked by mechanical means upon receipt of a falling supply pressure signal.

4. Lock-up pneumatic relays shall be set to trip at a supply air pressure of 60 psig.
5. The lock-up actuator shall permit a maximum valve position movement of no more than 5% when the pressure difference across the valve is at the maximum value specified.
6. All pneumatic control equipment, control drives and control valves, shall be capable of satisfactory operating on a main air supply pressure of approximately 125 psig normal down to 80 psig minimum.
7. Actuators shall be sized for at least 1.5 times the breakout torque required to open and close the valve based on the specified operating conditions.

J. Solenoid Operated Valves:

1. Solenoid operated valves shall be designed for full solenoid operation. All units shall be provided with supplementary manual operating means if specified in the data sheet, to ensure that systems can be made safe in the event of failure of the normal driving source

of the solenoid. A manual retaining catch shall be included with electrical interlocking where required to ensure that the solenoid is not energized until the valve is hand reset.

2. All valves shall be supplied with an adjustable permanent "lock off" where the application requires this feature.
3. For high ambient temperature and units operating on hot fluids, adequate external insulation against heat shall be provided. In addition a heat insulating barrier shall be fitted between the valve and solenoid section. Solenoids shall be continuously rated and insulated with at least Class "B" insulation in a totally enclosed dustproof enclosure and of waterproof construction where necessary, i.e. same class as for electric actuators.
4. The units shall be provided with additional contacts at OPEN or CLOSE positions for electrical interlocking or remote indication purposes where required.
5. All electrical terminals shall be adequately insulated and shrouded and shall be of size not less than 0.25 inch unless otherwise approved. Set or pinch type screws shall not be used. All terminals shall be provided with lock washers or lock nuts.
6. All contacts shall be form “C”, snap acting. They shall be easily removable.

K. Valve Types:

1. Globe Control Valves, Cage Type Trim:

   a. The cage and plug shall be hard stainless steel as a standard. Coefficients of thermal expansion for cage and plug shall be similar, so that required clearances are maintained over the range of operating temperatures.
   b. Reduced trim for one nominal size smaller than valve body size shall be available as a standard option.

2. Globe Control Valves, Conventional Plug and Seat Rings:

   a. A linear characteristic shall be provided when the pressure drop across the control valve under all operating conditions is more than 2/3 of the pressure drop across the valve in the closed position. Unless otherwise approved, an equal percentage characteristic shall be provided for all other cases.
   b. Plug and seat rings shall be hard stainless steel or stellite as standard.
   c. Hardened guide material may be 350 BHN minimum, with a differential hardness not less than 125 BHN between sliding metal surfaces.
   d. The bonnet and bottom flange, where supplied, shall be interchangeable so as to permit reversal of the valve action without additional parts or alterations.

L. Control Valve Accessories

1. Travel Stop

   a. Travel stops shall be top mounted screw assembly with lock nut and cover, designed to limit the stem travel on loss of air pressure. Limit shall be manually adjustable using a wrench.

2. Manual Override Actuators

   a. Top Mounted Hand wheels can be used as an adjustable travel stop with handwheel and lock nut. Top mounted Hand wheels shall be arranged to move the

stem against the spring action and to limit the stem travel on loss of air pressure and shall be selected to limit operating forces to 80 pounds at the rim of the hand wheel.

b. Side Mounted Hand wheels shall be side mounted, with neutral position to allow normal automatic operation of the actuator. Hand wheels shall be capable of manually moving the valve fully in both directions against the spring, and limiting the travel of the actuator in at least one direction. Hand wheels shall be heavy duty with totally enclosed gearing, designed for frequent use and shall be selected to limit operating forces to 80 pounds at the rim of the handwheel.

c. Hydraulic Overrides shall be used, when the force requirements of the pneumatic actuator exceed the capabilities of side mounted hand wheels.

3. Volume Tanks

a. Volume tanks shall be designed to withstand a minimum pressure of 125 psig.

b. All volume tanks shall be constructed in accordance with ASME Boiler and Pressure Vessel Code, Section VIII, Division 1 (stamped UM).

M. Special Tools

1. Manufacturer shall provide one complete set of all special tools required for maintenance and adjustment of the valves and actuators.

2. Manufacturer shall provide the following items for each bypass valve type.

a. Hydro Trim Set

b. Blow Out Trim Set

N. Identification

1. Each valve is assigned a unique valve tag number and shall have a permanent stamped metal tag bearing the "Valve Tag Number" securely attached to the valve. Each valve shall be legibly marked in accordance with MSS SP-25. For the tag number to use, refer to the Control Valve Data Sheets. The tag number shall be punched or etched into the tag so that the tag number is recognizable even if the tag has been painted.

2. Each valve identification tag shall indicate the valve tag number, manufacturer's serial number, type, body material, seat material, bonnet material, pressure rating, and actuator air signal pressure range and bench set.

2.4 INSTRUMENTATION

A. Limit Switches

1. Limit switches shall be provided for remotely controlled on/off type valves and shall be factory mounted on the valves with provisions for adjusting the switch point.

B. Position Transmitters

1. Valve position transmitters for the turbine bypass valves shall be LVDT 2 wire type transmitters or General Manager approved alternative, as shown on the Data Sheets, factory mounted on the valve, and shall produce an electrical 4-20 mA dc signal in direct

relationship to the position of the control valve stem. Transmitters shall be provided with NEMA 4 or better enclosures.

2. Valve position feedback for the steam bypass valves and all the spray valves shall be obtained by utilizing the HART communicating protocol of the positioner in conjunction with a conditioning device (provided by others) to convert the HART signal to an analog output

C. Positioners

1. Positioners shall be electro-pneumatic type utilizing the HART communication protocol and shall be provided with pressure gauges for indicating the air supply, and control signal pressures. The input signal will be loop powered by General Manager's control system. Positioners shall be designed for a control signal input range of 4-20 mA, unless two control valves are required to be split-ranged, in which case the input ranges will be 4-12 and 12-20 mA and preset at the factory. Positioners shall provide an output signal from 0 psig to the full supply air pressure to the valve actuator. Positioners shall not be provided with bypasses.
2. Advanced Diagnostics functionality shall be provided for all control valves addressed in this specification as indicated in the data sheets.
3. All positioners shall be equipped with filter / regulator air supply sets factory mounted on the positioner or the valve yoke.

D. Solenoid Valves

1. Valves shall be selected to incorporate stainless steel body construction, with trim materials, and internal arrangements suitable to the application. Solenoid enclosures shall be NEMA 4 with 1/2-inch threaded conduit hub.
2. Solenoid valves shall be the three-way type and four-way type depending upon application, with trip reset and manual actuators, as required, for auto-controlled valves.

2.5 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

B. Shop/Factory Finishing:

1. All exterior surfaces of valves, operators, and accessories shall be thoroughly cleaned of mill scale, heat treating scale, heavy oxide, slag, flux, weld splatter, oil, grease, organic matter, dirt, or any other foreign materials by grit blasting or wire brushing.
2. Exterior surfaces of valves and accessories, with the exception of flanged surfaces and edges prepared for field welding for a distance of 1-½ inches from the welding edge, shall be given a shop coat of corrosion resistant primer. Manufacturers using a coating process that does not include a primer coat shall properly clean, chemically treat and prepare the exterior surfaces prior to the application of a corrosion and UV resistant paint.
3. All edges of valves prepared for field welding shall be protected against corrosion with a coat of rust inhibiting coating applied after inspection and cleaning.
4. External flanged surfaces of carbon steel and alloy steel valves shall be protected against corrosion with the application of a coat of water soluble, rust inhibiting coating.

5. Stainless steel valves shall not be painted or coated.
6. Exterior surfaces of operators and accessories shall be given a coat of corrosion resistant primer and a coat of Manufacturer's standard finish paint. Manufacturers using a coating process that does not include a primer coat shall properly clean, chemically treat and prepare the exterior surfaces prior to the application of a corrosion and UV resistant paint.

2.6 SOURCE QUALITY CONTROL

A. Refer to Section 481100, Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspections

1. As a minimum, the following tests shall be performed:

a. Factory Hydrostatic Tests:

1) Valves and attemperators shall be subjected to a hydrostatic leak test meeting the requirements of ASME B&PV Code Section I, Section VIII, or ASME B31.1, Power Piping Code or the applicable Code or Standard to verify integrity of the pressure boundary. No leakage is acceptable through the pressure boundary wall or assembly joints.
2) Parts shall not be primed or painted until hydro testing is successfully completed.

b. Leakage Tests

1) Control valve leakage shall be tested in accordance with ANSI/FCI 70.2.
2) In all cases, maximum seat leakage requirements shall be met.

c. All cast valves used in systems designed to ASME B31.1 requiring radiographic examination of the piping shall have the weld ends radiographic inspected.
d. In addition to Contractor's standard shop tests and inspections, a hydrostatic test on the body and seat of each steel valve shall be performed in accordance with ASME B16.34.
e. Prior to shipment, the valves shall be completely assembled, wired, and functionally tested at Contractor's factory. The wiring shall be checked for proper connections and grounds.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100, Combined Cycle Power Island for general requirements regarding spare parts.

3.2 FIELD QUALITY CONTROL

A. Field Acceptance Tests

1. Refer to Section 480032, Power Island Performance for general field acceptance test requirements.

B. Performance Tests

1. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Refer to Section 481100 Combined Cycle Power Island for individual equipment baseline performance testing.
2. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.

3.3 COMMISSIONING

A. General

1. Refer to Section 480032, Power Island Performance for general commissioning requirements.

SECTION 485221
STEAM TURBINE & TEWAC GENERATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This specification details the minimum technical requirements for the design, manufacture, testing, and furnishing of a steam turbine generator (STG) where the generator is a totally enclosed water to air cooled (TEWAC) design. It is not the intent to specify completely herein all details of design and construction of the equipment and its related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager. Reference to other codes, standards and regulations shall be interpreted as an integral part of this specification.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict among referenced standards, codes and the documents included in this specification, or a perceived conflict between the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. Steam Turbine Generator (STG) and Accessories including:

a. Steam Turbine with totally enclosed water to air cooled (TEWAC) generator and standard accessories
b. A heated and ventilated acoustic enclosure covering the steam turbine, generator, lube oil skid, condenser, condensate pumps, vacuum pumps, steam bypass valves, and various accessories designed to meet noise requirements of Section 480031, Combined Cycle Power Island Noise Control Performance. The enclosure must have provisions for allowing maintenance, such as removable roof panels, wall panels, etc., as required. The enclosure will be finish painted and mounted to foundations at grade. *PIE Contract bidders are required to describe the proposed enclosure with their bids.* Man doors, louvers, etc., shall be provided with the enclosure.
c. Neutral grounding transformer and resistor for generator neutral
d. Line termination hardware and cubicles (VTs, PTs, lightning arrestors and surge capacitors) provided for bottom entrance cable connection
e. Microprocessor based control system with one local (in the PDC) and one remote HMI, protocols for bidirectional communication with plant PCS system
f. Lubricating oil system with an oil conditioning purifier using a centrifugal separator. Include sight glass.
g. Electro-Hydraulic Control (EHC) system

h. Turbine and generator supervisory instrumentation and protective devices
i. Main steam stop and control valves with internal strainers and valve supports/hangers, as well as temporary valve cover(s) for steam blow and boiler cleaning.
j. Couplings, coupling bolts (turbine/generator rotors), and coupling guards
k. Acoustical/weather enclosures (finish painted) for the steam turbine and generator on outdoor units meeting the noise requirements in Section 480031, Combined Cycle Power Island Noise Control Performance.
l. Sole plates and shear lugs
m. Removable insulation blankets for turbine casing and stop and control valves
n. Skid mounted turbine shaft sealing system including pressure control valves, gland steam condenser, and 2x100% capacity gland steam exhausters with all valves, piping and instrumentation required for a complete system.
o. AC motor driven turning gear
p. Motors for all motor driven equipment furnished under this specification
q. Motor starters for all DC motors furnished under this specification
r. All auxiliary skids and electrical cabinets located outdoors are to be weather proofed suitable for the ambient conditions delineated in Section 480020, Site Conditions and shall meet the sound level requirements as delineated in Section 480031, Combined Cycle Power Island Noise Control Performance.
s. Shims, soleplates with leveling screws, fixators, keys, restraining blocks, shear lugs and any other non-embedded foundation components for the STG
t. Piping on the turbine generator proper and on Contractor supplied skids
u. Wiring and conduit in or on Contractor supplied enclosures or skids and the turbine generator proper
v. Turbine, steam leads, and valve drains complete with pneumatically actuated drain valves and manual isolation valves
w. Steam blow blanking plate(s) and fixture(s) for main steam stop valve and intercept valve
x. For main steam stop and control valves made from non-ASTM materials, Contractor shall supply transition piping made from ASTM materials welded to the stop and control valve in the factory
y. Brushless excitation system
z. Steam turbine local gauge panels
aa. Lube oil, EHC and turbine drain interconnecting piping and supports (exclusive of building steel)
bb. Lube oil and EHC system flush jumper hoses and hardware provided on a loan and return basis
cc. Sizing drawings and information (in English units) for all concrete embedments necessary for the STG including anchor bolts and conduit

2. Special tools and lifting devices required for assembly, operation, maintenance and disassembly of equipment furnished under this specification. Final thermal kit including all required correction curves or computer Heat Balance output for all customer cases, to verify performance at off-design conditions
3. Special services including field support, installation support, start-up and performance testing support, and training as specified
4. Drawings, data, Instruction Books, and other information as indicated in the attached "Contractor Data Requirements" including PE stamped drawings and calculations

5. Review and comment on STG foundation design drawings prepared by the BOP Contractor (interface information only). Such review shall not relieve the General Manager of responsibility for the foundation design.
6. Start-up and commissioning spares

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Unloading, storage, and erection of equipment at jobsite
2. Rigging and hoist for original setting of all equipment.
3. Rigid frame concrete pedestal for turbine-generator and concrete bases for all other Contractor supplied equipment.
4. Foundations, foundation bolts, nuts, washers, sleeves and standard shims. Anchor/jacking/pull-down plates, bearing pads, expansion anchors, Nelson studs, headed studs, spacer blocks, support plates and any other embedments required by the Contractor's equipment and identified on his drawings.
5. Grout for sole plates.
6. Piping in connection with the following ST systems will be supplied by others:

    a. Vent piping from oil reservoir vapor extractor, as required
    b. Vent piping from gland steam condenser exhauster
    c. Steam seal supply piping to a single, pre-defined location near Contractor's steam seal inlet
    d. Miscellaneous steam seal piping low point drains
    e. Cooling water piping to and from the lube oil coolers
    f. Cooling water piping to and from the generator coolers
    g. Condensate supply to exhaust hood spray system
    h. Steam seal vent outlet to gland steam condenser
    i. Condensate piping to and from the gland condenser

7. Supports for all piping external to Contractor's scope of supply.
8. Pipe insulation and lagging external to Contractor's scope of supply
9. Field wiring, cable and conduit connecting Contractor supplied components, except prefabricated cables with connectors.
10. Balance of plant control system shall be embedded in the plant PCS for control of General Manager supplied equipment
11. All control room furniture required for Contractor supplied terminals, keyboards and printers
12. AC motor starters
13. Synchronizing breakers
14. Switchgear and utility metering
15. CTs and VTs not integral to generator and lineside cubicle
16. Batteries and associated chargers for DC powered equipment
17. Gland steam desuperheater for main steam supply
18. Steam piping from Once Through Steam Generator (OTSG) terminal points to turbine terminal points
19. Interconnecting piping to the steam turbine condenser terminal points
20. STG exhaust / condenser expansion joint
21. Heat tracing

22. Turbine oil as required to flush and fill the lube oil and hydraulic oil systems.
23. Initial fill of all lubrication and control oils, all gases, all water
24. Field performance testing
25. Utilities as delineated in the attached "Technical Datasheet by General Manager"

1.4 RELATED SECTIONS

A. Section 260000 - Electrical Mechanical Equipment

B. Section 262050 - Specification for Low Voltage (NEMA) Motors

C. Section 480020 - Site Conditions

D. Section 480031 - Combined Cycle Power Island Noise Control Performance

E. Section 480032 - Power Island Performance

F. Section 481100 - Combined Cycle Power Island

G. Section 485122.11 - Steam Turbine Bypass Valves

H. Section 485432 - Steam Surface Condenser

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. American National Standards Institute (ANSI)

a. C50.13 - Standard for Cylindrical-Rotor 50 Hz and 60 Hz Synchronous Generators Rated 10 MVA and Above

2. American Society of Mechanical Engineers (ASME)

a. PTC 6/6.2 - Steam Turbines / Steam Turbines in Combined Cycle

B. Notes on code applications:

1. All heat exchangers, except generator coolers, shall be designed and constructed to meet or exceed the requirements of the applicable sections of the HEI standards, the ASME BPV Code Section VIII, Division 1 and Power Piping Code B31.1.
2. All piping shall be designed and fabricated to meet or exceed the requirements of ANSI B31.1 with components in accordance with the appropriate ANSI/ASME standard.
3. All material shall be designed and fabricated to meet or exceed the requirements of the relevant ASTM number or General Manager approved equal.
4. Performance determination, guarantees and testing shall be in accordance with ASME codes with testing in accordance with the applicable Performance Test Codes (PTC).

5. Recommended Practices for Prevention of Water Damage to Steam Turbines Used for Electric Power Generation, ASME TDP-1shall be followed.
6. ISA Standards and Practices shall be used for instrumentation.
7. Equipment and System designs shall be in accordance with the rules and regulation of OSHA and CALOSHA.
8. Electrical equipment shall be designed, constructed and tested in accordance with the relevant IEC, IEEE, NEMA and ANSI standards.

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. Reference Section 481100 Combined Cycle Power Island for general design requirements and expected operating profile.
2. The steam turbine, generator and accessories shall be designed for stable operation from minimum to full load.
3. All equipment shall be designed for continuous 24 hour per day operation with potential daily cycling from off-line to full load.
4. The steam turbine generator shall be designed per the steam inlet conditions as defined by the power island final design.

B. Performance Requirements – Steam Turbine

1. The steam turbine shall be designed for main steam admission variable (sliding) pressure control and shall also be capable of operating in inlet pressure control (IPC) mode. The STG shall be designed for continuous unrestricted operation in the ambient conditions listed for operating cases in Section 481100, Combined Cycle Power Island. The STG shall be considered to require daily cycling operation. The turbine generator control system must be designed to maintain acceptable frequency limits while accommodating all types of load changes and operating modes.
2. The turbine-generator shall meet the Performance Guarantees referenced in subpart 1.7E when operating at 95% of the steam valves wide open (VWO) turbine heat balance conditions.

3. At the rated inlet, exhaust and makeup conditions specified in datasheets and guarantee conditions referenced in subpart 1.7E, the turbine shall be capable of operating continuously with the steam flow rate not less than 5% greater than the guarantee flow. This will be defined as the valves wide open (VWO) point.
4. The turbine shall be designed for continuous operation with 105% throttle pressure. Brief incursions into higher abnormal pressures (>105%) should not to exceed 12 hours per 12 month operating period.
5. Average throttle steam temperature per 12 month operating period will not exceed turbine manufacturer's limit.
6. Net power output shall be measured at the guarantee point. The net electrical generating capacity shall be defined as the net power output after all the power for excitation, mechanical losses, and the electrical losses up to the generator terminals have been deducted.
7. Generator output and heat rate performance guarantees shall be stated at the ISO 3977 standard reference ambient conditions described in Section 480020, Site Conditions. Contractor's correction curves and Heat Balance output for all General Manager specified cases shall be the basis for performance guarantees at ambient conditions for testing other than ISO 3977 standard reference conditions.

C. Performance Requirements – Generator

1. The generator open circuit terminal voltage wave deviation factor shall not exceed 10% as defined by ANSI standard
2. The generator shall be capable of operating continuously with the turbine at VWO and 5% overpressure conditions.
3. Starting from stabilized temperature at rated conditions, the generator armature shall be capable of operating at 130% of rated armature current for at least one minute.
4. Starting from stabilized temperature at rated conditions, the generator field windings shall be capable of operating at a field voltage of 125% of rated load field voltage for at least one minute.
5. The stator windings shall satisfactorily withstand a normal maintenance, high-potential test without damage. There shall be no visible abnormal deformation or damage to the winding coils and connections resulting from the test.
6. Generator shall be capable of withstanding, without damage, the thermal effects of unbalanced faults at the generator terminals including the decaying effects of field current (where protection is provided by causing field current reduction, such as with a field breaker or equivalent) and the DC component of the stator current, for times up to 120 seconds, provided the integrated product $[(I_2)^2 t]$ of generator negative phase sequence current (I_2) and time (t) does not exceed Contractor's quoted rotor heating constant, $[(I_2)^2 t=30$.
7. The generator shall be capable of withstanding without mechanical damage of any type of short circuit at its terminals for times not exceeding the short time thermal capabilities, when operating at rated kVA and power factor and 5% overvoltage, provided the maximum phase current is limited by external means to a value which does not exceed the maximum phase current obtained from the three-phase fault.
8. Generator, controls and all applicable equipment shall be designed to accept full grid load rejection without overspeed and shall be capable of maintaining house loads, as necessary

D. Reliability: No single failure of an auxiliary component or system shall result in damage to the System. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of

causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

E. Guaranteed Performance Refer to Attachment 6 – Performance Guarantees

1. The Contractor shall guarantee the following parameters when operating the turbine generator through the range of identified operating cases for the plant:

   a. The STG shall be guaranteed to operate reliably across the range of operating load conditions specified in Section 481100, Combined Cycle Power Island.
   b. Turbine Guaranteed Heat Rate based on the Plant Heat and Mass Balance at required main steam stop valve inlet conditions, with a manufacturer's tolerance of 0.33%.
   c. The net electrical generating capacity shall be defined as net power output after all power for excitation, mechanical losses, and electrical losses up to generator terminals have been deducted.
   d. The Output Voltage shall be 13.8 kV.
   e. The temperature rise of the Generator Rotor and Generator Stator shall fall within the limits of NEMA MG-1 with Class B temperature.
   f. The sound levels shall meet the requirements of Section 480031, Combined Cycle Power Island Noise Control Performance.

1.8 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

A. Shop Drawings

1. Refer to Section 481100 Combined Cycle Power Island for general shop drawing requirements.

B. Operation and Maintenance Manuals

1. Refer to Section 481100 Combined Cycle Power Island for general operation and maintenance manual requirements.
2. Maintenance instructions shall include as a minimum the following topics:

   a. Regular preventative maintenance required for reliable operation of the equipment
   b. Periodic major planned maintenance or replacement of major parts
   c. Lubrication details
   d. Major and minor overhauls inspections
   e. Tests, settings, and calibrations
   f. Method of calculating effective operating hours

1.9 QUALITY ASSURANCE

A. Refer to Section 481100 Combined Cycle Power Island for general quality assurance requirements.

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping

1. Refer to Section 481100 Combined Cycle Power Island for general packaging and shipping requirements.
2. The steam turbine generator and accessories shall be packaged for shipment to allow for outdoor storage as prescribed by Contractor for a period of six months without damage from dust, sun, wind, or rain. Preparation for shipment shall require:

a. Equipment to be completely free of water prior to packaging for delivery.
b. Flanges and threaded connections to be coated with rust preventatives and blanked-off or plugged. Blanking flanges shall utilize at least four bolts. Open ends of pipe shall be caps or plugged.
c. Unpainted surfaces to be protected from weather with weather tight and weatherproof covers. Machined surfaces shall be coated with a heavy grease or similar material before covering.
d. Lifting and support points shall be clearly identified.
e. Packages shall be identified with items and serial numbers, purchase order number, and item descriptions. Identifying tags shall be corrosion and weather resistant.
f. Temporary bracing and covers shall be painted yellow.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Refer to Section 481100 Combined Cycle Power Island for general material and welding requirements.

2.2 MANUFACTURED UNIT

A. Structural Requirements

1. General

a. Refer to Section 481100 Combined Cycle Power Island for general structural design requirements.

2.3 EQUIPMENT

A. General

1. The steam turbine generator shall be of modern design with proven durability, efficiency and reliability. The STG construction shall permit controlled acceleration from zero speed to full speed. At a minimum, the STG shall be capable of withstanding 110% overspeed at 6" HgA backpressure. Turbine blade designs shall preclude the occurrences of blade resonant frequencies throughout the expected operating range. At General Manager's request, turbine blade design criteria and modeling information shall be made available to General Manager for review prior to fabrication. The Contractor shall provide data on off-frequency operation capabilities and limitations.

B. Steam Turbine

1. The Contractor shall select and provide suitable materials of proven design for the turbine blading, diaphragms, casing, nozzles, and other parts that are in contact with the steam.
2. Turbine design shall allow all bolting 2" (50.8 mm) and larger to be tightened by heating and cooling, or by a hydraulic device that shall be furnished with the turbine.
3. The Contractor's steam purity requirements shall be based on an OTSG boiler feed water treatment scheme employing all volatile treatment (AVT) and existing site Demineralized Water quality as indicated in Section 480020, Site Conditions. The Contractor's steam purity requirements shall be submitted to General Manager with the Proposal.
4. Piping supplied by Contractor with the exclusion of the main steam leads, shall be in accordance with ASME B31.1. All Contractor-furnished piping shall be provided with a minimum 1/16 inch corrosion allowance. Minimum allowable pipe diameter is 1.0 inch for all steam, condensate and drain lines, however, there are some occasions where smaller drains are required.. For all other systems, the minimum allowable pipe diameter is a 1/2 inch. No PVC pipe is allowed.
5. The steam turbine and generator shall be factory assembled and skid mounted to the maximum extent possible.
6. The speed reducing gear shall be complete with sole plates and alignment screws, lubrication equipment, instrumentation and wiring, conduits and junction boxes.
7. The generator shall be shipped completely assembled with the exclusion of the inlet ducting and filter house. The lubricating oil, EHC and sealing steam systems shall be skid mounted assemblies, factory wired and piped to the greatest extent possible.
8. The steam turbine and associated piping systems shall conform to ASME Standard TDP-1, "Recommended Practices for the Prevention of Water Damage to Steam Turbines Used for Electric Generation."
9. The use of screwed, flanged or other non-welded joints in the lube oil, seal oil, and EHC systems shall be minimized. This does not apply to stainless steel tubing connections. The General Manager has final approval rights on the utilization of non-welded joints in these systems.
10. Welded connections 2" (50 mm) nominal pipe size (NPS) and smaller shall be socket weld couplings in accordance with the requirements of ANSI B 16.11 and ANSI B31.1. Welded connections greater than 2" (50 mm) NPS shall be butt weld connections.
11. Carbon steel piping shall be pickled, rinsed and protected against corrosion by coating with a rust preventative. The rust preventative shall be compatible with the fluids carried.
12. Contractor-furnished steam piping shall be internally cleaned by the Contractor either by pickling or by grit blasting. If grit blasted, only iron grit or steel shot shall be used.

13. Stainless steel piping shall have mill scale removed and be suitably protected for shipment and storage.
14. Contractor-furnished field butt-welded piping and valves shall have ends weld prepped prior to shipment.
15. Contractor shall use a suitable thread lubricating compound on all fasteners utilized in the factory assembly of the STG and accessories.
16. Structural and support welding shall be performed in accordance with AWS D1.1.
17. Pressure vessels (lube oil coolers, filters, gland steam condenser, etc.) shall be designed, fabricated, and tested per ASME Section VIII, Division 1.
18. The design of the turbine and generator baseplate(s) shall be provided with optical alignment provisions and jacking systems.
19. All connections required to perform ASME Performance Test Code (PTC) 6S – Steam Turbines.
20. The General Manager furnished foundation embedments shall be manufactured using English dimensions (non-metric). Contractor shall size all equipment embedments and anchors using English dimensions. The mating equipment components shall also be designed to accommodate English sized anchor bolts and embedments.

C. Turbine Rotors
1. The rotor design shall minimize stress concentrations. The fully assembled rotors shall be statically balanced in the factory. The turbine rotor will be low speed balanced, and vibration level is checked during no-load mechanical running test at shop.

D. Generator

1. Rating

a. The generator shall be 3 phase, 60 Hz, wye connected for high resistance grounding. The generator shall be capable of delivering rated load at any set voltage within plus or minus 5% of the nominal voltage. Generator rating shall be sized appropriately rated to allow maximum turbine rating power delivery at rated power factor.
b. The generator shall be fully capable of operation within the power factor range specified in the attached “Technical Datasheet by General Manager” under all conditions without limitation by any device such as the under excitation limiter or over excitation limiter. The only allowable exceptions to this are those due to coordination with steady-state stability limits, in which case calculations shall be provided by the contractor to show that is required, or allowed elsewhere within this specification.
c. With the design cooling water temperatures as shown in the attached “Technical Datasheet by General Manager”, the generator shall be capable of continuous, uninterrupted operation at the allowable outputs prescribed by the generator capability curve with a temperature not exceeding the Class F temperatures in accordance with IEEE C50.13.
d. The generator shall be capable of sustaining 130% of rated armature current for one minute and 125% of rated field current for one minute without damaging the unit.
e. The generator shall be able to withstand a 20% overspeed for one minute without damage to itself and shall be braced for full short circuit 3 phase fault at terminals for ten seconds according to IEEE C50.13, latest edition.

f. Both ends of the stator windings shall be brought out of the side of the generator housing through bushings located at one end of the generator. Stator windings shall be wye connected, with the neutral connection made up external to the generator housing. Enclosure around the bushings shall be included in Contractor's scope of supply.
g. A minimum of six (6) stator winding RTD's (two per phase), located in those areas expected to attain the highest temperature, shall be provided. RTD's shall also be provided to monitor generator bearing metal temperatures.
h. All temperature sensors shall be wired to terminal blocks in dust-tight and drip-proof terminal boxes (NEMA 4) accessible from outside the generator housing.
i. Space heaters shall be provided for the generator to prevent condensation when not in operation.
j. The generator shall be clearly marked with an arrow showing the direction of rotation and the terminals shall be marked with the corresponding phase rotation sequence.
k. The generator shall be capable of synchronizing and parallel operation without excessive harmonic and circulating currents. For the generator as specified, the Contractor shall submit maximum levels for these currents.
l. The generator shall comply with IEEE C50.13 Requirements for Cylindrical Rotor Synchronous Generators as applicable.

2. Generator Cooling System

a. The generator shall be totally enclosed water to air cooled (TEWAC).
b. The generator cooler tubes and tubesheet materials are specified in the attached "Technical Datasheet by General Manager", according to the selected cooling system type. Tubes shall be seamless, minimum 5/8 inch OD, with 22 BWG minimum thickness. Tube velocity at the design cooling water flow rate shall be 7 to 9 feet per second (fps). The surface area of the generator coolers shall be based on 100^{o}F cooling water. An 85% cleanliness factor shall be used in the design calculations to determine the required heat transfer surface area. Design conditions for the coolers shall be as delineated in the attached "Technical Datasheet by General Manager".
c. The cooling system shall be designed such that valving one cooler out of service does not prevent operating the generator at 66% of rated MVA.

E. Lube Oil System

1. A complete skid mounted lubricating oil system shall be provided by the Contractor including oil pumps, coolers, strainers, filters, heaters, skid piping and pipe supports, valves, instrumentation and oil reservoir.
2. The lube oil and hydraulic oil systems shall be self-contained and designed to meet the lubrication requirements of the turbine, generator, turning gear (if external lubrication is required for this component), and all other Contractor supplied equipment requiring continuous lubrication and the requirements of all Contractor supplied actuators requiring hydraulic fluid.
3. Two (2) 100% capacity AC motor driven main lube oil pumps shall be provided. These pumps shall be reservoir mounted. A common strainer shall be supplied in the return line. Two redundant pressure switches shall be provided to automatically start the standby pump in the event of low lube oil pressure.

4. One (1) 125 VDC motor driven emergency lube oil pump shall be provided. The emergency lube oil pump shall be sized to handle a STG shutdown in the event of AC power failure. The DC pump shall also auto-start on a low-low lube oil pressure. The pump shall be reservoir mounted and contain a coarse suction strainer.
5. A duplex, in-line, bypass type full flow 10-micron filter shall be provided with provisions to change out one filter while the other is in operation.
6. Two (2) 100% capacity, shell and tube single pass coolers or two pass coolers with a return waterbox shall be provided. U-tube or plate and frame heat exchangers are not acceptable. Tubes may be either seamed or seamless with a minimum OD of 0.75 inch and a minimum design pressure of 125 psig. Maximum tube side pressure drop shall be 13 psig. An 85% cleanliness factor shall be used in the design calculations to determine the required heat transfer surface area. On-line transfer capability shall be provided. The oil cooler system shall be provided with inlet and outlet temperature indicators, pressure test connections (inlet and outlet) and a thermal relief valve if required for compliance with the governing design codes. Cooling water for the oil systems and other auxiliary components will be supplied by the Contractor. Cooling water temperature, tube/tubesheet materials and tube velocities for the coolers shall be as delineated in the attached "Technical Datasheet by General Manager".
7. One lube oil reservoir sized in accordance with these specifications shall be provided. The reservoir shall be provided with a self-contained thermostatically controlled immersion heater with a maximum heating density of 12.9 W/in^2 (2 W/cm^2).
8. The lube oil reservoir level shall be measured locally plus a level transmitter for control room indication shall be provided. The reservoir shall be sized for a 5 minute "working capacity" time (low - level alarm to suction-loss level) at normal flow rate.
9. The oil reservoir shall be prefabricated, pre-piped, prewired, and shipped as a packaged unit with provisions for lifting. The lube oil reservoir shall feature access doors to the reservoir interior.
10. The oil reservoir shall also include connections for feed and return lines to the purification equipment. Reservoir internal piping shall be such that complete drainage through either connection is not possible.
11. A slight vacuum shall be maintained within the lube oil system by an AC motor driven vapor extractor mounted on the reservoir. A butterfly valve in series with the extractor shall allow precise adjustment of vacuum pressure. Two (2) 100% capacity lube oil vapor extractors complete with a Koch-Otto York, Dollinger or General Manager approved equal mist eliminator shall be provided.
12. All skid and turbine proper lube oil piping, interconnecting piping between the turbine and the skid, tubing, manual valves and instrumentation shall be provided by the Contractor.
13. Means shall be provided for testing of the standby pump auto start circuits.
14. Contractor supplied lube oil supply piping to the two turbine bearings shall be guarded from the lube oil tank to the bearings with an external thin wall mild steel pipe to minimize fire hazard. Piping shall be designed to eliminate pockets and hideouts to aid in flushing system. Welded pipe shall be used where practical to minimize leakage. Contractor shall provide all necessary piping between the lube oil reservoir skid and the turbine, generator and speed reducing gear.
15. Any contractor-furnished oil piping, fittings (including flanges) and valves from the lube oil filters to the bearings shall be 316L stainless steel. Valve bodies may be carbon steel if the trim that is in contact with the oil is 304 or 316 stainless steel and an isolating flange kit designed for isolating dissimilar metals is installed between the carbon steel and stainless steel flanges. The isolating kit shall be of an appropriate material and pressure and temperature rating designed for lube oil service.

16. Pressurized lube oil piping adjacent to the turbine and other hot surfaces shall be shielded such that oil leakage or spray is directed away from the hot surfaces. All oil piping shall be located on the same side of the STG and slope toward the reservoir for gravity drain when the lube oil pumps are not operating to prevent water from accumulating.
17. The use of screwed, flanged or other non-welded joints in the lube and seal oil supply systems shall be permitted only where components must be removed during routine maintenance. This requirement does not apply to tubing.
18. A sight flow glass and one Type K duplex ungrounded thermocouple (simplex wired) will be supplied and mounted in each individual bearing drain by General Manager.

F. Lube Oil Conditioning Purifier

1. The Contractor shall provide a centrifugal separator to remove water and particulates from the lube oil system with flanged connection to the lube oil reservoir.
2. The Contractor shall size the centrifugal separator appropriately to maintain lube oil with the steam turbine manufacturer's requirements for lube oil purity.
3. The centrifugal separator shall be AC motor drive in a 1x100% arrangement mounted on or near the lube oil reservoir. It shall be designed for intermittent or continuous operation as necessary to maintain lube oil purity within steam turbine manufacturer's requirements.

G. Electro-hydraulic Control (EHC) System - Manufacturer's standard turbine control oil system common with lube oil system will be provided instead of EHC. Refer to Attachment 1 – Scope of Supply.

1. A complete Electro-hydraulic Control (EHC) system shall be provided by the Contractor including oil pumps, coolers, strainers, filters, heaters, skid piping and pipe supports, interconnecting piping, valves, instrumentation and fluid reservoir. The EHS turbine control system shall be complete with protection, vibration monitoring, and turbine supervisory instrumentation.
2. The EHC system shall be skid mounted and totally independent from the lube oil system using fire resistant EHC fluid (Fyrquel or equal).
3. Two 100% capacity AC motor driven positive displacement pumps shall be provided. The pumps shall take suction directly from the EHC reservoir with suction strainers provided for each pump. Each pump shall also be provided with a full capacity relief valve, check valve, isolation valve, and discharge pressure gauge. Pressure switch(es) shall be provided to automatically start the standby pump in the event of low EHC system pressure. Means shall be provided for testing of the standby pump auto start circuits.
4. Two (2) 100% capacity cartridge type, 3-micron filters shall be provided with provisions to change out one filter while the other filter is in operation.
5. Two (2) 100% capacity, air-cooled EHC coolers shall be provided. On-line transfer capability shall be provided.
6. Redundant full capacity hydraulic fluid accumulators shall be provided.
7. All EHC skid mounted piping, tubing, manual valves, "last chance" filters, servo valves and instrumentation shall be provided. EHC system piping and tubing shall be 316L stainless steel.
8. The EHC reservoir shall be fabricated of stainless steel and be furnished with a self-contained thermostatically controlled immersion heater with a maximum heating density of 18 W/in^2. The EHC reservoir level shall be measured locally plus a level transmitter for control room indication shall be provided.

H. Emergency Trip System

1. The Emergency Trip System shall include all devices (pressure transmitters, thermocouples, speed pickups, vibration probes, etc.) required to automatically shutdown the steam turbine generator. The Emergency Trip System shall contain redundant sensors with redundant protection circuitry. Sufficient redundancy shall be provided in the protection scheme so that no single failure of an instrument (excluding vibration probes) will cause a turbine trip. Redundant trip circuitry shall be configured to allow on-line testing of trip functions without compromising unit safety, as indicated below.
2. The Emergency Trip System shall include, as a minimum, the following trips:

    a. Overspeed (primary and secondary) (on-line testing [remote] with 2 out of 3 voting logic required)
    b. Low – low lube oil pressure (on-line testing [local] with 2 out of 3 voting logic required)
    c. High – high exhaust hood pressure (2 out of 3 voting logic required)
    d. High – high exhaust hood temperature (2 out of 3 voting logic required)
    e. High – high bearing vibration (1 out of 2 voting with a time delay)
    f. Thrust bearing failure (1 out of 2 voting logic)
    g. Generator protection
    h. External trip initiated from General Manager's control system (not redundant)
    i. Emergency manual trip
    j. High – high bearing metal temperature
    k. Low – low lube oil level

    Note: all non-manual initiated trips shall have a pre-alarm

I. Turbine Shaft Sealing System

1. A skid mounted automatic shaft sealing system shall be provided. The shaft sealing system shall utilize a single point main steam supply provided by the Contractor furnished OTSG for the source of sealing steam during start-up and low load as well as normal operation, as soon as the OTSG is producing steam. The desuperheater for the main steam supply to the shaft sealing skid and all other required desuperheaters for shaft sealing shall be provided by the Contractor.
2. Gland sealing system including gland steam condenser with exhauster, all valves and instrumentation required for a complete system, and the following piping shall be provided:

    a. Steam seal regulator piping, including piping within the unit, re-entry lines, and steam seal header, from a single Contractor/General Manager sealing steam supply terminal point.
    b. Drain valves for the stop valve, casing and miscellaneous drains.
    c. Piping of control valve stem leak-off to steam seal header.

3. The shaft sealing system shall be provided with all necessary pneumatic control valves (steam regulator and dump valves), manual isolation and bypass valves, strainers, steam traps, drains, vents and instrumentation to support both local-manual and remote-automatic operation (General Manager's PCS control) of the steam seal system. As a minimum, one local pressure gauge, two pressure transmitters and one local thermometer

shall be provided. The shaft sealing system shall be skid mounted with all associated piping and wiring. The Contractor shall supply the steam piping from the sealing system skid to the turbine glands. The General Manager will supply the piping from the dump valve to the main surface condenser.

4. The Contractor shall supply all piping from control valve stem leak-off to the steam seal header, including all necessary valves and drains.
5. A skid mounted gland evacuation system shall be provided complete with condensate-cooled gland steam condenser, two 100% capacity AC motor driven gland steam exhausters, manual isolation and balancing valves, and instrumentation.
6. The gland steam condenser shall be a single pass, shell and tube heat exchanger and shall be designed with the Contractor's standard margin (200% the normal operating steam and air flow rates). The tubes shall be ASME SA-249 TP316L stainless steel tubes, minimum ¾ inch OD, 22 BWG minimum thickness with a tube side minimum design pressure of 400 psig and a minimum design temperature of 200°F. Maximum tube side pressure drop at maximum turbine exhaust flow shall be 5 psig. The tubesheets shall be fabricated from ASME SA-240 TP316L stainless steel. The shell and waterboxes shall be fabricated from carbon steel and be provided with a 1/8-inch corrosion allowance. The gland steam condenser shell shall be provided with a pressure gauge.

J. Heat Trace and Insulation

1. Refer to Section 481100 Combined Cycle Power Island for general heat trace and insulation requirements.

K. Platforms and Stairs

1. Refer to Section 481100 Combined Cycle Power Island for general platform and stairs requirements.

L. Turbine Rotor Lifting Equipment

1. Any special casing and/or rotor lifting beams and guides shall be provided. Beams shall be provided with certification of their safe load capacities.

M. Foundation Design

1. The Contractor shall specify all foundation requirements including normal, seismic, wind, and transient loads for the STG and accessories (e.g. size and number of anchor bolts; all Contractor equipment embedment requirements such as size, number, loads and location; concrete strength requirements; grouting requirements; etc.). Seismic loads shall be applied to all system components as applicable in accordance with the governing building code(s) specified in Section 480020, Site Conditions.
2. The General Manager shall be responsible for foundation design including the design of all embedments and the calculations to verify the embedment details are adequate for the Contractor specified loadings.

2.4 COMPONENTS

A. Casing and Exhaust Hood

1. Borescope inspection ports shall be provided in the turbine casings. For down exhaust arrangements, the exhaust hood is to be provided with rupture disc(s). For side or axial exhaust arrangements, Contractor shall recommend whether the condenser is to be provided with rupture disc(s) and the exhaust hood rupture disc(s) are not required. Disc capacity shall be sufficient to prevent exhaust hood or condenser over pressurization with all turbine steam admission valves fully open, at maximum throttle pressure, all extraction lines isolated, and complete loss of condenser circulating water.
2. An exhaust hood spray system shall be provided by the Contractor with spray control available through a General Manager-supplied PCS.
3. The exhaust hood spray system shall be designed for fully automated operation, but include means for hand operation in the event of failure of the power supply to electrically controlled equipment.

B. Acoustic Enclosure

1. The steam turbine and various accessories shall be housed in weather-tight acoustical enclosures. The unit shall be designed and packaged into fully integrated, compact modules with provisions for in-package maintenance. All auxiliary skids and electrical cabinets located outdoors shall be weather proofed suitable for the ambient conditions and shall meet the sound level requirements delineated in Section 480032, Combined Cycle Power Island Noise Control Performance. All gauges and manual valve operators shall be unobstructed and accessible from an immediately adjacent platform or grade.
2. Enclosures shall be designed such that adjoining panels and otherwise exterior mating surfaces are gasketed sufficiently to prevent the intrusion of rain water. Where gasketing is impractical or impossible, enclosure shall be designed for and Contractor shall include weatherproof sealant or caulking that is compatible with the materials on which it is to be applied and the environment to which it will be exposed.
3. A minimum 72" clearance shall be provided for all passageways inside the enclosure and modules. Roof hatches shall be provided as necessary for removal of equipment and large valves.
4. The steam turbine enclosure shall have a walk-in area around the turbine and be provided with a complete system of platforms, walkways and ladders inside the enclosure to allow access to all equipment, valves and instruments as required for routine operations and maintenance.
5. Any conduit requiring removal to access removable maintenance roof panels shall include quick disconnects. No conduit, piping, air ducts, or accessories shall be mounted on removable panels.
6. Turbine enclosure ventilation air enters the turbine compartment at the front corners of the turbine enclosure through ventilation ducts.
7. Pressure in the enclosure is established by AC motor driven fans.
8. Ventilation dampers shall automatically close upon actuation of the fire protection system. The dampers shall be capable of manual testing.
9. Remote temperature monitoring of the turbine compartment shall be provided by others for elevated temperatures caused by leaking piping or turbine flanges.
10. Enclosures having any type of hazard to personnel shall be provided with a secondary means of emergency egress.

C. Turbine Drains

1. Interior recesses and passageways in the turbine in which condensation may collect shall be adequately drained.

2. Drain valves that are required during startup and/or during shutdown shall be pneumatically actuated.

D. Turning Gear

1. The turning gear shall be AC motor driven or hydraulically driven and shall engage and start automatically upon zero turbine rotor speed. The turning gear shall automatically disengage when turbine speed exceeds the turning gear speed. The turning gear shall be controlled to prevent operation at turbine speeds above turning gear disengaging speed. A low lubricating oil pressure trip interlock shall be provided to prevent turning gear operation without oil to the bearings. Means shall be provided for manual operation of the turning gear in the event of power loss.

E. Couplings and guard

1. A rigid flange type coupling shall be provided for the turbine generator. Contractor shall provide hydraulic tapered coupling bolts (i.e.: Pilgrim bolts) for the turbine rotor to generator coupling. If a stub coupling is utilized (flanged both ends) at the generator, hydraulic coupling bolts shall be provided for both ends.

F. Turbine Connections

1. Turbine steam connections and piping shall be arranged such that condensate formed is free draining away from the turbine.

G. Steam Strainers

1. A strainer assembly integral with the stop valve shall be provided on the main steam admission. A wye or tee strainer shall be provided upstream of the gland steam regulator valve.
2. Each strainer shall have a permanent screen of either coarse mesh or perforated plate. All strainer filter elements shall be removable and shall be fabricated of stainless steel.

H. Turbine Valves and Steam Lead Piping

1. The Contractor shall provide all stop valves and steam admission control valves. Flanges shall be provided for valve removal during steam blows for valves incapable of being provided with blanking plates.
2. The turbine stop valves shall be hydraulically operated with spring closure on loss of hydraulic pressure. Control of these valves shall be provided by the turbine EHC system. A means of testing (full closure or partial stroking) individual valves under load shall be provided to assure the valves are functioning properly. The stop valve shall rapidly close on turbine trip to prevent unacceptable turbine overspeed and shall be capable of on-line calibration and partial stroke testing.
3. The turbine stop valve shall be equipped with inputs as required by the turbine control system and one valve open switch (for testing) and one valve closed switch.
4. The main steam stop valve shall be suitable for use as the steam turbine isolation valve during field hydrostatic testing (not to exceed 1.5 times the isolation valve's maximum design pressure). The main steam stop valve shall also be designed to allow steam flow through the valve body during start-up steam blows. The Contractor shall provide steam

blow blanking plate(s), assorted gaskets and fixture(s) to protect the valve trim during steam blows.

5. Turbine control valve shall utilize LVDT analog valve position feedback instead of limit switches. Turbine control system shall mimic a limit switch as a digital output via its configuration logic when necessary for interlocking purposes.
6. The Contractor shall provide all steam lead piping and pipe supports from the main steam stop valve to the turbine steam chest. If the Contractor's main steam stop and control valve is made from non-ASTM materials, Contractor shall also furnish transition piping made from ASTM material matching interconnecting steam piping material from the OTSG. This transition piping shall be factory welded to the Contractor's valve(s).
7. All pneumatic, hydraulic, or motor operated on/off valves shall have control room indication of open or closed status via two SPDT position limit switches or proximity switches. All critical control valves that are modulated via the PCS shall be provided with a position transmitter. Critical valves will be mutually agreed to by General Manager and Contractor during P&ID reviews. Valves shall have a local position indicator wherever practical. Position transmitters shall be provided for the main and reheat steam valves. Limit switches shall be provided for the pneumatic drain valves.
8. All MOV actuators shall be Limitorque or General Manager approved equivalent.
9. All pneumatically actuated control valves shall be Fisher or General Manager approved equal.

I. Generator Components

1. Insulation:

   a. Insulation shall be Class F, suitable for all service conditions. The windings shall be so designed that the insulation temperature rise at rated load will not exceed the continuous Class B insulation temperature limit. Winding insulation shall be resistant to the recommended lube oil.

2. Bearings

   a. Generator bearings shall be pressure lubricated.
   b. Close running shaft seals shall prevent oil leakage as well as prevent the entrance of foreign materials such as water and dirt in the bearing area.
   c. All bearings shall be insulated. Shaft ground brushes or an equivalent system shall be provided at the turbine end of the generator to prevent shaft current and resulting bearing damage.
   d. Rotor endplay limits shall be marked.

3. Leads and Terminal Boxes

   a. The generator power leads shall terminate in the generator enclosure that shall also contain the current transformers (CTs). Contractor shall also supply a separate VT/Surge cubicle for the STG containing voltage transformers (VTs), surge capacitors. The generator enclosure and VT/Surge cubicle shall provide adequate space for termination of General Manager-furnished isolated phase bus. Provisions shall be provided by the Contractor for terminating excitation transformer leads and voltage transformer leads.
   b. The VT/Surge cubicle shall be arranged for side cable entry and shall be sized to allow service access to the VTs and surge arresters provided by the Contractor.

c. Terminal boxes shall be provided with each voltage level (space heaters, RTDs, voltage regulator, etc.) separated by barriers or other means as required to maintain voltage separation. All leads shall be uniquely identified and numbered.

4. Neutral Grounding System

a. The generator shall be suitable for and provided with a high impedance neutral grounding assembly consisting of a standard distribution type transformer with a resistor connected to its secondary side.

5. Current and Voltage Transformers

a. Current Transformers (CTs):

1) The generator shall be provided with current transformers having a minimum ANSI relay accuracy of C-400 and ANSI metering accuracy of 0.3B-1.8 at the highest anticipated burden.
2) Current transformers shall have polarity marks clearly marked on each transformer and at the lead termination at the associated terminal blocks.
3) Quantity and location of CTs shall be as shown on Contractor's single-line drawing.
4) Redundant protective relaying (such as redundant multi-function generator protection relays) shall be connected to separate redundant sets of current transformers in order to preserve full redundancy.

b. Voltage Transformers (VTs):

1) The generator shall be provided with wye connected (4-wire) voltage transformers located in a weatherproof VT/Surge Cubicle.
2) Voltage transformers shall be of draw-out construction and shall have voltage, volt-amp, and BIL ratings suitable for the application. Voltage transformers shall have a metering accuracy of 0.3 for burdens W, X, M & Y when applied at 69.3 volts AC.
3) Quantity and location of VTs shall be as shown on Contractor's single-line drawing.
4) Redundant protective relaying (such as redundant multi-function generator protection relays) shall be connected to separate redundant sets of voltage transformers in order to preserve full redundancy.

6. Lightning Arresters and Surge Capacitors

a. Station type lightning arresters and surge capacitors shall be provided in accordance with Contractor's standard design and mounted in the VT/Surge Protection Cubicle.

7. Temperature Measurement

a. Six duplex RTDs (two per phase) or twelve simplex RTDs (four per phase) shall be imbedded in the stator windings or in the air discharge of the stator coil. One duplex RTD (simplex wired) per journal bearing shall be provided to monitor bearing metal temperature. At least one duplex RTD on the hot air side and one

duplex RTD on the cold air side shall be provided to monitor generator cooling air temperatures. The RTDs and thermocouples shall be uniquely identified and numbered, and terminated on thermocouple terminal blocks in separate boxes. One duplex Type K ungrounded thermocouple (simplex wired) will be provided and installed by General Manager in each bearing drain to monitor drain lube oil temperature.

8. Space Heaters

   a. Space heaters shall be provided for the generator. Location and maximum surface temperatures of the heaters shall be such that no damage can be caused to any insulation or other equipment. Heaters shall be suitable for operation on 1 phase, 110 V or 3 phase, 480 V power supplied by General Manager's MCC and designed to turn upon receipt of a signal from General Manager's PCS.

9. Excitation System

   a. Generator shall be supplied with one digital automatic voltage regulator including voltage adjust system, one manual field current controller with regulation, and a brushless excitation system. In addition to the requirements contained herein and the requirements contained in the standards, the performance of the excitation system shall meet any performance requirements of relevant organizations (such as interconnected utilities).
   b. The following protections shall be provided, as a minimum, with the generator excitation system:

      1) Under-excitation limiter
      2) Over-excitation limiter
      3) Over-excitation trip to trip the machine if excessive excitation remains for a predetermined time both in automatic and manual operation.
      4) Voltage-per-hertz limiter
      5) Automatic and continuous ground detection equipment, including facilities to permit in service tests of the ground detection system at any time.
      6) Voltage unbalance detector
      7) Field over-current limiter, which shall have characteristics similar to the thermal capability of the rotor in order to permit full utilization of the rotor thermal capability while protecting the rotor from damaging over-currents.
      8) A SEL-551 three-phase over current relay (50/51) for the protection of the excitation transformer (is not required due to brushless excitation PMA is supplied).

   c. The automatic voltage regulator shall maintain the generator terminal voltage within plus or minus 0.5% of the voltage set point over the range from no load to maximum load at the rated generator frequency. Manual voltage regulation capability shall be included as an independent feature.
   d. Excitation system shall be capable of changing generator power factor throughout the range required in the attached "Technical Datasheet by General Manager" and shall provide an interface to the automatic power factor control incorporated in the turbine control system.
   e. The exciter shall be wide range stabilized to permit stable operation down to 25% of rated exciter voltage.

f. The exciter ceiling voltage, as defined by ANSI standards, will be at least 120% of rated voltage when operating with a load resistance equal to the generator field. The exciter shall be capable of supplying ceiling excitation under load for at least one minute.
g. The response ratio of the exciter as defined by ANSI standards will be at least 0.5. The response ratio will be 0.5 for an error signal of 10%.
h. Terminal voltage shall be held within ±0.5% from no load to full load at rated voltage.
i. The excitation system shall provide field ground alarm information through the MODBUS connection, for General Manager's use.
j. The excitation system shall be suitable for automatic operation controlling voltage from the STG control system. Note: Power Factor control as well as VAR control is prohibited on units connected to the WECC transmission system. The Contractor shall be responsible for initial setup including any and all calculations necessary to support proposed settings to the General Manager or relevant organization.
k. The excitation system shall be sized to provide adequate field voltage and current to continuously produce rated MVA at the maximum rated generator output voltage. A redundant AVR as part of the controls that switches from one AVR to the other upon failure is provided.
l. All equipment necessary (such as field breaker, relays, metering, protective devices, and supervisory safety monitoring devices) to provide a fully functioning excitation system shall be provided.
m. Generator excitation equipment shall be provided in a metal enclosed NEMA dead front dust proof enclosure with internal illumination, hinged access doors, observation windows, cooling system, and any other required equipment. The voltage regulator will be mounted in the generator instrument & relay cubicle.
n. The collector shall be furnished in an enclosure suitable for indoor or outdoor installation. The enclosure shall be air cooled with ventilation provided by a centrifugal blower that is integral to the collector shaft assembly. The enclosure shall include a base that supports the stationary components and a door on each side. It shall include grounding lugs, air temperature RTD's and space heaters.
o. Enclosures shall include convenience outlets for maintenance equipment and incandescent lights and switches necessary to provide adequate lighting. All equipment mounted in enclosures shall be completely wired with all instrument, meter and control leads wired to terminal blocks for external connections. All major items shall be identified with engraved nameplates acceptable to General Manager.

10. Alarms and trips: The generator shall be provided, at the minimum, with the necessary instrumentation to provide the following pre-alarm and trip initiations:

a. High generator stator coil discharge gas or winding temperature
b. High generator bearing metal temperature alarm
c. High – high generator bearing metal temperature trip. (optional)
d. High generator rotor vibration level alarm
e. High – high generator rotor vibration level trip
f. High lube oil supply temperature alarm
g. Generator field ground
h. High and low voltage
i. Over-excitation limit
j. Under-excitation limit

k. Volts per hertz limit

11. Enclosure Grounding: The generator shall be provided with a minimum of two permanently attached grounding connectors located on opposite sides of the generator. The grounding connectors shall be corrosion resistant metal pads with each containing a minimum of two NEMA sized threaded holes.
12. Insulation Against Stray Currents: The generator shall be adequately insulated against stray currents.
13. The generator enclosure shall be constructed of prefabricated panels. Structural members will be erected individually and the panels will be hung onto the structural framework. Erection of the structural members, erection of the panels, and final outfitting will be performed on-site by others.

J. Motors and Accessories

1. All motors shall conform to IEEE 841, with respect to material, workmanship, design, and tests. All motors shall be designed for the environmental atmosphere as described in this document. All motors shall be "premium efficiency".
2. Motors shall permit the driven equipment to develop its specified capacity continuously without exceeding the specified temperature and without encroaching on the service factor.
3. Electrical Motor Design

a. Motors shall be squirrel cage induction type and shall have a design life objective of 30 years when operated with the connected load at rated voltage.
b. Parts that require replacement to achieve design life shall be readily replaceable.
c. All motors rated below ½ HP shall be single phase, 120 VAC, 60 Hz.
d. All motors rated 1 HP up to and including 200 HP shall be three phase, 480 VAC, 60 Hz.
e. Motors rated at ½ HP and ¾ HP can be either single phase, 120 VAC or 3 phase, 480 VAC at 60 Hz.
f. All motors above 200 HP shall be three phase, 4160 VAC, 60 Hz.
g. DC motors shall be rated at 125 VDC for service from the General Manager furnished battery system.
h. Variable frequency and variable speed controls are acceptable. Motors shall be provided with Class F non-hygroscopic insulation limited to a Class B rise.
i. Motors shall be designed for across-the-line starting and shall be capable of accelerating the connected load to full load speed with 80% of rated voltage at the motor terminals.
j. DC motors shall be capable of accelerating the connected load and operating continuously at 105 VDC to 140 VDC.
k. A maximum rated voltage starting current of 6.5 times rated full load amps must not be exceeded for all motors rated larger than 3 HP.
l. Where repetitive starting is restricted, the permissible number of starts shall be clearly indicated on the nameplate.
m. The full load current when operating at plus or minus 10% of rated voltage shall not exceed 1.11 times rated full load current.
n. Motor safe locked rotor time at rated locked rotor current shall be equal to or greater than the maximum accelerating time at 80% of rated voltage.
o. Motors shall be selected to permit the connected load to develop its specified output continuously without encroaching on the service factor under normal

operating conditions. Service factor shall be 1.15 for all 480 VAC and lower voltage motors.

p. Motors shall be selected to permit operation up to, but not to exceed, their service factor rating during infrequent and short periods of operation.

4. Mechanical Motor Design

a. 480 VAC motors shall be totally enclosed fan cooled (TEFC).

b. 480 VAC motor bearings shall be anti-friction type, conservatively sized, suitable for continuous service under the conditions specified, and sealed against the entrance of dirt and the loss of lubricant. Grease lubricated bearings shall be lubricated prior to shipment. Bearings requiring periodic re-greasing shall have provisions for in-service positive lubrication with means to prevent damage due to over greasing. Bearings of the completely sealed or the pre-lubricated type shall not have provisions for in-service lubrication.

5. Motor Accessories

a. Separate terminal boxes shall be provided for main leads, space heater leads, and temperature indicating device leads. For motors larger than 20 HP, main terminal boxes shall be one size larger than specified in IEEE 841 or NEMA C50.41 and shall be compatible with the motor enclosure specified. Main terminal boxes shall be capable of rotation in 90˚ steps.

b. Space heaters shall be provided for motors 25 HP and larger. They shall be of low heat density and rated and sized for continuous operation when the motor is off to maintain the internal temperature 10 ˚C above ambient temperature. Heaters shall be mounted in the motor to prevent deterioration of nearby components. Unless otherwise approved, space heaters shall be installed so that they may be serviced or replaced without disassembly of motor. The voltage rating and operating voltage of the heaters shall be at least 120 VAC. Total enclosed motors up to 15 HP shall have at least one drain hole with piping plug at each end.

c. Motors with frame sizes larger than 184 T shall be provided with a suitable NEMA 2 hole grounding pad with tapped holes.

d. Motors shall have permanently attached nameplates indicating the following information in addition to the standard nameplate markings shown in NEMA C50.41 and IEEE 841.

1) Rotation
2) Magnetic center, horizontal motors with sleeve bearings
3) Starting restrictions
4) Terminal leads markings
5) Bearing number, each bearing
6) Recommended lubricant
7) Service factor
8) Full load voltage
9) Full load amperage

6. Motor Tests

a. Tests shall be performed on motors in accordance with IEEE 112, IEEE 113, IEEE 115, IEEE 116, IEEE 841, as applicable. If single phase locked rotor test is performed, polyphase values of a duplicate motor must be available.
b. Tests typically shall include:

1) No-load current input and speed at rated voltage and frequency
2) Locked rotor current input at rated voltage
3) Dielectric test
4) Noise level measurements in accordance with IEEE 85

2.5 INSTRUMENTATION AND CONTROLS

A. General

1. It is the intent of the General Manager to integrate the Contractor's equipment into a Contractor-furnished plant control system (PCS). HMI and all operator workstations for control, monitoring and protection, shall have the capability to digitally communicate with the General Manager's Plant Control System (PCS) for speed/load control and monitoring purposes. This communication shall be MODBUS protocol and shall be redundant.
2. All control devices furnished by the Contractor shall be capable of digitally interfacing with the PCS and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the PCS to remotely start and stop all rotating equipment and to allow automatic switch over to any backup units.
3. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant. Contractor will supply a detailed list of instruments for discussion for meeting this requirement.
4. The Contractor shall permanently install a 1.25 inch stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified “Instrument Tag Number” to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
5. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of non-skid mounted devices. Special cables or termination kits if required for flame scanners, ignition transformers, etc. shall be provided by the Contractor for installation by the BOP contractor.
6. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
7. The control system shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.
8. The plant control system is to be designed to provide automation to minimize operator actions during normal plant start-up, shutdown, and at-power operations. Once gas

turbine and steam turbine have been placed in their ready-to-start conditions, balance of plant systems have been filled and vented, and equipment has been placed in automatic mode, normal plant operations can proceed with few operator actions. The operator is required to start each turbine with a single command to bring it to a desired load level. At that point the gas turbine can be put in plant master mode. The operator can then enter a single plant load setpoint to which total plant output is controlled.

9. Plant systems and equipment are to be monitored and/or controlled through the PCS. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant PCS.
10. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
11. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two SPDT position limit switches or proximity switches, unless noted otherwise.
12. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Contractor shall accommodate this objective in the design of their equipment and Contractor shall furnish any and all transmitting instrumentation required to observe and record the process conditions listed in Performance Test Datasheet herein. These instruments shall be furnished regardless of whether or not they are required by Contractor's control system for ordinary equipment operation. These instruments shall be furnished and calibrated in accordance with specification section 481100, Combined Cycle Power Island, Instrumentation and Controls. These performance data sheets shall then be completed and submitted as part of the plant performance testing described in section 480032, Power Island Performance Testing.

B. Instrumentation & Control Devices – Requirements

1. 3-wire, 100-ohm platinum RTDs shall be used.
2. Duplex type K thermocouples shall be used. Appropriate junction devices shall be supplied with thermocouples for use with thermocouple conductors where necessary to avoid cold junction signal distortion.
3. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
4. Electronic transmitters shall be Yokagawa, Endress & Hauser, or SMAR smart transmitters.
5. Control valves and pressure regulators shall be manufactured by Fisher or equivalent pre-approved manufacturer.

C. STG Controls

1. The STG shall be equipped with all necessary controls configured for complete start-up, synchronizing, loading, operation and shutdown from the General Manager's main control room via the Contractor furnished operator terminal with keyboard, printer and dual Operator Consoles screens. Manual synchronization, via a General Manager supplied manual synchronization panel, shall also be possible from the General Manager's main control room.
2. A complete microprocessor based control system using standard ISA tagging shall be provided by the Contractor for the overall control of the steam turbine generator and its auxiliaries. The power supply for the control system equipment will be from the General Manager's power supply system. Refer to Attachment 1 – Scope of Supply.

a. The control system shall be a digital system with manufacturer's standards processor capable of performing unit speed/load control, normal and emergency overspeed control, automated unit start-up, synchronization, loading, frequency, shutdown, steam admission pressure control, unit protection and supervision. The electronic speed governor shall control rotor speed to within 108% of synchronous upon a full load rejection.

b. The generator will normally be operated in parallel with the local SCE utility grid. Should the connection with the PWP grid be lost, the control system shall be designed to trip the steam turbine.

c. The control system shall permit full manual control and partial manual assist control and include on-line and off-line unit protection testing capabilities.

d. Automated unit start-up, synchronization, loading and shutdown shall be controlled utilizing feedback from Contractor's turbine stress evaluation program.

e. The steam turbine and control system shall be capable of providing an immediate and sustained response to abnormal frequency excursions within the machine design parameters. The governor shall provide droop characteristics and be fully responsive to frequency deviations consistent with the capabilities of the turbine and generator.

f. Frequency Control: Generator frequency control shall be maintained during unit run-back operation via the Contractor furnished control system.

g. The control system shall be provided with, but not limited to, the following features:

1) Speed feedback inputs for Speed Control - To be used during startup and shall have a minimum adjustable set point range of 0 - 100% rated speed from the operator's workstation and the General Manager's PCS.
2) Speed indication
3) Speed setpoints / mode selector
4) Ramp rate setpoints
5) Pressure control setpoints
6) Sliding pressure control: Rate sensitive inlet pressure limiter- capable of accepting a throttle pressure setpoint from the station PCS during sliding pressure operation.
7) Load limit and indication for Load Control - To be used during normal operation and shall have a setpoint range of 0-100% maximum capability.
8) Load setpoints / mode selector:

    a) Setpoint Control - Shall be governed by the turbine control system.
    b) Remote Setpoint Control - Shall be arranged to allow for controlling the setpoint remotely from the operator's workstation and General Manager's PCS interface console.

9) Turbine drain controls.
10) Lube oil and EHC system interlocks
11) Emergency trip system
12) On-line and off-line testing capabilities
13) Thermocouples (ungrounded) and/or RTDs to measure steam, bearing, metal and lube oil supply temperatures
14) Power supplies to power the system from both the General Manager's 230 VAC, 60 Hz supply and 125 VDC power supply, as applicable.

h. The Contractor shall provide, at a minimum, the following screens for the operator interface Consoles:

1) Main display
2) Bearing metal temperatures
3) Bearing and Rotor vibration Monitor
4) HP and LP steam pressures and temperatures
5) Valve status
6) Speed/load control
7) Start-up screen and permissives
8) Alarm screen
9) Turbine exhaust temperature monitoring
10) Generator temperature monitoring and generator quantities
11) Sensor reset
12) Turbine Trips
13) Lube Oil system
14) Turbine rotor and casing displacements

i. Following Pushbutton/Selector switches:

1) Speed Control mode selector
2) Load control mode selector
3) Trip & Reset
4) Raise speed/load setpoint (fast and slow pushbuttons)
5) Lower speed/load setpoint (fast and slow pushbuttons)
6) Stop valve test
7) Other pushbutton selector switches as required for Contractor's control interface

j. Digital Indications:

1) Speed
2) Control valve position
3) Vibration at each point
4) Setpoint

k. Indications

1) Stop valve open/closed
2) Stop valve test in progress
3) Low condenser vacuum pressure

l. The control system shall provide, as a minimum, the following interfaces with the General Manager’s control system (PCS):

1) Hardwired Controlled inputs
   a) Emergency trip
   b) Customer trip
   c) Speed raise/lower
   d) Load raise/lower
   e) Control mode selection

2) Selections
   a) Speed control mode selector
   b) Load control mode selector
   c) Trip & Reset
   d) Raise speed/load setpoint (fast and slow pushbuttons)
   e) Lower speed/load setpoint (fast and slow pushbuttons)
   f) Stop valve test
   g) Other selections as required for controls
   h) Manual open/close of each valve

3) Digital Indicators
   a) Speed
   b) Control valve position
   c) Vibration at each bearing
   d) Setpoint
   e) Rotor position
   f) Thrust wear indication

4) Digital Indications
   a) Stop valve open/closed
   b) Stop valve test in progress
   c) High vibration and trip
   d) High condenser vacuum
   e) Turbine-generator control system alarms (i.e., component failure or self diagnostic)

m. Sixteen (16) analog outputs and twelve (12) additional digital inputs/outputs shall be reserved for General Manager's use.
n. The Contractor-furnished control system shall be provided with a redundant communication data link to interface with the General Manager's control system via ModBus or DNP3.
o. All STG alarms and trips shall be printed out on the Contractor-furnished printers.
p. The control system shall have the capability to store historical data for a usable period of time. The system shall be capable of displaying historical data for analysis and importing to a PC database.

3. STG Protective Relay and Meter Control Panel

a. The Contractor-furnished STG protective relay and meter control panel shall be located in General Manager furnished building. All necessary devices shall be provided to allow STG start-up, manual and auto synchronization, loading, operations, and shutdown from the panel. The control and monitoring requirements shall be organized into functional groups.
b. The following equipment, at a minimum, shall be provided on the control panel. The relay functions described below shall be contained within two independent digital generator protection devices (DGPs), a digital transformer protective device and discrete lockout relays.
c. Relays

1) (1) SEL-300G3 generator protective relay equipped with the additional standard I/O board and the latest firmware version. Associated support

material shall include (2) sets of I.Ls, two USB to RS232 cables, and the latest version of the associated communications software (AcSELerator) and event analysis software (SEL-5601).

AND

(1) Beckwith M3425A multifunction generator protection relay including the comprehensive protection function option, Additional I/O, HMI Module, and Target Module. Associated support material shall include (2) sets of I.Ls., two USB to RS232 cables, and the latest version of the associated communications software (IPScom) and event analysis software (IPSplot Plus).

OR

(1) GE G60 generator protective relay equipped with Enhanced front panel with user programmable buttons, CPU with 10 Base FL, 10 Base-T, RS485 communications and IRIG-B port, 16 standard Inputs, (2) 8 Fast Form C outputs modules, (2) standard 4CT/4VT modules with enhanced diagnostics, (1) 4 Form-A output with 8 digital input module. Associated support material shall include (2) sets of I.Ls., and the latest version of the associated communications software and event analysis software. In addition, logic creation software, ViewPoint Engineer and ViewPoint Maintenance shall also be included.

2) (2) SEL-587 station service transformer protection relays.
3) (1) GE MIV voltage protective relay to detect ground faults between the generator PCB and the GSU low-side terminals.
4) (5) Lockout relays, 86G, 86-1, 86AE, 86T, and 86BF (86BF applicable only to units with a low-side generator breaker as delineated in the attached "Technical Datasheet by General Manager"). Each lockout to be furnished with E-Max RAW coil monitoring with a common alarm to the PCS.
5) States FMS test switches applied to each metering and relay current inputs. Each relay voltage, meter voltage, relay contact, and each relay input shall have one Entrelec test switch,
6) Each normally-open contact on each lockout and tripping relays utilized for tripping and breaker failure initiation shall be wired through an Entrelec test switch. Spare contacts for each lockout relay shall also be wired through individual test switch. This shall be consistent across the four available breaker configurations: low-side generator breaker with single high-side line breaker, low-side generator breaker with dual high-side line breakers, single high-side generator breaker, and dual high-side generator breakers.

d. Meters/Transducers: Listed quantities shall be available to the General Manager's PCS system through the data link between the steam turbine control system and the General Manager's PCS system.

1) 1-Watt-hour Meter with Pulse Initiator
2) 1-Var-hour Meter with Pulse Initiator
3) 1-Watt Transducer
4) 1-Digital Monitor, DM1, with hardware to control system. This meter shall be ION 8600 multi-function meter with the following features and functions;

a) Panel display
b) 1-Generator VAR Output to PCS
c) 1-Generator VAR Import/Export Output to PCS
d) 1-Generator Power Factor Output to PCS
e) 3-Generator Current Output to PCS
f) 3-Generator Voltage Output to PCS
g) 1-Generator Frequency Output to PCS

e. 1-Digital Monitor, DM2, with hardwire to turbine control system:

1) 3-System Voltage Output to turbine control system
2) 1-System Frequency Output to turbine control system

f. 1-Digital Meter, DM4:

1) 1-Generator Field Voltage
2) 1-Generator Field Current
Note: the exciter field ammeter and voltmeter quoted will be analog meters with 4-20 mA outputs to PCS.

g. Transducer Input or connection from an IED to General Manager′s Plant PCS and/or SCADA RTU

1) 1-Generator Voltage, Three Phase
2) 1-Generator Current, Three Phase
3) 1-Generator MW
4) 1-Generator MVAR
5) 1-Generator MW-Hour
6) 1-Generator MVAR-Hour (with both Import and Export MVAR-Hour

h. Automatic Synchronizer System

1) 1-Synchroscope with Lights
2) 1-Automatic Synchronizer, 25
3) 1-Synch Check, 25X

4. Vibration and Rotor Position Monitoring Equipment: Contractor's standard vibration package for tripping the unit shall be provided, however as a minimum, the Contractor shall provide a Bently Nevada Series 3500 monitoring package for supervisory purposes with the following devices:

a. Two (2) radial vibration probes (x and y Proximiters), relative type, on each steam turbine and generator bearing.
b. Two (2) axial position probes on the steam turbine front standard. Two out of three probes must indicate a trip condition before tripping the turbine.
c. Keyphasor probe.
d. One proximiter (probe driver) with calibrated leads for each of the above probes.
e. LCD display.
f. Monitoring system with adjustable alert (alarm) and trip signals shall be provided.
g. 4-20 mA outputs for all radial and axial position signals along with a serial link for data transmission.

5. Instrument and Control Wiring

    a. Reference Section 260000, Electrical Mechanical Equipment

6. Conduit

    a. Reference Section 260000, Electrical Mechanical Equipment.

2.6 FABRICATION

A. Refer to Section 481100 Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

2.7 SOURCE QUALITY CONTROL

A. Tests and Inspection

1. General

    a. Refer to Section 481100 Combined Cycle Power Island for general source quality control, test, and inspection requirements.
    b. The Contractor shall make all connections required to perform tests in accordance with ASME Performance Test Code (PTC) – Steam Turbines, PTC 6/6.2.
    c. The STG and accessories shall be factory tested following manufacturer's standard procedures. The test procedures shall be submitted to the General Manager for information after contract award, with a summary description of factory testing submitted with the proposal.
    d. All castings and forgings used in the construction of the unit shall be high quality and have necessary casting processing, radiographic testing, magnetic particle inspections, and sonic testing performed that are outlined in applicable ASME/ASTM specifications.

2. Shop Inspections & Testing

    a. The equipment and accessories shall be factory assembled into major components and inspected as required to establish critical fits, clearances, alignment, weld connections, mating surfaces and bolt hole alignment to minimize field adjustments.
    b. Inspection and testing shall be in accordance with the codes specified.
    c. Instruments shall be protected during hydro testing.
    d. Wiring shall be checked for continuity and insulation integrity.
    e. Filters shall be removed for hydro test of filter housing.
    f. Full information describing the tests which are included in the price quotation shall be included with the Proposal.
    g. Certified copies of all the minimum test results shall be submitted for acceptance before shipment of the equipment is made

B. Shop Testing: The STG and accessories shall be factory tested following manufacturer's standard procedures. The test procedures shall be submitted to the General Manager for review. As a minimum, the following tests shall be performed.

1. Factory Hydro Tests

   a. Water jackets, coils, coolers, and shop installed piping shall be hydro tested at 1-1/2 times the design pressure in accordance with ASME B31.1.
   b. Pressure retaining components shall be subject to the hydrotest requirements of ASME B&PV Code, Section 1, Section VIII, or ASME B31.1, Power Piping Code, as applicable. Only the prototype castings of turbine pressure retaining components shall be subject to hydro-testing.
   c. Parts shall not be primed or painted until hydro testing is successfully completed.

2. Factory Rotor Balancing: The fully assembled steam turbine and generator rotors shall be individually statically balanced in the factory. The turbine rotor will be low speed balanced, and vibration level is checked during no-load mechanical running test at shop. Acceptance criteria for the factory balance is as follows:

   a. At rated speed, relative vibration shall not exceed 2.0 mils peak to peak absolute, with shaft mechanical and electrical runout compensation.
   b. Shaft runout shall be measured prior to test acceptance.

3. Steam Turbine Factory Overspeed Testing

   a. The steam turbine rotor shall be overspeed tested at a minimum of 110% of synchronous speed.
   b. The generator rotor shall be overspeed tested at a minimum of 120% of synchronous speed and held for a minimum of 2 minutes.

4. Factory Accessory Testing

   a. The accessory equipment shall be functionally tested in the factory. Contractor and General Manager shall mutually agree on what will be tested.

5. Testing requirements on turbine and associated equipment (minimum)

   a. Stop valves shall be mechanically stroked to prove function and to verify closure speed.
   b. Internal clearances shall be confirmed.
   c. The rotor shall be given a heat stabilization test in a semi-finished state to minimize thermal stresses.
   d. Major rotating parts shall have chemical and physical analysis.
   e. The completed rotor shall be balanced to run smoothly without excessive vibration and operated at 120% rated speed for at least 2 minutes.
   f. The rotor shall be ultrasonically tested.
   g. The materials for rotor and rotating blades shall be magnafluxed or ultrasonically tested prior to finish machining.
   h. Contact checks shall be performed on horizontal and vertical casings, and valve chest cover joints.
   i. The high pressure casing shall be hydraulically tested.

6. Mechanical Testing requirements on the generator equipment (minimum)

    a. Rotor mechanical balance.
    b. Rotor overspeed at 120 percent of rated speed.
    c. Mechanical inspection.
    d. Air leakage test.

7. Electrical Testing requirements on the generator equipment (minimum)

    a. Measurement of cold resistance of armature and field winding.
    b. Insulation resistance measurements with armature at 1000 volts DC and field at 500 volts DC
    c. Armature dielectric test with an AC voltage twice the rated generator voltage plus1000 volts for a period of 60 seconds
    d. Field dielectric test with an AC voltage ten times rated excitation voltage applied for 60 seconds
    e. Calibration test for all temperature sensing elements.
    f. Functional test and calibration for turbine-generator controls.

8. Excitation system shall be tested in accordance with manufacturer's standard tests as described in the proposal.
9. The generator shall be tested, along with the excitation system, at 25%, 50%, 75% and 100% current levels to verify temperature rises.

C. Factory Generator Tests

1. Rotor mechanical balance.
2. Rotor overspeed at 120% of rated speed.
3. Mechanical inspection.
4. Air leakage test.
5. Measurement of cold resistance of armature and field windings.
6. Insulation resistance of stator and rotor windings.
7. High potential tests.
8. Dielectric tests of armature and field.
9. Dissipation Factor Measurement (tan δ) for stator winding after impregnation.
10. 8-hour burn-in runs for each voltage regulator and a 48-hour burn-in test for each rectifier assembly diode. These burn-ins may be accomplished concurrently with other shop tests.
11. Resistance temperature detectors test.
12. Calibration test for all temperature sensing elements.
13. Functional test and calibration test for turbine-generator controls.
14. Stator core iron induction test at 1.0 Tesla or other stator core imperfection test subject to approval by the General Manager. This test is required to verify the absence of hot spots in the core iron stacking and shall be performed after completion of the stacking of the stator core.
15. Excitation system shall be tested in accordance with manufacturer’s standard tests Contractor shall describe these tests in the proposal.
16. The generator shall be tested along with the excitation system at different current levels to verify temperature rises, voltage control parameters, exciter compatibility and other appropriate parameters.

D. Control Board and Software Testing

1. Electrical shop tests shall be made on all control boards. These tests shall include high potential tests on power equipment and operating tests to demonstrate that the equipment functions correctly. Electrical tests shall be made in accordance with ANSI C37-20.
2. Control wiring tests shall include those that are necessary to determine that all instruments, meters, relays, instrument transformers, etc. are correctly wired and function in the specified manner when energized. Each circuit shall be continuity tested. Insulation resistance tests shall be conducted on each circuit (except in circuits containing electronic components); the insulation resistance shall be no less than 25 mega ohms.
3. A Factory Acceptance Test (FAT) shall be performed on the complete software system prior to shipment. Simulated (software) inputs are acceptable during the FAT.

E. Instrument Calibration

1. Refer to Section 481100, Combined Cycle Power Island for instrument calibration requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Painting

1. Refer to Section 481100 Combined Cycle Power Island for general field painting requirements of exposed structural and carbon steel elements.

3.2 FIELD QUALITY CONTROL

A. Tests

1. Refer to Section 480032 Power Island Performance for general field acceptance test requirements.

B. Performance Tests

1. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.
2. The performance test will be carried out to the manufacturer's standards in general accordance with the following internationally recognized standards:

   a. ASME PTC 6/6.2 - Steam Turbines / Steam Turbines in Combined Cycle
   b. ASME PTC 19.1 – Measurement Uncertainty

3.3 COMMISSIONING

A. General

1. Refer to Section 480032 Power Island Performance for general commissioning requirements.

3.4 TRAINING

A. Refer to Section 481100 Combined Cycle Power Island for general training requirements.

END OF SECTION 485221

APPENDIX A – TECHNICAL DATASHEET BY GENERAL MANAGER

The detailed technical data will be furnished by the Contractor during contract execution. The design will be to manufacturer's standards and will support the power island guarantees and will meet the design life requirements.

Project Configuration	
Number of STG Units	1
Type of Turbine	Condensing, Single Pressure, No Reheat
Exhaust Configuration	Axial
Project Location	Pasadena, CA
Installation Location	Outdoors
Generator Cooling (OAC, TEWAC or Hydrogen)	TEWAC
System Design Parameters	
Generator Power Factor Range	0.85 (lagging) to 0.95 (leading)
Power System Stabilizer Required (Y/N)	N
Synchronization Breakers (One Low Side, One High Side, or Two High Side)	One Low Side provided by Others (BOP Contractor)
Mode of Operation	Daily cycling from off line or minimal load to 100%
Main Steam Admission Control	Sliding Pressure and IPC
Cooling Water Supply Loop (Open/Closed)*	Closed
* Cooling Water Supply Loop Selection Above Indicates the Following Parameters:	
Cooling Water Temperature, °F	83˚F
Cooler Tube Material	316 SS or Titanium
Tubesheet Material	316 SS
Cooler Tube Velocity Range	8-10 ft/sec
Utilities Supplied by General Manager	
Instrument Air	80 psig to 120 psig (See Note 1)
Service Air	80 psig to 120 psig
Three Phase AC Power	4160 V/60 Hz, 480 V/60 Hz

Single Phase AC Power	120 V/60 Hz
DC Power	125 V nominal
Lube Oil Coolers	
1) No. of Coolers Required	2-100% Capacity
2) Tube Side Design Pressure	125 psig
3) Tube Side Design Temperature	150 °F
4) Allowable Tube Side Press. Drop	10 psig
5) Cleanliness Factor	85%
EHC Coolers	
No. of Coolers Required	2-100% Capacity
Generator Coolers	
1) No. of Coolers Required	4-25% Capacity
2) Tube Side Design Pressure	125 psig
3) Tube Side Design Temperature	150 °F
4) Allowable Tube Side Pressure Drop	10 psig
5) Cleanliness Factor	85%
Gland Steam Condenser	
No. of Condensers Required	1-100% Capacity
Cooling Water Source	Condensate
Shell and Waterbox Material	Carbon Steel
Shell/Waterbox Corrosion Allowance	1/8 inch
Tube Material	316L Stainless Steel
Tubesheet Material	316L Stainless Steel
Tube Side Design Pressure	400 psig
Tube Side Design Temperature	200 °F
Allowable Tube Side Pressure Drop at Maximum Turbine Exhaust	5 psig

Note 1: Pneumatic actuators shall be designed to provide adequate torque with 60 psig instrument air pressure.

SECTION 485222
GAS TURBINE GENERATOR (AERODERIVATIVE)

PART 1 - GENERAL

1.1 SUMMARY

A. This section details the minimum technical requirements for the design, manufacture, testing, and furnishing of an aeroderivative gas turbine generator (GTG). It is not the intent to specify completely herein all details of design and construction of the gas turbine generator and its related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification as defined in Division of Responsibilities in Attachment 1. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. Packaged aeroderivative gas turbine with totally enclosed water to air cooled (TEWAC) generator and standard accessories including a heated and ventilated enclosure for outdoor installation. Water temperature to the TEWAC generator shall vary based on ambient or inlet chilling conditions to account for turbine output power capability. For chilling to 48 °F inlet temperature from an ambient of 113 °F, TEWAC cooling water temperature of 85 °F maximum shall be required. For low ambient temperature (17 °F) the water temperature inlet to TEWAC cooler shall be maximum 80 °F. TEWAC water temperature vs. Power output diagram (HEP 31210) shall be provided.
2. Inlet air filtration system, intake silencer and interconnecting ductwork
3. Inlet air filter house and inlet duct support structure including ladders and platforms
4. Fuel gas system (GTG fuel gas module) including final filter
5. Optional systems identified on attached datasheets as described in this Section with segregated pricing for each optional system
6. Fuel gas metering and throttle control valves for GTG control system
7. Compressor water wash system suitable for both on-line and off-line water wash
8. Hydraulic Lubricating oil system
9. Turbine lube oil and Generator/gearbox lube oil systems
10. Turbine starting system and gearbox turning gear assembly
11. GSU transformer
12. Brushless excitation system
13. Line termination hardware and cubicle (CTs, VTs, surge arresters)
14. Neutral grounding equipment (neutral grounding transformer)

15. Microprocessor based control system with one local and four remote HMI units, protocols for bidirectional communication with plant PCS system
16. Gas turbine and generator supervisory instrumentation and protective devices with the means to interface with balance of plant control system via Modbus over TCP/IP communication link
17. Gas turbine generator outdoor weather enclosures including ventilation fans, lighting, and electrical receptacles
18. GTG Contractor shall furnish design information for BOP Contractor supplied motor control centers, batteries, and chargers normally supplied in a PCM, to be installed in a PDC by the Balance of Plant Contractor. GTG Turbine Control Panel physical layout is provided.
19. Fire protection system with associated detection and alarms
20. Sole plates needed for supplied generator/gearbox for GTG
21. All piping, raceway, and wiring contained within or supported by the GTG bases and associated auxiliary system skids
22. Wiring and conduit within or mounted on Contractor supplied equipment enclosures or skids (wiring, cables, and ducts, etc. to electrical motors to be limited to terminal box on individual skid)
23. Interconnect hoses between main unit and auxiliary skid
24. Shear lugs required for seismic restraint
25. On-skid Instrument air piping and actuators
26. Noise mitigation measures to achieve requirements defined in Section 480031, Combined Cycle Power Island Noise Control Performance
27. Special tools and lifting devices (one set of turbine lifting equipment and generator rotor withdrawal equipment for use with an overhead crane) required for assembly and disassembly of equipment furnished under this specification
28. Field advisory services including field support, installation support, start-up support, commissioning support, and training
29. Start-up spare parts and consumables
30. Submittal documents required in this Section as defined in Attachment 11
31. Cleaning and finishing prior to shipment
32. Finish paint of all enclosures, ducting and inlet filter house
33. Static testing at factory and signoff reports of the results with onsite witness by the General Manager
34. All required correction curves to verify performance at off design conditions using Deck Transfer correction methodology, a model based correction procedure using the APPS program.
35. A GTG performance degradation curve showing degradation from “New & Clean” conditions from 0 to 1000 fired hours in 50 hour increments
36. Manuals and drawings to support balance of plant design, installation, operation, and maintenance of the specified equipment as defined in Attachment 11
37. Signoff reports and quality plan listed in this Section
38. Priced list of recommended spare parts for two years of operation
39. Packing and shipment DDP to the Glenarm Power Plant jobsite in the city of Pasadena, CA.

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Receipt, off-loading, storage, protection of equipment at General Manager's designated delivery point, and erection of equipment at the plant site
2. Foundations, anchor bolts/nuts, standard embedments, and grout
3. Plant Control System (PCS)
4. Power and control raceway, wiring, instrument tubing, and pneumatic supply piping external to GTG bases and auxiliary equipment skids, including all interconnect wiring between Contractor supplied equipment
5. Fuel gas supply, pressure control and conditioning equipment, except for GTG fuel gas filter
6. Drains and/or vent piping from the gas turbine package to a remote discharge point
7. Site grounding
8. Lightning protection
9. Load management/load shedding system
10. Automatic Isochronous load sharing Control
11. Power systems study
12. Compressed, filtered, and dried instrument air supply to common connection point
13. Initial fill of lube oil, control oil, all gases, all water and all dry fire fighting chemicals
14. Field performance testing
15. All control room furniture required for Contractor supplied terminals, keyboards, and printers
16. Electrical distribution between the generator, generator circuit breaker, and step-up transformer
17. Current transformers (CTs) and voltage transformers (VTs) not integral to the generator and terminal compartments
18. Insulation and heat tracing of Contractor supplied piping as detailed in the Contractor's insulation and heat tracing drawings
19. Initial fuel gas filter/separator, dew point heating, and piping up to the GTG fuel gas filter and piping from GTG fuel gas filter to GTG skid
20. Generator circuit breaker and low voltage power source feeder
21. Utilities as delineated in the "Technical Data By General Manager"
22. Demineralized water treatment plant, storage tank and supply system up to the inlet of the NOx water injection system, at the water wash system, and the SPRINT skid.
23. Cathodic protection

1.4 RELATED SECTIONS

A. Section 260000, Electrical Mechanical Equipment (LM6000 standard electrical mechanical equipment design is provided in Contractor's scope of supply.)

B. Section 262050, Low Voltage Motors (LM6000 standard design motors are provided in Contractor's scope of supply.)

C. Section 480020, Site Conditions

D. Section 480031, Combined Cycle Power Island Noise Control Performance

E. Section 481100, Combined Cycle Power Island

F. Section 485471, Inlet Air Chiller

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. IEEE

   a. C50.13 - Standard for Cylindrical-Rotor 50 Hz and 60 Hz Synchronous Generators Rated 10 MVA and Above

2. American Society of Mechanical Engineers (ASME)

   a. PTC 22 - Gas Turbines (with Contractor comments)

3. International Organization for Standardization (ISO)

   a. 2314 - Gas turbines : Acceptance tests (with Contractor comments)

4. National Fire Protection Association (NFPA)

   a. 12 - Carbon Dioxide Extinguishing Systems

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. Reference Section 481100 Combined Cycle Power Island for general design requirements and expected operating profile.
2. All equipment shall be designed for continuous 24 hour per day operation with potential daily cycling of each GTG from off-line to full load.

B. Performance Requirements

1. The GTG and accessories shall be mechanically capable of continuous, unrestricted operation (up to the engine mechanical power limitation) over the specified ambient temperature range and from approximately 20% to full load with properly supplied cooling water to the generator.
2. The GTG shall be capable of operating within the specified emissions concentration levels over the specified ambient temperature from 25% to 100% plant load. The Contractor's proposal shall include complete information regarding part load emissions capabilities for the specified ambient temperature range.
3. The GTG shall be designed for operation on the fuel(s) described in Section 480020, Site Conditions which shall meet Contractor's gas fuel spec MID-TD-0000-1 in Attachment 10. The Contractor shall provide detailed fuel specifications to ensure fuel composition and supply flows and pressures are met.
4. The generator shall be rated at nameplate 0.85 power factor, 13.8 kV at 80 °F water temperature where output is greater than the gas turbine capability at all operating conditions.
5. The Contractor shall guarantee the gross power output of the combined cycle plant on a LHV and HHV basis at site design conditions and the ambient temperature stated in Section 480020, Site Conditions, as stated in Attachment 6.
6. Heat rate and gross power output guarantees shall be made at the injection water flow rates and other applicable operating parameters required for meeting exhaust gas emission concentration and mass flow rate guarantees, as stated in Attachment 6.
7. Noise emissions shall meet requirements of Section 480031, Combined Cycle Power Island Noise Control Performance, as stated in Attachment 6.
8. Contractor shall guarantee that the gas turbine generator package shall meet the specified noise criteria when tested in accordance with ASME PTC 36 and/or ASME B133.8, as stated in Attachment 6.
9. Contractor shall state water injection flow rates and the exhaust gas emission rates for NOx, CO, Volatile Organic Compound (VOC), Total Suspended Particles (TSP), PM-2.5, PM-10 and SOx for each of the load conditions specified. Maximum emission rates for the fuel gas firing in ppmvd (at 15% excess O2 averaged over one hour) and lb/hr, over the range of operating conditions at the stated water flow rates shall be guaranteed, as stated in Attachment 6.
10. Contractor shall provide available data hazardous air pollutant (HAP) regulated under 40 CFR Part 63 and toxic air pollutant regulated under state of California and South Coast Air Quality Management District for each of the load conditions specified over the range of operating conditions at the stated water flow rates, as stated in Attachment 6.
11. The vendor shall provide the load level at which water injection begins over the range of site conditions and the range of operating conditions, as stated in Attachment 6.

C. Reliability

1. No single failure of a GTG auxiliary component or system (lube oil pump, GTG enclosure fans, etc.) shall result in GTG damage. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure in Contractor's Cause & Effect matrix drawing 969149.

1.8 SUBMITTALS

A. Refer to Attachment 11

1.9 QUALITY ASSURANCE

A. GTG manufacture shall be ISO 9001:2008 certified facility. The Quality Management system is applicable to design, manufacturing, factory repair/refurbishment, and project management of installation and commissioning of Aeroderivative gas turbine generators. Contractor shall supply the GTG equipment in accordance with its Quality Procedures

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping
   1. GTG package preparation for shipping will be per Contractor packaging and shipping standards.
   2. The gas turbine generator and accessories shall be packaged for shipment to allow for outdoor storage as prescribed by Contractor for a period of six months without damage from dust, sun, wind, or rain. Contractor to notify General Manager for the crates which requires indoor storage. Preparation for shipment shall be provided as per Contractor's standard procedure:

      a. Equipment to be completely free of water prior to packaging for delivery.
      b. Unpainted surfaces to be protected from weather with weather tight and weatherproof covers. Machined surfaces shall be coated for protection.
      c. Lifting and support points shall be clearly identified.
      d. Packages shall be identified with items, purchase order number, and item descriptions. Identifying tags shall be corrosion and weather resistant.
      e. Temporary bracing and covers shall be provided wherever required.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Contractor's structural welding and fabrication shall be performed in accordance with AWS D1.1 to include inspections. Contractor's Quality Assurance weld inspection specification shall meet or exceed all requirements stated in AWS D1.1 for all NDE methods, including visual. All visual weld inspections shall be performed by AWS certified weld inspectors. .

2.2 EQUIPMENT

A. Main GTG Package

1. The gas turbine shall be an aero-derivative type unit, capable of operating in simple or combined cycle as specified in the datasheet attached to the end of this Section. The gas turbine shall operate continuously at base load as defined in Section 481100, Combine Cycle Power Island over the range of ambient conditions and using the fuels specified and meet Contractor's gas fuel specification MID-ID-0000-1 in Attachment 10.
2. The gas turbine shall provide efficient and reliable service throughout the range of operating conditions and environmental requirements as defined in Section 481100, Combine Cycle Power Island. Reliability, prompt starting, ease of operation and a minimum of maintenance attention are primary considerations, and the rating and model size chosen by the Contractor shall reflect this.
3. The gas turbine generator package, as specified herein shall be completely engineered, designed, and an assembled array of equipment components and modules. The components and modules shall be designed, manufactured, and constructed of materials as required by the application for performance, reliability and maintenance.
4. The compressor, combustion system, and turbine shall meet the design criteria specified in ASME B133.2, "Basic Gas Turbine." This shall include lateral and torsional critical speed analysis of the combined turbine and generator. The Contractor is not required to submit lateral and torsional critical speed analysis reports; however these reports shall be presented for review at Contractor's facility after contract award, if requested specifically.
5. The gas turbine may be directly coupled to the generator, via a reduction gear.
6. Rating

    a. Prototype or first time designs are not acceptable. The gas turbine generator model must have demonstrated experience for a minimum of two years operation. Operation experience may be applied to modifications to an established model or family of models that are shown to meet the stated requirements with improved performance (lower heat rate, higher output, etc). The Contractor shall be prepared to provide, upon request, evidence of specific locations where the model and components have the required two years experience.
    b. The gas turbine generator shall be designed for safe and reliable operation at all load conditions and with the range of environmental conditions and fuels specified. The various operations include cold start-up or immediate restart after coast down including synchronization and loading to full capacity.
    c. Exhaust and noise emission requirements shall be met at all specified loads and operating scenarios, as stated in Attachment 6.

7. Blading

    a. The blading and disks of the compressor/turbine shall be designed to be free from resonant vibrations in the normal speed range up to over speed and shall withstand thermal transients without distortion, creep or incremental damage.
    b. The blading shall also be resistant to pitting, corrosion, erosion, crystallization, creep, or other.

8. Combustion Chambers

    a. The combustion chambers shall be designed to accommodate thermal expansion without imposing loads on adjacent parts and shall be mounted so that they can be easily inspected when necessary. The gas temperatures of all combustion chambers shall be closely matched.

b. Automatically operated igniters shall be provided for the burners. The igniters shall be designed for maximum reliability, and their operation shall be automatic. Redundant ignition devices shall be provided.
c. Flame failure detection and automatic cut off the fuel supply in the event of fuel failing to ignite on startup shall be part of the GTG control system and shall be as per defined in Contractor's position paper #60. Also, in the event of fuel failing to ignite on startup, means shall be provided for automatically purging all unburned gaseous fuel from the gas turbine generator.

9. Casing and Rotors

a. Although Compressor Blade maintenance can be accomplished in the package, our engines shall be designed for removal from the package for maintenance on an as needed basis. LPT Module maintenance is planned at the periodic overhauls at Contractor's depot. Refer to Attachment 16 for maintenance detail.
b. Ports shall be provided in the compressor/turbine sections to permit radial inspection of the interior by means of a Borescope.

10. Speed

a. The gas turbine generator shall be designed to have an adequate margin of safety when run 15% above design.

11. Shafts

a. Running surfaces inside bearings shall be polished

12. Seals

a. Arrangements shall be made where possible to enable the compressor/turbine seals to be examined and replaced without the necessity of dismantling the casings. The design shall provide for no gas leakage from seals into enclosures.

13. Bearings

a. Bearing housings shall be horizontally split and designed to allow bearing inspection and replacement The bearings shall be accessible for inspection and repair without moving major components, such as inlet duct or silencer.
b. The main bearings shall be designed consistent with the requirements for continuous service. Guards and shields shall be provided to protect personnel from rotating shafts. The bearing housing shall prevent oil vapors from leaking out and air from leaking in.
c. Hydrodynamic radial and thrust bearings shall be supplied for generator. The radial bearings shall have replaceable pads. The thrust bearing shall be tilting pad, adjustable type for axial positioning of the rotor. Two vibration detectors are mounted 90° apart at each radial bearing (Total 4).
d. For generator bearings, dual element RTDs in the bearing metal and in the oil drain lines provide bearing temperature sensing.
e. Sight glasses shall be located on all generator/gearbox bearing drains and shall be easily read and accessible. GTG shall include ball and roller bearings taking radial and thrust loads.

14. Enclosures

a. The gas turbine and various accessories shall be housed in acoustical enclosures. The unit shall be designed and packaged into fully integrated, compact modules with provisions for in-package maintenance. All auxiliary skids and electrical cabinets located outdoors shall be weather proofed suitable for the ambient conditions and shall meet the sound level requirements delineated in Section 480031, Combined Cycle Power Island Noise Control Performance. All gauges and manual valve operators shall be accessible.
b. Adequate clearance shall be provided for all passageways inside the modules.
c. Gas turbine generator enclosures that have a walk-in area around the gas turbine generator shall be provided with walkways, adequate lighting, valves and instruments as required for routine operations and maintenance.
d. Turbine, generator/gearbox and auxiliary skid enclosures shall be provided with heaters and 100% redundant ventilation fans.
e. Air ducts shall be easily disassembled and independently supported and arranged so that the amount of ductwork that must be removed for gas turbine generator maintenance is minimized. Any conduit requiring removal to access removable maintenance roof panels shall include quick disconnects. No conduit, piping, air ducts, or accessories shall be mounted on removable panels.
f. Ventilation dampers shall automatically close upon actuation of the fire protection system. The dampers shall be capable of manual testing.
g. Remote temperature monitoring of the turbine compartment shall be provided for elevated temperatures
h. Turbine, generator/gearbox enclosures having any type of automatic CO2 fire system shall be provided with a secondary means of emergency egress.
i. Enclosures shall be designed such that adjoining panels and otherwise exterior mating surfaces are gasketed sufficiently to prevent the intrusion of rain water. Where gasketing is impractical or impossible, enclosure shall be designed for and Contractor shall include weatherproof sealant or caulking that is compatible with the materials on which it is to be applied and the environment to which it will be exposed.

2.3 OPTIONAL FEATURES

A. Inlet Air Chilling Coils

1. Inlet air chilling coils shall be provided for each GTG to increase power output during warm ambient conditions.
2. In the chiller system, chilled water circulates through tube coils within the inlet combustion air flow stream.
3. The design shall include sufficient heat transfer capacity to lower the inlet combustion air temperature to the design minimum during the highest ambient temperature conditions specified in Section 480020, Site Conditions. Adequate temperature measurement shall be provided in the inlet air duct to monitor compressor inlet air temperature.
4. The inlet air chilling coil controls as required shall be self contained and capable of data communications interface to the PCS. Capability for remote start/stop of the chiller systems from the plant control system (PCS) is required. Control devices required to perform the automatic and remote control functions of the chiller system shall be included.

B. Water Injection System

1. Control of NOx emissions by water injection shall be based on maintaining a predetermined water to fuel ratio for gas fuel. The water to fuel ratio shall be field adjustable and shall be set based on emissions performance tests.
2. Water injection pumps shall be two 100 % installed capacity pumps, with stainless steel wetted parts. Piping, valves and tube fittings shall be stainless steel. Furnish and install flow bypass check valves.
3. Temperature sensor, flow transmitter, flow metering and controls shall be furnished and installed, incorporating Contractor's standard features for regulation of flow for NOx control. Provide temperature and flow signals to the plant distributed monitoring and control system via Modbus TCP/IP communication link.
4. Water injection equipment shall be skid-mounted, packaged in a weather tight, heated, well lit enclosure with insulation.

2.4 COMPONENTS

The following descriptions include minimum requirements for auxiliary combustion gas turbine systems when provided with the GTG.

A. Inlet Air Filtration and Duct System

1. The self cleaning pulse type inlet air filtration and duct system shall be Contractors standard design comprising of air filtration barrier filters, ducting, guide vanes, silencers, internal lighting and all necessary controls and instruments for the safe and efficient operation of the system. The inlet air filtration and duct system shall at a minimum include the following components, in the direction of the airflow:

    a. Stainless steel wire trash/bird screen
    b. Galvanized (phosphatized / bonderized) and one coat painted steel weather hood
    c. 2-coat painted system over carbon steel construction filter house
    d. Inlet air chilling coils
    e. Inlet filter house 2-coat painted carbon steel plenum
    f. Transition section from filter house to silencer 2-coat painted carbon steel, interior and exterior.
    g. Inlet silencer assembly with 304 stainless steel liner (combustion section)(includes 316 stainless steel transition duct on expansion joint)
    h. The ductwork includes the nylon "last chance" (trash) screen
    i. Stainless steel inlet volute

2. The inlet air filtration system shall include the following components and functionality:

    a. The air filtration shall limit the ingestion of airborne sand and dust into the GTG with more than 99.9% removal of all particles 5.0 microns and larger. A two or three tier arrangement self cleaning filter housing shall be provided to reduce the filter housing foot print area. The filtration system shall be a pulse-jet self cleaning type generally complying with OEM specifications which are applicable to the site conditions.

b. The air to media velocity, filter efficiency shall be based on ARMCO specifications. The initial pressure drop of the system with chilling coils is estimated at 5.0 inch of WC.
c. Contractor provided instrument air system will be used for pulse cleaning during the turbine outage.
d. The air filter controls as required shall be self contained .

3. Contractor's standard 2-coat paint system shall be utilized.
4. The inlet air filtration and duct system shall be supported by Contractor's supplied structural steel based on an outdoor application. Necessary platforms and ladders shall be provided.
5. Although some contingencies in the air filter design that allow for the addition of miscellaneous small loads (such as site conduit runs, etc.). The inlet system is not designed to support more significant loads, such as the chiller coil supply and return piping not in Contractor's scope of supply, without a detailed understanding of the piping configuration and a complete re-analysis of the system. The coil header flanges are not designed to take any load from the City's piping runs.
6. Single stage pulse filter shall be provided. The weather hood provides a deflecting surface to prevent driving rain and snow from entering the filter house. In addition, paper, leaves and wind-blown trash are blocked by the inlet screen. The high-efficiency conical and cylindrical pulse filter elements (provided as a pair) are mounted to a vertically oriented dirty-to-clean air separation sheet ("tube sheet") within the pulse filter modules. The pulse filter removes more than 99.9% of all particles 5.0 micron and larger.
7. The weather hood shall be acoustically lagged.
8. The total estimated inlet air filtration and duct system total pressure loss with chilling coils (at conditions listed on Contractor's guarantee sheet) for loads up to base load is estimated at 5.0 inches of WC.

B. Fuel Gas System

1. Main components for fuel gas system shall include:

a. Final fuel gas filters and strainers
b. Primary and secondary fuel gas shutoff valves
c. Fuel gas control valve and metering valves at GTG module
d. Fuel gas manifolds internal to Contractor supplied enclosures
e. Associated instrumentation (transmitters, thermocouples, and gages)

2. Contractor shall provide one fuel gas flow transmitter for the GTG. Accuracy of the gas flow meter shall be rated at +/-1.0%, but capable of being calibrated in the range of 0.5% to 0.8%. CEMS receives the fuel gas flow via Modbus over Ethernet TCP/IP communication link.

C. Starting Unit

1. A GTG starting system shall be provided by the Contractor. The system shall be capable of rotating the turbine for starting and water washing. It shall be suitable for extended operation at purge, startup, accelerated cool down and compressor cleaning speeds.
2. The system shall be directly operated by AC electric motor with a hydraulic pump and include necessary peripheral equipment for operation.

3. The starting system shall include automatic control features and such additional equipment as is necessary to ensure reliable starting capability in the shortest possible time.
4. The starting sequence shall incorporate a period for purging the gas path of any dangerous fuel/air mixture and drain the system of any un-ignited fuel. Protection shall be built into the sequence so that in the event of an abortive start another start cannot be attempted until conditions are safe to do so.

D. Lube Oil System

1. A complete separate turbine and generator/gearbox lubricating oil systems shall be provided by the Contractor including oil pumps, coolers, strainers, filters, heaters, interconnecting hoses, valves, instrumentation and oil reservoir.
2. The reservoir shall be provided with a self-contained thermostatically controlled immersion heater. The lube oil reservoir level shall be measured locally with a level transmitter provided for control room indication.
3. The lube oil reservoir shall be constructed of 304 stainless steel.
4. 2x100% capacity redundant lube oil AC pumps shall be provided for the generator/gearbox lube oil system. One positive displacement lube oil pump shall be provided for the turbine lube oil system. Two redundant pressure transmitters shall be provided to automatically start the standby pump in the event of low lube oil pressure of the generator/gearbox lube oil system.
5. For the generator/gearbox lube oil system, a DC emergency lube oil pump shall be provided. The emergency lube oil pump shall be capable of handling the GTG shutdown without equipment damage in the event of an AC power failure. The emergency lube oil pump shall auto-start on a low-low lube oil pressure condition.
6. Means shall be provided for testing of the standby pump auto start circuits.
7. All GLO pumps suctions shall either contain a coarse suction strainer or a coarse mesh strainer
8. A sight flow glass and a dual element RTD shall be provided in each generator bearing drain.
9. One pressure balanced duplex filter, 6-micron absolute elements with visual indicator for manual transfer capability shall be provided. A differential pressure transmitter shall be provided.
10. Lube Oil Cooling

    a. 2x100% capacity, shell and tube, single pass coolers or two pass coolers shall be provided. Cooling water for the oil systems and other auxiliary components will be from the Contractor supplied auxiliary cooling water module.

11. One Contractor approved mist eliminator shall be provided. The discharge from the mist eliminator shall be routed in such a manner to prevent vapor induction into the GTG inlet air filter.
12. In general, the use of screwed, flanged or other non-welded joints shall be permitted where components must be removed during routine maintenance. This requirement does not apply to tubing.
13. Oil piping, tubing, fittings (including flanges) are 304 stainless steel, and valves shall be carbon steel with stainless steel trim. Tube fittings shall be Swagelok. Valve bodies shall be carbon steel if the trim that is in contact with the oil is 304 or 316 stainless steel.
14. All oil piping shall slope toward the reservoir for gravity drain when the lube oil pumps are not operating to prevent water from accumulating.

E. Hydraulic Starting Oil System

1. Contractor shall supply one hydraulic oil system with 1x100% capacity fin-fan hydraulic supply system cooler, one dual low pressure with 10 micron element return filter and one simplex case drain return filter with 10 micron element. Filters shall have visual indicators, City to change filter elements on a regular basis and replace them at least once a year regardless of indicator reading, sooner if conditions warrant.
2. The hydraulic oil system shall be enclosed if appropriate for the minimum ambient temperature conditions.
3. The cooler shall be sized such that the GTG can continue to operate normally for two hours with a maximum ambient temperature shown in the Section 480020, Site Conditions without equipment damage, oil degradation. Operation beyond this point will require operator action to correct the abnormal condition.
4. Fluid reservoir level shall be measured and control room indication of the level shall be provided via Modbus TCP/IP communication link.
5. In general, the use of screwed, flanged or other non-welded joints shall be permitted where components must be removed during routine maintenance. This requirement does not apply to tubing.
6. The hydraulic oil reservoir shall be constructed of 304 stainless steel.
7. All hydraulic supply system piping and tubing shall be 304 or 316stainless steel. Tube fittings shall be 316 stainless steel and Swagelok.

F. Water Wash System

1. Contractor shall provide a water wash system suitable for both on-line and off-line water washing of the turbine compressor. The water wash pumps, water storage tank, and accessories shall be provided in a skid mounted enclosure.
2. The water wash system will be permanently located per Contractor's requirements and the Contractor shall supply all on-base and on-skid piping/tubing in addition to all necessary controls. Interconnecting piping from the water wash skid to the GTG unit will be provided by the BOP Contractor.
3. City shall provide water wash water and detergent which shall meet Contractor MID-TD-0000-4 and MID-TD-0000-5 specifications in Attachment 10.

G. Fire Protection System

1. Contractor shall supply a skid mounted fire protection system. A complete self-contained system including the following items shall be provided:

    a. Fire suppressant or CO2 bottles
    b. Sunshield
    c. Manifold and control valves
    d. Gas detectors, optical flame detectors, and thermal detectors
    e. Control panel and all necessary interconnecting materials including piping from the bottles to the protected areas.

2. The BOP Contractor shall perform an actual discharge test to ensure proper concentrations and holding times are achieved per NFPA and local requirements. Refill of the CO2 bottles shall be the BOP Contractor's responsibility
3. In case of fire an emergency, shutdown of the GTG shall initiate and fuel flow stopped.

4. When fuel gas accumulation in the GTG enclosure exceeds the pre-set low explosion limit (LEL), enclosure ventilation dampers shall open for fans to vent fuel gas to atmosphere while fuel flow to the GTG continues.
5. When detectors sense a pre-set high explosion limit of gas accumulation, fuel flow must be stopped, the dampers shall close, and fans shall stop.
6. Detectors are required in all compartments to initiate a release of CO2 in concentrations that meet the requirements of NFPA 12. A complete system shall be provided including nozzles, manifolds, CO2 bottles, and control panel all in accordance with NFPA 12.

H. Instrument Air System

1. Contractor shall supply the instrument air piping/tubing and actuators within the GTG package. All piping/tubing and fittings shall be 304 SS. Tube fittings shall be Swagelok.

I. Enclosure Ventilation

1. Turbine enclosure ventilation air shall enter the turbine compartment around the inlet collector of the turbine enclosure through ventilation ducts.
2. Pressure in the enclosure must be established by AC motor driven fans.

J. Hazardous Area Classification

1. The Contractor shall indicate on drawings any areas of the gas turbine generator which are classified as hazardous in accordance with the National Electrical Code, ANSI/NFPA 70 and the classification for the area. The Contractor shall supply electrical devices where used within the classified area.

K. Foundation Design

1. The Contractor shall specify all foundation requirements including normal, seismic, wind, and transient loads for the GTG and accessories (e.g. size and number of anchor bolts; all Contractor equipment embedment requirements such as size, number, loads and location; grouting requirements.). Seismic loads shall be applied to all system components as applicable in accordance with the governing building code(s) specified in Section 480020, Site Conditions.
2. The General Manager shall be responsible for foundation design including the design of all embedments and the calculations to verify the embedment details are adequate for the Contractor specified loadings.

2.5 ELECTRICAL COMPONENTS

Generator

1. The generator shall be an alternating current synchronous generator, rated to match the maximum turbine output in accordance with the Specification. The generator shall be of cylindrical rotor revolving field type. The enclosure shall be totally enclosed air cooled designed for outdoor application.
2. The stator frame shall be designed and manufactured to withstand forces exerted by electrical and mechanical stresses in the generator core.

3. Insulation of the stator core laminations shall be non-aging and of a type which will maintain its insulating properties at temperatures well above the normal operating range. The windings shall be completely insulated full voltage to ground as defined in ANSI C50.10 using an impregnation process. Wedges shall be polyester glass. Alternate insulation systems shall be pre-qualified and approved by the General Manager prior to proposal submittal. Leads from both ends of all phase windings shall be brought out to an accessible location, for external wye connection.
4. The generator rotor shall be machined from a single alloy steel forging. The rotor shall be cooled by the generator air cooling system with fans provided within the generator housing.
5. The generator shaft shall be designed and constructed with a minimum of two bearings and supports. Bearings shall be split to permit removal of the upper and lower halves for inspection. Bearings shall be lubricated by the unit main lubricating oil system, and provided with visual oil flow sight glass. Stainless steel oil piping shall be provided to the main bearings. Rotor shaft shall be protected from the circulating flow of eddy currents.
6. Cooling air flow utilized to maintain the generator temperature within the operating range shall be of sufficient flow rate so that the unit may operate at 100 % rated kVA at maximum ambient conditions. Cooling air shall be supplied from the filtered turbine intake air system in accordance with this Section.
7. The generator shall be provided with three high voltage terminals for high impedance grounding in neutral cubicle and three high voltage terminals in the generator line side cubicle for bottom cable entry customer connection. Instrument transformer requirements (CTs and PTs mounted in line and neutral compartments as shown on GTG one line diagram) shall be provided.
8. Space heaters shall be provided for the generator to prevent condensation when not in operation.
9. Generator space heater shall be finned type heater. The heater rating shall be sized to maintain windings and internal parts dry when the main breaker is open. Generator shall be equipped with a separate connection box for space heaters.
10. Generator Cooling System

    a. The generator shall be totally enclosed water to air cooled (TEWAC).
    b. The generator cooler tubes material shall be 90/10 CuNi, and tube plates materials shall be carbon steel epoxy coated to suit water analysis. Tubes shall be seamless, shall be 16 mm OD with 0.9mm wall thickness. The surface area of the generator coolers shall be based on 100 °F cooling water. An 85% cleanliness factor shall be used in the design calculations to determine the required heat transfer surface area.
    c. The cooling system shall be designed such that valving one cooler out of service does not prevent operating the generator at 66% of rated MVA.

B. Generator Surge Component

1. Generator surge component shall be totally enclosed.
2. Generator surge protection component shall include three station-type lightning arresters and three single phase (non-PCB) surge capacitors sized/rated appropriately for the machine ratings/characteristics.

C. Generator Neutral Grounding Component

1. The neutral grounding component shall be totally enclosed.

2. The grounding transformer shall be a dry-type epoxy encapsulated unit, with the following minimum ratings:

    a. High voltage winding: 13.8 kV.
    b. Low voltage winding: 240 V.
    c. BIL rating: 95 kV.
    d. Single phase, 60 HZ.
    e. Short time rating: 30 seconds.

3. The secondary resistor shall have the following minimum ratings:

    a. Voltage rating: 240 V, 60 HZ.
    b. Insulation level: 600 V.
    c. Short time rating 30 seconds.
    d. Impedance determined by Contractor in collaboration with the General Manager.

D. Excitation System

1. The excitation system shall consist of a rotating shaft-mounted brushless system.
2. Excitation system shall regulate the generator voltage at any setting from 90 to 105 %of the rated voltage of the generator, from no load to full load, with terminal voltage maintained within +/- 0.5% of setting.
3. Continuous rating of the exciter shall meet the excitation requirements of the generator, at 105% of rated voltage under continuous rated MVA operation requiring maximum field current.
4. The excitation ceiling voltage obtainable by manual control will be at least 120% of rated voltage when operating with a load resistance equal to the generator field. The excitation will be capable of supplying ceiling excitation under load for at least one minute.
5. Excitation system shall be capable of operating throughout a range of system frequencies from 57.0 to 65 HZ.
6. Voltage response ratio shall be 0.5 as defined in IEEE Standard 421, Criteria and Definitions for Excitation Systems for Synchronous Machines. The response ratio will be 0.5 for an error of 10%.
7. The excitation system shall be wide-range stabilized to permit stable operation down to 25% of rated excitation voltage on manual control.
8. Excitation System Protective Devices:

    a. Over excitation protection in AVR shall be provided. The protection shall trip the excitation field and generator main breaker for conditions when the voltage or current levels exceed a safe limit beyond a timed interval.
    b. The excitation system and generator shall be protected against damage from excessive volts-per-hertz operation.
    c. Generator rotor ground fault RGF 64 device shall be provided as defined in Contractor's one line diagram.

9. Excitation System Component Design Features:

    a. The excitation system shall be capable of sustained operation in the event of a temporary loss of AC control supply. Removal or restoration of the control power shall not cause any change in the status of the excitation system during normal operation or during any startup or shutdown sequences of control.

b. The brushless system shall include parallel fully rated diodes for 100% redundancy, protected by individual fuses. Diode failure indication shall be included.

10. Voltage Regulator:

a. An automatic voltage regulator shall be provided and shall have an accuracy of ±/- 0.25% over operating temperature range for a load variation from no load to full load. Manual voltage regulation capability shall be included as an independent feature. The voltage regulation system shall include the following functions:

1) Over excitation protection.
2) PT fuse failure detection blocks voltage increase and alarms on loss of sensing voltage.
3) Voltage set point adjuster monitor via GTG HMI.

b. A digital voltage adjusting system shall be used for the automatic voltage regulator set point.
c. Under excited operation when on the automatic voltage regulator shall be limited by means of an adjustable limiting function that automatically prevents steady-state operation below the rated generator capability for under excited operation. Similarly, maximum excitation limits shall be established.
d. An adjustable reactive current compensator shall be provided for the automatic voltage regulator.
e. The following information shall be provided on GTG HMI:

1) Generator terminal voltage.
2) Exciter field voltage.
3) Exciter field current

f. Other standard offerings provided by specific manufacturer shall be provided.
g. Test switches furnished in the Turbine Control Panel shall permit isolation of the voltage regulator from the generator voltage transformers. A shorting-type test switch shall be provided to permit isolation of the generator current transformer from the reactive current compensator and from the under excitation limit device.

E. Test Switches

1. A sufficient number of Test Switches shall be provided for lockout relays, CTs and VTs.

F. Instrument Transformers

1. Voltage transformers shall be dry type, single ratio, with current limiting primary fuses. The primary fuses shall be arranged and protected to permit ease of removal and replacement. Voltage transformers shall be General Electric ITI Type PTG 5. Secondary wiring shall be brought to terminal blocks in a box housing located external to the transformers.
2. Current transformers shall be single ratio, window-type with accuracy class ratings in conformance with applicable ANSI standards for relaying and metering utilization. Current transformer secondary leads shall be extended to shorting type terminal blocks in a box housing located external to the transformers.

G. GTG Motor Control Center

1. The GTG Motor Control Center will be located in the Power Distribution Center provided by the Balance of Plant Contractor. Power Island Contractor shall furnish necessary motor and load information as shown in GTG MCC schedule drawing to enable the Balance of Plant Contractor to purchase MCC's meeting the requirements of the GTG.
2. The 120 VAC supply for computer, telephone and other critical loads associated with the GTG package will be provided from the General Manager's UPS system.

H. Generator Design Conditions

1. The generator rated voltage shall be 13.8 kV nominal with windings connected for grounded wye 60 HZ operation, in accordance with IEEE standards.
2. The telephone influence factors of the generator shall be in accordance with the latest IEEE standards. The deviation factor of the open circuit terminal voltage wave of the generator shall not exceed 10% as defined by IEEE standards.
3. The generator armature shall be capable of operating at 130% of rated armature current for at least one minute, starting from stabilized temperatures at rated conditions.
4. The generator field windings shall be capable of operating at a field voltage of 125% of rated load field voltage for at least one minute starting from stabilized temperatures at rated conditions.
5. The generator rotor shall be capable of withstanding, without permanent damage, the thermal effects of unbalanced faults or other unbalanced conditions on the system at the generator terminals, in accordance with the provisions of IEEE standards.
6. The generator shall be capable of withstanding, without mechanical injury, any type of short circuit at its terminals for times not exceeding the short time thermal capabilities, when operating at rated kVA and power factor and 5% overvoltage, in accordance with the provisions of IEEE standards.
7. The generator shall be suitable for continuous operation at rated kVA, power factor, and frequency at any voltage not more than 5% above or below rated voltage, in accordance with the provisions of IEEE standards.
8. The generator shall be capable of operating continuously at full rated load under usual service conditions, (per IEEE standards and ambient temperatures not exceeding 40 ˚C). The total temperatures shall be in accordance with the IEEE C50.13 and shall be based on supplying air cooler with air between minimum and maximum ambient temperatures (see Section 480020, Site Conditions). The total temperatures shall not exceed temperature allowed for Class B insulation when operating at full load or below. The stator and rotor shall be provided with Class F insulation. Generator shall have 0.85 power factor at maximum generator kW rating.
9. The short circuit ratio of the gas turbine-generator shall be 0.5 or greater at the maximum calculated output rating.

2.6 INSTRUMENTATION AND CONTROLS COMPONENTS

A. General

1. Instrumentation and controls design shall be as per Contractor's standard LM6000 PG.
2. The GTG shall be equipped with all necessary controls configured for complete start-up, automatic or manual synchronizing, loading, operation and shutdown from the General

Manager's main control room (local GTG HMI) and from the Power Distribution Center (remote GTG HMI).

3. Turbine Control panel contains GTG protective relay and metering, shall be shipped to the site for installation.
4. Contractor to furnish the electrical support interface requirements and loads imposed on the foundation (refer to Contractor's MCC Schedule 969035 drawing). BOP Contractor to design foundations to satisfy all code requirements. A remote HMI for the GTG unit shall also be provided by the Contractor for installation in the General Manager's main control room for remote operations of the gas turbine generators. Main control room furniture for Contractor supplied controls components will be supplied by the BOP Contractor.
5. It is the intent of the General Manager to integrate the Contractor's equipment into a BOP Contractor-furnished plant control system (PCS). All control devices furnished by the Contractor shall be capable of interfacing with the PCS via communication link or Contractor's standard hardwired signal design and provide sufficient data and status information required for system control via communication link. This includes all data from process sensors (transmitter and switches) furnished on GTG by the Contractor. Components and controls furnished by the Contractor shall allow the PCS to remotely start and stop GTG and to allow automatic switch over to the back-up unit.
6. All critical pneumatic, hydraulic, and motor operated open/close (non-modulating) valves shall have control room indication of the open and/or closed status via one SPDT position limit switches or proximity switches. All critical control valves that are modulated via the GTG shall be provided with a position transmitter.
7. Instruments shall be furnished and calibrated in accordance with Contractor's standard LM6000 PG design. Refer to Attachment 6 for Contractor's performance guarantee.

B. Identification
1. The Contractor shall permanently install an Ø 1-3/16" circle stainless steel identification tag in a conspicuous location on each instrument and control device which are listed on F&ID. The tag shall bear the Contractor's specified standard "Instrument Tag Number". The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other applicable communication with the General Manager.
2. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points as per Contractor's standards. Provisions shall be made for wiring of non-skid mounted devices. Specification for special cables or termination kits, if required for circuits between supplied equipment, shall be provided by the Contractor as per Contractor's interconnect cable schedule drawing for installation by the General Manager.

C. Microprocessor Based Control System: A complete microprocessor based control system using Contractor's standard tagging shall be provided by the Contractor for the overall control of the gas turbine generator. The DC power for the control system equipment located in the electrical/control package will be supplied by the BOP Contractor's 24 VDC and 125 VDC systems and their chargers. The AC and DC power for the control system equipment located within the central control room will be supplied by the General Manager's power supply system.

1. The control system shall be a digital system capable of performing unit speed/load control, normal and emergency overspeed control, automatic unit start-up, synchronization, loading, and shutdown, frequency, and unit protection and supervision.
2. The generator will normally be operated in parallel with the local SCE utility grid. Should the connection with the PWP grid be lost and notification be provided to Contractor's control system via a single contact or signal from others, the combustion gas turbine control system shall be designed to maintain GTG on-line at a minimum present residual load (unit run-back).
3. The gas turbine and control system shall be capable of providing an immediate and sustained response to abnormal frequency excursions within the machine design parameters. The governor shall provide droop characteristics and be fully responsive to frequency deviations consistent with the capabilities of the turbine and generator.
4. The control system shall permit full automatic control and partial manual assist control and include on-line and off-line unit protection testing capabilities.
5. The control system shall include security features to restrict HMI users to certain maintenance functions and to limit access to specific HMI features to appropriate personnel for the intended tasks.
6. The generator shall have the following two modes of operation:

    a. Droop
    b. Isochronous

7. An operator interface shall be provided to allow operation of either governing mode.
8. The Contractor shall provide, at a minimum, the following screens for the operator interface monitors:

    a. Main display
    b. Generator Bearing metal temperatures
    c. Bearing Vibration Monitor
    d. Load/Speed control
    e. Start-up screen and permissives
    f. Alarm screen
    g. Water wash display
    h. Water injection display
    i. SPRINT display
    j. Exhaust LPT inlet gas temperatures
    k. Generator monitoring and generated quantities
    l. Fuel control
    m. Fuel gas system
    n. Turbine trips
    o. Turbine combustion and ventilation system
    p. Lube oil system
    q. Engine Overview temperatures (T2, T3, …)
    r. Turbine counters

9. The following hardwired control inputs to the Contractor furnished control system from the General Manager's control system shall be accommodated:

    a. Emergency Trip
    b. Customer Trip
    c. Load Raise/Lower

d. Isoch/Droop Mode Selection
e. GTG MW Load Setpoint input
f. Ready to start

10. Eight (8) analog outputs and eight (8) additional digital inputs/outputs shall be reserved for General Manager's hardwire use.
11. The Contractor furnished control system shall be provided with a redundant communication data link to interface with the General Manager's control system via ModBus over Ethernet TCP/IP.
12. All alarms and trips shall be printed out on a Contractor furnished printer in the General Manager's control room.
13. The control system shall have the capability to store historical data for a usable period of 30 days. The system shall be capable of displaying historical data for analysis and importing to a PC database.

D. GTG Protective Relay and Metering

1. The Contractor furnished GTG protective relay and metering shall be located in the Turbine control panel. All necessary devices shall be provided to allow GTG start-up, manual and auto synchronization, loading, operations, and shutdown from the panel. The control and monitoring requirements shall be organized into functional groups.
2. The following equipment, at a minimum, shall be provided on the control panel. The relay functions described below shall be contained within two independent digital generator protection devices (DGPs) and two 86G discrete lockout relays.

a. Relays

1) One (1) SEL-300G3 generator protective relay equipped with the standard I/O board and the latest firmware version. Associated support material shall include two (2) sets of I.Ls., two USB to RS232 cables, and the latest version of the associated communications software (AcSELerator) and event analysis software (SEL-5601).

AND

One (1) Beckwith M3425A multifunction generator protection relay including the comprehensive protection function option, HMI Module, and Target Module. Associated support material shall include two (2) sets of I.Ls., two USB to RS232 cables, and the latest version of the associated communications software (IPScom) and event analysis software (IPSplot Plus).

2) One (1) Brush Rotor Ground Fault (RGF 64) device shall be provided in the GTG unit as defined in one line diagram.
3) Two (2) 86G Lockout relays
4) Test switches applied to each metering and relay current inputs. Lockout relays, CTs and VTs shall have ESSAILEC test switches.
5) Each normally-open contact on each lockout as tripping relays utilized for tripping and breaker failure initiation shall be wired through an ESSAILEC test switch.

b. Meters/Transducers
   1) 1-Watt Transducer
   2) 1-Multifunction Digital Meter (DMMF), DMMF information shall be displayed on HMI screen and available via Modbus over TCP/IP communication to PCS;
   3) Synchronizing System

      a) 1-Synchroscope with Lights
      b) 1-Automatic Synchronizer
      c) 1-Synch check relay, 25S in IGPS
      d) 1-Breaker controls switch for use during manual synchronization.
      e) Voltage up and down switch for use during manual synchronization.
      f) Speed up and down switch for use during manual synchronization.
      g) Selection of auto or manual synchronizing mode shall be accomplished in the Contractor's Control System.

E. Vibration and Rotor Position Monitoring Equipment: Contractor's standard vibration package for tripping the unit shall be provided, however as a minimum, the Contractor shall provide a Bently Nevada Series 3500 or 3701 monitoring package for supervisory purposes with the following devices:

1. One (1) accelerometer probe on the compressor rear frame bearing.
2. One (1) accelerometer probe on the turbine rear frame bearing.
3. Two (2) proximity transducers on both generator bearings.
4. One (1) proximity keyphasor probe on drive end of the generator.
5. Two (2) vibration elements on the gearbox.
6. Modbus over TCP/IP communication link shall be available for data transmission.

F. Instrumentation

1. 3-wire, 100 ohm platinum duplex RTDs shall be used.
2. Type K, mineral insulated, 304 stainless steel sheathed thermocouples suitable for use in high temperatures shall be used. Appropriate junction devices shall be supplied with thermocouples for use with thermocouple conductors where necessary to avoid cold junction signal distortion.
3. Thermowells shall be provided as required by Contractor's standard design.
4. Electronic transmitters (PTs, PDTs, RTDs) shall be Yokagawa, Rosemount, or as required by Contractor's standard design as shown on Contractor's F&ID.
5. One (1) Watt transducer shall be provided in the GTG unit. One multifunction digital meter (DMMF) shall be provided in the GTG unit. DMMF information shall be displayed on HMI screen and available via Modbus over TCP/IP communication to PCS.
6. All tubing fittings shall be Swagelok.

G. Instrument and Control Wiring
   1. Contractor provides the following types of wire:

      - Panel

      Type ETFE Multi-core, 600 volt insulation, 18, 14, 12 and 10 AWG

      - Skid

Type CLX, XHHW, 600 volt insulation, 14 and 16 AWG, Belden Special. Instrumentation wiring is single to mult-core with individual and overall shielding.

- Turbine/Generator Enclosure: Power, control and instrumentation: XHHW equivalent, 600 volt insulation, SS braided armor, 10, 12, 14, 16 AWG. Instrumentation wiring is single to multi-core with individual and overall shielding.

Contractor furnishes appropriately sized copper conductors with white insulation. The ground wires are green/yellow. Other color coded insulation is not supplied

H. Conduit
1. Conduit is copper free aluminum per Contractor's standard

2.7 ACCESSORIES

A. Ladders, Platforms and Walkways
1. Ladders, Platforms and Walkways for the GTG inlet air filter shall meet CAL-OSHA requirements.

B. Insulation
1. Insulation materials that meet Contractor's spec are provided. Contractor utilizes winterization consisting of heat tracing and insulation resulting in suitability of the unit for the ambient temperature of the project.

2.8 FABRICATION

A. Fabrication, cleaning, finishing, and painting are as per Contractor standards.

2.9 SOURCE QUALITY CONTROL

A. Source quality control, test, and inspection are as per Contractor's standards.

B. The Contractor shall provide quality plan and all tests to be performed on the combustion gas turbine, generator, control system and accessories.

C. The GTG and accessories shall be factory static tested following manufacturer's standard procedures. The test procedures shall be submitted to the General Manager for information after contract award.

D. Tests and Inspections

1. As a minimum, the following tests shall be performed:

a. Factory Rotor Balancing

1) LM6000 PG shall be balanced per Contractor's standard procedure in order to meet factory vibration acceptance criteria as stated in MID-TD-6000-05.

b. Overspeed Testing

1) Combustion gas turbine rotors shall be capable of 110% of the synchronous speed, which shall be verified by component test and analysis.
2) The generator rotors shall be factory overspeed tested for a minimum of two minutes at a minimum of 120% of the synchronous speed.

c. Factory Accessory Testing

1) The combustion gas turbine package shall be static functionally tested in the factory. Contractor's standard static test procedure is followed.

d. Factory Generator Tests

1) Measurement of cold resistance of armature and field windings
2) Mechanical inspection
3) Insulation resistance of stator and rotor windings
4) High-potential tests
5) Dielectric tests of armature and field
6) Resistance temperature detectors test

e. Control Board and Software Testing

1) Electrical shop tests shall be made on all control boards. These tests shall include high potential tests on power equipment and operating tests to demonstrate that the equipment functions correctly. The Hipot Test performed on the MicroNet Power Supplies shall meet EN 60079-15 (Explosive Atmospheres) and EN 61010-1 (Low Voltage Directive/CE Requirements).
2) Control wiring tests shall include those that are necessary to determine that all instruments, meters, relays, instrument transformers, etc. are correctly wired and function in the specified manner when energized. Each circuit shall be continuity tested. Insulation resistance tests shall be conducted on each circuit (except in circuits containing electronic components); the insulation resistance shall be meggered.
3) A Factory Acceptance Test (FAT) shall be performed on the complete software system prior to shipment. Simulated (software) inputs are acceptable during the FAT.

f. Instrument and Power Cable

1) All instrument and power cables installed to the Contractor supplied skids shall be insulation and continuity checked prior to shipment

g. Instrument Calibration

1) Instrument calibration is by instrument manufacture.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Painting

1. Contractor's standard painting system is provided.

3.2 FIELD QUALITY CONTROL

A. Field Acceptance Tests

1. Refer to Section 480032, Power Island Performance for general field acceptance test requirements and Attachment 5 in the Contract.

B. Performance Tests

1. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements and Attachment 5 and 6 in the Contract.
2. The performance test will be carried out to the manufacturer's standards in general accordance with the following internationally recognized standards:

a. ASME PTC 19.1, Test Uncertainty
b. ASME PTC 22, Performance Test Code on Gas Turbines
c. ISO 2314, Gas Turbines – Acceptance Tests

3.3 COMMISSIONING

A. General

1. Refer to Section 480032 Power Island Performance for general commissioning requirements.

3.4 TRAINING

A. Refer to Section 481100 Combined Cycle Power Island for general training requirements and Attachment 14 in the Contract.

END OF SECTION 485222

APPENDIX A – Technical Datasheets by General Manager

	Client Name	Pasadena Water & Power
	Project Name	Glenarm Repowering Project (GT-5 Combined Cycle Installation)
	Project Number	123374
1.0	**Inlet Section**	
	Inlet Air Evaporative Cooling / Type	Not applicable
	Inlet Air Fogging	As required to meet minimum output requirement in 481100 Combined Cycle Power Island
	Inlet Air Chilling Coil	As required to meet minimum output requirement in 481100 Combined Cycle Power Island
	Filter Pulse Cleaning	By Contractor
2.0	**Compressor Section**	
	Water Injection Intercooling	By Contractor
3.0	**Combustor Section**	
	Dry Low Emissions Combustor	Not applicable
	Single Annular Combustor	By Contractor
	Water Injection	By Contractor
4.0	**Exhaust Section**	
	Stack / Type	OTSG supplied under 481100, Combined Cycle Power Island
5.0	**Generator**	
	Open Air Cooled	Not applicable
	Enclosed Air to Air Cooled	Not applicable
	Totally Enclosed Water to Air Cooled	Required
6.0	**Auxiliary Systems**	
	Component Cooling Water	By Contractor
	Closed System w/ Auxiliary Cooling Water	Required
	Closed System w/ Fin-Fan Cooler	Not Applicable
	Open System w/ Wet Cooling Tower	Not Applicable
	Packaged Chiller System	Option as Required

APPENDIX B – PASADENA GLENARM GT5 COMBINED CYCLE PERFORMANCE TEST DATASHEET to be provided during project execution

APPENDIX C – TECHNICAL DATASHEETS BY CONTRACTOR to be provided during project execution

Item	Description	Units	Technical Data (Contractor to fill in)
1.	**Mechanical Data**		
1.1	Manufacturer and Model Number		
1.2	Power Output at base load at ISO conditions		
	a) fuel gas firing at generator terminals	KW	
	b) Generator rating	MVA	
1.3	Number of similar units in service		
1.4	Year First Similar GTG was placed in service	Yr	
1.5	Compressor Data		
	a) Number of stages		
	b) Blade material		
	c) Rated Speed of all shafts	RPM	
	d) Pressure Ratio		
	e) Type of Inlet Guide Vanes		
	f) 1st Critical Speed	RPM	
	g) 2nd Critical Speed	RPM	
1.6	Turbine Data		
	a) Number of Stages		
	b) Blade Material		
	c) Nozzle Material		
	d) Method of Cooling		
	e) Rated Speed	RPM	
	f) 1st Critical Speed	RPM	
	g) 2nd Critical Speed	RPM	
1.7	Combustors		
	a) Type		
	b) Number		
	c) Material		
	d) Number of fuel nozzles per combustor		
	e) Number and type of fuel igniters		
1.8	Starting System		
	a) Driver Type		
	b) Time interval required between startup attempts	Min	
	c) Starter Motor Rating	KW	
1.9	Lubrication System		
	a) Lubricant Type		
	b) Capacity	Gal	
	c) Flow Rate	GPM

SECTION 485311.10
CONDENSATE PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This specification details the minimum technical requirements for the design, manufacture, testing, and furnishing of vertical canned pumps for power plant condensate service. It is not the intent to specify completely herein all details of design and construction. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict among referenced standards, codes and the documents included in this specification, or a perceived conflict between the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. 2x100% capacity, vertically mounted canned pumps, pump cans, and drivers selected to perform as required for the equipment supplied under Section 481100, Combined Cycle Power Island Equipment.
2. All seals, bearing lubrication systems, couplings, coupling guards, driver motor, baseplates/support systems and other standard accessories or as specified herein
3. Cleaning and finishing prior to shipment
4. Startup spares, special tools and lifting devices required for installation, maintenance, and operation, as required
5. Performance testing at factory and certificates of results
6. Performance data and curves as specified herein
7. Inspection certificates and quality control documentation listed in this Section
8. Drawings and design data to support facility design, construction and maintenance showing all interface requirements, including anchor bolts, foundation loads, foundation outlines, and electrical and instrumentation connections
9. Complete set of component cut sheets
10. Operating, commissioning, installation and maintenance manuals for the supplied equipment
11. Priced list of recommended spare parts for two years of operation
12. Provide pricing for technical assistance during the installation and field testing of pumps
13. Furnish all documentation as outlined in this Section
14. Packing and shipping to the Glenarm Plant or a location to be identified by the General Manager either in the city of Pasadena, CA or other nearby city.

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Foundations, grouting and foundation bolts
2. Piping, wiring and conduit to Contractor's connections
3. Instrumentation
4. Receipt, unloading, storage and handling
5. Installation
6. Field inspection and testing
7. Field touch-up painting
8. Suction and discharge piping to and from the pumps.
9. Motor starters
10. Auxiliary cooling water as required
11. Final alignment
12. Pump discharge flow measurement for minimum flow controls.
13. Minimum flow recirculation control

B. Section 262050 - Low Voltage Motors

C. Section 261050 - Medium Voltage Motors

D. Section 480020 - Site Conditions

E. Section 480031 - Combined Cycle Power Island Noise Control Performance

F. Section 480032 - Power Island Performance

G. Section 481100 - Combined Cycle Power Island

H. Section 485413 - Once-Through Heat Recovery Steam Generator (OTSG)

I. Section 485432 - Surface Condenser

1.5 CODES AND STANDARDS

A. Refer to 481100, Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section:

1. American National Standards Institute (ANSI)

   a. 2.3 - American National Standard for Vertical Pumps Design and Application

2. American Society for Nondestructive Testing (ASNT)

   a. SNT-TC-1A, Recommended Practice, Personnel Qualification and Certification in Nondestructive Testing

3. American Society for Testing and Materials (ASTM)
4. Hydraulic Institute (HI)

    a. ANSI/HI 1.3, Standard for Centrifugal Pumps Design and Application
    b. ANSI/HI 2.3, Standard for Vertical Pumps Design and Application

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. All equipment shall be designed for a thirty (30) year life objective. Components for which this service life cannot be expected shall be identified and those components shall be designed for ease of replacement and maintenance.
2. The pumps shall be suitable for continuous outdoor operation in the ambient conditions as detailed in Section 480020, Site Conditions.
3. All equipment shall be designed for continuous 24 hour per day operation with potential daily cycling from off-line to full load.
4. Each pump shall be completely assembled with the electric driving motor prior to shipping from factory. If necessary, the assembly may be disassembled for shipping.
5. When a standby pump is required it shall be designed to start automatically in an emergency situation when the failed operating pump shuts down.
6. The pumps shall also be provided with minimum flow recirculation control arrangement to recirculate condensate back to the condenser hotwell so as to render the pumps safe at low and no load conditions. The minimum recirculation valves shall be sized and selected, including trim and plug design, actuators, valve materials and valve accessories to properly satisfy the operating and design conditions of each condensate pump. The control valves shall be furnished with pneumatic spring opposed diaphragm operators. Valve position transmitters shall be provided and positioner shall be HART type. Any flow restricting orifice plate or back pressure regulators required for the recirculation line shall be provided. Use of ARC valve for minimum flow controls is not acceptable.
7. The pump materials shall be suitable for the feed water quality leaving the condenser hotwell plus any chemical injection or small quantities of phosphate and ammonia (from the breakdown of boiler water treatment chemicals).

8. The two condensate pumps shall be identical in design and component parts shall be interchangeable. It shall be possible to operate two or more pumps together and they shall remain inherently stable when running in parallel while in this mode.
9. The Suction Specific Speed shall not exceed 12,000 or outermost tip on the first stage impeller exceed 65 ft/sec based upon Hydraulic Institute recommendations. Deviation from this recommendation is allowable for special designs if the Contractor can show risk of erosion and cavitation is minimal under normal operating conditions.
10. Pumps shall not produce more than 225 feet of head per stage to avoid damage due to vibration, cavitation, or erosion. More developed head per stage may be allowable if the design is proven by the Contractor.
11. The characteristics of the pumps shall be such that the motors will not exceed the rated capacity and temperature rise under any operating conditions. Under no circumstances shall the service factor of the motor be used to achieve required pump performance.

B. Performance Requirements

1. The design duty of the pumps shall be based on ability to deliver condensate flow corresponding to the maximum output capability of the once-through heat recovery steam generator (OTSG). When operating at maximum flow the condensate pump discharge pressure shall be sufficient to overcome a system resistance equal to the sum of the condensate air extraction system, condensate polishing system, the pressure loss through interconnecting piping up to the feed regulation/control valves, the static pressure difference between the condensate pumps and the boiler feed water pumps, and the net positive suction head requirement of the boiler feed water pumps, minus the net positive suction head of the condensate pumps. The Contractor shall guarantee the following:

    a. Capacity without negative tolerance. Tolerances will be per IST.
    b. TDH without negative tolerance and plus 3% at the design capacity.
    c. $NPSH_{req}$ without positive tolerance minus 10% at design capacity.
    d. Pump efficiency without negative tolerance.
    e. Shutoff head without positive tolerance above guarantee, minus 3%.
    f. Acceptable TDH deviation amongst identical units of 2% at design capacity.
    g. Noise requirements as specified in Section 480031, Combined Cycle Power Island Noise Control Performance
    h. Wire-to-water horsepower input at pump design operating point, corrected to actual fluid temperature within HI tolerances.

2. The characteristics of the pump must be such that the shutoff valve head is approximately 115 to 125% of the pressure at rated output. The Contractor shall state the maximum pump head with discharge valve closed.
3. The pumps shall be suitable for both continuously and intermittent service and shall operate satisfactorily without vibration, cavitation, or distress to any part through an operating range from minimum flow to maximum specified capacity.
4. Pump's point of maximum efficiency shall coincide with the specified design capacity.
5. Pumps are noted as 100% capacity, runout does not apply. A 2 ft NPSH margin is provided at the rated condition.
6. The pump sets (pump, motor and base) shall be designed to avoid occurrence of one-half, first, second, and third harmonic critical speeds in undamped condition resulting in amplified excitation of vibration levels. This includes 20% separation between operating speed and natural harmonic critical speed. A lateral and torsional evaluation shall be conducted to assure the avoidance of critical speed.

7. Contractor shall guarantee that the equipment supplied shall meet the specified noise criteria in Section 480031, Combined Cycle Power Island when tested in accordance with ASME PTC 36.

C. Reliability: No single failure of an auxiliary component or system shall result in damage to the System. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

1.8 SUBMITTALS Refer to Attachment 11 Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

B. Testing

1. Certificates and records of all shop tests shall be submitted to the General Manager for approval at least one week before shipment.
2. Certificates and records shall include, as a minimum:

   a. Mill-test certificates for casing, impellers, and shafting or other components (if required by the governing code).
   b. Pump performance-test reports, including test data and performance curves
   c. Motor test reports
   d. Hydrostatic test reports
   e. “As Built” pump data sheets

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 481100, Combined Cycle Power Island for general packaging, delivery, storage, and handling requirements.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The following Manufacturers are pre-approved to supply equipment specified within this Section. Additional Manufacturers must be submitted to the General Manager for approval before consideration to include in the Contractor's Proposal.

1. Not Used

2.2 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

2.3 EQUIPMENT

A. General Requirements

1. Design of rotating elements shall be such that all critical speeds shall be at least 25% greater than the operating speed.
2. Contractor shall provide all connections for suction, discharge, sealing, flushing, and venting. Piping shall be in accordance with ASME B31.1. All piping furnished by the Contractor shall be provided in ANSI standard sizes in nominal English units (inch sizes) unless otherwise required in Section 480020, Site Conditions. The location, size, type, and quantity of all openings, connections, and fittings shall be shown on Contractor's drawings.
3. Contractor shall be entirely responsible for the pump-to-motor interface including, but not limited to, the following:

    a. Supply of coupling for joining the pump and motor shafts
    b. Coordination of dimensions between the pump and motor
    c. Machining of the motor shaft to accept the coupling

B. Pumps

1. Each pump submitted by Contractor shall be designed for operation using the criteria specified.
2. The pump suction requirements, including submergence NPSHR, and inlet velocity, shall be determined using one pump runout capacity or 120% of design capacity, whichever is greater.
3. The design point total head specified shall use the discharge connection centerline as the reference point. Head losses through the pump, including suction inlet losses, are not included in the total head listed.
4. All pumps shall be identical in design and performance, with all replacement parts being interchangeable.
5. Wetted pump parts shall be suitable for the water handled by pumps for that service.
6. Each pump shall operate satisfactorily when a second, parallel, or standby pump is placed in operation.

7. Pumps shall be designed so that reverse rotation at the runaway speed caused by reverse water flow under maximum head will not cause damage to any of the components of the pump.
8. Pumps shall be designed to pass any foreign object having maximum dimensions indicated in the Datasheets without damage to the pumping equipment.

C. Pump Characteristics

1. Each pump shall be designed with a head-capacity characteristic which rises steadily from the one pump runout capacity to minimum flow.
2. It is preferred that each pump have low shutoff head and maximum efficiency at approximate design capacity and head.
3. Pumps shall be suitable for extended operation over the range from minimum flow to single pump runout at minimum system resistance, without damaging pitting, capitation, excessive noise, or excessive vibration.
4. Pumps shall be designed to have a required NPSH at one pump runout conditions of no more than 75% of the NPSH available. Reliability during all operational conditions is major consideration.

D. Additional Technical Requirements

1. ASME Performance Test Connections – Contractor shall provide the necessary instrumentation connections on the equipment as required for the acceptance tests specified in PTC 8.2.
2. The Contractor shall incorporate into the pump can design any and all provisions necessary to prevent or eliminate the potential for vortexing.
3. The inlet to the condensate pump shall be sized to limit the flow velocity at design conditions to not more than 3 ft/sec and no more than 4 ft/sec in the suction can to minimize potential for reduction in NPSHA due to flow losses.
4. Pump inlet and outlet connections shall be on the same centerline.

2.4 COMPONENTS

A. To minimize equipment failure and damages caused by unproven components, the General Manager intends to install reliable, proven equipment and components which shall perform in accordance with the specifications. The Contractor shall disclose to the General Manager each design manufacturing procedure, component or assembly which does not have at least two (2) years satisfactory operating experience in similar service. Further, the Contractor shall have manufactured at least two pumps of comparable design, power rating, speed, and discharge pressure. The failure to make such disclosures specifically and in writing shall extend the Contractor's warranty to include all direct costs to the General Manager that may result from the Contractor's use of such procedures, components or assemblies.

B. Impellers and Bowls

1. The pump impellers shall be carefully machined and finished, with enclosed construction.
2. The impellers shall fit the shaft accurately and shall be securely keyed and locked in position so as to prevent any movement on the shaft during normal and reverse rotation operation.

3. Collets or taper fits will not be acceptable.
4. The bowls shall be flanged. Screwed in bowls are not acceptable.
5. The wear surface of the bowls and impellers is integrally cast with the components, which include an allowance for future installation of wear rings
6. Full size impellers shall not be used. An allowance for a 5% future TDH increase is included.
7. All impellers shall be statically and dynamically balanced.
8. Pump bowls shall be prepared and coated in accordance with specifications provided in this Section.

C. Pump Column

1. Joints in the pump column shall be flanged and bolted.
2. The pump column shall be designed and constructed to provide accurate alignment automatically when the column is assembled.
3. The pump discharge connection shall be flanged and drilled to match ASME B16.5 requirements. Flanges shall be 150# minimum. Discharge flange top two bolt holes shall straddle flange vertical centerline.
4. The pump shall include provisions designed to resist the discharge thrust developed with the pump operating at shutoff head, the piping weight, and piping thermal expansion.
5. Discharge head skirt shall have through holes drilled with stainless steel bulkhead fittings installed for the through-passage of seal and flushing water supply connections as well as mechanical seal and skirt drain connections.
6. Each column section shall have at least 2 lifting lugs.
7. Pump column section shall be prepared and coated in accordance with specifications provided in this Section.

D. Shaft

1. The pump shaft shall be sized to transmit the power requirements of the pump.
2. The shaft is machined across its entire length and ground and polished at critical areas.
3. A tensioning device shall be provided for each pump with a shaft enclosing tube to assure exclusion of the pumped liquid.
4. If applicable, line shaft and enclosing tube shall be fabricated from316 stainless steel.

E. Shaft Seals

1. The pumps shall be equipped with mechanic seals. The seals shall employ API seal plan 13 or equivalent method to vent non-condensable gases from the seal chamber to the condenser.
2. Mechanical seals shall be specifically designed for the intended service. Seals shall have throttle bushings, vent, drain and flush connections. Plugs for unused seal connections shall be of the same material as the gland.

F. Bearings and Lubrication

1. All radial shaft bearings shall be as recommended by the Contractor for the service and shall be of sufficient number to prevent shaft whip and minimize noise level. Maximum spacing between adjacent line shaft bearings (bushings) shall be in accordance with API 610.

2. The impeller suction and discharge bowl bearings shall be as recommended by the Contractor for the service.
3. All bearings shall be mechanically secured to the bearing housings to prevent bearing rotation or movement during operation.
4. Pump bearings are flushed by the liquid passing through the column.
5. Pump shaft sealing with John Crane or equivalent mechanical seal shall be accessible through openings in the motor support stand shall be provided above the upper bearing.
6. A space coupling is provided to allow the mechanical seal to be removed. Split seals are not utilized.
7. A shaft sleeve shall be provided at the mechanical seal.
8. The space between the motor and the mechanical seal shall be sufficient to permit removal and replacement of the seal without dismantling the pump.
9. Pump axial thrust will be resisted by a thrust bearing in the drive motor through the rigid coupling.

G.Drive Support

1. Each pump shall be provided with a cylindrical fabricated steel support pedestal for mounting the drive motor directly on the pump discharge head. The base shall be designed to support the total weight of the complete pumping unit and all imposed dynamic loads.
2. Reinforcing ribs and braces, if required, shall be on the interior of the support base.
3. Access holes that are sufficiently large, and in sufficient number, shall be provided for dismantling the drive shaft coupling and for maintenance and inspection of the pump seal. Access holes shall have bolted covers.
4. The support pedestal shall be machined and drilled as required to receive and provide for proper alignment and securing of the drive motor to the pedestal.
5. All bolts, nuts, washers, and pins required for securing the motor to the pedestal shall be furnished and shall be constructed with Type 316 stainless steel.
6. Drive motor mountings shall be machined in accordance with dimensions supplied by the motor manufacturer.

H.Baseplate

1. Each pump shall be provided with a heavy structural steel baseplate. The suction can mounting flange acts as the “soleplate”. Base plates shall be made of ASTM A36 carbon steel.
2. Fastening of the base plate to the sole plate shall be accomplished by drilling and tapping soleplate to receive fasteners through the base plate. Fully threaded bolts shall be furnished for this purpose.
3. Edges of base plate attachment holes shall be no closer than 1.5 diameters from the edge of the hole in the soleplate through which the pump column passes. Contractor shall determine fastener size for this connection which meets all local code requirements and furnish required torque value for this connection to achieve design preload.
4. Where base plate and sole plate meet, the mating surfaces shall be machined flat. Contractor shall apply corrosion-resistant treatment to mating surfaces prior to shipment.

I. Shaft Couplings

1. A rigid, adjustable, flanged type coupling shall be provided for connecting the pump to the drive motor.

2. The drive motor coupling shall be specifically designed for vertical pump application, shall provide for vertical adjustment of the impeller, and permit changing the mechanical seal without removal of the motor.
3. The drive motor coupling shall be keyed to both the drive motor and pump line shafts. The shaft coupling shall be sized to transmit the maximum brake horsepower requirements of the driven equipment with a service factor of not less than 2.
4. A permanent corrosion-resistant plate shall be attached with corrosion resistant fasteners to the drive motor support pedestal stating the direction of rotation and coupling gap required for impeller positioning.
5. Line shaft couplings shall be of the sleeve and keyed type to permit ease of maintenance. Threaded couplings are not acceptable.

J. Coupling Guards

1. Safety guards shall be provided for protection of personnel from all exposed moving and/or rotating machine elements in accordance with the requirements of the applicable section of 29 CFR 1910.
2. Each guard shall be fabricated from ASTM A36 steel plate having a minimum thickness of 10 BWG and designed for easy installation and removal.
3. Necessary supports and accessories shall be furnished with each guard.

K.Lifting Lugs

1. Four lifting lugs shall be provided on the pump discharge head to facilitate handling during installation, maintenance and removal. Lugs shall be designed to handle the full weight of the assembled pump and accessories.

L. External Piping Connections

1. Contractor shall provide all connections for suction, discharge, flushing, and venting.
2. Connections shall have flanged ends in accordance with ASME B16.5.
3. Piping shall be in accordance with ASME B31.1.
4. Sizes and design pressures and temperatures of suction and discharge flanges shall be as specified in attached General Manager Datasheet.
5. Suction and discharge connections shall be provided with 1/2-inch NPT pressure gage connections located at the pipe springline.
6. The location, size, type, and quantity of all openings, connections, and fittings shall be shown on Contractor’s drawings.

M. Accessories

1. Miscellaneous trim - All piping and valves required for the mechanical flushing or seal water, air vent valves, oil level indicators, grease lubricators, and other miscellaneous accessories shall be furnished by the pump manufacturer. All wetted parts (valve, tubing, etc.) are to match or exceed the characteristics of the casing materials.

N.Identification

1. A nameplate shall be securely attached to each pump in a visible location. The nameplate shall be made of stainless steel and attached to the pump with stainless steel screws. The following information shall be included on the nameplates:

a. Name of Equipment
b. Manufacturer
c. Serial Number
d. Pump size
e. Model Number
f. Design Capacity (flow and head)
g. Design Pressure
h. Design Temperature
i. Maximum continuous speed
j. General Manager's equipment tag number

O.Drive Motors

1. Drive motors enclosures shall meet requirements of Section 262050, Low Voltage Motors or Section 261050, Medium Voltage Motors.
2. Motors shall be equipped with anti-reverse ratchets to prevent reverse rotation in the stopped condition.

2.5 INSTRUMENTATION AND CONTROLS Not applicable to Contractor scope of supply

A.General

1. It is the intent of the General Manager to integrate the Contractor's equipment into a Contractor-furnished Plant Control System. All control devices furnished by the Contractor shall be capable of interfacing with the plant Control System and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the plant Control System to remotely start and stop all rotating equipment and to allow automatic switch over to the backup unit.
2. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant.
3. The Contractor shall permanently install a 1-1/4 inch stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified "Instrument Tag Number" to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
4. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of non-skid mounted devices. Special cables or termination kits if required for flame scanners, ignition transformers, etc. shall be provided by the Contractor for installation by the BOP Contractor.
5. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
6. The control system shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of

abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.

7. The plant control system is to be designed to provide automation to minimize operator actions during normal plant start-up, shutdown, and at-power operations.
8. Plant systems and equipment are to be monitored and/or controlled through the plant Control System. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant Control System.
9. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
10. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two DPDT position limit switches or proximity switches, unless noted otherwise.

B. Instrumentation & Control Devices – Requirements

1. Duplex Type J thermocouples shall be used.
2. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
3. Control valves and pressure regulators shall be by Fisher or General Manager approved equivalent.
4. Electronic transmitters shall be Yokagawa, Endress & Hauser, SMAR smart transmitters or General Manager approved equivalent.

C. Instrumentation to be Supplied by Contractor

1. Pump Minimum Recirculation Controls

   a. The pumps shall be provided with suitable minimum recirculation controls to protect the pump under light load or no load conditions and to maintain a minimum safe flow of condensate through the condensate pumps. When the flow drops to a predetermined minimum value the recirculating valve shall begin to open in a controlled manner. The leak off control shall be such that when the condensate pumps are operating at low load, and in parallel, no hunting is caused by leak off valves opening or closing. The minimum recirculation control valve shall close when the pump flow increases to a predetermined quantity.
   b. The minimum flow recirculation valve for each pump shall be a conventional flow control valve. Leak off flow will be discharged into the condensate intake via separate multi-orifice pressure reducing devices. The condensate pumps shall be capable of running without distress continually with main discharge valves closed. The leak off piping will be provided by Others. However, the minimum flow control valve and the back pressure regulators shall be supplied by the Contractor.
   c. ARC valve type recirculation valves are not acceptable.

2.6 CIVIL AND STRUCTURAL

A. Refer to Section 481100, Combined Cycle Power Island for civil and structural requirements.

2.7 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

B. Shop/Factory Finishing

1. General

a. Steel material furnished under this specification, excluding machined surfaces, surfaces to be bonded to concrete, stainless steel, or "off the shelf" components, shall be blast cleaned and coated as required herein.
b. Priming and finish painting of piping is required. The base plate, coupling guards, and other exposed carbon steel surfaces shall be primed and coated prior to shipment.
c. Surface preparation and priming shall be in accordance with Manufacturer's standards.
d. The coatings shall not be applied until the equipment has been fabricated, hydrostatic tests completed, weld-spatter removed, welds ground smooth, sharp edges and corners ground to a curve, surfaces cleaned with clean mineral spirits, and abrasive blasting performed.
e. Off the shelf components such as control boxes, motors, valves, pipe hangers, etc., shall receive the Contractor's "standard shop finish".
f. Coatings shall be applied in accordance with the requirements of the coating manufacturer.

2.8 SOURCE QUALITY CONTROL

A. Refer to Section 481100, Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspections

1. Hydrostatic Tests

a. Equipment and vessels shall be subjected to a hydrostatic leak test meeting the requirements of the applicable Code or Standard to verify integrity of the pressure boundary. No leakage is acceptable through the pressure boundary wall or assembly joints.

2. Functional and Performance Tests

a. The equipment shall be subjected to functional and performance tests in the Contractor’s shop to the greatest extent possible to verify the Contractor’s performance guarantees. The performance test for Contract purposes shall be executed at the final installation by the General Manager in accordance with a test procedure developed by the General Manager and approved by the Contractor.

3. Shop Tests

a. Full information shall be submitted describing the Manufacturer's testing facilities. All tests shall be performed in accordance with the requirements of the latest edition of ASME PTC 8.2, except as otherwise required herein. Shop test will not utilize the actual suction can.
b. Each pump shall be performance tested at rated speed to determine the head, capacity, and brake horsepower.
c. Tests shall be conducted in accordance with Hydraulic Institute Standards for Vertical Pumps and as specified herein and/or on the pump data sheet. One pump shall be subject to a witness test. Test data shall be sufficiently comprehensive to produce guaranteed performance curve showing head versus:

    1) Capacity
    2) Efficiency
    3) Net positive suction head required
    4) Brake horsepower

d. A minimum of 7 points shall be tested. One point shall be at shutoff. One point shall be run out. One point shall be the rated point. The remaining points shall be spaced evenly between the rated point and shut-off. The range of test operating points must bracket all design operating points presented on the data sheet. Shop testing shall be conducted with the same driver to be furnished with the equipment specified herein.
e. If the shop tests indicate that the tested pump fails to meet the guarantees stated herein, the other pump(s) for the same service shall be shop tested in accordance with this Section.
f. Any pump not meeting the guarantees shall receive all adjustments, repairs, additions or replacements as required for it to meet the guarantees.
g. Re-testing and modifications shall be repeated until all performance guarantees are met or until arrangements are made which are acceptable to the General Manager.
h. Certified copies of performance curves resulting from the testing shall be submitted to the General Manager for acceptance before shipment of the equipment. These curves shall indicate actual test pressure, temperature conditions, and the observed test points.
i. Complete documentation regarding the prototype model test conditions and results shall be submitted. Complete documentation verifying the development of the performance curves from the prototype model test curves shall be submitted.
j. Certified copies of performance curves resulting from the prototype model testing shall be submitted to the General Manager for acceptance before shipment of the equipment. These curves shall indicate actual test pressure and temperature conditions and the performance curve points corresponding to the observed prototype model pump test points. The performance curves shall be guaranteed.
k. If pump suction test conditions (pressure and/or temperature) differ from the conditions listed in the General Manager Data Sheet, appropriate correction factors shall be applied to the observed test curve, and a corrected curve shall be indicated. This corrected curve shall then represent expected pump performance with the suction conditions listed in the General Manager Data Sheet.
l. The General Manager reserves the right to witness all pump testing and re-testing.
m. Contractor shall submit certified copies of test and inspection reports within 14 days of completion of the inspection or test.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100, Combined Cycle Power Island for requirements regarding spare parts.

3.2 FIELD QUALITY CONTROL

A. Field Acceptance Tests

1. Refer to Section 480032, Power Island Performance for general field acceptance test requirements.

B. Performance Tests

1. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Refer to Section 481100 Combined Cycle Power Island for individual equipment baseline performance testing.
2. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.

3.3 COMMISSIONING

A. General

1. Refer to Section 480032, Power Island Performance for general commissioning requirements.

END OF SECTION 485311.10

PART 4 - ATTACHMENTS

4.1 TECHNICAL DATASHEET BY GENERAL MANAGER

The detailed technical data will be furnished by the equipment vendor during contract execution. The design will be to manufacturer's standards and will support the power island guarantees and will meet the design life requirements.

Item	Description:	Units	Condensate Pumps
1.1	Pump Tag No.(s)		TBD
1.2	Type:		Canned vertical
1.3	Quantity Required		2
1.4	Capacity,	%	100%
1.5	Location (Outdoor/Indoor)		Outdoor
1.6	Fluid Pumped		Condensate
1.7	Pump Materials:		
	Suction can, column, and discharge head		Fabricated parts: Carbon steel, ASTM A36 or ASTM A283 Grade C Castings: Cast Carbon Steel, ASTM A216 Grade WCB
	Bowls		Cast Carbon Steel ASTM A216 Grade WCB
	Impellers		12-14% Chromium Stainless Steel, ASTM A743 or A217 Grades CA-15 or CA-6NM
	Shaft		11.5-13.5% Chromium Stainless Steel, ASTM A276 Type 410, Condition T
	Shaft Sleeves		11.5-13.5% Chromium Stainless Steel, ASTM A276 Type 410, Condition H
	Shaft Seals		Mechanical Seal - API 610 (John Crane or equivalent)
	Wear Rings		12-14% Chromium Stainless Steel, ASTM A582, Type 416, Condition H
	Bearings		Carbon or Graphalloy
	Bowl Bolting		12% Chromium Stainless Steel, ASTM A193, Type 416

APPENDIX B – TECHNICAL DATASHEET BY CONTRACTOR 15

SECTION 485311.20
BOILER FEEDWATER PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This specification details the minimum technical requirements for the design, manufacture, testing, and furnishing of Boiler Feedwater Pumps with electric motors capable of VFD operation - VFD by others.. It is not the intent to specify completely herein all details of design and construction. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict among referenced standards, codes and the documents included in this specification, or a perceived conflict between the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. 2x100% multistage centrifugal pumps with electric driver motors.
2. Base plates for each pump and driver
3. Discharge minimum recirculation flow control valves and back pressure regulators for each pump (to be supplied loose)
4. Pump suction strainers for each pump with startup strainer elements and a spare element (to be supplied loose)
5. All oil piping and balance drum leakoff piping on the pump base (or skid)
6. Temperature elements for the pump and motor bearings and motor windings, as specified herein
7. Spare parts for erection and commissioning
8. Priced list of recommended spare parts for two years of operation
9. Performance testing at factory and certificates of results
10. Performance data and curves as specified herein
11. Inspection certificates and quality control documentation listed in this Section
12. Drawings and design data to support facility design, construction and maintenance showing all interface requirements, including anchor bolts, foundation loads, foundation outlines, and electrical and instrumentation connections
13. Complete set of component cut sheets
14. Operating, commissioning, installation and maintenance manuals for the supplied equipment
15. Finish painting
16. Delivery to site
17. Provide pricing for technical assistance during the installation and field testing of pumps
18. Special tools, if required

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Motor starters and power wiring
2. Control wiring from Contractors interface points.
3. Auxiliary cooling water as required
4. Foundations, grouting and foundation bolts
5. Offloading at site and installation
6. Final alignment
7. Field inspection and testing
8. Field touch-up painting
9. Suction and discharge piping to and from the pumps.
10. Pump discharge flow measurement for minimum flow controls.

1.4 RELATED SECTIONS

A. Section 260000, Electrical - Mechanical Equipment

B. Section 261050, Medium Voltage Motors

C. Section 262050, Low Voltage Motors

D. Section 480020, Site Conditions

E. Section 480031, Combined Cycle Power Island Noise Control Performance

F. Section 481100, Combined Cycle Power Island

G. Section 485413, Once-Through Steam Generator

1.5 CODES AND STANDARDS

A. Refer to 481100, Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section:

1. American Society of Mechanical Engineers (ASME).

a. PTC 8.2 - Power Test Code for Centrifugal Pumps

2. Hydraulic Institute (HI)

B. All interfaces shall be supplied designed to the applicable North American standards.

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. All equipment shall be designed for a thirty (30) year life objective. Components for which this service life cannot be expected shall be identified and those components shall be designed for ease of replacement and maintenance.
2. All equipment shall be designed for continuous 24 hour per day operation with potential daily cycling from off-line to full load.
3. The pumps shall be suitable for continuous operation in the ambient conditions as detailed in Section 480020, Site Conditions.
4. Each pump shall be completely assembled, piped and mounted on a common base plate aligned with the electric driving motor.
5. There shall be two 100% capacity feed pumps. One 100% capacity boiler feed pump will be operating while the other is on standby. The standby pump shall be designed to be able to start automatically while the failed pump shuts down.
6. The pumps shall be provided with minimum flow recirculation control arrangement to recirculate water back to the hotwell so as to render the pumps safe at low and no load conditions. The minimum recirculation valves shall be sized and selected, including trim and plug design, actuators, valve materials and valve accessories to properly satisfy the operating and design conditions of each boiler feed pump. The control valves shall be furnished with pneumatic spring opposed diaphragm operators. Valve position transmitters shall be provided and positioner shall be HART type. Recirculation shall be to the hotwell when operating under normal conditions. Any flow restricting orifice plate or back pressure regulators for the recirculation line shall be provided. Use of automatic recirculation control (ARC) valves for minimum flow controls is not acceptable.
7. The pump materials shall be suitable for the feed water quantity leaving the condensate polisher plus any chemical injection or small quantities of phosphate and ammonia (from the breakdown of boiler water treatment chemical additives).
8. Pumps shall be located at ground level. Any special handling equipment necessary for the erection and subsequent maintenance of the pump and motor shall be supplied under this contract.
9. Pumps shall be identical in design and component parts shall be interchangeable. It shall be possible to operate both the pumps together and they shall remain inherently stable when running in parallel while in this mode.

10. The characteristics of the motors shall be such that the pumps will not exceed the rated capacity and temperature rise under any operating conditions.

B. Performance Requirements

1. The design duty of both pumps shall be based on the ability of one pump to deliver a water flow corresponding to the maximum output capability of a heat recovery steam generator plus spray water requirements for superheat attemperation at the steam turbine bypass valve. When operating at this flow the boiler feed pump discharge pressure shall be able to overcome a system resistance equal to the sum of the drum pressure, the pressure loss through the economizer, feed regulation/control valves, feed pipework up to the steam generator inlet piping, and the static pressure difference between the pump and the steam generator inlet piping center line; minus the net positive suction head. The contractor shall guarantee the following:

    a. Capacity without negative tolerance.
    b. TDH without negative tolerance and plus 3% at the design capacity.
    c. $NPSH_{req}$ without positive tolerance minus 10% at design capacity.
    d. Pump efficiency without negative tolerance.
    e. Shutoff head tolerance shall be +/-8% per API 610 requirements.
    f. Acceptable TDH deviation amongst identical units of 2% at design capacity.
    g. Noise requirements as specified herein.
    h. Wire-to-water horsepower input at pump design operating point, corrected to actual fluid temperature within HI tolerances.
2. The characteristics of the pump must be such that the pump shutoff head is 108% of the rated head. The Contractor shall state the maximum pump head with discharge valve closed.
3. Normally one boiler feed water pump will operate. The second pump will be on auto standby available for emergency start. However the feed water pumps shall be capable of operating in parallel over the full duty range.
4. The pumps shall be suitable for both continuously and intermittent service and shall operate satisfactorily without vibration, cavitation, or distress to any part through an operating range from minimum flow to maximum specified capacity.
5. Pump's point of maximum efficiency shall coincide with the specified design capacity.
6. The Net Positive Suction Head Available ($NPSH_{avail}$) is estimate in the attached datasheet. The pump selection shall maintain an $NPSH_{req}/NPSH_{avail}$ ratio of 50% at the runout flow condition. The pump run-out flow shall be defined as no more than 120% of design.
7. The Suction Specific Speed shall not exceed 9,000 based upon Hydraulic Institute definitions.
8. The pump sets (pump, motor and base) shall be designed to avoid occurrence of one-half, first, second, and third harmonic critical speeds in undamped condition resulting in amplified excitation of vibration levels. A lateral and torsional evaluation shall be conducted to assure the avoidance of critical speed.
9. Pumps shall be suitable for continuous operation across the entire sliding pressure operation range of the OTSG without vibration, cavitation, or undue stress to any part of the pumps.

C. Reliability: No single failure of an auxiliary component or system shall result in damage to the System. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of

causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

1.8 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 481100, Combined Cycle Power Island for general delivery storage and handling requirements.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The following Manufacturers are pre-approved to supply equipment specified within this Section. Additional Manufacturers must be submitted to the General Manager for approval before consideration to include in the Contractor's Proposal.

1. Not Used

2.2 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

B. The minimum requirements for pump materials are as follows :

1. Pump materials shall be equivalent to, or shall exceed the strength and corrosion-erosion resistance of the following listed materials.

Component	Material
Casing	ASTM A743, Grade CA-6NM
Casing Studs	ASTM A193, Grade B.7
Casing Wear Rings	ASTM A743, Grade CA-40 H.T.
Throttle Bushing	ASTM A743, Grade CA-40 H.T.
Impellers	ASTM A743, Grade CA-6NM
Impeller Wear Rings	ASTM A473, Type 410
Impeller Hub Rings	ASTM A473, Type 410
Balance Sleeves	ASTM A479, Type 410
Shaft Sleeves	ASTM A479, Type 410
Throat Bushings	ASTM A743, Grade CA-40 HT
Shaft	ASTM A479, Type 410 CL2
Keys – Internal	ASTM A582, TP 416 Cond T
Bearing Housings	ASTM A48, CL30
Baseplate	ASTM A36

2. Contractor's recommendations for pump superior materials will be considered by General Manager. Contractor may bid these superior materials as an alternate in addition to the base bid. As a minimum these materials shall meet the requirements of API-610 Table H-1 Class C-6.
3. The materials in contact with the feedwater shall be a minimum 13% chrome steel. The responsibility for selection of the correct materials for the pumps shall be left with the Contractor.
4. A difference of at least 100 Brinell hardness numbers shall be maintained between stationary and rotating parts.
5. US customary size fasteners shall be used throughout pump assembly.
6. Components operating with close running clearances shall have a minimum hardness of 400 Brinell.
7. Shaft sleeves, high chrome steel, with minimum surface hardness of 500 Brinell.

2.3 EQUIPMENT

A. Boiler Feed Pumps
1. Casing shall be multi-stage ring section pump suitable for frequent and fast start/stops operations. It shall be constructed to reduce the possibility of internal leakage.

2. Each pump shall be of the horizontal, centrifugal, multi-stage diffuser or volute type with impellers arranged in series specially designed for feed water pump services.
3. The suction, and discharge nozzles shall be ANSI class flanges appropriate for the pressure and temperature.
4. Effective sealing devices shall be provided on all bearings to prevent oil and water leakage. Mechanical seals shall be of the pressure balanced cartridge type and designed and materials that have been tested and proven most suitable for the specified service conditions. The seals shall be equipped with all necessary accessories to flush, cool and vent the seal faces, to provide the maximum service of the seal parts. Mechanical seal gland water source shall be from the pumps.
5. Pump shaft sealing with John Crane or equivalent mechanical seals with a closed, filtered cooling water system per API Plan 23, utilizing stainless steel tubing with welded connections shall be provided. Auxiliary cooling water piping shall be designed to meet or exceed the pressure and temperature ratings appropriate for the service. Auxiliary cooling water piping for each pump shall terminate with one supply and one return connection at the Contractor's interface point.
6. Wearing rings, impellers, shaft sleeves, and other parts (either rotating or stationary) forming the pump assembly, shall be securely locked in place and liberally designed and renewable. Internal design clearances shall be rated for the requisite stiffness with API-610 clearances from minimum continuous safe flow to run out flow.
7. Hydraulic axial thrusts are to be compensated by a balance drum device in combination with a thrust bearing of the oil lubricated tilting pad type. Balance water leaking across the balance drum shall be piped back to the pump suction. Thrust bearings shall be of the anti-friction type with ring oil lubrication.
8. The assembled shaft including impellers shall be of robust design with critical speed at least 20% above running speed. The rotating components shall be statically and dynamically balanced to ensure minimum vibration throughout the entire speed and load range.
9. Each pump and motor shall be mounted on a common fabricated steel base, with a drip rim and drains connection. Sound pressure levels for the pump/motor set shall be in accordance with noise specification Section 480031, Combined Cycle Power Island Noise Control Performance.
10. The pump shall be provided with flexible spacer type coupling bored and keyed to match the pump and the motor shafts.

2.4 COMPONENTS

A. Electric Motors

1. The design requirements for electric motors are specified separately in Sections 261050, Medium Voltage Motors and 262050 Low Voltage Motors.
2. Motors shall be equipped with anti-reverse ratchets to prevent reverse rotation in the stopped condition.

B. Lubrication

1. Thrust bearings shall be of the anti-friction type with ring oil lubrication. Pressure gauges shall be installed at the inlet and outlet of the filter and at the oil pump discharge. Thermometers shall be installed at the inlet and outlet of the cooler and on all main bearings and motors.

2. Effective sealing devices shall be provided on all bearings to prevent oil and water leakage. Mechanical shafts shall be of the pressure balanced cartridge type and designed with materials that have been tested and proven most suitable for the specified service conditions. The seals shall be equipped with all necessary accessories to flush, cool and vent the seal faces, to provide the maximum service life of the seal parts. Mechanical seal gland water source shall be from the pumps.

C. Bearings and Balancing

1. Bearings shall be split sleeve type, lined with an approved tin base babbit, pressure lubricated and with cast iron housings. Thrust bearing shall be of the Kingsbury type. This bearing shall not be overloaded under any mode of operation.
2. Axial balancing devices shall be provided, designed to carry the complete axial thrust load of the pump. These devices shall consist of a rotating balancing drum combined with a pressure lubricated thrust bearing.

D. Guards

1. Guards shall be designed and provided in accordance with the manufacturer’s standard and OSHA requirements.

E. Strainers

1. Temporary suction cone-type strainer to be located upstream of each pump, shall be supplied as loose items. The strainer shall be manufactured from ASTM A-216 Grade WCB material and shall be provided with type 316 stainless steel screens and with ANSI flanged end connections.

2.5 INSTRUMENTATION AND CONTROLS

A. General

1. It is the intent of the General Manager to integrate the Contractor's equipment into a Contractor-furnished Plant Control System (PCS). All control devices furnished by the Contractor shall be capable of interfacing with the Plant Control System and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the Plant Control System to remotely start and stop all rotating equipment and to allow automatic switch over to the backup unit.
2. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant.
3. The Contractor shall permanently install a 1-1/4 inch stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified “Instrument Tag Number” to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
4. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of

non-skid mounted devices. Special cables or termination kits, if required, shall be provided by the Contractor for installation by the BOP Contractor.

5. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
6. The Plant Control System shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.
7. The plant control system is to be designed to provide automation to minimize operator actions during normal plant start-up, shutdown, and at-power operations.
8. Plant systems and equipment are to be monitored and/or controlled through the plant Control System. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant Control System.
9. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
10. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two DPDT position limit switches or proximity switches, unless noted otherwise.

B. Instrumentation & Control Devices – Requirements

1. Duplex Type J thermocouples shall be used.
2. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
3. Electronic transmitters shall be Yokagawa, Endress & Hauser, or SMAR smart transmitters.
4. Control valves and pressure regulators shall be manufactured by Fisher or approved equivalent.

C. Instrumentation to be Supplied by Contractor

1. Pump Minimum Recirculation Controls

a. The pumps shall be provided with suitable minimum recirculation controls to protect the pump under light load or no load conditions and to maintain a minimum safe flow of water through the feed water pumps. When the flow drops to a predetermined minimum value the recirculating valve shall begin to open in a controlled manner. The leak off control shall be such that when the feed pumps are operating at low load, and in parallel, no hunting is caused by leak off valves opening or closing. The minimum recirculation control valve will close when the pump flow increases to a predetermined quantity.

b. The minimum flow recirculation valve for each pump shall be a conventional flow control valve. Leak off flow will be discharged into the boiler feedwater tank via separate multi-orifice pressure reducing devices. The feed pumps shall be capable of running without distress continually with main discharge valves closed. The leak off piping will be provided by others. However the minimum flow control valve and the back pressure regulators shall be supplied by the Contractor.

c. Automatic recirculating control (ARC) valve type recirculation valves are not acceptable.

2.6 CIVIL AND STRUCTURAL

A. Refer to Section 481100, Combined Cycle Power Island for general Civil and Structural Requirements.

2.7 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

2.8 SOURCE QUALITY CONTROL

A. Refer to Section 481100 Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspections

1. Hydrostatic Tests

a. Pumps casing shall be hydrostatically tested to a minimum of 1.5 times the design discharge pressure at pump shut-off according to the requirements of the applicable Code or Standard to verify integrity of the pressure boundary. No leakage is acceptable through the pressure boundary wall or assembly joints.

2. Functional and Performance Tests

a. The equipment shall be subjected to functional and performance tests in the Contractor’s shop to the greatest extent possible to verify the Contractor’s performance guarantees. The performance test for Contract purposes shall be executed at the final installation by the General Manager in accordance with a test procedure developed by the General Manager and approved by the Contractor.

3. Shop Tests

a. Pump performance tests shall be performed on each completed pump assembly in the Contractor’s shop to demonstrate the capacity and the head of the pumps. Shop performance tests shall be submitted to General Manager for approval prior to shipment of the pumps. Contractor's standard or generic pump family curves will not be acceptable in lieu of shop testing job-specific pumps. Shop tests shall be performed by a qualified individual who shall certify his or her qualifications as well as the accuracy of the test results. The tests shall demonstrate developed head, efficiency and BHP, at minimum flow, rated flow and runout flow for each pump.

b. The NPSH tests shall be conducted at shutoff flow, and runout flow and five evenly spaced operating points between, for a total of seven test points. The center of these 5 test points shall be the rated flow point

4. Any pump not meeting the guarantees shall receive all adjustments, repairs, additions or replacements as required for it to meet the guarantees. Any such repairs, adjustments and or alterations shall be at Contractor's expense. Any and all modifications shall be

documented and submitted for General Manager's approval along with the final "for approval" shop performance testing results.

5. Re-testing and modifications shall be repeated until all performance guarantees are met or until arrangements are made which are acceptable to the General Manager.
6. Certified copies of performance curves resulting from the testing shall be submitted to the General Manager for acceptance before shipment of the equipment. These curves shall indicate actual test pressure, temperature conditions, and the observed test points.
7. If pump suction test conditions (pressure and/or temperature) differ from the conditions listed in the General Manager Datasheet, appropriate correction factors shall be applied to the observed test curve, and a corrected curve shall be indicated. This corrected curve shall then represent expected pump performance with the suction conditions listed in the General Manager Datasheet.
8. The General Manager reserves the right to witness all pump testing and re-testing. Contractor shall notify General Manager within 5 days of pump tests.
9. Contractor shall submit certified copies of test and inspection reports within 14 days of completion of the inspection or test. In no case shall the Contractor ship the pumps without approval of submitted shop performance testing by General Manager.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100, Combined Cycle Power Island for general requirements regarding spare parts.

3.2 FIELD QUALITY CONTROL

A. Field Acceptance Tests

1. Refer to Section 480032, Power Island Performance for general field acceptance test requirements.
2. Following erection/installation of equipment, General Manager or General Manager’s designated BOP Contractor shall test equipment in the installed condition to verify the equipment’s ability to operate under the specified conditions and to meet the specified performance guarantees.
3. The equipment will be tested, at a minimum, at the seven test points reported by Contractor in shop performance test reports.
4. Contractor shall cooperate with General Manager or General Manager's designated BOP Contractor in the preparation for and testing of equipment. Contractor shall provide any and all necessary technical support, in a timely fashion, as may be required during the field testing process.

B. Performance Tests

1. It is the General Manager’s intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Refer to Section 481100 Combined Cycle Power Island for individual equipment baseline performance testing.

2. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.

3.3 COMMISSIONING

A. General

1. The Contractor shall allow for training of the General Manager's personnel appointed to operate the equipment and involved in commissioning.
2. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the right to remove and take away from site such commissioning and test equipment upon completion.
3. The Contractor shall submit a detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 3 months prior to the commencement of site testing.

END OF SECTION 485311.20

APPENDIX A – TECHNICAL DATASHEET BY GENERAL MANAGER

The detailed technical data will be furnished by the equipment vendor during contract execution. The design will be to manufacturer's standards and will support the power island guarantees and will meet the design life requirements.

Item	Description:	Units	Boiler Feedwater Pumps

APPENDIX A – TECHNICAL DATASHEET BY GENERAL MANAGER 16

APPENDIX B – TECHNICAL DATASHEET BY CONTRACTOR18

SECTION 485312
CIRCULATING WATER PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This section details the minimum technical requirements for the design, manufacture, testing, and furnishing of the circulating water pumps. It is not the intent to specify completely herein all details of design and construction of the circulating water pumps. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager. While this specification is written specifically for the Circulating Water Pumps, it also generally applies to the supply of the Auxiliary Cooling Water Pumps.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. 2x100% capacity vertical circulating water pumps of non-pullout type construction.
2. Two electric drive motors (one speed)
3. All seals, bearing lubrication systems, couplings, and coupling guards.
4. Any special tools and lifting devices required for installation, maintenance, and operation
5. Cleaning and finishing prior to shipment
6. Painting
7. Performance testing at factory and certificates of results
8. Startup spare parts and special tools
9. Fabricated steel support pedestal with fasteners
10. Steel soleplates
11. Review proposed intake dimensions and make a recommendation.
12. Priced list of recommended spare parts for two years of operation
13. Packing and shipping to the Glenarm Plant or a location to be identified by the General Manager either in the city of Pasadena, CA or other nearby city.

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Receipt and off loading at site

2. Installation labor and erection at the site
3. Foundation and anchor bolts
4. Grouting
5. Controls and instrumentation external to the equipment
6. Electrical conduit and wiring
7. Motor starters
8. Field touch up painting
9. Initial lubrication from Contractor provided lubrication inventory
10. Field inspection and testing

1.4 RELATED SECTIONS

A. Section 260000, Electrical - Mechanical Equipment

B. Section 261050, Specification for Medium Voltage Motors

C. Section 262050, Specification for Low Voltage Motors

D. Section 480020, Site Conditions

E. Section 480031, Combined Cycle Power Island Noise Control Performance

F. Section 480032, Power Island Performance

G. Section 481100, Combined Cycle Power Island

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. American National Standards Institute (ANSI)

a. 2.3 - American National Standard for Vertical Pumps Design and Application

2. American Petroleum Institute (API)

a. 610 - Centrifugal Pumps for Petroleum, Petrochemical, and Natural Gas Industries

3. American Society of Mechanical Engineers (ASME)

a. PTC 8.2 Power Test Code for Centrifugal Pumps

4. Hydraulic Institute (HI)

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. Refer to Section 481100, Combined Cycle Power Island for cooling system description and requirements.
2. All equipment shall be designed for a thirty (30) year life objective. Components for which this service life cannot be expected shall be identified and those components shall be designed for ease of replacement and maintenance.
3. The pumps shall be suitable for continuous operation in the ambient conditions as detailed in Section 480020, Site Conditions.
4. All equipment shall be designed and assembled to provide suitable access for operation and maintenance of the equipment.
5. All equipment shall be designed for continuous 24 hour per day operation with potential daily cycling from off-line to full load.
6. Each pump shall be completely assembled with the electric driving motor prior to shipping from factory. If necessary, the assembly may be disassembled for shipping.
7. The standby pump shall be designed to start automatically in an emergency situation when the failed operating pump shuts down.
8. Each pump shall be provided with a two speed electric motor.
9. The pumps shall also be provided with minimum flow recirculation control arrangement to recirculate water back to the cooling tower basin so as to render the pumps safe at low and no load conditions. The minimum recirculation valves shall be sized and selected, including trim and plug design, actuators, valve materials and valve accessories to properly satisfy the operating and design conditions of each circulating water pump. The control valves shall be furnished with pneumatic spring opposed diaphragm operators. Valve position transmitters shall be provided and positioner shall be HART type. Any flow restricting orifice plate or back pressure regulators required for the recirculation line shall be provided. Use of automatic recirculation control (ARC) valve for minimum flow controls is not acceptable.
10. The two circulating water pumps shall be identical in design and component parts shall be interchangeable. It shall be possible to operate two pumps together and they shall remain inherently stable when running in parallel while in this mode.

11. The Suction Specific Speed shall not exceed 12,000 or eye inlet on the first stage impeller exceed 65 ft/sec based upon Hydraulic Institute recommendations. Deviation from this recommendation is allowable for special designs if the Contractor can show risk of erosion and cavitation is minimal under normal operating conditions.
12. Pumps shall not produce more than 225 feet of head per stage to avoid damage due to vibration, cavitation, or erosion. More developed head per stage may be allowable if the design is proven by the Contractor.
13. The characteristics of the pumps shall be such that the motors will not exceed the rated capacity and temperature rise under any operating conditions. Under no circumstances shall the service factor of the motor be used to achieve required pump performance.

B. Performance Requirements

1. The contractor shall guarantee the following Refer to Attachment 6 for Performance Guarantees:

    a. Capacity without negative tolerance. Tolerances will be per HIS.
    b. TDH without negative tolerance and plus 3% at the design capacity.
    c. NPSHReq without positive tolerance minus 10% at design capacity.
    d. Pump efficiency without negative tolerance.
    e. Shutoff head without positive tolerance above guarantee, minus 3%.
    f. Acceptable TDH deviation amongst identical units of 2% at design capacity.
    g. Noise requirements as specified in Section 480031, Combined Cycle Power Island Noise Control Performance
    h. Wire-to-water horsepower input at pump design operating point, corrected to actual fluid temperature within HI tolerances.

2. Circulating water pumps are non-throttling so the rise to shut off in 6 - 10%. The Contractor shall state the maximum pump head with discharge valve closed.
3. The pumps shall be suitable for both continuously and intermittent service and shall operate satisfactorily without vibration, cavitation, or distress to any part through an operating range from minimum flow to maximum specified capacity.
4. Pump's point of maximum efficiency shall coincide with the specified design capacity.
5. Pumps are noted as 100% capacity, runout does not apply. A 2 ft NPSH margin is provided at the rated condition.
6. The pump sets (pump, motor and base) shall be designed to avoid occurrence of one-half, first, second, and third harmonic critical speeds in undamped condition resulting in amplified excitation of vibration levels. This includes 20% separation between operating speed and natural harmonic critical speed. A lateral and torsional evaluation shall be conducted to assure the avoidance of critical speed.

C. Reliability

1. No single failure of a component or system shall result in damage. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

1.8 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100 Combined Cycle Power Island for general quality assurance requirements.

Testing

1. Certificates and records of all shop tests shall be submitted to the General Manager for approval at least one week before shipment.
2. Certificates and records shall include, as a minimum:
   a. Mill-test certificates for casing, impellers, and shafting or other components (if required by the governing code).
   b. Pump performance-test reports, including test data and performance curves
   c. Motor test reports
   d. Hydrostatic test reports
   e. "As Built" pump data sheets

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 481100, Combined Cycle Power Island for general Packaging, Delivery, Storage, and Handling requirements.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The following Manufacturers are pre-approved to supply equipment specified within this Section. Additional Manufacturers must be submitted to the General Manager for approval before consideration to include in the Contractor's Proposal.

1. Not Used

2.2 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

2.3 EQUIPMENT

A. General Requirements

1. Design of rotating elements shall be such that all critical speeds shall be at least 25% greater than the operating speed.
2. Drive motors enclosures shall be per requirements of Section 262050, Low Voltage Motors or Section 261050, Medium Voltage Motors.
3. Manufacturer shall provide all connections for suction, discharge, sealing, flushing, and venting. Piping shall be in accordance with ASME B31.1. All piping furnished by the Manufacturer shall be provided in ANSI standard sizes in nominal English units (inch sizes) unless otherwise required in Section 480020, Site Conditions. The location, size, type, and quantity of all openings, connections, and fittings shall be shown on Manufacturer's drawings.
4. Contractor shall be entirely responsible for the pump-to-motor interface including, but not limited to, the following:

    a. Supply of coupling for joining the pump and motor shafts
    b. Coordination of dimensions between the pump and motor
    c. Machining of the motor shaft to accept the coupling

B. Pumps

1. Each pump submitted by Contractor shall be designed for operation using the criteria specified.
2. The pump suction requirements, including submergence NPSHR, and inlet velocity, shall be determined using one pump runout capacity or 120% of design capacity, whichever is greater.
3. The design point total head specified shall use the discharge connection centerline as the reference point. Head losses through the pump, including suction inlet losses, are not included in the total head listed.
4. All pumps shall be identical in design and performance, with all replacement parts being interchangeable.
5. Wetted pump parts shall be suitable for the water handled by pumps for that service.
6. Each pump shall operate satisfactorily when a second, parallel, or standby pump is placed in operation.
7. Pumps shall be designed so that reverse rotation at the runaway speed caused by reverse water flow under maximum head will not cause damage to any of the components of the pump.
8. Pumps shall be designed to pass any foreign object having maximum dimensions indicated in the Datasheets without damage to the pumping equipment.

C. Pump Characteristics

1. Each pump shall be designed with a head-capacity characteristic which rises steadily from the one pump runout capacity to minimum flow.

2. It is preferred that each pump have low shutoff head and maximum efficiency at approximate design capacity and head.
3. Pumps shall be suitable for extended operation over the range from minimum flow to single pump runout at minimum system resistance, without damaging pitting, cavitation, excessive noise, or excessive vibration.
4. Pumps shall be designed to have a required NPSH at one pump runout conditions of no more than 75% of the NPSH available. Reliability during all operational conditions is major consideration.

D. Additional Technical Requirements

1. ASME Performance Test Connections – Manufacturer shall provide the necessary instrumentation connections on the equipment as required for the acceptance tests specified in PTC 8.2.
2. The Contractor shall incorporate any provisions necessary to prevent or eliminate the potential for vortexing and define installation provisions (i.e. recommended number of intake bell diameters from pit floor).

E. Pump inlet and outlet connections shall be on the same centerline.

2.4 COMPONENTS

A. To minimize equipment failure and damages caused by unproven components, the General Manager intends to install reliable, proven equipment and components which shall perform in accordance with the specifications. The Contractor shall disclose to the General Manager each design manufacturing procedure, component or assembly which does not have at least two (2) years satisfactory operating experience in similar service. Further, the contractor shall have manufactured at least two pumps of comparable design, power rating, speed, and discharge pressure. The failure to make such disclosures specifically and in writing shall extend the Contractor's warranty to include all direct costs to the General Manager that may result from the Contractor's use of such procedures, components or assemblies.

B. Motors

1. The design requirements for electric motors are specified separately in Section 262050 Low Voltage Motors and Section 261050 Medium Voltage Motors.
2. Motors shall be equipped with anti-reverse ratchets to prevent reverse rotation in the stopped condition.

C. Impellers and Bowls

1. The pump impellers shall be carefully machined and finished, with enclosed construction.
2. The impellers shall fit the shaft accurately and shall be securely keyed and locked in position so as to prevent any movement on the shaft during normal and reverse rotation operation.
3. Collets or taper fits will not be acceptable.
4. The bowls shall be flanged. Screwed in bowls will not be accepted.
5. The wear surface of the bowls and impellers is integrally cast with the components, which include an allowance for future installation of wear rings.

6. Full size impellers shall not be used. An allowance for a 5% future TDH increase is included.
7. All impellers shall be statically and dynamically balanced.
8. Pump bowls shall be prepared and coated in accordance with specifications provided in this Section.

D. Pump Column

1. Joints in the pump column shall be flanged and bolted.
2. The pump column shall be designed and constructed to provide accurate alignment automatically when the column is assembled.
3. The pump discharge connection shall be flanged and drilled to match ASME B16.5 requirements. Flanges shall be 150# minimum. Discharge flange top two bolt holes shall straddle flange vertical centerline.
4. The pump shall include provisions designed to resist the discharge thrust developed with the pump operating at shutoff head, the piping weight, and piping thermal expansion.
5. Discharge head skirt shall have through holes drilled with stainless steel bulkhead fittings installed for the through-passage of seal and flushing water supply connections as well as mechanical seal and skirt drain connections.
6. Each column section shall have at least 2 lifting lugs.
7. Pump column section shall be prepared and coated in accordance with specifications provided in this Section.

E. Shaft

1. The pump shaft shall be sized to transmit the power requirements of the pump.
2. The shaft is machined across its entire length and ground and polished at critical areas..
3. A tensioning device shall be provided for each pump with a shaft enclosing tube to assure exclusion of the pumped liquid.
4. Line shaft and enclosing tube, if applicable, shall be fabricated from316 stainless steel.

F. Shaft Seals

1. The pumps shall be equipped with packed box.
2. Mechanical seals shall be specifically designed for the intended service. Seals shall have throttle bushings, vent, drain and flush connections. Plugs for unused seal connections shall be of the same material as the gland.

G. Bearings and Lubrication

1. All radial shaft bearings shall be as recommended by the manufacturer for the service and shall be of sufficient number to prevent shaft whip and minimize noise level. Maximum spacing between adjacent line shaft bearings (bushings) shall be in accordance with API 610.
2. The impeller suction and discharge bowl bearings shall be as recommended by the manufacturer for the service.
3. All bearings shall be mechanically secured to the bearing housings to prevent bearing rotation or movement during operation.

4. Pump bearings are flushed by the liquid passing through the column. Pump shaft sealing with John Crane or equivalent mechanical seal shall be accessible through openings in the motor support stand shall be provided above the upper bearing.
5. The mechanical seal shall be split to facilitate maintenance.
6. A shaft sleeve shall be provided at the mechanical seal.
7. The space between the motor and the mechanical seal shall be sufficient to permit removal and replacement of the seal without dismantling the pump.
8. Pump axial thrust will be resisted by a thrust bearing in the drive motor through the rigid coupling.

H. Drive Support

1. Each pump shall be provided with a cylindrical fabricated steel support pedestal mounting the drive motor directly on the pump discharge head. The base shall be designed to support the total weight of the complete pumping unit and all imposed dynamic loads.
2. Reinforcing ribs and braces, if required, shall be on the interior of the support base.
3. Access holes that are sufficiently large, and in sufficient number, shall be provided for dismantling the drive shaft coupling and for maintenance and inspection of the pump seal. Access holes shall have bolted covers.
4. The support pedestal shall be machined and drilled as required to receive and provide for proper alignment and securing of the drive motor to the pedestal.
5. All bolts, nuts, washers, and pins required for securing the motor to the pedestal and securing the pedestal to the sole plate shall be furnished and shall be constructed with Type 316 stainless steel.
6. Drive motor mountings shall be machined in accordance with dimensions supplied by the motor manufacturer.

I. Baseplate

1. Each pump shall be provided with a heavy structural steel baseplate. Separate heavy steel soleplates, with thickness appropriate to the weight and power of the pump, shall be provided for leveling and grouting and shall be designed to permit removal of the entire pump and baseplate without disturbing the soleplate or grout. Base plates and sole plates shall be made of ASTM A36 carbon steel.
2. Fastening of the base plate to the sole plate shall be accomplished by drilling and tapping soleplate to receive fasteners through the base plate. Fully threaded bolts shall be furnished for this purpose.
3. Edges of base plate attachment holes shall be no closer than 1.5 diameters from the edge of the hole in the soleplate through which the pump column passes. Contractor shall determine fastener size for this connection which meets all local code requirements and furnish required torque value for this connection to achieve design preload.
4. Where base plate and sole plate meet, the mating surfaces shall be machined flat. Contractor shall apply corrosion-resistant treatment to mating surfaces prior to shipment.

J. Shaft Couplings

1. A rigid, adjustable, flanged type coupling shall be provided for connecting the pump to the drive motor.

2. The drive motor coupling shall be specifically designed for vertical pump application, shall provide for vertical adjustment of the impeller, and permit changing the mechanical seal without removal of the motor.
3. The drive motor coupling shall be keyed to both the drive motor and pump line shafts. The shaft coupling shall be sized to transmit the maximum brake horsepower requirements of the driven equipment with a service factor of not less than 2.
4. A permanent corrosion-resistant plate shall be attached with corrosion resistant fasteners to the drive motor support pedestal stating the direction of rotation and coupling gap required for impeller positioning.
5. Line shaft couplings shall be of the sleeve and keyed type to permit ease of maintenance. Threaded couplings are not acceptable.

K. Coupling Guards

1. Safety guards shall be provided for protection of personnel from all exposed moving and/or rotating machine elements in accordance with the requirements of the applicable section of 29 CFR 1910.
2. Each guard shall be fabricated from ASTM A36 steel plate having a minimum thickness of 10 BWG and designed for easy installation and removal.
3. Necessary supports and accessories shall be furnished with each guard.

L. Lifting Lugs

1. Four lifting lugs shall be provided on the pump discharge head to facilitate handling during installation, maintenance and removal. Lugs shall be designed to handle the full weight of the assembled pump and accessories.

M. External Piping Connections

1. Contractor shall provide all connections for suction, discharge, flushing, and venting.
2. Connections shall have flanged ends in accordance with ASME B16.5.
3. Piping shall be in accordance with ASME B31.1.
4. Sizes and design pressures and temperatures of suction and discharge flanges shall be as specified in attached General Manager Datasheet.
5. Discharge connections shall be provided with ½ inch NPT pressure gage connections located at the pipe springline.
6. The location, size, type, and quantity of all openings, connections, and fittings shall be shown on Manufacturer's drawings.

N. Accessories

1. Miscellaneous trim - All piping and valves required for mechanical seal flushing or seal water, air vent valves, oil level indicators, grease lubricators, and other miscellaneous accessories shall be furnished by the pump manufacturer. All wetted parts (valve, tubing, etc.) are to match or exceed the characteristics of the casing materials.
2. Lifting lugs shall be provided to facilitate handling during installation, maintenance, and removal.

O. Identification

1. A nameplate shall be securely attached to each pump in a visible location. The nameplate shall be made of stainless steel and attached to the pump with stainless steel screws. The following information shall be included on the nameplates:

   a. Name of Equipment
   b. Manufacturer
   c. Serial Number
   d. Pump size
   e. Model Number
   f. Design Capacity (flow and head)
   g. Design Pressure
   h. Design Temperature
   i. Maximum continuous speed
   j. General Manager's equipment tag number

2.5 INSTRUMENTATION AND CONTROLS COMPONENTS Not applicable to Contractor's scope of supply

A. General

1. It is the intent of the General Manager to integrate the Contractor's equipment into a Contractor-furnished Plant Control System. All control devices furnished by the Contractor shall be capable of interfacing with the plant Control System and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the plant Control System to remotely start and stop all rotating equipment and to allow automatic switch over to the backup unit.
2. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant.
3. The Contractor shall permanently install a 1-1/4 inch stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified "Instrument Tag Number" to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
4. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of non-skid mounted devices. Special cables or termination kits if required shall be provided by the Contractor for installation by the BOP Contractor.
5. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
6. The control system shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.

7. The plant control system is to be designed to provide automation to minimize operator actions during normal plant start-up, shutdown, and at-power operations.
8. Plant systems and equipment are to be monitored and/or controlled through the plant Control System. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant Control System.
9. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
10. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two DPDT position limit switches or proximity switches, unless noted otherwise.

B. Instrumentation & Control Devices – Requirements

1. Duplex Type J thermocouples shall be used.
2. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
3. Control valves and pressure regulators shall be by Fisher or General Manager approved equivalent.
4. Electronic transmitters shall be Yokagawa, Endress & Hauser, or SMAR smart transmitters or General Manager approved equivalent.

C. Instrumentation to be Supplied by Contractor

1. Pump Minimum Recirculation Controls

a. The pumps shall be provided with suitable minimum recirculation controls to protect the pump under light load or no load conditions and to maintain a minimum safe flow of water through the circulating water pumps. When the flow drops to a predetermined minimum value the recirculating valve shall begin to open in a controlled manner. The leak off control shall be such that when the circulating water pumps are operating at low load, and in parallel, no hunting is caused by leak off valves opening or closing. The minimum recirculation control valve shall close when the pump flow increases to a predetermined quantity.
b. The minimum flow recirculation valve for each pump shall be a conventional flow control valve. Leak off flow will be discharged into the cooling tower. The circulating water pumps shall be capable of running without distress continually with main discharge valves closed. The leak off piping will be provided by the Others. However, the minimum flow control valve and the back pressure regulators shall be supplied by the Contractor.
c. ARC valve type recirculation valves are not acceptable.

2.6 CIVIL & STRUCTURAL

A. Refer to Section 481100, Combined Cycle Power Island for general Civil and Structural Requirements.

2.7 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

B. Shop/Factory Finishing

1. General

a. Steel material furnished under this specification, excluding machined surfaces, surfaces to be bonded to concrete, stainless steel, or "off the shelf" components, shall be blast cleaned and coated as required herein.
b. Priming and finish painting of piping is required. The base plate, sole plate, coupling guards, and other exposed carbon steel surfaces shall be primed and coated prior to shipment.
c. Surface preparation and priming shall be in accordance with Manufacturer's standard finishing shall apply.
d. The coatings shall not be applied until the equipment has been fabricated, hydrostatic tests completed, weld-spatter removed, welds ground smooth, sharp edges and corners ground to a curve, surfaces cleaned with clean mineral spirits, and abrasive blasting performed.
e. Off the shelf components such as control boxes, motors, valves, pipe hangers, etc., shall receive the Contractor's "standard shop finish".
f. Coatings shall be applied in accordance with the requirements of the coating manufacturer.

2.8 SOURCE QUALITY CONTROL

Refer to Section 481100, Combined Cycle Power Island for general source quality control, test, and inspection requirements.

Tests and Inspections

1. Hydrostatic Tests

a. Equipment and vessels shall be subjected to a hydrostatic leak test meeting the requirements of the applicable Code or Standard to verify integrity of the pressure boundary. No leakage is acceptable through the pressure boundary wall or assembly joints.

2. Functional and Performance Tests

a. The equipment shall be subjected to functional and performance tests in the Contractor’s shop to the greatest extent possible to verify the Contractor’s performance guarantees. The performance test for Contract purposes shall be executed at the final installation by the General Manager in accordance with a test procedure developed by the General Manager and approved by the Contractor.

3. Shop Tests

a. Full information shall be submitted describing the Manufacturer’s testing facilities. All tests shall be performed in accordance with the requirements of the latest edition of ASME PTC 8.2, except as otherwise required herein.
b. Each pump shall be performance tested at rated speed to determine the head, capacity, and brake horsepower.

c. Tests shall be conducted in accordance with Hydraulic Institute Standards for Vertical Pumps and as specified herein and/or on the pump data sheet. One pump shall be subject to a witness test. Test data shall be sufficiently comprehensive to produce guaranteed performance curve showing head versus:

1) Capacity
2) Efficiency
3) Net positive suction head required
4) Brake horsepower

d. A minimum of 7 points shall be tested. One point shall be at shutoff. One point shall be run out. One point shall be the rated point. The remaining points shall be spaced evenly between the rated point and shut-off. The range of test operating points must bracket all design operating points presented on the data sheet. Shop testing shall be conducted with the same driver to be furnished with the equipment specified herein.

e. If the shop tests indicate that the tested pump fails to meet the guarantees stated herein, the other pump(s) for the same service shall be shop tested in accordance with this Section.

f. Any pump not meeting the guarantees shall receive all adjustments, repairs, additions or replacements as required for it to meet the guarantees.

g. Re-testing and modifications shall be repeated until all performance guarantees are met or until arrangements are made which are acceptable to the General Manager.

h. Certified copies of performance curves resulting from the testing shall be submitted to the General Manager for acceptance before shipment of the equipment. These curves shall indicate actual test pressure, temperature conditions, and the observed test points.

i. Complete documentation regarding the prototype model test conditions and results shall be submitted. Complete documentation verifying the development of the performance curves from the prototype model test curves shall be submitted.

j. Certified copies of performance curves resulting from the prototype model testing shall be submitted to the General Manager for acceptance before shipment of the equipment. These curves shall indicate actual test pressure and temperature conditions and the performance curve points corresponding to the observed prototype model pump test points. The performance curves shall be guaranteed.

k. If pump suction test conditions (pressure and/or temperature) differ from the conditions listed in the General Manager Data Sheet, appropriate correction factors shall be applied to the observed test curve, and a corrected curve shall be indicated. This corrected curve shall then represent expected pump performance with the suction conditions listed in the General Manager Data Sheet.

l. The General Manager reserves the right to witness all pump testing and re-testing.

m. Contractor shall submit certified copies of test and inspection reports within 14 days of completion of the inspection or test.

n. Test and inspection reports within 14 days of completion of the inspection or test.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100, Combined Cycle Power Island for general requirements regarding Spare Parts.

3.2 COMMISSIONING

A. General

1. The Contractor shall allow for training of the General Manager's personnel appointed to operate the equipment and involved in commissioning.
2. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the right to remove and take away from site such commissioning and test equipment upon completion.
3. The Contractor shall submit a detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 3 months prior to the commencement of site testing.

B. Field Testing

1. Refer to Section 481100, Combined Cycle Power Island for general field acceptance test requirements.

SECTION 485374.21
COMPRESSED AIR SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. This Section defines the scope and services, responsibilities, and terminal points for design, fabrication, inspection, testing and certification of a compressed air system used to supply instrument air and service air to the plant for operational and maintenance requirements. The system includes air-cooled, oil-free, rotary screw air compressors, regenerative desiccant air dryers, lined carbon steel air receivers, interconnecting stainless steel piping and valves, along with all associated controls.

B. It is not the intent to specify completely herein, all details of design and construction of the equipment/systems. However, the equipment/system shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractors guarantee in a manner acceptable to the General Manager.

C. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

D. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor will be responsible for design, manufacture, shop testing, packaging, shipping, along with technical direction of the installation and field-testing of the plant compressed air system including but not limited to the following:

1. Single skid mounted packaged compressed air system sized by the Contractor for equipment supplied under Section 481100 Combined Cycle Power Island with 15% additional capacity margin for instantaneous demands.
2. 2x100% Air-cooled, oil-free, rotary screw air compressors
3. Dual tower desiccant air dryers
4. Service Air receiver
5. Instrument Air receiver
6. Pre-filter and after-filter
7. Intercooler and after-cooler
8. Interconnecting stainless steel piping and valves
9. Vents, drains, and piping appurtenances
10. All associated controls and instrumentation required to fully automatically operate the compressors and protect compressors from any fault or alarm condition.
11. Supply of motor drives, disconnect switches and motor starters housed in Contractor-furnished control panel rated for outdoor service.
12. Weather proof enclosure.

13. Noise abatement required to meet the project noise specification
14. Startup spares and special tools including at a minimum, two complete sets of particulate and/or coalescing filters.
15. Performance testing at factory and certificates of results
16. Drawings and design data to support facility design, construction and maintenance
17. Inspection certificates and quality control documentation listed in this Section
18. Complete set of component cut sheets
19. Operating, commissioning, installation and maintenance manuals for the supplied equipment.
20. Priced list of recommended spare parts for two years of operation
21. Packing and shipping to the Glenarm Plant or a location to be identified by the General Manager either in the city of Pasadena, CA or other nearby city.

B. The compressor system terminal points shall be:

1. Instrument/Service air connection
2. Control signals to the plant control system with a terminal block at the package control panel.
3. Two electrical terminations for the package power supply.
4. Drain connection
5. Air connection for supplementary air supply

C. The requirements of this specification are the minimum for the equipment and are supplemented by the Contractor's own requirements. The compressed air system shall be the primary source for plant instrument and service air.

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Foundations, grouting and foundation bolts
2. Unloading, storage, and installation
3. All piping external to the compressed air system
4. Heat tracing of vessels and drain lines, if required
5. Two 480V power supplies to the compressor skid
6. Electrical, instrumentation and controls wiring to the compressor control panel
7. Off-skid instrumentation

1.4 RELATED SECTIONS

A. Section 260000 – Electrical-Mechanical Equipment

B. Section 262050 - Low Voltage Motors

C. Section 480020 – Site Conditions

D. Section 480031 - Combined Cycle Power Island Noise Control Performance

E. Section 480032 - Power Island Performance

F. Section 481100 - Combined Cycle Power Island

1.5 CODES & STANDARDS

A. Refer to 481100, Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. The compressed air system shall be designed in accordance with these specifications and data provided in the attached data sheets and satisfy the requirements noted within regulations, codes, and standards listed as reference and others which are applicable to the site.
2. Refer to section 480020, Site Conditions for ambient temperature and humidity data.
3. All equipment shall be designed for a thirty (30) year life objective.
4. All equipment shall be designed for continuous 24 hour per day outdoor operation with potential daily cycling from off-line to full load. Motors, compressors and coolers shall be sized to prevent thermal or electric overload during continuous operation.
5. All equipment shall be designed and assembled to provide suitable access for operation and maintenance of the equipment.

B. Performance Requirements

1. The dryers shall be sized for the full flow of each air compressor with a flow limiting valve on the service air system to prevent loss of adequate instrument air pressure for control valve operation when service air is in use.

C. Noise Level – Equipment noise level shall meet the requirements of Section 480031, Combined Cycle Power Island Noise Control Performance

1.8 SUBMITTALS - REFER TO ATTACHMENT 11 -DRAWING SCHEDULE

1.9 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 481100, Combined Cycle Power Island for general Delivery, Storage, and Handling requirements.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

2.2 EQUIPMENT

A. Equipment Skid

1. The compressed air system shall consist of the following specified equipment, associated piping and instrumentation, mounted on a single rigid frame skid designed to maintain equipment alignment.
2. Skid shall be furnished with a galvanized corrugated metal canopy for the prevention of damage related to direct exposure to sunlight. Canopy structure shall be designed to comply with all applicable local and national codes.
3. Piping shall be cross-connected between compressors, dryers, and receivers. Cross-connections shall be valved appropriately to allow for isolation and sufficient operational flexibility.
4. The equipment shall be completely assembled, piped, wired and shop-tested and shall enable immediate operation after installation.

B. Compressors

1. The compressors shall be air cooled, oil free, rotary screw type.
2. The compressors shall automatically load, unload and alternate lead/lag assignments (automatic sequencing) independent of the BOP control system.
3. Each compressor shall be furnished complete with drive motors, inlet filter-silencer, inlet valve, baseplate/mounting frame, discharge pressure band control system, air-cooled intercooler and aftercooler (if necessary), speed increaser gears, lubricating oil system with warning/safety system, blowoff vent silencer, blowoff valve, couplings, coupling guards, vibration isolators, and other accessories required for a complete prepackaged installation.

C. Air Dryers

1. The dryers shall also have integrated automatic controls. The compressed air system shall include a separate remote mount Master Controller which interfaces with each of the compressors and dryers to operate completely automatically without need of operator intervention.
2. Each air dryer shall be of the heavy duty type with a dual tower arrangement.
3. The outlet dew point temperature shall follow Instrument Society of America standards for Instrument Air but in no case shall exceed -40 ˚F. In addition, the pressure dew point as measured at the dryer outlet shall be at least 18 ˚F below the minimum temperature to which any part of the instrument air system is exposed. Instrumentation furnished with each dryer shall be mounted and piped, and shall include air-inlet and outlet temperature indicators, a discharge air dew point indicator, and differential pressure gauge across the inlet and outlet of the air dryer.
4. All compressed air system supply shall pass through the dryers.
5. Pressure relief valves shall be provided on each dryer. Pressure relief valves, if not furnished as an integral part of the manufacturer's dryer, shall be set to relieve at no more than 90% of the dryer's maximum rated working pressure.
6. Each dryer shall have a bypass circuit for full-flow bypass of the dryer. Bypass circuit shall comprise 3 valves total and shall be arranged to allow for complete isolation of the dryer for the purpose of servicing and/or removal. For this purpose inlet, outlet and drain connections to the air dryer shall be made with unions, rated for the pressure and temperature service they will be subjected to.

D. Air Receivers

1. The air receiver sizes are indicated in the attached Data Sheets and shall be carbon steel vertical tanks, complete with pressure relief valves. Pressure relief valves shall be provided for the working pressure of the compressor plus 10% but not greater than the receiver design pressure.
2. The air receivers shall be designed for the maximum pressure noted in the attached General Manager Data Sheets, and shall be designed and built in accordance with the requirements of ASME Section VIII Pressure Vessel Code.
3. Each receiver shall be provided with, but not necessarily limited to, the following accessories, openings, and connections:

    a. Inlet and outlet connections with spring loaded check valves on the outlet connections.
    b. Pressure gauge with isolation and test port valves.
    c. Pressure switch with isolation and test port valves and isolated connection for low pressure alarm.

d. The air receiver vessel shall include a minimum corrosion allowance as specified in the attached Data Sheets and interior of the air receiver shall be treated /coated to be corrosion resistant for at least a 30-year life.
e. An automatic condensate trap shall be provided for each receiver. A drain connection and valve.
f. A manhole shall be provided on each receiver sized sufficiently to permit inspection access.
g. Each receiver shall have one spare 3" flanged nozzle, complete with blind flange, bolt-up hardware and gasket.

4. Pressure switch/low pressure alarm connection may be connected to the receiver at the same point as the pressure gauge but shall still have independent isolation and test port valves.
5. The skid shall be designed to permit full access for maintenance and removal of condensate traps.

2.3 COMPONENTS

A. Seals: The compressors shall be provided with stainless steel sealing rings. Shaft seals shall be designed to prevent escaping air or oil from coming into contact with adjacent equipment and personnel. Shaft seals shall positively prevent entry of oil into the air stream. Seal rings shall be free for radial self-adjustment along the rotor shafts.

B. Vents and Drains

1. Compressor cases shall have vents and drains. Drains shall be complete with drain valves and piping. Vents shall be tapped and plugged. Plugs shall be installed with suitable anti-seize agent to ensure future ease of removal.
2. All drains shall be piped to the edge of the skid. While package size is to be kept to a minimum, accessibility for maintenance shall not be sacrificed.

C. Couplings: Couplings shall be rated a minimum of 150 percent of the rated motor horsepower. Protection shall be provided by a strong steel guard complying with all applicable state and federal standards, rigidly fastened to the frame or equipment, and arranged for ease of access to the coupling.

D. Intercoolers, After-Coolers and Moisture Separators: Each after-cooler shall be fitted with a moisture-separator and shall be provided with a relief valve, temperature indicators at air inlet and outlet, and sight flow indicators. Both intercoolers and after-coolers shall have automatic drain traps. The automatic drain traps shall be provided with inlet strainer, bypass and bypass valves, and balancing line connections.

E. Filters

1. Coalescing filters upstream and particulate after filters downstream of the air dryers shall be provided. Coalescing pre-filters shall be rated at 0.3 micron. Coalescing/particulate after filters shall be rated at 3 micron.
2. Filtration efficiency shall be per manufacturer’s recommendation.
3. Each pre-filter and each after filter shall be full capacity. All piping and valves required for isolation and full size bypass of each filter shall be provided.

4. Filters shall be sized so that pressure drops in clean condition shall not exceed the pressure drops specified in attached Data Sheets.
5. The filters shall be provided with disposable, replaceable cartridges. Each filter cartridge shall be capable of withstanding a 50 psi differential pressure. Filter installation shall permit unobstructed removal and replacement of cartridges.
6. The pre-filter shall have adequate sump capacity and be equipped with an automatic drain valve and a bypass valve.
7. A differential pressure gauge shall be provided for each filter.

F. Piping and Valves – Contractor's standard piping and valves may be used, provided they meet established safety standards and are of a quality that will provide the high reliability required in a power plant (i.e., sized appropriately to avoid flow bottlenecks, corrosion resistant to avoid contamination of the instrument air, etc.). All on-skid piping shall be minimum schedule 80 wall thickness. Flanges shall be constructed of materials equivalent to the pipe with which they are used.

G. Sound Attenuated Enclosures: A sound attenuated enclosure shall be provided for the compressor unit if required to meet noise limits described in Section 480031, Combined Cycle Power Island Noise Control Performance. The enclosure shall be constructed of sheet steel, reinforced as required to assure a suitably rigid structure. Quick release panels and/or hinged doors shall be provided as required for ease of access to the equipment for inspection and maintenance.

2.4 ELECTRICAL REQUIREMENTS

A. Motors for auxiliary services shall be 460 Volt, 3 ph, 60 Hz and in compliance with Section 262050, Low Voltage Motors.

B. Electrical Codes and Standards – All electrical devices and materials shall be furnished and installed per the NEC (National Electrical Code, NFPA 70), Electrical Codes and Ordinances and all other applicable electrical codes and standards and shall be listed and labeled.

C. The electrical work for this system shall be in compliance with Section 260000, Electrical Mechanical Equipment.

D. All PLC's and/or controllers to have available connections for UPS power feeds.

2.5 INSTRUMENTATION & CONTROL REQUIREMENTS

A. General

1. Refer to Section 481100, Combined Cycle Power Island for instrument calibration requirements. Contractor is advised that factory instrumentation calibration, especially instrumentation which governs compressor operation, will be required to be furnished prior to acceptance of equipment.

2. A control panel mounted on the baseplate at a convenient height and shall be furnished separately for each compressor and air dryer. The local panels for each compressor shall communicate with each other.

3. All instruments and control devices shall be factory mounted, connected, and wired in a control cabinet meeting the following criteria:

    a. Comply with NEMA 4 or 4X rating, gasketed to resist splashed water and dust infiltration
    b. Shall be adequately sized per NEC to allow for proper termination of cables.
    c. The wiring and cable supports provided shall meet the requirements of the National Electrical Code, and all local rules, regulations, and ordinances.

B. Air Compressor Controls

1. A complete control system shall be furnished for each compressor. The control system shall include all necessary control switches, indicating lights, alarms, primary measuring equipment, control components, and final drive devices for complete and functional control systems.
2. The interlocks and control sequences for each compressor (start-up permissive, load and unload circuitry, malfunction alarms, shutdown, etc.) shall be provided in a local control panel.
3. In the event of a low-pressure condition, the lag compressor(s) shall automatically start to supplement the lead compressor.
4. The compressor loading will vary from zero flow to full rated flow. Changes in demand may be sudden and large. The load and unload control shall operate the compressor between predetermined minimum and maximum pressure settings by opening and closing the blowoff and inlet valves accordingly.
5. Each compressor shall be equipped with a time delay device so that it will be automatically unloaded upon starting until the motor is up to rated speed and lubricating oil is up to operating pressure.
6. Contractor shall furnish a local control panel for each compressor on which shall be mounted an analog oil pressure gauge, analog discharge air pressure gauge, status (running; off; hot standby; cold standby), compressor controls, and all necessary switches, lights, and indicators required for operation.
7. At a minimum the following controls shall be mounted on the local compressor control panel:

    a. Manual-Off-Auto Switch: The manual switch position shall be spring-loaded to return to the Off position.
    b. Constant Run/Stop-Start selector switch
    c. High-air temperature shut down and alarm. Provide local light for control cabinet. Compressor shall automatically shut down on high-air temperature.
    d. Run and stop lights with dry contact outputs for remote indication of run and stop status.
    e. Externally mounted or integrated disconnect switch with interlock that precludes opening the panel door under energized conditions by unauthorized personnel.
    f. Lead/Lag/Alternating Preference selector switch

8. Contractor shall furnish all necessary switches and relays for alarm and automatic shutdown of compressor. Actuation of any shutdown device shall energize a latch type relay located at the compressor. Circuits shall be arranged to permit the compressor to be restarted only after the relay is manually reset. Alarm and shutdown switches for the same function shall be separate and the alarm signal shall be such as to precede the

shutdown signal. As a minimum, the following indicators shall be furnished for each compressor:

a. Compressor Running
b. Compressor Alarm
c. Compressor Loaded

9. Contractor shall provide an air system "master controller" which can monitor, control and sequence the operation of all the air compressors and air dryers. At a minimum, the master controller shall have dry contact outputs, rated at 24VDC, for a general alarm, run status and stop status for each compressor, (6) contacts total.
10. The Contractor shall indicate in his proposal the type of HMI provided, its preferred location, and minimum hardwired signals recommended for plant control system.

C. Air Dryer Controls

1. All electrical components in the air dryer shall be completely factory wired into the control cabinet so that only one field connection is required to place the dryer into complete automatic operation. Power supply circuit and external alarm circuits shall be terminated at the terminals provided in the dryer control cabinet.
2. The control system shall sense and indicate actual moisture conditions, shall alarm on high moisture or other failed performance conditions, and shall indicate locally as well as transmit to the Plant Control System, all hardwired alarms and dew point temperature.
3. At a minimum the following controls shall be mounted on the local air dryer control panel:

a. Control for selection of automatic or manual regeneration
b. Contacts for starting and remote indication and alarms in the main control room for moisture and temperature, as a minimum
c. Inlet and outlet pressure
d. Operating status lights for each tower
e. A moisture indicator, with the capability of monitoring the percent moisture in the effluent air, and at a set high point, it shall annunciate and activate the regeneration cycle on the tower then in operation if the dew point of the air exceeds the set point. This shall not eliminate the timing feature which is provided to perform this operation on a time interval basis.
f. Moisture monitoring and energy saving energy control
g. Alarms to the Plant Control System for differential pressure across the filters high and dryer malfunctions

D. Control Devices

1. All control devices required to perform the control functions indicated, to interlock the functions, annunciate and/or indicate shall be furnished, including components to be mounted on the piping and equipment furnished under separate sections of these contract documents. This shall include, but not be limited to, solenoid air control valves, control valves, pressure switches, level switches, relays, time delays, transducers, controllers, indicating lights, control switches, and push buttons.
2. All control devices shall be installed in the local panels unless the functional requirements for a device make such installation impractical.

3. The controls system shall include separate electrically isolated contacts for remote monitoring of each unit's operational status and alarm condition. These isolated contacts shall be wired to local panel terminals. Contacts shall be normally open, closed on alarm condition.

E. Instrumentation

1. Quantity and types of items furnished shall be as required to meet the specific performance and as otherwise noted.
2. Contractor to supply Ashcroft indicators and Yokagawa, Endress & Hauser, or SMAR transmitters or General Manager approved equivalent where applicable.
3. Where analog gauges are used, gauges shall be glycerin-filled.

2.6 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

2.7 SOURCE QUALITY CONTROL

A. Refer to Section 481100, Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspections

1. Inspection and testing shall be in accordance with the codes specified.
2. Instruments shall be protected during hydro testing.
3. Wiring shall be checked for continuity and insulation integrity.
4. Filters shall be removed for hydro test of filter housing.
5. Full information describing the tests which are included in the bid price shall be included with the Proposal.
6. Certified copies of test results shall be submitted for acceptance before shipment of the equipment is made. Test results shall include a tabulation of settings of valves, equipment-protection devices, relays and alarm contact settings for proper operation and/or as left following factory testing.
7. As a minimum, the following tests shall be performed:

    a. Wiring shall be checked for continuity and insulation integrity.
    b. Functional checkout through simulated conditions of all control panel operation and alarm control schemes.
    c. Performance testing sufficient to determine that the subject equipment meets the specified performance criteria in this Section.

C. The General Manager reserves the right to witness shop tests. A minimum of 14 working days advance notice shall be given. Unless General Manager shall advise Contractor not to proceed with the inspection and testing prior to seven days before the date which General Manager has stated in its notice, Contractor may proceed and any inspection and tests shall be deemed to have been made in General Manager presence, and Contractor shall forthwith forward to General Manager duly certified copies of the inspection and test results.

D. The Contractor will establish an inspection plan for the equipment that will include observation by the General Manager of pertinent manufacture and test operations. The Contractor shall cooperate with, and assist as necessary, the General Manager's inspectors.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100, Combined Cycle Power Island for general requirements regarding spare parts.

3.2 FIELD QUALITY CONTROL

A. Field Acceptance Tests

1. Refer to Section 480032, Power Island Performance for general field acceptance test requirements.

B. Performance Tests

1. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Refer to Section 481100 Combined Cycle Power Island for individual equipment baseline performance testing.
2. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.

3.3 COMMISSIONING

A. General

1. Refer to Section 480032, Power Island Performance for general commissioning requirements.

SECTION 485374.22
FUEL GAS COMPRESSOR SPECIFICATION

PART 1 - GENERAL

1.1 SUMMARY

A. This document specifies scope of services, requirements for the design, manufacture, shop testing, packaging, shipping, field support, and supervision of installation and field-testing of a fuel gas compressor package.

B. It is not the intent to specify completely herein all details of design and construction of the equipment/systems. However, the equipment/system shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractors guarantee in a manner acceptable to the General Manager.

C. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. 2x100% capacity skid mounted screw type gas compressors
2. 1x100% common inlet scrubbers
3. Suction pulsation controls
4. 2x100% common discharge coalescing filters
5. 1x100% oil cooler heat exchanger (shell and tube)
6. 1x100% fuel gas discharge heat exchanger (if required)
7. Capacity and header pressure controls
8. Discharge gas receiver (if required)
9. Instrumentation
10. Compressor control panel
11. Noise attenuation
12. Motor drives, disconnect switches
13. Cleaning and finishing prior to shipment
14. Finish painting
15. Factory testing and certificates of results
16. Site specific drawings and design data to support facility design, construction and maintenance
17. Inspection certificates and quality control documentation listed in this Section
18. Complete set of component cut sheets
19. Operating, commissioning, installation and maintenance manuals for the supplied equipment.
20. Provide field support and supervision for installation and field testing of the compressor package.
21. Priced list of recommended spare parts for two years of operation

22. Packing and shipping to the Glenarm Plant or a location to be identified by the General Manager either in the city of Pasadena, CA or other nearby city.

1.3 FURNISHED BY OTHERS

A. Supply by Others shall be limited to the following:

1. Foundation and anchor bolts
2. Receipt and off-loading
3. Installation at site
4. DCS configuration and graphics programming
5. Off-skid electrical wiring
6. Electrical, instrumentation and controls wiring
7. Instrumentation
8. All piping to/from Contractor's terminal points
9. Final job site cleanup and touch-up painting

1.4 RELATED SECTIONS

A. Section 260000, Electrical Mechanical Equipment

B. Section 261050, Medium Voltage Motors

C. Section 262050, Low Voltage Motors

D. Section 480020, Site Conditions

E. Section 480031, Combined Cycle Power Island Noise Control Performance

F. Section 480032, Power Island Performance

G. Section 481100, Combined Cycle Power Island

1.5 CODES AND STANDARDS

A. Refer to 481100, Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. American Petroleum Institute (API)

   a. 619 - Rotary Type Positive Displacement Compressors for Petroleum, Petrochemical and Natural Gas Industries
   b. 660 - Shell-and-Tube Heat Exchangers
   c. 661 - Air-Cooled Heat Exchangers for General Refinery Service

2. Heat Exchanger Institute (HEI)

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. General:

1. The fuel gas rotary screw compressors shall provide required quantity and pressure of natural gas to operate the gas turbine power plant. The gas compressor package design shall be modern, well proven, safe, and economical in capital, operating, and maintenance costs.
2. The gas compressors and auxiliaries shall be designed and selected to ensure high reliability and availability of the complete plant for a 30 year operating life in an outdoor installation.
3. An appropriate level of redundancy shall be included in each system. The equipment shall be designed so that no single auxiliary component failure within gas compressor package shall result in the total loss of the gas turbine unit generating capability. In this context, it is required that with agreed exceptions, all unit auxiliaries shall be provided with at least one installed spare (N+1).
4. The compressor package shall be fully automated and require minimum operator intervention for normal operation.
5. The fuel gas system will interconnect to the plant fuel gas system at the General Manager supplied tie-in to bring the gas line to the project site. The fuel gas will be pressurized and conditioned through gas compressors before supplied to the gas turbine unit.
6. The fuel gas system upstream of gas compressor package will comprise the following equipment supplied by Others:

    a. Fire Safety Emergency Shutoff Valve
    b. Fuel gas spectrophotometer
    c. One fuel gas flow check meter

7. The gas compressor cooling shall be provided by a closed loop auxiliary equipment cooling water system. The gas compressor package shall be skid mounted with all accessories including inlet scrubber, discharge receiver, discharge pressure and capacity control system and compressor controls. A final 2x100% discharge coalescing filter shall be installed to meet the gas turbine manufacturer's specification for liquid droplet and solid particle filtration. Contractor shall be responsible for ascertaining gas turbine

manufacturer's fuel gas inlet requirements and furnishing that information with the filter skid submittal(s) to prove compatibility.

B. Design Requirements:

1. The rotary screw compressor set shall be designed such that the motor and the compressor rotor can be run at full rated RPM over the specified suction pressure and temperature range; discharge pressure; flow rate from 0% through 100% demand; and over the entire ambient temperature range without any destructive effects or overload of the motor, compressor or coolers. Use of the service factor of the motor(s) to obtain 100% demand performance shall not be permitted
2. All equipment provided by Contractor will comply with NEMA and Class-I, Division 2, Group D requirements as a minimum.
3. The compressors will be connected to a regulated gas pipeline with variation in suction pressure and gas flow variation due to gas turbine duty requirements.
4. The steady state supply pressure exiting the discharge receiver shall be regulated to +/- 1% (with peak to peak) for frequencies above 20 Hz. No pulsation is allowed at 20 Hz and below. The gas leaving the gas compressor package shall be filtered to at least 3 microns absolute.
5. The traces of lube/cooling oil leaving the gas compressor package shall not exceed 1.0 ppm.
6. Where conflict appears to occur between fuel gas conditioning requirements described herein or where conditioning requirements are not otherwise specified, the gas turbine manufacturer's fuel gas inlet requirements shall govern. Contractor is responsible for obtaining gas turbine manufacturer's fuel gas requirements and furnishing equipment that is compliant therewith.
7. The fuel gas compressor skids shall be equipped with the appropriate noise attenuation measures to meet the requirements of Section 480031, Combined Cycle Power Island Noise Control Performance. The Sound Attenuation measures shall be provided by the Contractor may include: (1) Acoustical Insulating Blankets / Compressor Motor housings and/or (2) 4 sound attenuating walls around gas compressor skids or (3) Enclosure (4 wall + roof) for each gas compressor skid. In the event that the enclosure is provided, the necessary ventilation, gas detection, and fire-fighting system shall also be provided.

C. Performance Requirements Refer to Attachment 6 – Performance Guarantees:

1. Contractor shall guarantee total auxiliary power consumption per compressor when operating at rated conditions. This includes related off-skid electrical loads such as cooling fans, etc.
2. Near field noise and contribution to far field noise emissions of the plant shall not exceed the limits provided in Section 480031, Combined Cycle Power Island Noise Control Performance.
3. The performance of the complete compressor package shall be in accordance with General Manager’s drawings, specifications, and Data Sheets.
4. The compressor control shall allow continuous control of output over the range from 0% flow to full rated flow at rated pressure.
5. Fuel Gas Compressor discharge pressure and flow variation shall be automatically controlled on the compressor skid by an automatic slide gate valve or with fuel gas recirculation and bypass system, as needed to provide quick response and operation below 25% capacity.

6. The compressor discharge gas temperature shall not exceed the maximum allowable temperature limit as stated on the Technical Datasheets by General Manager or set in the gas turbine manufacturer's fuel gas specification. This maximum temperature limit shall not be exceeded under any operating load condition. Contractor shall furnish a gas cooling system if necessary to meet this requirement.

D. Reliability:

1. The gas compressor package shall provide efficient and reliable service throughout the range of operating conditions. Reliability, ease of operation and a minimum of maintenance attention are primary considerations, and the rating and model size chosen by the Contractor shall reflect this. Only proven equipment and systems shall be offered for this contract.

1.8 SUBMITTALS - Refer to Attachment 11 -Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 481100, Combined Cycle Power Island for general delivery, storage, and handling requirements.

1. The gas compressor control panel shall be shipped with copies of all factory functional testing documentation described herein.

1.11 SITE CONDITIONS

A. Reference Section 480020, Site Design Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

2.2 EQUIPMENT

A. Compressor

1. The compressor unit shall be suitable for outdoor installation.
2. The compressor shall be a screw type, in accordance with API 619.
3. The pressure containing components shall be designed to comply with Section VIII Div-2 of ASME pressure vessel code with appropriate stress intensity factors.
4. The gas compressor pressure protection system shall be furnished and sized as API Recommended Practice 520 (including fire case).
5. The rotor stiffness shall be adequate to prevent contact between the rotor and the casing at the most unfavorable specified conditions. The rotor material shall be proven materials and shall be selected by the manufacturer.
6. The rotor shaft shall be a helical rotor, dynamically balanced to provide vibration free operation.
7. The rotor assembly including thrust disk, balance piston (when applicable) and half key on shaft end shall be dynamically balanced prior to compressor assembly.
8. All materials of construction shall be clearly stated in the proposal with an equivalent ASTM specification. API-619, Table F-1 material selection guide shall be followed.
9. Shaft seals shall be provided to restrict or prevent gas leakage to the atmosphere. The seals operation shall be suitable for specified variations in suction or discharge conditions that may prevail during start-up, shutdown or normal operation. Dual or single seal design with independent seal fluid system is acceptable.
10. The compressor shall be installed on a structural steel frame including provisions for filling in with high strength grout with allowance for motor and coupling alignment. Alignment shall be verified just prior to shipment and at site.
11. Compressor and motor mounting base shall be machined after all welding is completed so that all the machined mounting pads contacting with compressor and motor legs are within a tolerance by manufacturer's standard of each other in parallel when measured on the milling machine.
12. Compressor shall have slide valve to adjust the flow rate due to suction pressure variations and capacity change. The instrumentation shall be provided to indicate the position of the slide valve.
13. The maximum allowable working pressure (MAWP) shall be at least 110% of or 75 psig greater than the maximum operating pressure, whichever is higher.
14. The coupling connecting between compressor and drive motor shall be sized for all operating conditions. The drive coupling assembly shall be protected with a removable, non-sparkling guard.
15. The main pressure casing shall be bolted and main casing split face shall use a metal-to-metal joint (such as O-ring) to avoid gas leakage due to high pressure. Gasket joints are not acceptable.
16. A liquid separator shall be provided at the compressor discharge to limit lube / cooling oil leaving the gas compressor package to 1.0ppm.
17. The compressor package shall accommodate a system trip, utilizing a “measured” response while going into recycle, thereby preventing negative impact to the upstream or downstream equipment.

B. Capacity Control

1. The Contractor shall supply the capacity control system.
2. The control system shall include a manual override (local manual start and control).

3. The capacity control shall provide 0%-100% throughout the range of conditions as specified in data sheet. This criteria is also applicable in the case of multiple compressor installations, with any number of compressors operating.
4. Capacity control shall be done by the combination or either of slide valve built in compressor and spill back valve on bypass line.
5. The compressor control system shall include a recycle/slide gate valve positioner and position transmitter.

C. Compressor Lube Oil System

1. The lube oil system shall be equipped with the alarms, indicators and shutdowns as required.
2. Compressor lube oil system shall include:

    a. Dual flow filter assembly including 10-micron replaceable element and differential pressure indicator and continuous flow transfer valve.
    b. System relief valve for full pressure lubrication to bearings and seals.
    c. Control oil system for hydraulic cylinder for slide valve movement. It shall be a common oil system with the lube oil.
    d. A single cooler for lube oil system shall be provided.
    e. Two sets of motor driven lube oil pumps shall be provided (one for main and another for stand-by). Stand-by pump shall have automatic cut in function when lube oil supply pressure hits low alarm point. No compressor shaft driven pump is allowed in any case. The compressor shall be provided with pre-lube pump.
    f. A water cooled lube oil system shall be provided with temperature indicators for reading directly both the inlet and outlet oil temperatures.
    g. A shell and tube heat exchanger designed to API 660 standards for single pass or double pass with a return water box with cooling water supplied form the auxiliary cooling water system shall be provided. U-tube or plate and frame type heat exchangers are not acceptable. Refer to requirements listed in subpart 2.3A.7 for detail specifications of the lube oil heat exchanger.
    h. If necessary, a compressor oil sump electric immersion heater shall be supplied with electrical connections fully accessible.

2.3 COMPONENTS

A. Compressed Fuel Gas Heat Exchanger

1. Waste heat from gas compression and recycle gas shall be discharged from the system by a shell and tube heat exchanger provided by the Contractor.
2. A 1x100% heat exchanger arrangement shall be provided for each compressor skid.
3. The heat exchanger shall be sized for all operating conditions, not only for compressor full load operation, but also be capable for gas recycle operation with 0% gas flow rate to the gas turbine with minimum slide valve load.
4. The gas cooler discharge shall not exceed the gas turbine fuel gas temperature limit.
5. Noise levels shall be guaranteed and verified in conformance with Section 480031, Combined Cycle Power Island Noise Control Performance.
6. The corrosion allowance of carbon steel components shall be a minimum of 0.063”.
7. Shell and Tube Heat Exchanger

a. Shell and tube heat exchangers shall be design to API 660 standards for single pass or double pass with a return water box with cooling water supplied form the auxiliary cooling water system. U-tube or plate and frame type heat exchangers are not acceptable.
b. Tubes may be either seamed or seamless with a minimum OD of 0.75 inch and a minimum design pressure of 125 psig. Maximum tube side pressure drop shall be 13 psig. An 85% cleanliness factor shall be used in the design calculations to determine the required heat transfer surface area.
c. The fuel gas cooling system shall be provided with inlet and outlet temperature indicators, pressure test connections (inlet and outlet) and a thermal relief valve if required for compliance with the governing design codes.
d. Tubes shall be stainless steel and tubesheets carbon steel. The shell and heads shall be carbon steel with epoxy coating on wetted surfaces.
e. Fluid velocity through the cooler tubes shall be 4-7 ft/sec with a design target velocity of 5 ft/sec.

B. Vessels

1. All pressure vessels shall be sized for the maximum possible system flow rates; and, designed in accordance with ASME Section VIII, Division 1. Each vessel shall be designed per ASME Code and ASME Code stamped. National Board certification is required. Code stamp and vessel information shall be legible.
2. All pressure vessels shall be manufactured from SA-106 Grade B or higher grade seamless pipe; or, from SA-516-70 rolled steel with a single ERW longitudinal weld seam. Heads are to be spun from SA-516-70 steel. All flanges shall be SA-105 forged steel and shall be RFWN or LWN forgings. All pipe fittings shall be SA-234-WPB steel. All couplings to be 3000# or greater.
3. The suction scrubber shall be designed for at least 110% of or 50 psig greater than the maximum operating suction pressure, whichever is higher. and design temperature shall be 200°F. The scrubber design shall include a 0.063 inch minimum corrosion allowance. All flanged connections shall have reinforcing pads, except on heads, where LWN connectors or heavy wall piping may be utilized to preclude the need for the more difficult pad forming.
4. All suction scrubbers and other vessels shall be fabricated fully tested and then painted.
5. Attachment of the vessels that mount on the skid shall be by welding or bolting the vessel skirt to the thick plates, which are specifically arranged as a stiff section of the skid frame members for mounting the vessels.
6. Scrubber “trim” shall include a high level alarm and shut-down switch; a level gauge manual drain with shut-off valve.
7. Discharge Coalescing Filter Separator “trim” shall provide for upper and lower chambers. Trim shall include externally mounted high level alarm switches; level gauges; with shut-off valve; and pressure indicating gauge(s), with local differential pressure indicator and transmitted signal to the gas compressor controller PLC for oil coalescing element; and temperature indicating instruments. Automatic drain level control is not required.
8. The Discharge Coalescing Filter Separator shall be designed for 99.9% filtration of particles, one (1) micron and larger. All possible oil carry-over from the compressor must be filtered, even at the highest possible flow rates. The coalescing filter shall have a quick access fully supported to facilitate change of internal filters. Replacement filters shall be readily available.
9. The Discharge Bulk Oil Separator and Coalescing Filter Separator shall be designed for at least 110% of or 75 psig greater than the maximum operating discharge pressure,

whichever is higher and design temperature shall be 250°F. These vessels shall include a 0.063-inch minimum corrosion allowance.

10. Final oil carry over downstream of the Coalescing Filter Separator shall be less than 0.5 ppmwt as a guarantee, unless otherwise specified.
11. All vessel welds shall have radiographic examination in accordance with the ASME code.
12. Stainless steel 6-inch thick minimum, mesh pad type mist eliminators or high efficiency vane type mist eliminators shall be 316L stainless steel. Either style design shall be fully supported with continuous seal welds inside the scrubber.
13. Special care shall be exercised to assure each vessel's internals are cleaned thoroughly.

C. Drains Tank (by others)

D. Piping

1. The Contractor shall supply all necessary piping, piping supports, isolation valves and fittings for all lines for fuel gas, lube oil, vents, drains, instrument control air and instruments. All piping connections shall terminate with flanged or socket weld connections at the edge of the skid.
2. The material and fabrication of all skid piping and connections to equipment shall conform to ANSI B31.1. Carbon steel fuel gas piping shall be in accordance with ASTM A-106 Grade B seamless. Sizes 2.5" through 12" shall be Schedule 80 minimum and shall have welded or flanged connections. Sizes 2" and smaller shall be Schedule 80 minimum and may be flanged, welded or socket welded.
3. Skid piping shall be designed and fabricated to minimize and eliminate the possibility of gas leakage and provide for individual isolation for instruments and downstream piping without causing a system shutdown in order to isolate a leak or make repairs.
4. A lubricating type threaded joint sealant suitable for gas service shall be used to insure vibration and leak proof joints for all threaded pipe joints and all threaded instrument connections. (No Teflon tape, no copper based pipe thread sealant on oil lines)
5. Equipment breakout pipe unions, when used, shall be located downstream of the first isolation block valve in branch piping or fuel gas headers.
6. Ball valves shall be used for gas piping and forged steel gate and globe valves, 2" and smaller, shall be seal welded bonnet, bar stock type.
7. Suction and discharge gas connections shall be flanged and rated for the design pressure and temperature in accordance with ASME B16.5. In no case shall any flange be of lesser rating than those on the same line or system. Bolt holes for flanged connections shall straddle lines parallel to the main horizontal or vertical centerline of the equipment, and shall be indicated on drawings.
8. Gas piping on the skid shall be sized for a maximum gas velocity of 3600 feet per minute or pressure drop calculations where applicable.
9. All piping furnished by the Contractor shall be installed and supported on the compressor skid. Piping shall provide proper flexibility and easy accessibility for operator maintenance and cleaning. When a system includes standby components, valves shall be provided and installed as required to allow removal of components for maintenance without draining the system or shutting down the compressor.
10. Piping shall be firmly fixed in a neat and orderly arrangement adapted to the contour of the machine and shall not obstruct access openings. Piping, tubing, or conduit shall be supported and protected to prevent damage from vibration, operation, or maintenance. Valved connections 1-1/2" and smaller into gas piping shall be designed to minimize

over-hung weight and gusseted to avoid breakage due to pulsation-induced vibration. Piping shall be free of rust, slag, welding beads, and other foreign materials.

11. Instrument pressure take-off points shall be a minimum of 1/2" and a common pressure take-off connection may be used for pressure gauges and pressure switches or transmitters. Instrument pressure take-off points shall be located at spring line of the pipe. In no case shall instrument pressure connections be located at pipe invert. Each instrument take-off point shall have an isolation valve and all instrument air supply lines to control valves or instrument devices shall have isolation valves. Instrument isolation valves shall be Whitey (or equal) and fittings shall be Swagelok (or equal).
12. All instrument pressure connections, level bridle connection, etc., from a gas pressure vessel or piping header to the first instrument isolation block valve shall be welded or socket welded. Threaded joints with seal welded construction are not permitted. Threaded connections on instrument devices like pressure gauges, switches, transmitters, temperature indicators, etc. shall not be seal welded.
13. Each process connection to a pressure instrument shall feature a 12" drip leg at the point of connection or last horizontal bend before point of connection for the purpose of draining accumulated condensate.
14. Thermowell connections shall be 1" NPT.
15. All control valves shall be flanged. Wafer or lug-wafer style valves shall not be permitted.
16. All Lubricating oil lines shall be made of stainless steel. Stainless steel fittings with stainless steel tubing shall be furnished. Pressure piping downstream of oil filters shall be free of internal obstructions or pockets that could accumulate dirt at pipe joints. Other lube oil piping fittings shall be butt weld type. When butt welds are necessary, such precautions as internal grinding of joints, heliarcing the first weld pass, and other steps shall be taken to prevent weld spatter inside the lines. After fabrication, oil lines shall be thoroughly cleaned.
17. Oil lines from forced-feed lubricators to lubrication points for gas service shall have a minimum wall thickness of 0.049 inch and shall be stainless steel with stainless steel fittings and check valves.
18. Relief valves for all equipment shall meet all Federal, State, and local regulations. The Contractor shall furnish and install all relief valves required on all piping and equipment within his Scope of Supply with settings clearly and indelibly marked on the valve or stamped onto the valve's nameplate. The Contractor shall determine sizes and set pressures for relief valves related to the equipment. The relief valve installations shall be complete by equipment skid manufacturer with all valve vent piping extended to a safe location above the operating deck by others. Vent valves shall be individually routed; ganging of vent lines from multiple compressors shall NOT be permitted.
19. Drain and vent piping 2" and smaller shall be Schedule 80 minimum and not less than 1" O.D. All drains shall be manifolded into a common header per compressor. Drains from multiple compressors shall not be ganged together. Header size shall not be less than 2”. Drains shall be sloped toward the collection point at a minimum of 1%.
20. All drain manifolds, packing and distance piece vent manifolds shall have flanged or plugged couplings on each end of the skid to facilitate the connection of these lines from either end of the skid.
21. The packing and distance piece drains shall be manifolded and piped to skid edge. Supply of the drain collection tank and routing of drain piping to drain tank shall be completed by others.
22. Gas piping shall be radiographed in accordance with applicable code requirements. All skid gas piping that is installed or routed under the skid deck shall be 100% radiographed.

23. All compressor discharge skid piping that operates above 140°F and subject to handling by operating personnel shall be identified in the submittals, for insulation by General Manager.

2.4 ELECTRICAL

A. All motors and electrical equipment shall be in full accordance with all specification requirements of Sections 260000 Electrical Mechanical Equipment, 261050 Medium Voltage Motors, 262050 Low Voltage Motors,

B. Electrical Systems

1. All electrical equipment shall be suitable for installation in NEC Class I, Division 2, Group D hazardous locations.

2.5 INSTRUMENTATION AND CONTROLS

A. General

1. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Contractor shall accommodate this objective in the design of their equipment and Contractor shall furnish any and all transmitting instrumentation required to observe and record the process conditions listed in Performance Test Datasheet herein. These instruments shall be furnished regardless of whether or not they are required by Contractor's control system for ordinary equipment operation. These instruments shall be furnished and calibrated in accordance with specification section 481100, Combined Cycle Power Island, Instrumentation and Controls. These performance data sheets shall then be completed and submitted as part of the plant performance testing described in section 480032, Power Island Performance Testing.

B. Control Panel and Shutdown System

1. There shall be one common control panel provided that controls all compressors, which shall be designed at a minimum to:

   a. monitor and control all required functions;
   b. indicate and shutdown on any unit malfunction;
   c. have push button MANUAL START,
   d. MANUAL LOADING and UNLOADING capability,
   e. AUTOMATIC SHUTDOWN, actuated either remotely or
   f. AUTOMATIC SHUTDOWN, by panel shutdowns.
   g. Provide for temperature and pressure monitoring and control as required
   h. Provide for discharge pressure control

2. The control system shall include provision to control compressor capacity with a slide gate valve.

3. The control panel shall be designed with internal cooling and heating as required to assure component availability for continuous operation over entire temperature range for the site.
4. The panel shall have a sunscreen to assure readability of panel read-outs.
5. Full length hinged and lockable doors shall be provided on the panel to permit easy access to all panel components.
6. The control panel, tie-in junction box(es), hinges, hinge bolts, nuts, and washers shall all be made of 304 stainless steel.
7. Enclosure shall be rated as NEMA 4X as a minimum but shall meet the requirements of the area electrical classification.
8. Stiffeners as required, shall be used to ensure panel integrity during shipment and jobsite installation.
9. All components protruding through the front or side of the panel shall have the function identified with phenolic nameplates.
10. The panel shall be designed to give a first out indication of process upsets.
11. Control panel shall contain the logic to sequence the operation of the valves for each compressor.
12. Each step of the sequence shall be confirmed to work properly before proceeding to the next successive step. The compressor start sequence shall be automatic. Back-up Auto Start-Stop is required in multiple compressor installations so a "trip" on one unit will cause the automatic start of an alternate compressor as required to sustain gas turbine operation.
13. Each compressor unit shall always start in an "unloaded" mode.
14. The compressor unit shall be designed to automatically blow-down only on ESD, emergency shutdown, if requested. A timed purge cycle must be integrated into the control system for any instance in which the gas compressors is vented and cleared of gas.
15. The main junction box(es) as required for power and controls wiring interfaces on skid shall be located in an accessible area on the edge of the skid. Each skid shall have a remote I/O panel permanently mounted securely on the skid that interfaces to the main PLC control panel to control all functions on that skid. This remote I/O panel may be installed in the junction box.
16. The main PLC control panel may be located off-skid on a foundation by others. This main panel shall be connected to the individual skids remote I/O panel by single communication cable to reduce wiring performed by the General Manager.
17. The gas compressor PLC shall be capable of Ethernet communication to the Plant Control System (PCS) for remote monitoring and supervisory control.
18. The control panel shall have provision for remote start or stop through both the Ethernet communication link with the Plant Control System (PCS) and hardwired points.
19. The control panel shall have a local panel mounted emergency stop (E-stop) as well as a provision for remote hardwired E-stop from the General Manager's control room.

C. Instruments, Indicators, Monitors, Shutdowns

1. Refer to Section 481100, Combined Cycle Power Island for instrument calibration requirements.
2. Contractor shall provide manufacturer's standard vibration monitoring system.
3. Compressor and motor probes shall be mounted in the bearings and wired to a base-mounted NEMA 4 rated proximiter housing. Vibration probes shall be Bently Nevada Series 3300XL proximity probes.

4. Vibration monitor shall be Bently Nevada Series 3500. One common vibration monitor system shall be provided for all the compressor / motor sets. Bently Nevada system shall have provisions to export data via Ethernet ModBus TCP port. ModBus configuration and commissioning support shall be provided. A ModBus point list shall be provided.
5. Indicating instruments and protective devices shall be provided to assure, accurate indication and data transmission under all operating conditions; a safe; and, fully functional system. Each device shall be manufactured by a reputable and proven supplier.
6. All indicating instruments shall be dual scale, reading in English units. All such devices shall have indication in the proper operating range.
7. All required instruments, controls, and control valves shall be furnished and installed on the skid by the Contractor
8. The Contractor shall provide and install all skid-mounted instruments, controls, gauges, and safety devices.
9. The following alarms and control signals shall be provided in the local control panel by the Contractor, for General Manager interconnection to a remote Plant Control System (PCS).

    a. Common dry contact alarm signal from the compressor skid to the General Manager's Plant Control System.
    b. Common shutdown signal from the compressor skid to the General Manager's Plant Control System.
    c. Signal from the compressor skid to the General Manager's Plant Control System panel indicating that the unit is running.
    d. Signal from the compressor skid to the General Manager's Plant Control System panel indicating that the unit is stopped.
    e. Unit shutdown signal from the General Manager's central Plant Control System panel to the compressor control panel. The shutdown shall cause the unit block valves to close.
    f. Ethernet data link for monitoring to the plant control system.
    g. Provision for two (2) remote shutdowns.

10. If the Contractor feels that additional shutdowns are required for the complete protection of the compressor, motor, or other skid components, they shall be specifically noted in the quotation.
11. All shutdowns shall be the lockout type requiring manual reset.
12. No end device shall be allowed to reset automatically.
13. A compressor shutdown shall be fail safe.
14. The shutdown devices are to activate the unit sequential shutdown system.
15. All pressure instruments shall be equipped with test connections in manifold valves, located for ease of calibration and all pressure gauges shall be glycerin filled and equipped with snubbers to prevent gauge damage due to pulsation.
16. Each pressure gauge shall be furnished with a block and bleed needle or manifold valve.
17. All temperature probes shall be inserted in 1" thermo wells connected through ¾" couplings / latrolets in the pressure piping. No thermowell may extend beyond the centerline of the pipe. All thermo wells shall be 316L SS. External projections for thermal devices are to be held to a minimum.
18. Wherever completed control loops are installed within the skid limits, each controller shall be assembled as follows:

    a. Instrument air from header shut-off gate valve shall be piped to each instrument.
    b. Each instrument shall be provided with an isolating block and bleed needle valve.

19. All tubing shall terminate at a bulkhead in the bottom or side of the panel designed for easy tie-in of interconnecting tubing.
20. All tubing and fittings shall be 304L stainless steel.
21. Bulkhead fittings shall have companion fittings and shall be plugged for shipment.
22. All tubing shall be protected, straight neatly arranged, and properly supported.
23. All tubing bends shall be shaped using tube benders.
24. All tubing shall be adequately mounted and protected.
25. Tube bundles shall be utilized where practical.
26. Tubing bundles shall be supported at least every 6 feet or at intervals as recommended by the tubing bundle manufacturer, whichever is closer.
27. Where multiple tubing runs are made along skid frames or vessels, the Contractor shall furnish and install support brackets and tubing gang clamps.
28. All tubing supports and tubing support hardware (nuts, bolts, u-bolts, etc.) shall be 316L stainless steel.

2.6 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

B. Each Compressor and its accessory equipment shall be mounted on an individual skid. Each skid shall be heavy-duty welded steel with full-length longitudinal runners and full depth cross members with sufficient reinforcement to allow a four-point lift of the each complete assembly. Each skid deck shall be covered with checkered plate and fully seal-welded with drainage slope to prevent settling or puddling of rainwater. Jackscrews and foundation bolt holes shall be provided on the outside runner.

C. Each skid shall have a two-inch drip-lip extending around the outer perimeter oil containing areas of the skid for spill containment. The drip lip shall have plugged couplings for drain connections. General Manager shall approve design of the drip lip.

D. Seismic and dynamic analyses shall be utilized in the design of the skid assembly to provide a system, which is free of equipment vibration problems, and foundation and anchor problems during operation.

E. The Contractor shall supply and install two NEMA two-hole grounding pads near diagonally opposite corners of each skid. Grounding pads shall be in accordance with the electrical standard specifications included in this package.

2.7 SOURCE QUALITY CONTROL

A. Refer to Section 481100, Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspections

1. Contractor shall notify General Manager two weeks in advance of functional testing. General Manager reserves the right to witness functional testing at Contractor's works.

2. The gas compressor control panel and all controls shall be thoroughly tested on the completed unit prior to shipment. This testing shall assure functionality and proper operation / installation of all components. All P&ID items shall be verified and any changes shall be issued as "As-Built" drawings. Also, all BOM items are to be verified on the unit and in the BOM, including the proper scale of measurement utilized for the application.
3. "Functionality" as used in this context includes at a minimum: ringing out of all I/O points and verifying against Contractor's point-to-point drawings, verifying and documenting alarm set points, switch contact developments, calibration of all skid-mounted instrumentation and successful functional checkout of all startup, shutdown and trip operating sequences. Points and alarm conditions may be simulated using jumpers or other similar means in order to verify functionality.
4. Documented results of functional testing, in Contractor's testing format, shall include actual measured values, required values, manufacturer's accepted values where requirements are not specifically identified as part of these specifications, functional step checkout, electrical drawing red lines, equipment and instrument adjustments made shall be submitted to the General Manager prior to shipment.

C. Code Compliance: It is the Contractor's responsibility to obtain copies of all documents referenced in this specification. The referenced documents shall be binding. The Contractor of the fuel gas compression systems shall certify that the components of the system, where applicable, shall be designed, fabricated, tested, and documented in accordance with applicable portions of API Specification 619.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100, Combined Cycle Power Island for general requirements regarding spare parts.

3.2 FIELD QUALITY CONTROL

A. Field Acceptance Tests

1. Refer to Section 480032, Power Island Performance for general field acceptance test requirements.

B. Performance Tests

1. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Refer to Section 481100 Combined Cycle Power Island for individual equipment baseline performance testing.
2. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.

3.3 COMMISSIONING

A. General

1. Refer to Section 480032, Power Island Performance for general commissioning requirements.

END OF SECTION 485374.22

APPENDIX A –TECHNICAL DATASHEETS BY GENERAL MANAGER

The detailed technical data will be furnished by the equipment vendor during contract execution. The design will be to manufacturer's standards and will support the power island guarantees and will meet the design life requirements.

Description		**Units**	**Comments**
Gas Turbines			
Number of Gas turbines	1		
Expected Fuel Gas Demand per Unit			
Total Plant Fuel Gas Demand			
Fuel Gas Demand Range			
Cooling Medium	Water or Air		
Fuel Gas Supply to Plant at Compressor Suction			
Minimum Pressure	150	psig	
Nominal Pressure Range	150 to 200	psig	
Temperature Range	50 to 75	ºF	
Average Temperature	60	ºF	
Fuel Gas Supply Requirements to Gas Turbine Generator			
Compressor Discharge Pressure, Design Conditions		psig	Refer to Gas Turbine Manufacturer Re-quirements
Compressor Discharge Pressure, Maximum		psig	
Pressure Required at GTG		psig	
Maximum Allowed Discharge Temperature		°F	
Fuel Gas Compressors			
Required Flow Each Compressor		MMSCFD	
Design Standard	API-619		

Parameter	**Definition**
Site Voltage	Refer to Section 260000
Control Voltage	Refer to Section 260000

Instrument Air	Refer to Section 481100
Gas Compressor Duty	Multiple start/stops per day with varying discharge flows
Arrangement	2x100% capacity
Maximum oil carryover	0.5ppmwt
Pulsation Suppression / Silencers Study	Required as per Para 6.9 API-619
Location	Outdoor
Winterization	Required to site minimum temperature
Acoustic Insulation Blanket / Housing	Required

SECTION 485413
ONCE-THROUGH HEAT RECOVERY STEAM GENERATOR

PART 1 - GENERAL

1.1 SUMMARY

A. This specification details the minimum technical requirements for the design, manufacture, testing, and furnishing of a once-through heat recovery steam generator (OTSG). It is not the intent to specify completely herein all details of design and construction of the OTSG and its related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict among referenced standards, codes and the documents included in this specification, or a perceived conflict between the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment for a complete OTSG system, including but not limited to the following:
1. Once-Through Steam Generator with economizer, evaporator, and superheater sections unfired and at a single pressure
2. General Manager Datasheet
3. Inlet transition duct and expansion joint to the OTSG from GTG/OTSG interface
4. Two pressure relief valves, complete with silenced vent stacks
5. Main steam electromatic relief and pneumatic start-up vent valves and mechanical SRVs as per the ASME Sec 1 requirement and silencers (note: silencers must be designed to comply with the noise specifications. Primary start-up operation shall be to bypass to condenser). Silencer supports by OTSG manufacturer.
6. Main feedwater flow devices
7. Main steam outlet desuperheater
8. Steam turbine bypass system
9. Pressure vessel stop valves and check valves
10. Feedwater control valves
11. All required headers for the boiler sections
12. All boiler trim valves (including safety valves equipped with silencers) and trim piping, including all necessary valves to the OTSG scope limit
13. Superheater and steam piping low point automatic drains with valves, conductivity probes, and condensate legs
14. Field instrumentation and control valves
15. Outlet transition ducting and main stack with damper
16. EPA Emissions test ports and SCAQMD test ports
17. Access platforms, one set of full height stairway to the main operating level and handrails

18. Base plates and slide pads
19. Sole plates and shear keys
20. Structural steel supports for the OTSG
21. Double wall insulated steel casing for transition ducts, economizers, evaporators and superheater sections
22. Boiler feedwater control valves and trim (supplied loose for field mounting)
23. Boiler feedwater valve piping stations
24. Interfacing insulation and liner between all ducting and module field joints
25. OTSG drain system for both the casing and water side (piping by Others)
26. CO catalyst system
27. SCR system as indicated
28. 19% Aqueous ammonia vaporization and injection system
29. Tempering air fans
30. Grounding lugs for the General Manager's lightning protection and grounding system
31. Shop finish coat
32. Spare parts list
33. Per diem rates for supervision for unloading, field erection training and commissioning
34. All activities required for completion of the Work including the following:

    a. Design, materials, fabrication and assembly
    b. Shipping preparation, loading and securing on carrier.
    c. Shipment to the Glenarm Plant or a location to be identified by the General Manager either in the city of Pasadena, CA or other nearby city.
    d. Submittal of drawings, data and documents.
    e. Expediting of materials, equipment and submittals.
    f. Inspection, examination and testing.
    g. Monitoring and reporting.
    h. Special lifting equipment (i.e. lifting lugs) but not standard lifting equipment such as slings, spreader beams, etc Field technical services including erection advisor, startup advisor and operator training
    i. Coordination during OTSG performance testing
    j. Attendance at a project kickoff meeting and a design review meeting in the General Manager's office.

35. Interconnecting piping, ducts, bolts, nuts and gaskets or other items required for connections between components included in the Work. Drill-in or shot-in concrete anchors required to install the Contractor's components shall be provided. Refer to the M195 Drawing in Attachment 1 – Scope of Supply.
36. The Contractor's scope shall include all items within the following terminal points and as described herein and on the Contractor's conforming P&ID's. Refer to the M195 Drawing in Attachment 1 – Scope of Supply. Terminal elevations shall be as shown. Top terminal points for main steam outlets and bottom terminal inlets for feedwater inlets are preferred. Upper and lower terminals shall extend beyond the HRSG sidewalls. Far side is the side opposite the General Manager's pipe rack. Valves and instruments in terminal piping shall be located above platforms or accessible from grade as specified herein. When auxiliary equipment sections are included in this specification, additional terminal points in those sections also apply:

General Manager/Contractor Terminal Points	
Contractor's Scope Includes	**Terminal Location**
Exhaust Gas	
Downstream of GTG outlet expansion joint	GTG outlet
TEG condensation area drain piping outlets and upstream	At General Manager's grade funnel, both sides
Casing drain caps and upstream	At cap
Stack drain piping outlets and upstream	General Manager's grade funnel, far side
Stack damper drain piping outlet and upstream	General Manager's grade funnel, far side
Stack outlet and upstream	Top of stack
Steam/Water	
Boiler feedwater inlets and downstream	Top, pipe rack side
Superheated steam stop valve/bypass valve piping and upstream	Top or bottom, pipe rack side
Start-up vent silencer outlets and upstream	Top of silencer; Piping from the start up vent valve to the silencer shall be by others.
PSV silencer outlets and upstream	Top of silencer
PSV and startup vent drip pan/silencer drain piping	General Manager's grade funnel, both sides
High point vent valve pigtail outlet and upstream	Safe location
Desuperheater inlet piping and downstream	Top or bottom, pipe rack side
Steam sample piping outlets and upstream	Top or bottom, pipe rack side
FW piping inlet	Top or bottom, pipe rack side
Low point drain outlet terminals and upstream	General Manager's grade funnel, both sides
Electrical	
Weather enclosure fan motor wiring terminals	Top, pipe rack side
Weather enclosure heater wiring terminals	Top, pipe rack side
Aviation light control box terminals	Not Applicable
Off-skid individual actuator and instrument terminals	At actuator or instrument
Ambient Air	
FW preheater re-circulating pump drain outlets and upstream	Not Applicable
Pneumatic	
Off-skid individual actuator and instrument terminals	At actuator or instrument
Nitrogen	
Nitrogen blanketing isolation valve inlet and downstream	Not Applicable

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:
   1. All piping up to the specified terminal points
   2. HP steam flow devices

3. Sample analyzers for steam and water sampling
4. Sample coolers
5. Labor and equipment for unloading, field erection, and storage
6. Electrical and instrument wiring and wiring supports
7. Electronic transmitters for remote control
8. Plant Control System (PCS) and all system integration logic for start up and operation
9. Motor starters (as required for purge/tempering air fans)
10. 19% Aqueous ammonia storage tank
11. Control room instrumentation
12. Concrete Foundations, sole plates, shear keys, imbedded anchor bolts, washers and nuts
13. Flushing during commissioning
14. Grouting
15. Insulation, lagging and heat tracing of piping
16. Piping outside of interface points shown on flow sheet
17. Platform lighting and receptacles
18. Grounding and lightning protection system
19. Lighting
20. Piping beyond ASME BPVC Section 1, Boiler External Piping

1.4 RELATED SECTIONS

A. Section 261050 - Medium Voltage Motors

B. Section 262050 - Low Voltage Motors

C. Section 260000 - Electrical - Mechanical Equipment

D. Section 409413.22 - Continuous Emissions Monitoring System

E. Section 480020 - Site Conditions

F. Section 480031 - Combined Cycle Power Island Noise Control Performance

G. Section 480032 - Power Island Performance

H. Section 485311.20 - Boiler Feedwater Pumps

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.
   1. American Boiler Manufacturers Association (ABMA)
      a. Boiler 402, Boiler Water Quality Requirements and Associated Steam Quality for Industrial/Commercial and Institutional Boilers
   2. American Society of Mechanical Engineers (ASME):
      a. Boiler and Pressure Vessel Code, Section I, Power Boilers

b. Boiler and Pressure Vessel Code, Section II, Parts A and B, Ferrous and Non-Ferrous Materials
c. Boiler and Pressure Vessel Code, Section V, Nondestructive Examination
d. Performance Test Code, PTC 4.4, Gas Turbine Heat Recovery Steam Generators
e. STS-1, Steel Stacks

3. American Society for Testing and Materials (ASTM)
   a. D 1066, Standard Practice for Sampling Steam
4. California Air Resources Board (CARB)
   a. AB 32, GHG Reporting
5. Code of Federal Regulations (CFR)
   a. 40 CFR Part 60, Standards of Performance for New Stationary Sources
   b. 40 CFR Part 75, Continuous Emissions Monitoring
   c. 40 CFR Part 98, GHG Reporting
6. South Coast Air Quality Management District (SCAQMD)
   a. Rule 218, Continuous Emission Stack Monitoring
   b. Rule 218.1, Continuous Emission Monitoring
   c. Rule 2012, Requirements for Monitoring, Reporting, and Recordkeeping for Oxides of Nitrogen (NOx) Emissions

B. The OTSG shall be designed and fabricated in accordance with ASME Section I and upon completion of erection and testing shall receive an ASME Section I "Nameplate", the manufacturers "S" and "PP" symbol stamps and be registered with the National Board of Boiler and Pressure Vessels.

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements
   1. Reference Section 481100 Combined Cycle Power Island for general design requirements and expected operating profile.

2. The OTSG shall be designed, constructed, inspected, tested and stamped in accordance with ASME BPVC Section 1. The Work shall conform to the local authority Boiler Code and Registration requirements. The Contractor shall verify the local requirements. Confirmation of local authority requirements and approvals shall be furnished to the General Manager for any changes from the ASME Code and General Manager specified requirements due to the local requirements. The OTSG shall be registered with the National Board and as required by the local authority. All fabrication documentation necessary for the BOP contractor to complete its pressure vessel certifications (P3's, etc.) shall be supplied with the OTSG.
3. The design shall include a modular assembly for simplicity of field installation and allow for steam blows performed during commissioning of the plant.
4. Material design temperature shall be at least 25°F above the maximum calculated metal temperature for heat transfer surfaces. The Contractor shall define the minimum design metal temperature for projects with low ambient temperatures.
5. The TEG temperature entering the stack shall be per OTSG vendor design practices.
6. All condensate and feedwater piping material supplied between the condenser hotwell to the OTSG feedwater connection shall be 316SS.
7. Structural calculations and drawings shall be stamped by a structural engineer registered in the state of California.
8. Fabrication shall be in approved shops as required by local authorities.
9. Electrical equipment and panel design and approval by local authorities shall be included by the Contractor if required by the authorities.
10. Steam and water pressure parts within ASME BPVC Section I code breaks shall conform to ASME BPVC Section I and ASME B31.1.
11. Steam and water piping systems not within ASME BPVC Section I code breaks and utility piping systems shall conform to ASME B31.1 for OTSG's installed in self-contained power plants.
12. Components that can be exposed to pump shutoff pressure upon valve closure shall be designed for the related pump shutoff pressure in accordance with ASME BPVC Section 1 Boiler External Piping.
13. The Work shall conform to the following additional general requirements. When auxiliary equipment sections are included in this specification, additional general requirements in those sections also apply.

    a. The OTSG site specific design and performance requirements, the basis for the requirements and utility, site and mechanical data shall conform to the attached, "Technical Datasheet by General Manager". The OTSG site specific performance tests and guarantees shall conform to the General Manager's Performance Tests and Guarantees specified in this Section and in Section 481100 Combined Cycle Power Island.
    b. The OTSG equipment layout and tagging shall conform to that shown in the General Manager's general arrangement drawings provided as part of the bid documents and the OTSG/GTG/Foundation Interfaces specified.
    c. Terminal points, piping, instrumentation, controls and trim shall conform to this specification and shall be shown accordingly on the Contractor's Conforming P&ID's.
    d. The OTSG structure, casing, ductwork, stacks, ladders, platforms and stairways shall conform to General Manager's structural requirements.
    e. Induction motors shall conform to the General Manager's induction motor specifications: 260000 Electrical Specification for Mechanical Equipment, 261050 Medium Voltage Motors, and 262050 Low Voltage Motors. Noise limits shall

conform to the General Manager's Noise Limits as stated in Section 480031, Combined Cycle Power Island Noise Control Performance.

f. Unless specified herein, wiring harnesses between Contractor equipment and General Manager's interface too large to be shop assembled are not included under 260000 Electrical - Mechanical Equipment. Hazardous area definitions in this specification shall apply.

g. Motor operated valves shall conform to the General Manager's Standard MOV Interface, External Reversing Starter requirements. Motor operated valves, both open/close and modulating, shall be shop tested and calibrated prior to shipment. Certification of calibration and/or shop testing shall be furnished to General Manager for review for each valve.

h. Instrument, remotely operated valve and relief valve data sheets submitted shall conform to the content in the General Manager's Instrument and Remotely Operated Valve datasheets, or to ISA data sheets.

i. The Contractor's field erection and heavy haul shall conform to the General Manager's Plot Plan, Construction and Lay-Down Plan and Site Plan drawings and the General Manager's Contract

j. Drawing submittals shall conform to the Contractor's drawing and data requirements detailed in this specification.

14. The Work shall be designed for, successfully meet, and withstand all continuous load, operating cycle, part load, GTG transitions, GTG water injection and transitions, GTG inlet chiller, evaporative cooler and fogger transitions, start-up, shut-down, stand-by and idle conditions.
15. Normal operation will be from the PCS. Preparation for start-up will be done remotely by PCS operators.
16. The Work shall accommodate expansions and contractions under all conditions within the range of specified conditions
17. Flow mal-distribution, vibrations, vortex shedding noise, fluid pulsations and acoustic excitations shall be minimized. Their effects shall be incorporated into the design.
18. Permanent local piping, valves, flanges, fittings, bolting, gaskets, instruments, trim, controls and accessories required for operation, control and safeguarding shall be provided by the Contractor unless stated otherwise in this specification. All Code and General Manager specified requirements shall be incorporated.
19. Asbestos materials shall not be used

B. Performance Requirements

1. The OTSG shall be capable of sliding pressure control to the steam turbine.
2. The System shall be mechanically capable of continuous, unrestricted stable operation (up to the GTG mechanical power limitation) over the specified ambient temperature range and from approximately 25% to full load.
3. When the OTSG is supplied with emissions control, the System shall be capable of operating within the specified emissions concentration levels over the specified ambient temperature range and from approximately 25% to full load (with the GTG emission concentrations given in the Data Sheets attached to this specification). The Contractor's proposal shall include complete information regarding part load emissions capabilities for the specified ambient temperature range.
4. When the OTSG is supplied with emissions control, the specified emissions concentration levels shall be met for both combined cycle and OTSG run dry modes of operations.

5. The system shall be capable of operating dry (no water in OTSG) at full rated turbine exhaust pressure and temperature for extended periods as required for extended start-up, emergency trip, and shut-down operations, while meeting all emission requirements.
6. The high pressure (HP) steam system shall be designed to generate the flowrate of HP steam at the pressure and temperature as specified in the Data Sheet at each operating point subject to the GTG exhaust energy given herein. The HP steam conditions are specified at the OTSG outlet piping terminal point. The OTSG shall be able to operate with HP terminal point flows, pressures and temperatures varying as specified in the Datasheet.
7. Performance Correction Curves shall be provided as requested and/or Heat Balance output for all customer-specified cases.

C. Reliability
1. No single failure of an auxiliary component or system shall result in damage to the System. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

D. Guaranteed Performance Refer to Attachment 6 – Performance Guarantees
1. The OTSG shall be guaranteed to meet the performance listed in Section 481100, Combined Cycle Power Island Equipment.
2. Stack Emission: The emission concentration exiting the OTSG stack shall be guaranteed to not exceed the value listed in the Technical Datasheets by General Manager and/or permit conditions for both combined cycle and OTSG run dry modes of operation.
3. HP Steam Quality and Purity: Steam quality and purity to the steam turbine should follow the requirements of ABMA Boiler 402 (Boiler Water Quality Requirements and Associated Steam Quality for Industrial/Commercial and Institutional Boilers) and EPRI Guidelines as a minimum requirement. Also refer to Section 480020 Site Conditions for boiler water purity requirements.
4. Steam sampling ASTM D-1066 standards or agreed methods may be utilized for sampling. It is recognized that for OTSG, steam purity is directly affected by feed water quality to the OTSG and OTSG manufacturer guidelines for water quality may be stricter than the standards referenced.

1.8 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100 Combined Cycle Power Island for general quality assurance requirements.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping
1. Refer to Section 481100 Combined Cycle Power Island for general packaging and shipping requirements.

2. The System shall be packaged for shipment to allow for outdoor storage as prescribed by Contractor for a period of six months without damage from dust, sun, wind, or rain. Preparation for shipment shall require:

   a. Equipment to be completely free of water prior to packaging for delivery.
   b. Flanges and threaded connections to be coated with rust preventatives and blanked-off or plugged. Blanking flanges shall utilize at least four bolts. Open ends of pipe shall be caps or plugged.
   c. Unpainted surfaces to be protected from weather with weather tight and weatherproof covers. Machined surfaces shall be coated with a heavy grease or similar material before covering.
   d. Lifting and support points shall be clearly identified.
   e. Packages shall be identified with items and serial numbers, purchase order number, and item descriptions. Identifying tags shall be corrosion and weather resistant.
   f. Temporary bracing and covers shall be painted yellow.

1.11 SITE CONDITIONS

A. Refer to Section 480020 Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Refer to Section 481100 Combined Cycle Power Island for general material and welding requirements.

2.2 MANUFACTURED UNIT

A. Structural Requirements
   1. General

      a. Refer to Section 481100 Combined Cycle Power Island for general structural design requirements.

   2. Materials

      a. Refer to Section 481100, Combined Cycle Power Island for general structural material requirements.

2.3 EQUIPMENT

A. OTSG

1. The HP final steam temperature shall be controlled. During certain load conditions, attemperation may be required as a means to control final steam temperature. The OTSG shall be designed so that attemperation is not necessary when operating at the design point. Desuperheaters shall include internal liners and shall be located for proper mixing, accurate upstream and downstream temperature readings and to prevent water quenching damage to downstream components. The HP steam attemperator shall be provided by the PIE Contractor.
2. Minimum length of straight pipe upstream of the liner shall be three pipe diameters. Length of the liner downstream from the spray nozzle(s) shall be between three and six feet. Location of the temperature sensor downstream of the liner shall be positioned to allow 0.2 seconds of residence time to ensure complete mixing. If the mass flow of the spray water is greater than 15% of the mass flow of the superheated steam, this residence time shall be 0.3 seconds. Spray water control valve trim exit velocity shall be less than 100 ft/sec. to prevent cavitation and erosion damage. Control valve shall be sized appropriately to ensure precise control over the entire spray water flow range, especially at low Cv values. The control system shall be designed such that final steady state temperature of the desuperheated steam is within 5˚F of the setpoint.
3. Desuperheater probes and nozzles shall withstand the cyclical environment to which they are exposed without damage and nozzle tips shall remain in their correct orientation. The temperature of the steam after the desuperheater shall be at least 27°F above the steam saturation temperature at that point.
4. The OTSG shall be designed to prevent any detrimental effects resulting from high combustion turbine exhaust flows and turbulence, or combustion turbine induced vibrations. It is the responsibility of the Contractor to design the inlet duct and liners such that no damage will occur due to gas turbine exhaust turbulence, flow induced vibration, poor velocity distribution, or uneven flow patterns. The design shall meet the requirements of this article while there is no water in the OTSG.
5. The OTSG shall be a modular design. The location of external steam and feedwater connections shall be identical between the units supplied for a project when applicable. Field welding shall be minimized.
6. All components shall be factory assembled and shipped as complete packages when possible in order to minimize field erection. All pieces shall be suitably identified to facilitate installation. All holes shall be pre-drilled. All field welded pipe ends on pipe larger than 2” diameter shall be weld prepped prior to shipment. Steel shot blasting or iron grit blasting of all external steam and feedwater lines in the steam turbine path is required after post weld heat treatment.
7. The Contractor shall be responsible for all piping system stress analysis and pipe supports to the terminal points and shall work closely with the General Manager on the balance-of-plant stress analysis to coordinate overall pipe stress analysis and pipe support design. Steam and feedwater pipe stress analysis shall be by others.
8. Piping shall not be smaller than ¾ inch. The wall thickness for ¾ inch piping shall not be less than schedule 80. Piping shall be designed to provide unobstructed access to valves, instruments, and control devices. All valves shall be readily accessible from platforms or grade for operation and maintenance. Piping over 2” shall be butt-welded construction and piping 2” and under shall be socket welded construction.
9. Crosby, Consolidated, or approved equivalent safety valves shall be furnished. Pressure safety relief valves shall be flanged on both ends. They shall be provided with gags, lifting levers, sleeves, weather protection for outdoor installations, drip ell, drip pan and discharge piping. Drain lines shall be provided for the drip ell, pan and discharge piping. The discharge piping connection to relief valve silencers shall be welded, not bolted

10. The OTSG shall be equipped with water inlet and steam outlet manual stop valves consisting of ASME code required non-return (check) valves and gate valves. Solid wedge gate valves are prohibited. Parallel slide gate valves are required for cycling steam service and flexible wedge gate valves with bypass are required for all others. Boiler drain and blow-off valves shall be provided as required by code. Valves shall be equipped with motor operators.
11. The OTSG shall be equipped with additional spacing in the housing to allow addition of an SCR and CO catalyst.

B. CEMS SAMPLE PORTS

1. The Continuous Emissions Monitoring System (CEMS) hardware, sampling system, instrumentation, datalogger, and related equipment are supplied under Section 409413.22.
2. CEMS sample ports shall be provided in accordance with applicable 40 CFR Part 60 & 75 and SCAQMD rules and source testing guidelines.
3. Ports in the stack at the sampling platform and has provided shared ports in the inlet duct. No provision for ports between the SCR and CO is provided.

C. TEST CONNECTIONS

1. The OTSG ductwork and stack shall be supplied with all connections necessary to perform ASME PTC 4.4, Gas Turbine Heat Recovery Steam Generators. Instruments and controls for performance testing will be the same as supplied for operation.

D. TEMPERING AIR

1. 2x100% tempering air fans shall be provided by the Contractor to protect the SCR unit from high TEG temperatures during GTG operation with an OTSG dry mode.
2. The tempering air system shall include all ducting, air distribution lances, dampers, suction filters, and controls incorporated into the system.
3. For the SCR system to meet NOx emission requirements at all operating conditions, the tempering air system shall be sized and provided by the Contractor to reduce flue gas temperature at the SCR catalyst.
4. The system shall be designed to ensure proper mixing of the dilution air upstream of the NOx catalyst bed.
5. Fan motors shall be 1800 rpm, 480VAC, 60 Hz, 3 phase induction motors per Section 262050, Specification for Low Voltage Motors.
6. The tempering air fans shall be sized appropriately to accommodate maximum firing temperature at all expected load ranges and ambient conditions including dry tube operation with consideration for maximum degraded temperature to account for increased GTG exhaust gas temperature rise over the life of the turbine.

2.4 COMPONENTS

A. Tubes and Headers

1. All tubes shall be seamless and of suitable material for continuous dry running of the OTSG under the conditions described in Section 481100 Power Island Equipment Supply. Considerations must also take into account conditions when metal temperatures are below the TEG water vapor and acid dew points or when flue gas temperatures exceed 750˚F.

2. Headers shall be made of seamless pipe. Contractor shall clearly indicate specific ASTM material designation on shop drawings.
3. Headers shall be self-draining to minimize risk of off-load corrosion and thermal shock in steam circuits. Headers shall be sloped and supported properly to allow for full drainage.
4. Tube headers shall be provided with a vent drain as necessary to facilitate start-up. Vent and drain connections shall be external to the casing. Sizes of all vents and drains shall be clearly indicated on shop drawings.
5. All tubing arrangements shall be fully drainable.
6. Fin density and thickness shall be per the manufacturer's design standards. Fins shall be attached to tubes by high frequency, continuous welding or high temperature brazing. Fins shall be solid or serrated. The minimum fin thickness is the nominal fin thickness before the manufacturing tolerance is applied.
7. Tube fin material shall be per the manufacturer's design standards and meet temperature and corrosion resistance demands.
8. Installation of K type, mineral insulated, 304 stainless steel sheathed surface thermocouples shall be installed on each of the water inlet and superheater outlet tubes for investigation of water and steam maldistribution during startup, shutdown and normal operating conditions of the unit. Thermocouple wiring shall be long enough to terminate each thermocouple at thermocouple junction boxes to be furnished by the contractor and located on the exterior of the unit. Reference Section 260000, Electrical Mechanical Equipment for thermocouple junction box and terminal block requirements.

B. Casings, Liners and Insulation of Casing and Ducts
1. The outer casing shall be gas tight, minimum 1/4 inch thick and shall be designed for a minimum of 20 inches water column. Means shall be provided for draining water from the inside of the OTSG casing after water washing the outside of tubes. Blind flanged nozzles shall be provided underneath the OTSG for water removal ports. Sleeves shall be provided for drains in insulated sections, extending to the internal liner or hot casing. Sleeve material shall be equivalent to the local liner or hot casing material.
2. Casing drains shall be 2 inch minimum. Vertical elbow duct drains shall be 4 inch minimum
3. Spacing between the casing and boiler tube bends shall allow room for inspection of tube leaks and repairs through internal access pathways. Access doors shall be provided for access to those locations between tube bundles not accessible through internal passageways.
4. Insulation and liners in inlet ducts shall withstand GTG discharge characteristics without deformation or insulation loss. Design shall include the impact of GTG discharge temperature variations, turbulence, flow re-circulation and vortices. Floor liners shall support foot traffic and distributed scaffolding weight.
5. The inner liner shall be minimum 11 gauge thickness throughout unless specified otherwise. The inner liner shall be stainless steel. The inlet duct features tighter pin/scallop spacing (11"x11")
6. Internal insulation for inlet ducts and adjacent superheater section insulation shall be 8 lb/ft^3 density, OSHA approved soluble ceramic fiber blanket suitable up to 2300°F. Mineral wool or other non-soluble fiber materials shall not be used for internal insulation.
7. External insulation and lagging shall be provided when required to meet the TEG water and acid dew point criteria specified in the Design Requirements article of this specification.
8. The insulation shall be of such thickness and material to minimize heat loss, but in no case shall the outer casing temperature exceed 140°F at 80°F ambient temperature, 0 mph wind conditions except for localized points at liner pin locations and internal casing

supports. The Contractor shall provide personnel protection as required. Protection shall extend 8 feet above grade or platform floor.

9. All insulation shall be installed in the Contractor's shop to the greatest extent possible. Contractor shall provide internal insulation suitable for the service conditions. Insulation in the inlet duct shall be covered with a 40 mesh SS screen prior to installing panels.
10. The OTSG casing shall be provided standard maintenance door on the module (18"x18"). 18"x24" will be provided in other ducting areas for operation and routine maintenance.
11. If not externally insulated for personnel protection, the stack shall be provided with an expanded metal standoff at the base area up at the EPA test/CEM port platform area.
12. All casing weld joints shall be left as bare metal (no paint or primer) within 3" of a field weld seam.

C. Internal Supports, Guides, Baffles and Flow Distribution Devices

1. Vertical tubes shall be top supported.
2. To meet OTSG performance requirements or maintain components within design limitations, TEG flow distribution devices shall be provided if necessary.
3. To prevent TEG bypassing of heat transfer surfaces and flow-induced vibration mechanical damage due to acoustic resonance, supports, acoustic baffles and other baffles shall be provided. Supports, guides, baffles and distribution devices shall be suitable for 50°F above the maximum local TEG temperature. These shall be removable for pressure part inspection and shall remain securely in place. The arrangement design shall prevent accumulation of TEG deposits and internal components erosion within the OTSG
4. Materials shall withstand the specified plant operating conditions. Carbon steel shall not be used.
5. Tube supports shall not damage fins or tubes during operation or during inspection/outage.

D. Ducts and Expansion Joints

1. The OTSG manufacturer shall provide verification of successful experience with the GTG specified and the inlet duct arrangement proposed. Transitions shall be designed for optimum dynamics. The duct flange shall match the GTG outlet.
2. The casing design shall ensure a uniform gas flow profile at the inlet to the catalyst section. Gas velocity profile entering each catalyst module shall be as required by the catalyst manufacturer.
3. The gas path shall be a pressure tight envelope with internal liner donuts. These shall be secured by z-clips on the TEG side of the liner and penetration seals external to the casing at piping and support penetrations. The latter shall not restrict movement of the penetrating items. Seismic restraints and stops shall be separately provided independent to piping penetrations.
4. Access doors (18"W x 24"H minimum) shall be provided in the inlet and exhaust ducts for the OTSG.
5. The entire inlet duct (up to the first heat transfer modules) for the OTSG shall be at least 1/4" casing through with a stiffener design suitable for the turbulent conditions of the GT. Cold casing duct casing plate thickness shall not be less than ¼ inch.
6. The inlet duct for the OTSG shall be furnished with twelve 3-inch flanged sampling ports with end caps located 180 degrees apart (6 on each side). The sampling ports shall be equally spaced up the sides of the inlet duct.
7. The inlet duct for the OTSG shall be provided with two 1 inch diameter flanged ports located on opposite sides for pressure measurement devices.

8. Expansion joints, if required in the design, shall be manufactured of fabric suitable for the design temperature. Each expansion joint shall be designed for axial, lateral and angular displacements caused by the expansion difference between the internally insulated casing sections. The outer skin of the duct expansion joints (where exhaust-gas temperature is greater than 480°F (250°C) shall be made of non-combustible materials to minimize burning or charring of the expansion joints by the exiting exhaust gas. The internal side of the expansion joints shall be protected to minimize "erosion" of the insulating material.
9. The boiler casing shall be designed to provide an uncooled gas-tight enclosure around the boiler pressure part sections/tube bank modules.
10. Ducts shall have stiffeners, access doors, internal insulation, and cladding to reduce heat loss and provide personnel protection, where necessary.
11. Ducts and duct internals shall be made of gas-tight steel designed for maximum expected temperatures.
12. When required to maintain homogeneous velocity profiles, baffles shall be provided. Baffles are designed to mitigate vibration and provide for expansion with changes in temperature.
13. Heat flow from the OTSG and associated equipment and supports shall not cause foundation concrete temperatures to exceed 150°F. Steel members shall be insulated to protect concrete slabs and foundations if required.

E. Stack

1. The stack shall be integral to the exhaust duct and supported on top of the OTSG. The stack shall be manufactured with internal liner and insulation for dry operation of the OTSG. Stack design shall conform to ASME STS-1 adapted to OTSGs. Stack plate thickness shall not be less than ¼ inch including corrosion allowance
2. The stack shall have an outlet damper located at the top of the stack. For vertical flue gas flow designs, the damper shall seal to keep out rain water to prevent damage to the SCR catalyst. A platform shall be provided to allow 360 degree access to the stack damper.
3. The stack shall be furnished with four 4 inch diameter flanged EPA sampling ports with pipe plugs located 90 degrees apart in accordance with 40 CFR Part 60 Appendix B Spec 2, 8.1.2 CEMS Measurement Location. The measurement locations shall be at least two equivalent diameters downstream from the nearest control device, the point of pollutant generation, or other point at which a change in the pollutant concentration or emission rate may occur and at least a half equivalent diameter upstream from the effluent exhaust or control device. This is consistent with SCAQMD Test Method 1.1 and must also meet SCAQMD Rule 2012 Chapter 2 requirements.
4. If the specified upstream and downstream distance requirements cannot be met per SCAQMD Rule 2012 (B) 14 other locations may be chosen subject to a written approval of the Executive Officer. If an alternate location is chosen which does not conform with District Method 1.1, the absence of flow disturbance shall be demonstrated using the District method in the source Test Manual, Chapter X, Section 1.4 - "Alternative Site Selection Method", or 40 CFR, Part 60, Appendix A, Method 1, Section 2.5 - "Alternative Measurement Site Selection Procedure", and, the absence of stratification shall be demonstrated using the District method in the source Test Manual, Chapter X, Section 13 - "Determination of Gaseous Constituent Stratification". Absence of flow disturbance and stratification can be demonstrated by the following methods:

    a. Each affected piece of equipment shall have sampling locations which meet the "Guidelines for Construction of Sampling and Testing Facilities" in the District Source Test Manual.

b. If an alternate location (not conforming to the criteria of eight duct diameters downstream and two diameters upstream from a flow disturbance) is used, the absence of flow disturbance shall be demonstrated by using the District method in the Source Test Manual, Chapter X, Section 1.4, or 40 CFR, Part 60, Appendix A, Method 1. Section 2.5 and the absence of stratification shall be demonstrated using District method in the Source Test Manual, Chapter X, Section 13.

5. The stack shall be furnished with two 6 inch diameter flanged ports for the CEMS probe as well as four test ports described above.
6. A cantilevered davit (500 lb. capacity) shall be provided to allow hoisting material from grade to the sampling platform.
7. A sampling platform 4 feet wide (minimum) and 5 feet below sample ports shall be provided to allow safe 360˚ access around the stack.
8. If the outlet damper cannot be serviced from the CEMS sample port access platform, a 4 feet wide platform shall be provided at an elevation to facilitate maintenance of the stack damper and actuator motor.
9. The OTSG gas path shall contain at least one 3 inch diameter drain.
10. Stack dampers or cap shall be provided to prevent ingress of rain water during extended outages that may foul the catalyst bed. The stack damper shall be actuated by a single 480 VAC motor with integral motor starter. The motor operator shall be Limitorque model MX or approved equal and furnished with limit and torque switches. In addition, the damper shall also be furnished with shaft mounted limit switches. Local position indication shall be provided. The dampers shall be designed to minimize stack draft when closed. The damper linkage and one of the damper blades shall be configured to automatically open should the combustion turbine generator be started without first opening the full damper. The damper shall be equipped with an auxiliary contact to act as a permissive for the GTG start and tempering air fan start logic. The damper linkages shall be configured for remote greasing of the damper bearings that are accessible from a working platform.
11. The stack shall be provided with a stack silencer appropriately designed to support the overall plant noise limitations specified in Section 480031, Combined Cycle Power Island Noise Control Performance.
12. The stack shall be insulated below the damper elevation to retain heat during shutdown periods.
13. The stack shall be a 10.17 ft inner diameter round stack.
14. OTSG vendor shall provide a square to round transition for the exhaust stack.

F. Drains
1. All OTSG components shall be fully drainable. All drain valves shall be brought out from underneath the OTSG casing.

G. Valves
1. The steam outlet non-return valves (stop checks) shall be manufactured by Edward, Weir (Atwood-Morrill), Pacific, or equivalent.
2. All drains, vents, and instrument sections shall have a double valve arrangement.

H. Control Valves
1. Control valves and pressure regulators shall be manufactured by Fisher or equivalent.
2. Pneumatic actuators shall be designed to provide adequate torque with 60 psig instrument air pressure.

I. Motor Operated Valves

1. Motor operators for MOVs shall be 460 VAC, 60 Hz, 3 phase, and contain an integral starter. A manual override handwheel shall be provided on each MOV. Limitorque Model MX or approved equivalent motor operators are acceptable. Local disconnect switches shall be provided on each MOV. MOVs shall conform to the General Manager's Standard MOV Interface, External Reversing Starter sketch.

J. Startup Vents
1. All start-up vent valves and silencers shall be sized for base load steam production including any external steam flows.
2. The HP start-up vent valve shall be a y-pattern globe valve with pneumatic actuator, positioner, position transmitter, solenoid valve, and local open/close indication. The valve has electromatic functionality as well as modulating pressure control during start-up. The valve inlet shall be buttweld and the outlet shall be flanged.

2.5 ACCESSORIES

A. CO Catalyst
1. CO catalyst will be required to reduce the CO from the combustion turbine for all operating cases to levels specified in the attached datasheets at the stack. CO catalyst shall be as supplied by Engelhard or General Manager approved equal. Reactor housing and catalyst support frame shall be included. The reactor housing shall be located downstream of the HP evaporator and designed to support 2" w.c. pressure drop across the catalyst.
2. The CO catalyst shall be designed for warranted for a 5 yr life (but typically lasts 8 yrs), and is hand-loaded without a rail system.
3. In vertical flue gas flow configurations, catalyst support frame shall include a rail system to an exterior platform on the end of the OTSG to facilitate replacement of the catalyst modules.

B. Selective Catalytic Reduction (SCR) System
1. General

a. Easily accessible, replaceable SCR catalyst shall be incorporated into the design of the OTSG. The catalyst shall be designed to simultaneously achieve the NO_X and NH3 slip concentrations exiting the OTSG stack as specified in the attached datasheets, provided that the combustion turbine generator exit NO_X and NH3 slip are no greater than the levels guaranteed by the gas turbine manufacturer. The stack NO_X and NH3 slip emission levels shall be guaranteed for a minimum of five years without exceeding the NH3 slips specified in the attached datasheets. The guaranteed NH3 slip with "new and clean" catalyst (less than 300 operating hours) shall also be guaranteed for five years. Refer to Attachment 6 – Performance Guarantees. The catalyst shall be located in the proper exhaust gas temperature zone so as to optimize the performance of the catalyst throughout all operating modes of the OTSG.

b. The catalyst shall be replaceable from the top of the unit on horizontal flue gas flow designs. Catalyst removal shall be from the side of the unit on vertical flue gas flow designs with a built in trolley system. Nine (9) of the catalyst cartridges shall be provided with a pre-made core sample. The nine core samples shall be equally spaced transverse and vertically within the catalyst reactor housing (three rows of three) and shall be accessible from internal platforms. Access doors (18"W

x 24"H minimum) shall be provided both upstream and downstream of the catalyst bed. A minimum of twelve 3 inch flanged sampling ports upstream of the ammonia injection grid and twelve 3 inch flanged sampling ports downstream of the catalyst shall be provided. A minimum of six ports shall be provided on each side (180 degrees apart) for both the upstream and downstream sampling ports. The sampling ports shall be equally spaced up the sides of the casing. Additionally, one 6 inch diameter flanged port for a NO_X CEM probe shall be provided immediately upstream of the ammonia injection grid.

c. Catalyst temperature rating shall be selected to accommodate the GTG flue gas maximum temperature taking into account temperature rise due to degradation of the GTG over time.

d. Space shall be reserved behind the catalyst bed to allow adding additional catalyst volume required to increase removal efficiency if required to meet the specified level as specified in the attached datasheets. The contractor shall be responsible for any additional catalyst volume that may be necessary to achieve the specified NO_X removal efficiency.

2. Ammonia Injection Grid (AIG)

a. The AIG shall be designed to provide an even distribution of ammonia to the SCR catalyst. A distribution header and riser system including balancing valves (globe or ball valves) and manometers shall be provided for the OTSG. The AIG shall be sized for the calculated ammonia flow required to reduce combustion turbine outlet NO_X as specified in the attached datasheets.

b. The AIG valves and flow orifices shall all be accessible from grade.

3. Aqueous Ammonia Dilution Skid

a. The aqueous ammonia dilution skid provided shall be a hybrid system using electric heaters for startup operation and hot gas recirculation when the unit is heated and able to maintain emissions compliance. The ammonia dilution skid shall contain all necessary devices to vaporize the 19% aqueous ammonia and meter the mixture to the ammonia injection grid (AIG). 2x100% capacity air diluent blowers shall be provided for each skid and 2x100% hot gas recirculation blowers. Ammonia flow control and measurement devices shall be included. All equipment shall be sized for the calculated ammonia flow required to reduce combustion turbine outlet NO_X as specified in the attached datasheets.

b. The ammonia dilution skid shall be pre-piped and suitable for outdoor installation whether or not the OTSG is indoor or outdoor installation. Contractor shall furnish all piping.

4. Catalyst Support Frame and Housing

a. The reactor housings shall include internal steel frames to support the SCR catalyst modules. The internal support and catalyst module configuration shall be such that no exhaust gas may bypass the active catalyst area. The SCR catalyst framing shall be capable of supporting a 5" w.c. pressure drop across the catalyst bed. The catalyst support system shall be designed and fabricated to accommodate the additional SCR catalyst referenced above in subpart 2.5B.1.d without the need for additional support members.

b. In vertical flue gas flow configurations, catalyst support frame shall include a rail system to an exterior platform on the end of the OTSG to facilitate replacement of the catalyst modules.

C. Platforms and Stairs
1. Refer to Section 481100 Combined Cycle Power Island for general platform and stairs requirements.

D. Heat Trace and Insulation
1. Refer to Section 481100 Combined Cycle Power Island for heat trace and insulation requirements.

E. Water Treatment System
1. Existing demineralized water quality is provided in Section 480020, Site Conditions. If the existing demineralized water quality does not meet the requirements of the OTSG and the Steam Turbine Generator, then the necessary Water Treatment System equipment shall be provided by the Contractor. The Water Treatment system shall be designed to use the existing demineralized water and produce boiler feedwater of sufficient quality to satisfy the requirements of both the OTSG and Steam Turbine Generator.

2.6 INSTRUMENTATION AND CONTROLS

A. General
1. Refer to Section 48110 Combined Cycle Power Island for general instrumentation and controls requirements and shop calibration and documentation requirements.
2. It is the intent of the General Manager to integrate the Contractor's equipment into a plant-wide Distributed Control System (PCS). All control devices furnished by the Contractor shall be capable of interfacing with the PCS and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the PCS to remotely start and stop all rotating equipment and to allow automatic switch over to the backup unit.
3. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant.
4. The Contractor shall permanently install a 1.25” stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified “Instrument Tag Number” to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
5. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of non-skid mounted devices. Special cables or termination kits if required for flame scanners, ignition transformers, etc. shall be provided by the Contractor for installation by the General Manager.
6. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
7. The control system shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.

8. The plant control system is to be designed (by General Manager per 1.2 above) to provide automation to minimize operator actions during normal plant start-up, shutdown, and at-power operations. Once the GTG and steam turbine have been placed in their ready-to-start conditions, balance of plant systems have been filled and vented, and equipment has been placed in automatic mode, normal plant operations can proceed with few operator actions. The operator is required to start each turbine with a single command to bring it to a desired load level. At that point the GTG can be put in plant master mode. The operator can then enter a single plant load setpoint to which total plant output is controlled.
9. Plant systems and equipment are to be monitored and/or controlled through the PCS. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant PCS.
10. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
11. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two DPDT position limit switches or proximity switches, unless noted otherwise.
12. It is the General Manager's intention that through equipment commissioning, Contractor shall create baseline performance profiles for each piece of equipment furnished by Contractor for use in future periodic performance testing by General Manager. Contractor shall accommodate this objective in the design of their equipment and Contractor shall furnish any and all transmitting instrumentation required to observe and record the process conditions listed in Performance Test Datasheet herein. These instruments shall be furnished regardless of whether or not they are required by Contractor's control system for ordinary equipment operation. These instruments shall be furnished and calibrated in accordance with specification section 481100, Combined Cycle Power Island, Instrumentation and Controls. These performance data sheets shall then be completed and submitted as part of the plant performance testing described in section 480032, Power Island Performance Testing.

B. Instrumentation & Control Devices – Requirements
   1. Duplex type K thermocouples and 100-ohm platinum RTDs shall be used.
   2. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
   3. Electronic transmitters shall be Yokagawa, Endress & Hauser, or SMAR smart transmitters.
   4. Control valves and pressure regulators shall be manufactured by Fisher.

C. OTSG Controls
   1. The following items shall be included as a minimum:

      a. Steam Temperature Control: The HP steam temperature shall be controlled by attemperation driven by the plant PCS.
      b. The OTSG outlet temperature setpoints are to be established by the ST metal temperature. Once set, the PCS automatically controls spray water flow to achieve the desired setpoint. Since steam turbine metal starting temperatures vary based on duration of shutdown, steam temperatures must be controlled to maintain allowable differentials between steam turbine metal temperatures and inlet steam temperatures.
      c. Each drain valve can operate in automatic or be overridden in manual. In automatic mode the drains stay open until steam piping warm-up is complete. After satisfactory superheat is achieved in the steam piping, drains will operate based upon detecting water in the condensate pots.

D. Instrumentation to be Supplied by Contractor Refer to the M195 Drawing in Attachment 1 – Scope of Supply.
   1. The following instrumentation shall be supplied by the Contractor for the OTSG.

      a. Gas side local pressure gauge on OTSG inlet duct.
      b. Steam local pressure gauges at steam outlets for all pressure levels.
      c. Feedwater local pressure gauges at feedwater inlets.

      d. Gas side thermocouples at:

         1) Four (2 per side) upstream and downstream of each OTSG heat transfer zone (Thermowells only, TC wire not required)
         2) Stack (4 required) RTDs to be equally spaced at CEMS platform elevation (0.5°F accuracy on reading is required)

      e. Feedwater/steam thermocouples and test thermowells at:

         1) Feedwater inlet
         2) Three thermocouples on HP steam outlet (1 test thermowell required)

2.7 FABRICATION

A. Refer to Section 481100 Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

2.8 SOURCE QUALITY CONTROL

A. Refer to Section 481100 Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspection
   1. Shop Inspections & Testing

      a. The OTSG and accessories shall be factory assembled into major components and inspected as required to establish critical fits, clearances, alignment, weld connections, mating surfaces and bolt hole alignment to minimize field adjustments.
      b. Testing shall be in accordance with Contractor's standard practices. Testing may be witnessed at General Manager's option. Testing shall include the following:

         1) Hydrostatic tests shall be performed per ASME code guidelines for tube assemblies (tube bend welds shall be shop installed and the welds radiograph or ultrasonically inspected). The hydro test shall be in accordance with the applicable Code and as follows-

            a) All air shall be vented from assemblies. Test pressure shall be held for sufficient time to examine the entire assembly for defects.
            b) Water for shop hydro test shall be potable with water quality reports submitted to the General Manager in advance of the hydro test. For

ferritic materials the chloride content shall not exceed 200 ppm and the water temperature shall not be less than 60°F The chloride content of water used for testing austenitic materials with more than 11% chrome shall not exceed 50 ppm unless treated with an inhibitor of 1.5% soda ash and 0.5% sodium nitrate. The chloride content of the soda ash shall not exceed 500 ppm. Required ppm levels are by weight. Contractor shall have hydro test water quality documentation available.

c) Hydro test water shall be drained and module internals shall be dry and capped after the hydro test.

d) The hydro test shall be successfully repeated after any repairs.

2. Extended Surface Inspection and Testing

   a. Extended surface shall be visually inspected to verify materials and dimensions.
   b. Fins shall be perpendicular to the tube within 15 degrees and uniformly spaced. The maximum discontinuity of resistance welds shall be 2-1/2% of the total tube length.

3. Structure, Casing, Duct and Stack Inspection and Testing – General Fabrication Tolerances

   a. Erection tolerances specified in the AISC Code of Standard Practice, Section 7, Erection, apply to the steel fabrication to the extent work affects the final erected outcome.
   b. Plates of flat sections shall be within ½ inch of a straight line, and within 3/8 inch in any 3 foot span.
   c. Framed beam length shall be within 1/16 inch for dimensions to 30 feet and 1/8 inch for dimensions over 30 feet.
   d. The distance from structural support members to the nearest splice or base plate surface shall be within 1/8 inch.
   e. Shop fabricated section overall dimensions shall be within +1/8 inch (3 mm) and -1/4 inch.

4. Model Test

   a. The Contractor shall conduct a flow model test to verify distribution within the OTSG and submit a copy of the model test report to the General Manager.
   b. A physical flow model test shall be conducted to verify that the exhaust flow velocity in the downstream horizontal direction is within +/- 15% of the average velocity in the downstream horizontal direction over 90% of the duct cross section with the GTG exhaust profiles applicable to the operating range of the SCR catalyst. Flow distribution measurements shall be in the plane just upstream of the ammonia injection grid and just upstream of the SCR catalyst. The physical model shall include all components in their actual locations.
   c. The above requirement for a flow model test may be waived by the General Manager if the Contractor can provide flow model test results from operating installations with OTSG design and GTG similar to the equipment specified herein.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Painting
1. Refer to Section 481100 Combined Cycle Power Island for general field painting requirements of exposed structural and carbon steel elements.

3.2 FIELD QUALITY CONTROL

A. Tests
1. Refer to Section 481100 Combined Cycle Power Island for general field acceptance test requirements.
2. Hydrostatic Test

a. After field assembly of the OTSG is complete, the Contractor shall perform a hydrostatic test of the pressure components per ASME BPVC Section 1 requirements. The hydro test shall be in accordance with the applicable Code and as follows:

1) All air shall be vented from assemblies. Test pressure shall be held for sufficient time to examine the entire assembly for defects.
2) Water for shop hydro test shall be potable with water quality reports submitted to the General Manager in advance of the hydro test. For ferritic materials the chloride content shall not exceed 200 ppm and the water temperature shall not be less than 60°F The chloride content of water used for testing austenitic materials with more than 11% chrome shall not exceed 50 ppm unless treated with an inhibitor of 1.5% soda ash and 0.5% sodium nitrate. The chloride content of the soda ash shall not exceed 500 ppm. Required ppm levels are by weight. Contractor shall have hydro test water quality documentation available.
3) Hydro test water shall be drained and module internals shall be dry after the hydro test.
4) The hydro test shall be successfully repeated after any repairs.

B. Performance Tests
1. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees. Refer to Section 480032 Power Island Performance for general performance test requirements.
2. The performance test will be carried out to the manufacturer's standards in general accordance with the following internationally recognized standards:

a. ISO 2314: Gas Turbines – Acceptance Tests
b. ASME PTC 4.4: Gas Turbine Heat Recovery
c. ASME PTC 19.1: Test Uncertainty

3.3 COMMISSIONING

A. General
1. Refer to Section 480032, Power Island Performance for general commissioning requirements.

3.4 TRAINING

A. Refer to Section 481100, Combined Cycle Power Island for general training requirements.

END OF SECTION 485413

APPENDIX A – TECHNICAL DATASHEET BY GENERAL MANAGER

	Client Name	Pasadena Water & Power
	Project Name	Glenarm Plant Unit GT-5
	Project Number	123374
1.0	**General**	
	Number of OTSGs	One
	Gas Turbine Model	
	GTG Operating Range	Approximately 25% to 100%
	Start/Stop Cycles per Year (each OTSG)	See 481100 Combined Cycle Power Island
	OTSG Type	un-fired, single pressure
	Number of Modules Wide	One
	Installation Location	Outdoors
2.0	**Stack and Emissions**	
	Stack Flue Gas Exit Velocity	86-111 ft/sec
	Main Stack Height (minimum above grade)	125 ft
	Minimum / Maximum Exhaust Temperature	341-377˚F / 378-417˚F And approximately 700 F in dry operation
	Stack ID	10.17 ft
	Stack Damper Required	Yes
	Stack Corrosion Allowance – including breaching through to stack outlet	1/8” on bottom 10 feet, 1/32” on the rest of the stack or coated internally
	Large Bore Interface Location	Right side of OTSG (in the flue gas flow direction) to approx. xx ft elevation
	Maximum Allowable Sound Level at a Distance of 3 Feet From Safety Valve and Start-Up Vent Silencers	Refer to Section 480032
	Maximum Allowable Far Field Sound Level (if applicable)	Refer to Section 480032
	Normal Mode of Operation	Unfired
	SCR System Required	Yes
	CO Catalyst System Required	Yes
3.0	**Supplementary Firing**	
	Duct Burner Fuel	Not Applicable
	Duct Burner Fuel Supply Pres-sure	Not Applicable
	Maximum Heat Release	Not Applicable

4.0	**Misc.**	
	Purge Air System	Required (By GT exhaust)
	Dilution Air System	As needed for SCR requirements
	Electrical Enclosure Type	NEMA 4 for outdoor installation
5.0	**Utilities Supplied by General Manager**	
	19% Aqueous Ammonia	
	Three Phase AC Power	480 V/60 Hz
	Single Phase AC Power	120 V/60 Hz

APPENDIX B – GLENARM GT5 COMBINED CYCLE PERFORMANCE TEST DATASHEET Data to be furnished during project execution

APPENDIX B – TECHNICAL DATASHEETS BY CONTRACTOR 21

SECTION 485432
SURFACE CONDENSER

PART 1 - GENERAL

1.1 SUMMARY

A. This specification details the minimum technical requirements for the design, manufacture, testing, and furnishing of a steam surface condenser and accessories. It is not the intent to specify completely herein all details of design and construction of the equipment and its related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict among referenced standards, codes and the documents included in this specification, or a perceived conflict between the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. Surface condenser (shop-tubed)
2. Water boxes with circulating supply and return water connections on one end
3. Deaerating hotwell
4. Hogging Air Extraction System with 2x100% liquid ring vacuum pumps.
5. Turbine exhaust duct and flange (Condenser neck)
6. Expansion joint between turbine exhaust flange and condenser neck
7. Miscellaneous piping, valves and fittings for attached accessories. Interconnecting piping and valving between condenser and auxiliaries is not included.
8. Condensate drain connections as specified herein
9. Four (4) Waterbox Gauge glasses and one (1) hotwell gauge glass, as specified herein
10. Bolts, nuts and gaskets required for field connecting equipment within Contractor's scope
11. Turbine internal drains flash vessel attached to the condenser
12. One (1) 24 inch diameter manway on the condenser connecting piece, and each waterbox compartment. Two (2) 24 inch diameter manways located in the hotwell
13. One main steam bypass connection with internal wear plates / baffles.
14. One (1) 4 inch DC Motor operated, water sealed vacuum breaker with integral starter
15. Motors for all motor-driven equipment furnished under this specification
16. Rupture Disks
17. Instrumentation as specified herein including four (4) waterbox temperature indicators and two (2) hotwell temperature indicators with thermowells
18. One set of tube installation/removal tool kits (less driver)
19. Spargers for all steam bypass lines

20. Final thermal kit including all required correction curves to verify performance at off-design conditions
21. Drawings, data, Instruction Books, and other information as indicated in the attached "Vendor Data Requirements"
22. Start-up spares consisting of one set of waterbox gaskets and one set of manway gaskets
23. Four (4) automatic air release valves for the condenser waterboxes
24. Special services including on site field support and start-up support as specified herein.
25. Shipment to the Glenarm Plant or a location to be identified by the General Manager either in the city of Pasadena, CA or other nearby city.

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Unloading, storage, and erection of equipment at jobsite
2. Foundations, anchor bolts, and standard concrete embedments
3. Grout
4. Pipe insulation and lagging
5. Finish painting
6. Condensate piping, expansion joints and valves
7. Circulating water piping, expansion joints and valves
8. Piping and automatic on/off valves for condenser curtain spray nozzles
9. Plant control system
10. Instrumentation as specified herein
11. AC motor starters
12. Field wiring
13. Field hydrostatic and performance testing

1.4 RELATED SECTIONS

A. Section 260000, Electrical Mechanical Equipment

B. Section 262050, Low Voltage Motors

C. Section 480020, Site Conditions

D. Section 481100, Combined Cycle Power Island

E. Section 485221, Steam Turbine Generator

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. American Society of Mechanical Engineers (ASME)
   a. ASME PTC-12.2 – Steam Condensing Apparatus

b. ASME PTC-24 – Ejectors

2. Heat Exchanger Institute (HEI)
   a. HEI 4A – Performance Standards for Liquid Ring Vacuum Pumps
   b. HEI 2629 – Standards for Steam Surface Condensers

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. Reference Section 481100 Combined Cycle Power Island for general design requirements and expected operating profile.

B. Performance Requirements

1. The performance requirements for the steam surface condenser are specified in Section 481100, Combined Cycle Power Island.
2. The steam surface condenser shall be designed with the water chemistry and temperature ranges specified in Section 480020 Site Conditions.
3. The following design performance parameters shall also be met by the surface condenser:

   a. The steam surface condenser and accessories shall be designed for stable operation from zero to maximum heat load and at 100% turbine bypass operation.
   b. The Air Extraction System shall be capable of drawing condenser vacuum necessary to support sustained steam bypass operation within 20 minutes.
   c. The minimum temperature of the condensate leaving the hotwell shall be the saturation temperature corresponding to the shell pressure (no subcooling).

C. Predicted Performance

1. The Contractor shall submit the predicted performance information for the operating cases shown in Section 481100, Combined Cycle Power Island. Additionally, the Contractor shall provide correction curves, or software at General Manager's discretion,

that will permit the General Manager to establish condenser performance when varying either concurrently or individually, the following parameters:

a. Circulating water flow rate
b. Circulating water supply temperature
c. Heat load
d. Demineralized make-up water flow rate

2. The correction curves shall indicate the condenser absolute pressures in inches of mercury on the Y-axis and the condenser duty (MMBTU/hr) from zero to maximum heat load on the X-axis.
3. Performance curves for inlet circulating water temperatures of 60, 70, 80, 90, and 100°F and with flow quantities of 100, 90, 80, and 70% of design flow shall be submitted.
4. A vacuum correction curve or curves shall also be furnished for use with the above performance curves indicating the applicable vacuum correction for tube cleanliness factors varying from 70 to 100%.
5. All curves shall be drawn to a scale adequate to permit readings to an accuracy of plus or minus 0.01 inch of mercury (absolute). The curves submitted will be used in the analysis of field tests to determine if the condenser has met the guaranteed performance.
6. Curves of exhaust steam enthalpy entering the condenser characteristic curves vs. exhaust steam flow at the different vacuum in the condenser (1.5", 2", 2.5" and 3"Hg).

D. Reliability: No single failure of an auxiliary component or system shall result in damage to the System. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

1.8 ALTERNATIVES

A. The Contractor may provide Alternate Bid(s). Any Alternate Bids proposed by the Contractor shall provide equal or better performance at reduced capital cost. The Contractor shall clearly state the technical differences between the Base Bid and any Alternate Bids. Alternate Bids shall be supported with complete technical, performance, and cost data.

B. The Contractor may request alternative materials, equipment, or configurations for consideration provided compliance to requirements of applicable codes is not compromised.

1.9 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

1.10 QUALITY ASSURANCE

A. Refer to Section 481100 Combined Cycle Power Island for general quality assurance requirements.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping

1. The System shall be packaged for shipment to allow for outdoor storage as prescribed by Contractor for a period of six months without damage from dust, sun, wind, or rain. Preparation for shipment shall require:

a. Equipment to be completely free of water prior to packaging for delivery.
b. Flanges and threaded connections to be coated with rust preventatives and blanked-off or plugged. Blanking flanges shall utilize at least four bolts. Open ends of pipe shall be caps or plugged.
c. Unpainted surfaces to be protected from weather with weather tight and weatherproof covers. Machined surfaces shall be coated with a heavy grease or similar material before covering.
d. Lifting and support points shall be clearly identified.
e. Packages shall be identified with items and serial numbers, purchase order number, and item descriptions. Identifying tags shall be corrosion and weather resistant.
f. Temporary bracing and covers shall be painted yellow.

B. Storage and Protection

1. The steam surface condenser and accessories shall be packaged for shipment to allow storage as prescribed by Contractor for a period of six months without damage from sun, wind, rain, or snow.

1.12 SITE CONDITIONS

A. Refer to Section 480020 Site Conditions.

1.13 WARRANTY

A. Refer to Article 13 in the Contract.

B. Performance Guarantees

1. Contractor shall provide guarantees for thermal performance, tube side pressure drop, acoustical emissions, and oxygen content in accordance with the contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Refer to Section 481100 Combined Cycle Power Island for general material and welding requirements.

2.2 MANUFACTURED UNIT

A. Structural Requirements

a. Refer to Section 481100 Combined Cycle Power Island for general structural requirements.

2. Materials: All materials shall be new. Structural steel members shall be hot-dipped galvanized, in accordance with ASTM A-123.

a. Structural Steel: ASTM A36 or ASTM A572 Gr. 50
b. Ladder(s): ASTM A36
c. High Strength Steel: ASTM A572, Gr. 50
d. Structural Tubing: ASTM A500 Gr. B
e. High Strength Bolts ASTM A325, Type 1
f. High Strength Nuts/Washers: ASTM A563 Gr. DH/ASTM F436
g. Common Bolts: ASTM A307 Gr. B
h. Pipe Handrail: 1 1/2 in. Schedule 40, ASTM A53 Type E or Type S, Gr. B or ASTM A500 Gr B
i. Safety Chain, 1/4 in. diameter with 1 1/4 in. links: ASTM A413, Class PC.
j. Steel Floor Grating and Stair Treads: ASTM A569
k. Checkered Floor Plate ASTM A786, Pattern No. 4
l. Miscellaneous Structural Steel: Structural steel shall be hot-dipped galvanized

3. High Strength Bolting:

a. Obtain and submit certifications that bolts, nuts, and washers comply with all of appropriate requirements of applicable specifications. Provide complete manufacturer's test reports to document that chemical and mechanical requirements of applicable specifications have been achieved. For acceptance of fasteners, lot numbers must appear on product containers and correspond to lot identification numbers on test reports. Verify manufacturer's symbol and grade markings appear on all bolts and nuts.
b. Complete and submit representative sample tests for bolt tightening per AISC Specification for Structural Joints for approval prior to installing any bolts.
c. High-strength bolting inspections, tests, test and inspection acceptance standards, and remedial procedures for slip-critical type connections: AISC "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts," except as specified herein.
d. Randomly inspect 10% of all high strength bolted slip-critical type connections for each bolt size as follows:

1) Inspect bolts tightened using the turn of the nut method: Specification 9(b) of AISC Specification for Structural Joints.
2) Bolts tightened using direct tension indicator washers: Feeler gauge to acceptance requirements in ASTM F959.

e. Method of sampling for high-strength bolts: "Production Lot Method", ASTM A 325.

2.3 EQUIPMENT

A. Steam Surface Condenser

1. General

a. The steam surface condenser shall be a double pass design with waterboxes at each end, circulating water connections on one end.
b. The condenser shall be provided with internal non-condensable gas removal sections, a hotwell and all necessary accessories.
c. The condenser shall be equipped with distribution headers located in the condenser neck for 100% steam turbine bypass operation with the gas turbine at full load.
d. The condenser shall be fabricated of all new material. Asbestos material shall not be used for any component. No copper or copper alloys shall be used where there may be contact with the condenser air or condensate.
e. The condenser shall be designed in accordance with HEI standards using the allowable stresses from the ASME Section VIII Code. The shell side and tube side are not required to be code stamped. The condenser shall be fabricated in an ASME Section VIII Code shop. All welding shall be per ASME Section IX.

2. Condenser Shell

a. The shell shall be of all welded carbon steel construction properly fabricated for strength and shall remain airtight at full vacuum. Bolting shall be permitted only at access manholes. The shell shall be shop-assembled to the maximum extent possible with the tubesheets, support plates, thermal sleeves, tubes and impingement protection (dummy tubes, baffles, etc.) in place before shipment. Drawings illustrating the condenser "as-shipped" and fully erected shall be provided with the proposal.
b. The condenser shell wall thickness shall be in accordance with recommendations of the Heat Exchange Institute (HEI) as modified herein. A corrosion allowance of 1/8 inch shall be used on all shell carbon steel pressure parts. The shell shall be properly reinforced to withstand design conditions. Bracing for flat surfaces shall be adequate to prevent excessive deflections.
c. The shell side shall be designed for full vacuum and 15 psig with a design temperature of 250°F.
d. All interior baffles, brackets, and support plates shall be designed so that they will not trap sand or dirt. Convenient access shall be provided to permit easy cleaning of all horizontal surfaces prior to placing the equipment in operation.
e. Suitable means shall be incorporated in the design to provide for the difference in expansion between shell and tubes to avoid undue stress upon the tube to tube sheet joints. A detailed description of expansion provisions and complete information on any special requirements for tube installation shall be submitted with the proposal.

3. Waterboxes

a. The waterboxes shall be fabricated of carbon steel and factory lined.
b. The waterboxes shall be designed for 75 psig maximum allowable working pressure and hydrostatically tested in accordance with HEI Standards. The design temperature shall be 150°F.

c. Waterboxes shall be of good hydraulic design and properly sized to provide low water velocities and optimum entrance conditions to the condenser tubes. The depth of the waterboxes from the tubesheet shall be at least equal to the circulating water pipe diameter at the waterbox inlet unless otherwise approved by General Manager.

d. The inlet and outlet waterboxes connecting to the circulating water piping system shall be bolted to the condenser shell to permit removal and oriented in such a way that it suits the interconnection with the existing CW piping. The thickness of the waterboxes shall be adequate to withstand the specified design pressure, plus a corrosion allowance of 1/8 inch. External waterbox reinforcement shall only be permitted upon review and written approval by the General Manager. External reinforcement, if required and allowed, shall be designed so as not to accumulate water or dirt. Internal stay bolts or ribs shall not be used. Grab bars, ladder brackets, and other internal projecting provisions shall be designed to result in minimum interference with smooth flow.

e. A corrosion allowance of 1/8 inch shall be provided on all carbon steel plates and nozzles.

f. Waterbox instrumentation connections shall be made of stainless steel to avoid the need for coating.

g. Sacrificial zinc or magnesium anodes shall be furnished in the waterboxes for corrosion protection.

h. Each waterbox compartment shall be provided with one 24 inch diameter, quick opening, hinged-type manways as manufactured by Tube Turns, or General Manager-approved equal. Manways shall be on the end of the waterboxes and in line with the tubes so that a tube can be pulled for inspection. Final manway locations shall be approved by the General Manager.

i. The waterboxes shall be provided with permanent lugs for lifting and handling and threaded holes and jackscrews for breaking gasketed joints. All bolts and gaskets shall be furnished. Each waterbox shall be shop leak tested.

j. Waterbox flanges shall be ASME Class 150 forged steel flanges.

k. The design of the waterboxes shall include, but not necessarily be limited to, the following connections:

Inlet / Outlet Box	Two circulating water
	One vent
	One drain
	Two gauge glass
	Two thermowells
	One pressure
Return Box	
	One vent
	One drain
	Two gauge glass
	Two thermowells
	One pressure

l. Vents and drains shall be provided on each compartment of each waterbox to permit complete draining within 15 minutes. An automatic vent valve shall be provided to vent air from each waterbox, in addition to manual vent(s).

4. Tube Support Plates

a. The spacing of the tube support plates shall be determined based on the HEI standard to minimize vibration during operation.
b. The tube support plates shall be carbon steel and shall not be less than 3/4 inch thick. The supports shall be of sufficient number with proper spacing to provide adequate support for the tubes and to prevent deleterious vibration.
c. Holes for the tubes shall be drilled and finished with suitably rounded edges on both sides of the plates to prevent damaging tubes during installation and operation.

5. Tubes

a. All tubes shall be furnished and shop installed in the condenser. Tubes shall be rolled at both ends and flushed on the inlet ends. All condenser tubes shall be arranged for self-drainage.
b. Contractor shall provide a single row of solid carbon steel rods to protect the tube bundle in the turbine bypass impingement zones.
c. The tube side shall be designed for 75 psig with a design temperature of 150°F.
d. Condenser tube OD, minimum thickness and material are specified in the attached data sheets. The tolerances for tube outside diameter, wall thickness and length variation shall be in accordance with the tube material ASTM specified in attached data sheets.
e. After final annealing, each tube shall be leak tested by immersing in water while containing air at 150 psig. If any tube shows leaks during the pressure test, it shall be rejected. Each tube shall be subjected to a full circumferential nondestructive electric test, which will indicate defects in the tube wall and inside and outside tube surfaces. Unacceptable defects shall include dents, seams, pinholes, or unsound metal and shall be cause for rejection. The results of this test shall be provided to the General Manager along with any other required documentation.

6. Tubesheets

a. Tubesheets shall be designed to HEI specifications. Tubesheet material is specified in "Technical Datasheets by General Manager" (see attached). For applications where titanium cladding is specified, the minimum thickness of the cladding shall be 3/16 inch.
b. Tubesheets shall be properly braced to give ample strength to withstand the pressure specified for the waterboxes, plus vacuum load, plus thermal stress. Tubesheet holes shall be rounded and have all burrs removed.
c. Tubesheets shall be attached to the condenser shell independently of the waterboxes to permit removal of the waterboxes without disturbing the tubesheets.
d. Tubesheets shall be the thickness recommended by HEI.
e. The maximum tubesheet bending stress under the higher of either the hydrotest or the maximum transient pressure condition shall be lower than limits defined within HEI.

f. Tubesheets and tube support plates shall be designed to permit the tubes to be installed straight and sloped downward a minimum of 1/16 inch per support plate. Tubesheets shall be designed for rolling of the tubes at both ends. Before tube rolling, tubesheets shall be plane and vertical within 1/16 inch at all points. The edges of the tube holes in the tube support plates shall be deburred to a minimum of 1/64 inch radius to facilitate tube insertion and to prevent scratching tubes during installation.

g. Layouts of the tubesheets and steam lanes shall be submitted to the General Manager for information only to show the adequacy and method of steam distribution in the condenser and the sizes and tolerances of tube holes. The basic shell area between the top and bottom tube rows shall have a tube occupied area of no greater than 35%.

h. The velocity distribution across the tubesheet shall be uniform such that the velocity of the circulating water shall not deviate more than 10% at any tube when compared to the average water velocity as a whole.

7. Hotwell

a. Condensate shall be collected in a hotwell attached to the condenser shell. The hotwell shall be of the same material as the shell. The hotwell bottom shall be provided with a condensate pump suction well to permit direct horizontal piping to the condensate pumps. Condensate pump suction connections shall be provided. The condensate pump suction connections shall be sized so that the pipe velocity does not exceed 1.5 fps at the maximum condensate flow rate with two pumps in operation. The condensate nozzles shall be provided with anti-vortex baffling.

b. Two (2) 24-inch diameter, quick opening hinged type manways shall be provided at suitable locations for condenser and hotwell maintenance and inspection access.

c. The hotwell shall be designed for complete drainage. At least one 3-inch diameter drain connection shall be provided.

d. Baffles shall be provided at the level transmitter connections to minimize water level disturbances.

8. Turbine Exhaust Duct (Condenser Neck)

a. The exhaust duct or condenser neck shall be fabricated from the same material as the condenser shell. The duct shall be designed to ensure even distribution of steam over the entire length of the condenser tubes. The exhaust connection shall be bolted.

b. The Contractor shall streamline struts, piping, and condenser internals to eliminate obstructions and protrusions and to eliminate additional pressure losses imposed on the steam turbine. Suitable means shall be provided to prevent condensate from collecting in the exhaust duct.

c. Internal bracing and miscellaneous structural members shall be designed to permit entrance and access from the condenser shell manways.

d. In steam turbine configurations where the turbine bearing is accessed through the exhaust duct, sufficient working space clearance and welded lifting lugs for bearing removal tools and rigging shall be provided.

9. Piping and Connections

a. All connections shall be flanged or welded as required by the General Manager. Welded connections larger than 2 inches shall have ends weld prepped for butt-welding. Connections 2 inches and smaller shall generally be of the 6,000 lb. socket welded type. Connections smaller than 1 inch shall not be allowed except for instrument connections.
b. Connections shall be provided on the condenser for make-up water, drains, one main steam bypass dump, two (2) condensate pump suction lines, two (2) condensate pump suction can vents, air extraction, instrumentation and any other connections as may be specified or required by the General Manager. The size and location of all nozzles on the condenser shall be arranged to best meet the requirements of the piping layout, and shall be subject to the approval of the General Manager.
c. Contractor shall include provisions to prevent erosion of tubes or shell interior for all connections introducing steam, condensate, and water. Thermal sleeves shall be provided as required.
d. One (1) 3 inch diameter flanged drain connection shall be installed on the bottom of the hotwell.
e. Two (2) 4 inch diameter Schedule 40 butt weld connections and six (6) 2 inch diameter 6,000 lb. socket weld connections with pipe extension and welded cap shall be provided as spares on the shell.
f. The turbine bypass connections shall be located in the condenser neck.
g. The condenser non-condensable gas off-takes shall be internally piped with standard weight 304L grade stainless steel pipe brought to the condenser shell exterior. The off-takes for each tube bundle shall be routed separately to the shell exterior.

10. Bolting

a. External condenser bolting shall be carbon steel. All internal bolting except tube support plate tie rods and spacers shall be Monel.

11. Valves (all accessories)

a. Valves shall be either cast or forged steel. No cast or ductile iron valves are allowed.

12. Baffles

a. All shell connections not requiring perforated distribution pipes shall be fitted with heavy stainless steel baffles, not less than ½ inch thick, within the condenser.
b. Baffles shall be designed to direct the discharge flow away from the condenser wall to prevent localized heating and/or erosion of the wall. The discharge flow shall be directed to minimize impingement upon the hot well water surface or any structural or functional component of the condenser. Baffles shall be designed to withstand the reaction forces resulting from the sudden introduction of the design fluid at maximum conditions.
c. The discharge area of the baffles shall not be less than 1.5 times the internal cross-sectional area of the pipe connections to be baffled.
d. All baffles shall be continuously strength welded to the condenser shell. Full penetration welds shall be used and, where possible, a seal weld shall be included on the impingement sides of the baffle-to-wall connection for weld protection.

Axial and shear forces as well as bending moments due to the impingement force and thermal behavior shall be adequately considered.

13. Piping Sleeves

    a. Piping sleeves, of the number and size required, shall be provided on the condenser shell to allow for penetration of piping where required.

14. Condenser Leak Detection

    a. Provisions shall be made to enable tube leaks to be detected, located and repaired with the unit remaining on load and with minimum disruption to the generated output. A description of the means of isolating a condensing zone for the purpose of carrying out this procedure shall be provided. The Contractor shall also define the loss of generated output during this procedure. A full description of the proposed instrumentation and equipment and the technique for detecting leaks shall be included.
    b. The shell of the condenser shall be provided with tubesheet leak detection troughs. Each trough shall be located directly below the tubesheet area associated with each waterbox. Water collected in each trough shall be routed to a conductivity cell located outside the shell (by Contractor), then returned to the condenser hot well below the operating water level.

15. Coating Systems

    a. The interior wetted surfaces of the surface condenser waterboxes and piping shall be coated with an epoxy-based system for corrosion and erosion protection. The coating system shall be Amercoat 78HB as manufactured by Ameron or General Manager approved equal. The coating system shall not have any solvents at any time in the coating process and shall have a total dry film thickness of 20 to 25 mils. Contractor shall indicate clearly on the exterior of internally coated components “Do Not Weld”.
    b. The waterbox coating shall be shop applied and tested in strict accordance with the manufacturer's recommendations. Additional dry film thickness measurements shall be taken throughout the waterbox to ensure minimum coating thickness. Any damage to the coating during shipment or installation shall be repaired and retested in accordance with the manufacturer's recommendations until no holidays or discontinuities are detected, at the Contractor’s expense. The coating shall cover the face of all flanged connections on the waterbox (not the flange itself).
    c. All metallic surfaces shall be cleaned, prepared, and protected by shop-applied coatings. Internal areas which will be exposed to steam or treated feedwater shall be shot blasted using metal shot only and coated with a water soluble preservative. Shop coatings as specified shall be applied to the exterior surfaces of the waterboxes, piping, condenser shell, exhaust trunks, and domes.

2.4 ACCESSORIES

A. Air Extraction System

1. Type and Arrangement

a. The condenser shall be supplied with a dual 100% liquid ring vacuum pumps with electric motor drivers for air extraction during start up and operation. The system shall be chosen by the Contractor to provide the lowest lifetime cost while meeting the air extraction requirements of the condenser and related equipment.

2. Design

a. The LRVP equipment shall be designed in accordance with HEI Performance Standards for Liquid Ring Vacuum Pumps.

B. Instrumentation

1. The Contractor shall supply the following instrumentation:

a. Waterbox gauge glass level indicators (one for each inlet/outlet waterbox and one for each return waterbox).
b. One hotwell gauge glass level indicator per shell (more than one gauge glass can be provided to cover the vertical height). A Jergeson, Mag Tech or Pemberthy type Mag level gauge glass shall be provided.
c. Waterbox temperature indicators (one for each inlet compartment and one for each outlet compartment).
d. Two hotwell temperature indicators per shell.

2. Connections shall be provided for the following instruments (instruments and isolation valves provided by others):

a. Two full-range level transmitters for hotwell level indication and hotwell make-up system operation; connections to be located on opposite ends.
b. One level switch for hotwell high-high level trip.
c. One level switch for hotwell low-low level trip.
d. One hotwell thermocouple.
e. Waterbox pressure indicators (one for each inlet compartment and one for each outlet compartment).
f. Waterbox sample connections.
g. Four shell pressure transmitters per shell.

C. Vacuum Breaker

1. The Contractor shall supply one minimum 6 inch diameter DC Motor operated vacuum breaker with actuator. The MOV will be operated from General Manager's control system and shall have a means for manually operating. The opening time for the valve shall be less than 5 seconds.

D. Atmospheric Relief

1. Contractor shall provide rupture disc(s) designed for full venting of the steam flows while not exceeding a shell pressure of 10 psig.

2.5 INSTRUMENTATION AND CONTROLS

A. General

1. It is the intent of the General Manager to integrate the Contractor's equipment into a plant-wide control system (PCS). All control devices furnished by the Contractor shall be capable of interfacing with the PCS and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the PCS to remotely start and stop all rotating equipment and to allow automatic switch over to any backup units.
2. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant.
3. The Contractor shall permanently install a 1-1/4 inch stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified “Instrument Tag Number” to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
4. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of non-skid mounted devices. Special cables or termination kits if required for flame scanners, ignition transformers, etc. shall be provided by the Contractor for installation by the BOP Contractor.
5. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
6. The control system shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.
7. The plant control system is to be designed to provide automation to minimize operator actions during normal plant start-up, shutdown, and at-power operations. Once gas turbine and steam turbine have been placed in their ready-to-start conditions, balance of plant systems have been filled and vented, and equipment has been placed in automatic mode, normal plant operations can proceed with few operator actions. The operator is required to start each turbine with a single command to bring it to a desired load level. At that point the gas turbine can be put in plant master mode. The operator can then enter a single plant load setpoint to which total plant output is controlled.
8. Plant systems and equipment are to be monitored and/or controlled through the PCS. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant PCS.
9. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
10. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two DPDT position limit switches or proximity switches, unless noted otherwise.

B. Instrumentation & Control Devices – Requirements

1. 3-wire, 100-ohm platinum RTDs shall be used.

2. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
3. Electronic transmitters shall be Yokagawa, Endress & Hauser, or SMAR smart transmitters.
4. Control valves and pressure regulators shall be manufactured by Fisher or equivalent approved manufacturer.

C. Instrument and Control Wiring By Others

1. Wire markers shall be attached on both ends of Contractor-furnished wiring.
2. The Contractor shall furnish and install all wiring from instruments and devices on the steam turbine, generator and accessories to junction boxes, panel boards or control panels to the greatest extent possible. All wiring shall be insulated for the service conditions and temperature (75 C minimum).
3. All wiring shall be separated according to class and instrument channel. All cable connections shall be made to local terminal blocks.
4. All terminal blocks shall have non-metallic terminal marking strips marked with the wire numbers. Contractor's wire numbers shall be used for circuits that interface with General Manager-supplied equipment. Terminal blocks shall be mounted at least 12 inches above the floor.
5. Stranded conductors connecting to screw terminals shall be terminated with full-ring tongue compression type connectors that firmly grip the conductor and have insulated compression sleeves to grip the wire insulation. All wiring terminating on terminal blocks shall be identified with durable and permanent wire markers.
6. Wiring around the turbine requiring frequent disconnection during maintenance and minor repairs shall be provided with locking type quick-disconnect connectors.
7. All thermocouples shall be terminated on thermocouple termination blocks

D. Conduit

1. Conduit shall be either rigid or IMC. All conduits shall be installed in accordance with NEC.

2.6 FABRICATION

A. Refer to Section 481100 Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

2.7 SOURCE QUALITY CONTROL

A. Refer to Section 481100 Combined Cycle Power Island for general source quality control, test, and inspection requirements.

B. Tests and Inspections
1. As a minimum, the following tests shall be performed (Hydrotest shall be per HEI; condenser tube-side and shell-side shall be hydrotested in the shop.):

a. Factory Hydro Tests

1) Water jackets, coils, coolers, and shop installed piping shall be hydro tested at 1-1/2 times the design pressure.
2) Pressure retaining components shall be subject to the hydrotest requirements of ASME B&PV Code, Section 1, Section VIII, or ASME B31.1, Power Piping Code, as applicable.
3) Parts shall not be primed or painted until hydro testing is successfully completed.

b. Factory Accessory Testing

1) The accessory equipment shall be functionally tested in the factory. Contractor and General Manager shall mutually agree on what will be tested.

2. Control Board and Software Testing

a. Electrical shop tests shall be made on all control boards. These tests shall include high potential tests on power equipment and operating tests to demonstrate that the equipment functions correctly. Electrical tests shall be made in accordance with ANSI C37-20.
b. Control wiring tests shall include those that are necessary to determine that all instruments, meters, relays, instrument transformers, etc. are correctly wired and function in the specified manner when energized. Each circuit shall be continuity tested. Insulation resistance tests shall be conducted on each circuit (except in circuits containing electronic components); the insulation resistance shall be no less than 25 megohms.
c. A Factory Acceptance Test (FAT) shall be performed on the complete software system prior to shipment. Simulated (software) inputs are acceptable during the FAT.
d. Control wiring tests shall include those that are necessary to determine that all instruments, meters, relays, instrument transformers, etc. are correctly wired and function in the specified manner when energized. Each circuit shall be continuity tested. Insulation resistance tests shall be conducted on each circuit (except in circuits containing electronic components); the insulation resistance shall be no less than 25 megohms.
e. A Factory Acceptance Test (FAT) shall be performed (by General Manager selected system integrator) on the complete software system prior to shipment. Simulated (software) inputs are acceptable during the FAT.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100 Combined Cycle Power Island for required spare parts.

3.2 INSTALLATION

A. Painting

1. Structural and Miscellaneous Carbon Steel

    a. The following requirements shall apply for all exposed structural and miscellaneous carbon steel shapes, plates, stiffening or support elements extending through insulation that are not hot-dipped galvanized.
    b. Surfaces shall only be primed. General Manager will apply the finish paint. Surfaces to be primed shall be blast cleaned in accordance with SSPC-SP6, "Commercial Blast Cleaning."
    c. One of the following painting systems, or General Manager approved equivalent, shall be used:

        1) Ameron Dimecote 9HS
        2) Carboline Carbo Zinc 11HS
        3) Tnemec Co., Inc 90E-92 Treme-Zinc

3.3 FIELD QUALITY CONTROL

A. Tests

1. Refer to Section 481100 Combined Cycle Power Island for general field quality control, test, and inspection requirements.
2. The surface condenser shall be hydrostatically field tested by the General Manager after final assembly.

B. Performance Tests

1. A site performance test shall be carried out to establish the performance of the complete unit against specific performance guarantees.
2. The performance test will be carried out to the manufacturer's standards in general accordance with the following internationally recognized standards:
    a. ASME PTC 12.2 - Performance Test Code on Steam Surface Condensers
3. The test will utilize both station instrumentation and any other specialist instrumentation provided for the test.
4. Correction to Guarantee Basis Conditions

    a. The Contractor shall supply to the General Manager, all correction curves and formulae for the equipment performance parameters which may be required to correct the as-run test values to the specified guarantee values.
    b. The tests results recorded during the performance test shall be corrected, as applicable, to those which would have been achieved had the test been carried out at the guarantee basis conditions by using the correction curves and/or formulae.

5. The correction curves and formulae shall be provided in the performance test procedure. A full set of final Correction Curves shall be provided by the Contractor at least 60 days prior to the start of performance testing.

3.4 COMMISSIONING

A. General

1. The Contractor shall provide onsite commissioning and testing support of the equipment.
2. The Contractor shall allow for training of the General Manager's personnel appointed to operate the equipment and involved in commissioning.
3. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the right to remove and take away from site such commissioning and test equipment upon completion.
4. The Contractor shall submit a detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 3 months prior to the commencement of site testing.

B. Commissioning Scope

1. The base scope of the installation and commissioning plan shall provide:

a. Advance knowledge of project schedules, completion dates, and key event dates.
b. General definition of manpower and material resources required.
c. A means of verifying that all critical calibrations, both mechanical and electrical, have been checked.
d. In addition to the documentation that makes up the base scope the Contractor shall include the services of an Installation and Commissioning Manager to monitor and continuously update the plan during the installation and commissioning period.

END OF SECTION 485432

APPENDIX A – TECHNICAL DATASHEETS BY GENERAL MANAGER
**Determined by Power Island final design*

The detailed technical data will be furnished by the equipment vendor during contract execution. The design will be to manufacturer's standards and will support the power island guarantees and will meet the design life requirements.

	Client Name	Pasadena Water & Power
	Project Name	Glenarm Plant Unit GT-5
	Project Number	123374
1.0	**General Installation**	
	Number of Condensers	1
	Type	Steam Surface Condenser; Horizontal Shell & Tube
	Installation Location (Indoors/Outdoors)	Indoors
	Steam Turbine Model	*
	Steam Turbine Exhaust Orientation	Axial
	Number of Water Passes	One
	Divided Waterbox (Y/N)	No
	Condensate Pump Connections	*
	Site Design Requirements	See Section 480020 - Site Conditions
	Site Location	See Section 480020 - Site Conditions
	Design Ambient Dry Bulb temperature range (Outdoor/ Indoor)	See Section 480020 - Site Conditions
	Minimum Design Metal Temperature :	See Section 480020 - Site Conditions
	Nominal site elevation (above mean sea level):	See Section 480020 - Site Conditions
	Governing Building Code (UBC, SBC, ASCE, BOCA, etc.)	See Section 480020 - Site Conditions
	Seismic Design Factors:	See Section 480020 - Site Conditions
	Soil Class:	See Section 480020 - Site Conditions
	Wind Design Criteria (wind speed, expo-sure, etc):	See Section 480020 - Site Conditions
	Condenser Design Requirements	
	Shell Side Design Pressure/Temperature	*
	Tube Side Design Pressure/Temperature	*
	Design Circulating Water Temperatures	See Section 480020 - Site Conditions
	Minimum / Maximum Allowable Tube Velocity	4 fps / 8 fps
	Maximum Allowable Tubeside Press. Drop	14-16 ft WC
	Percent Cleanliness, Design	85%
	Max Oxygen in Condensate	*

	Shell Material	Carbon steel
	Waterbox Material	Carbon steel (epoxy lined)
	Tube Material	304L Stainless Steel or Titanium
	Tube O.D.	*
	Minimum Tube Thickness	22 BWG
	Tubesheet Material	Carbon steel (clad with Stainless Steel or Titanium)
	Shell and Water Box Corrosion Allowance	1/8 inch
	Minimum distance from Lowest tube to HHWL - inches	18
	Minimum distance from HHWL and NWL – inches	6
	Minimum Hotwell Storage – NWL to LLWL trip (minutes)	3
	Liquid Ring Vacuum Pump	
	Time to draw vacuum	20 min (for full steam bypass operation)
	Materials of Construction	
	Casing	316SS
	Impeller	316SS
	Shaft	316SS
	Shaft Sleeves	316SS
	Mechanical Seals	Contractor to provide

APPENDIX B – TECHNICAL DATASHEETS BY CONTRACTOR Data to be furnished during project execution

Contractor furnished data and information is included in this specification to describe the general design, interface characteristics and construction features of Contractor furnished equipment. The accuracy of such information and the compatibility of such information with overall performance requirements specified by the General Manager are the sole responsibility of Contractor.

Item	Description	Units	Technical Data (Contractor to fill in)
1.0	**Manufacturer/Model/Type**		
2.0	**Main Condenser Design and Performance Data (each condenser)**		
2.1	Design Heat Rejection	MMBTU /hr	
2.2	Design Circulating Water Flow Rate	gpm	
2.3	Design Temperature Rise	˚F	
2.4	Tube Side Pressure Drop (at Design Circ. Water Flow Rate)	psi	
2.5	Tube Side Design Temperature	˚F	
	Tube Side Design Pressure	psi	
2.6	Tube Velocity (at Design Circ. Water Flow Rate)	fps	
2.7	Number of Water Passes		
2.8	Number of Tubes per pass / Total		
	Tube Material		
2.9	Tube OD	in.	
2.10	Tube Wall, BWG		
2.11	Tube Length (Total / Effective)	ft.	
2.12	Overall Condenser Length	ft.	
2.13	Shell Dimensions	ft.	
2.14	Required Surface Area (Calculated, Clean)	sq. ft.	
2.15	Surface Area Provided (85% Clean)	sq. ft.	
	Water Box Design Pressure	psi	
	Water Box Design Temperature	˚F	
2.16	Water Box Inlet Nozzles	in.	
2.17	Water Box Outlet Nozzles	in.	
2.18	Condenser Total Assembled Weight (Dry)	lb	
2.19	Condenser Total Operating Weight	lb	
2.20	Condenser Total Operating Weight (Flooded)		
2.21	Envelope Dimensions – H X L X W	in.	
	Distance Between Tube Support Plates	in.	
	Hotwell Capacity @ MWL / Max. WL	gal.	
	Distance from Bottom of Hotwell to:		
	-Normal Water Level	in.	
	-Bottom of Tubes	in.	
	Thickness/CA - Shell	in.	
	-Hotwell	in.	

Item	Description	Units	Technical Data (Contractor to fill in)

SECTION 485471
INLET AIR CHILLER

PART 1 - GENERAL

1.1 SUMMARY

A. This section details the minimum technical requirements for the design, manufacture, testing, and furnishing of a mechanical chiller assembled unit for lowering the temperature of inlet air to a gas turbine generator. It is not the intent to specify completely herein all details of design and construction of the inlet air chiller and its' related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. Packaged chiller with standard accessories
2. Skid mounted base frame with outdoor weather enclosure including climate conditioned ventilation, lighting, and electrical receptacles
3. Redundant mechanical centrifugal refrigerant chillers complete with electric motors and integral lubrication system
4. Inlet air chiller coil with temperature control, flow measurement, and flow and bypass control at the gas turbine generator (option, see attached datasheets)
5. Inlet air anti-icing system and controls (option, see attached datasheets)
6. Microprocessor based control system with one local and one remote HMI, protocols for bidirectional communication with plant control system (PCS)
7. Redundant capacity chilled water pumps
8. Expansion tanks essential to proper operation of the chiller system, mounted internal to the skid
9. All piping, raceways, and wiring contained within or supported by the skid mounted packaged along with the associated auxiliary systems
10. Switchgear / Starters / MCCs / electrical distribution board to be located in the PDC
11. Initial charge of refrigerant suitable to the project site
12. Cleaning and finishing prior to shipment
13. Finish painting interior and exterior
14. Insulation internal to the package boundaries
15. Noise mitigation measures to achieve requirements defined in Section 480031, Combined Cycle Power Island Noise Control Performance.

16. Performance testing at factory and certificates of results
17. Drawings and design data to support facility design, construction and maintenance
18. Manuals, drawings, and design data to support balance of plant design, installation, operation, and maintenance of the specified equipment
19. Inspection certificates and quality control documentation listed in this Section
20. Field advisory services including field support, installation support, start-up support, commissioning support, and training
21. Priced list of recommended spare parts for two years of operation
22. Packing and shipment FOB to nearest point of receipt to the plant site

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Receipt, off-loading, storing, and erection of equipment at the plant site
2. Foundations, sole plates, anchor bolts/nuts, standard embedments, and grout
3. Plant Control System (PCS)
4. Power and control raceway, wiring, instrument tubing, and pneumatic supply piping external to the chiller package and auxiliary equipment
5. Cooling tower with all structural support, interconnecting piping, instrumentation and controls to meet the operational requirements of the inlet air chiller. Reference Section 485491, Cooling Tower. (Cooling tower is part of the PIE Scope, but not provided by the chiller manufacturer. Cooling water for the chiller will be supplied by the PIE furnished cooling tower)
6. Chilled water piping from package boundaries to inlet air chiller coil
7. Cooling water piping from cooling tower to chiller
8. Insulation external to the package boundaries
9. Cooling water chemical injection and sampling
10. External instrumentation and weather station
11. Field inspection and testing
12. Final job site cleanup and touch-up painting
13. Instrument Air supply to Contractor’s terminal point

1.4 RELATED SECTIONS

A. Section 260000, Electrical Specification for Mechanical Equipment

B. Section 261050, Specification for Medium Voltage Motors

C. Section 262050, Specification for Low Voltage Motors

D. Section 480020, Site Conditions

E. Section 480031, Combined Cycle Power Island Noise Control Performance

F. Section 480032, Power Island Performance

G. Section 481100, Combined Cycle Power Island

H. Section 485222, Gas Turbine Generator (Aeroderivative)

1.5 CODES AND STANDARDS

A. Refer to 481100, Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. Air-Conditioning, Heating, and Refrigeration Institute (AHRI)

550/590 - Performance Rating of Water Chilling Packages Using the Vapor Compression Cycle
580 - Non-Condensable Gas Purge Equipment for Use with Low Pressure Centrifugal Liquid Chillers

2. American Society of Heating, Refrigerating, and Air conditioning Engineers (ASHRAE)

147 - Reducing the Release of Halogenated Refrigerants from Refrigerating and Air-Conditioning Equipment and Systems

3. Heat Exchanger Institute (HEI)
4. Hydraulic Institute (HI)
5. South Coast Air Quality Management District (SCAQMD)

Rules 1451 & 1415.1 - Reduction of Refrigerant Emissions from Stationary Refrigeration Systems

6. Tubular Exchanger Manufacturers Association (TEMA)

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. All equipment shall be designed for a thirty (30) year life objective.
2. All equipment shall be designed for continuous 24 hour per day operation with potential daily cycling from off-line to full load.
3. All equipment shall be designed and assembled to provide suitable access for operation and maintenance of the equipment.

B. Performance Requirements

1. Chiller package shall be designed so as to minimize plant auxiliary power requirements while achieving the required inlet air chilling over the full range of ambient and operating conditions.
2. The chiller load controls shall allow continuous control of chilled water output over the range from 25% flow to full rated flow.
3. The chilled water flow controls shall be achieved with an automatic chilled water recirculation and bypass system.
4. The chiller controls shall provide freeze free operation of the system.
5. The Contractor shall supply the required type and extent of silencing treatment, if any for the package to meet the noise level requirements in accordance with Section 480031, Combined Cycle Power Island Noise Control Performance. The Contractor shall state the expected maximum SPL (Sound Pressure Levels) produced by this equipment in operation and shall state the operating mode at which the maximum levels occur.

C. Reliability

1. No single failure of a component or system shall result in damage. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

1.8 SUBMITTALS - Refer to Attachment 11 -Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

1.10 Delivery, Storage, and Handling

A. Refer to Section 481100, Combined Cycle Power Island for delivery, storage, and handling requirements.

1.11 SITE CONDITIONS

A. Reference Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The following Manufacturers are pre-approved to supply equipment specified within this Section. Additional Manufacturers must be submitted to the General Manager for approval before consideration to include in the Contractor's Proposal.

1. Not Used

2.2 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

2.3 EQUIPMENT

A. Inlet Air Chiller Assembled Unit

1. The inlet air chilling system shall be furnished as a complete and operable system to chill the inlet air for a gas turbine generator (GTG) to a temperature suitable for an increase GTG output during high ambient temperature operating.
2. The chiller assembled unit shall be a skid mounted mechanical centrifugal refrigeration chiller.
3. The inlet air chiller shall be capable of continuous operation and shall be designed to accommodate start/stop and partial to full load cycles.
4. All equipment shall be designed to function properly over the entire temperature range specified in the datasheets unless a more severe duty is otherwise specified. Function properly includes starting, operating, and powered stand-by.
5. Chiller shall conform to AHRI 550/590-2003
6. The chiller modules should be chosen to achieve low auxiliary loads and low capital cost while accounting for physical space available.
7. The arrangement of assembled components shall be such that there is safe and suitable clearance for operation and efficient maintenance of the equipment.
8. In view of limited operating experience with R134A refrigerant based in large inlet air cooling systems, the Contractor shall provide back-up guarantees from chiller compressor manufacturer for the system design and auxiliary power guarantees.
9. The chiller compressor and the condenser shall be sourced from a proven supplier. An experience list of similar capacity and refrigerant compressor model shall be submitted with the proposal.

10. In addition to chilling, a system for heating GT inlet air shall be provided. In the inlet air heating mode, a shell & tube heat exchanger is provided. The heat exchanger will utilize extraction steam from the Once Through Steam Generator (OTSG) to heat the fluid contained within the chilled water closed loop. The system will utilize the chilled water pumps and temperature control valve to provide the hot water flow to the GTG inlet coils in order to increase the GTG inlet air temperature. The heat exchanger skid for inlet heating will include:
    - One (1) Carbon Steel Shell & Tube Heat Exchanger designed and constructed to ASME Sec. 8 Div. 1
    - One (1) Temperature Control Valve.
    - One (1) Plate & Frame Heat Exchanger
    - Expansion Tank
    - Condensate Recovery system including tank, level control, with 2 x 100% condensate forwarding pumps.
    - Miscellaneous valves and fittings
    - Painted Carbon steel base frame.

B. Compressor and Motor

1. Compressor

    a. The compressor shall be mechanical centrifugal.
    b. Chiller should be able to unload to 10 percent of design tonnage with constant entering chilled water temperature. The compressors shall have provision for hot gas bypass (if required) to achieve minimum turndown load.
    c. Compressor assembly shall be run-tested at the factory. Vibration shall not exceed 0.15 inches per second. The test data shall be recorded and provided to the General Manager in report form for approval.
    d. A multiple compressor arrangement may be used if economically superior.
    e. The failure of a single compressor, and subsequent repair (opening the refrigeration path), shall not impair the operation of the system by more than 50%. The compressor, condenser and evaporator must have inlet and outlet discharge isolation valves for positive isolation while other equipment and systems are in operation.
    f. Compressor's maximum efficiency shall coincide with the specified design capacity at highest ambient conditions and at annual average ambient conditions listed as the design conditions in Section 480020, Site Conditions.

2. Impeller

    a. The compressor impeller shall be fully shrouded and made of a high strength steel alloy or manufacturers recommended proven material. The responsibility for selection of most reliable materials of construction is left with the Contractor. Impellers shall be dynamically balanced and over-speed tested at 1.25 times impeller shaft speed.

3. Electric Motors

    a. The motor should be sealed and either suction or refrigerant cooled.

b. If an open drive motor is provided, a motor-compressor shaft seal leakage containment system shall be provided. An oil reservoir shall collect any oil and refrigerant that leaks past the seal. A float device shall be provided to open when the reservoir is full, directing the refrigerant / oil mixture back into the compressor housing. Manufacturer shall warrant the shaft seal, reservoir, and float valve system against leakage of oil and refrigerant to the outside of the chiller for a period of 5 years from initial start-up, including parts and labor to replace a defective seal and any refrigerant required to trim the charge to original specifications. Motors shall have temperature sensing for each phase. These temperatures shall be furnished to the unit control panel for monitoring and alarm.
c. Compressor motors shall be single speed, non-reversing, squirrel cage induction type rated at 4,000 volt and with a 1.15 service factor.
d. Hermetic motors shall be suitable for operation in a refrigerant atmosphere and shall be cooled by atomized sub-cooled refrigerant in contact with the motor windings.
e. Motor winding temperature sensors shall be provided, at least one per phase. Full load operation of the motor shall not exceed nameplate horsepower rating (i.e. motor shall not operate into the service factor under any mode of chiller operation).
f. Current imbalance detector which monitors 3-phase motor current to provide the following protection:

    1) Phase loss, reversal and imbalance protection
    2) Ground fault protection

g. The electrical motors shall comply with Section 262050, Specification for Low Voltage (NEMA) Motors and Section 261050, Specification for Medium Voltage Motors.

C. Evaporator and Condenser

1. Evaporators and condensers shall be built in accordance with ANSI/ASHRAE 15-1994 Safety Code for Mechanical Refrigeration. Any equipment operating above 15 PSIG shall be built in accordance with ASME Section VIII and provided with National Board registration. The chilled water piping connections with chiller package shall be Victaulic, with bevel preparation for welding.
2. Evaporator and condenser tube material shall be copper or copper/nickel. The minimum tube wall thickness shall be 0.028 inch. Tubes shall be internally or externally enhanced at the discretion of the Contractor.
3. Refrigerant metering devices and thermal expansion valves shall be provided for inspection and periodic adjustment.
4. Multi-stage compressors shall incorporate an interstage flash vessel "economizer". Units with single stage compressors shall have the condensers circuited for liquid subcooling and be provided with a thermometer well to monitor the amount of sub-cooling.
5. Supply and return head water boxes shall be designed for a working pressure of 150 psig and shall be factory hydrostatic pressure tested at 150 percent of the design pressure. Skid module design shall allow for annual removal of water boxes for cleaning. Skid enclosure shall include removable wall, access doors, or access panels for water box removal and for tube brushing. Skid layout shall include the “pull space” for this procedure.

6. Water box drain and vent connections shall be provided. All water box drains shall be hard-piped to a common drain location.
7. Insulation shall be 1" and cover all low temperature surfaces to include the evaporator, water boxes, and suction elbow. Economizer and motor cooling lines shall be also insulated.

D. Pumps

1. Pump Selection

a. Pumps shall be adequately sized for the specified duty conditions.
b. Pumps shall be double or single suction, vertical in-line centrifugal pump designed to deliver the flow rate at the specified total dynamic head in feet.
c. Pumps shall not be overloaded throughout the entire range of pump operations.
d. Pumps shall be redundant capacity and the General Manager estimated piping pressure losses as specified in the datasheets (this value to be validated by BOP Contractor) shall be considered in the pump design head.
e. Pumps construction shall allow servicing in all respects without removal of the pump or motor from the skid. Bearings, casing, seals and shaft must be removable without disassembly of the pump from the motor or the attached piping.

2. Centrifugal Pumps

a. Casing

1) Casing for pumps shall accommodate an impeller fifteen (15) percent greater in diameter than the impeller actually selected to meet specified performance.
2) The casing material shall be close-grained cast iron.
3) Casings shall be designed for scheduled working pressure and shall be hydrostatically tested. Suction and discharge flanges shall be drilled to ANSI Standards and be machined raised face.

b. Impeller

1) Full size impellers shall not be used. An impeller diameter that is at least 10 percent larger than the minimum impeller diameter and at least 10 smaller than the maximum diameter for the pump casing is preferred.

c. Wearing Rings

1) Provide bronze, renewable wearing rings on all pumps 1-1/2 inches and larger.
2) Pumps shall be fitted with renewable case wear rings indexed with a dowel pin for fixed positioning or manufacturer’s standard attachment.

d. Shaft

1) Furnish a stainless steel shaft, turned and ground to accurate dimension, of ample size to prevent deflection and key slotted as required.

e. Shaft Sleeves

1) All pumps shall be provided with mechanical shaft seals unless a specific application precludes the use of such seals. Mechanical shaft seals shall be of multiple spring balanced pusher type. If required mechanical shaft seals shall be furnished with a complete flushing system, including interconnecting piping. The flushing system shall utilize the pumped fluid unless otherwise required.

f. Bearing

1) The pump shaft shall be adequately supported by the pump bearings to limit the shaft deflection to 0.002 inches.
2) If pump bearings are used, the pump ball bearings shall be deep groove type with cartridge mounting, locked to shaft with positive locks, of ample size to withstand all axial and radial loads.
3) Each bearing housing shall be bolted to the upper and lower casing halves for a full 360 degree support registered fit to ensure positive alignment.

g. Pump Maintenance Access

1) An overhead monorail, minimum capacity of 1/2 ton or as required to pick the heaviest component, with trolley and chain-fall shall be provided to allow easy maintenance and repair for the pumps.
2) The rail will extend to near the service doors to assist in rigging the pumps or motors out of the module.
3) Provide sufficient pull space around pumps to provide for all operations, maintenance and removal activities.

h. Motor Extension Shaft

1) Machine the end bracket to receive the pump support bracket for rigid bolted assembly to ensure permanent, accurate alignment of the pump and motor.

i. Couplings

1) Provide a flexible mechanical coupling rated for the full rated horsepower of the driving motor at motor speed. Standard rigid, split, aluminum alloy couplings can be alternatively used.

j. Variable Frequency Drive (Contractor shall provide this as optional pricing)

1) The variable speed drives shall convert three-phase, 60 HZ utility power to adjustable voltage and frequency, three-phase, AC power for stepless motor speed control from 40% to 100% of the motor's 60 Hz speed.
2) The VFD power input stage shall convert three-phase AC line power to a fixed DC bus voltage. This will be accomplished with a solid state three-phase full-wave diode rectifier with metal oxide varistor (MOV) three-phase protection. Displacement power factor shall not be less than 0.95

throughout the speed range. Input line inductors (3%) shall be included on the line side of the power input state.

3) The VFD output power shall vary frequency to the motor from 24 to 60 Hz with resultant motor speed varying at the motor nameplate rated speed, with output voltage variation from zero to motor rated voltage for optimum volts per hertz (V/Hz) ratio for fan and pump loads. Output current shall be rated 110% of motor full load amps (FLA) for 1 minute based upon VFD's variable torque FLA rating. The output must be a voltage source type generating a sine waveform utilizing an asynchronous carrier frequency (output transistor switching frequency is to be independent of drive output frequency). This carrier frequency shall be adjustable to minimize harmonically induced noise or vibration.
4) The VFD shall include the following features:

   a) The VFD shall be housed in a NEMA 1 enclosure.

5) The following display/control parameters shall be located on the front of the enclosure:

   a) Hand/Off/Auto selector to start and stop the motor. In the auto position, the drive shall start/stop from a remote contact closure. In the auto position, motor speed shall be determined by the follower signal. In the manual position, motor speed shall be determined by manual adjustment.
   b) Power on indication that the VFD from the power line.
   c) Fault indication that the VFD has tripped on a fault condition.
   d) Display shall indicate load parameters such as load percent, frequency or running load amps.

2.4 COMPONENTS

A. Purge System

1. The refrigeration system shall be provided with a non-condensable gas purge system compliant with SCAQMD rules 1415 and 1415.1 and AHRI 580 and ASHRAE 147 guidelines for system design, performance, and efficiency.
2. At standard room operating conditions and with a condensing refrigerant temperature > 80 ˚F, the purge system shall be rated for no more than .02 lb of refrigerant per 1 lb. non-condensable. The purge efficiency shall not deteriorate over time.
3. Purge exhaust shall be to outdoors.

B. Chiller Package Enclosure

1. The structure shall be designed for both the “lifting” and the operating cases, using STAAD.PRO or equivalent, and designed per ASD-89. Design calculations shall be submitted for General Manager review.
2. Base frame shall be constructed of suitable structural wide flange beams. Joining of skid full-depth members shall be performed using full penetration welds, to a factory-certified ASME/AWS welding procedure with welders qualified to the specific certified procedures.

3. Each skid base shall have four (4) retractable lifting trunnions that maintain the unit within fifteen (15) degrees of horizontal when lifted with a single spreader bar with a single crane hook point. These trunnions shall be designed in accordance with ASME B30.20, latest edition. Where lifting trunnions assemblies penetrate the base beam, large reinforcing plates (ASD-89) shall be incorporated to both sides of the beam for structural integrity. Each outside longitudinal beam shall have at least three (3) jack bolts (provided by others) for leveling skid on concrete slab and making space for grouting. As an alternative, installation contractor may use shim plates for leveling. Provisions for anchor bolts to be supplied by others shall be included in the skid design.
4. Enclosure shall be supplied with thermostatically-controlled ventilation fans with adjustable setpoints from within the enclosure. Vent ducting shall be designed and fabricated with a serviceable means of filtering the intake air.
5. Enclosure floor shall be equipped with adequate drainage and sloped accordingly toward drains.

2.5 ELECTRICAL

1. Packaged System Electrical Requirements

   a. The chiller package will be fed with a single MV and a single LV power feed. These shall feed the main MV and LV MCC busses.
   b. The Electrical systems in the package shall comply with Section 260000, Electrical Specification for Mechanical Equipment.
   c. Electric Motors

      1) Chiller Compressor Motors

         a) Compressor motors shall be totally enclosed.
         b) Compressor motors shall be single speed, non-reversing, squirrel cage induction type rated at 4,000 volt and with a $\leq$1.0 service factor.
         c) Hermetic motors shall be suitable for operation in a refrigerant atmosphere.
         d) Motor winding temperature sensors shall be provided, at least one per phase. Full load operation of the motor shall not exceed nameplate horsepower rating (i.e. motor shall not operate into the service factor under any mode of chiller operation).
            Contractor's standard RTD wiring method applies.

      2) Current imbalance detector which monitors 3-phase motor current to provide the following protection:

         e) Phase loss, reversal and imbalance protection
         f) Ground fault protection

   d. Motor control centers and/or electrical cabinets shall be mounted on appropriate housekeeping pads or other pedestal system which shall be designed and constructed to prevent the intrusion of water into the cabinets. Housekeeping pads shall be a minimum of 4" tall.

2.6 INSTRUMENTATION AND CONTROLS COMPONENTS

1. System Controls

a. The system control panel shall consist of a programmable controller which shall coordinate the chilled water pumping systems, variable speed systems, and the chiller control systems to achieve the desired T2 temperature requirements of the turbine inlet air temperature.
b. PLC type Allen-Bradley Logix family, language is to be determined.
c. The control system panel shall communicate directly with the plant PCS via a network gateway (preferably Ethernet) to enable monitoring of system parameters directly on existing systems.
d. A Human Machine Interface (HMI) shall be included as part of the system control panel to provide the operator with a "Window" to the process. The HMI shall permit changes to the process such as setpoint and manual control functions. The HMI shall also be capable to perform system diagnostics such as alarming, trending, report generation and color graphics to simplify the operation.
e. The packaged control system shall have a built-in an industrial touch screen personal computer running standard off the shelf HMI graphical interface such as Rockwell Automation RSView or approved equal.
f. The packaged control system coordinates the pumping systems with the actions of the chiller system. It also schedules pump rotation to equalize runtime and wear on each pump and chiller system by using different rotation schemes thus providing a more reliable chiller plant by periodically exercising all of its components.
g. Intelligent "smart" motor starters shall be used throughout the system to enable motor control and motor monitoring diagnostics. Motor control system shall be provided with DeviceNet.
h. The packaged control system shall monitor both the supply and return water temperatures to determine system demand. The system shall take into consideration the available on-line chiller capacity in determining the set point of chiller system. In addition, the system shall monitor the flow rate through the chillers to meet the ideal conditions to chill water and maintain desired T2 temperature. Pumps may also be staged on / off to maintain optimal efficiency for the entire TIC system.
i. The packaged control system shall monitor condenser discharge pressure to determine the number of fans required to achieve the optimized condenser refrigerant pressure.
j. Temperature Control Valves shall be used to control and regulate chilled water flow rates through the cooling coils at gas turbine filter house, decrease parasitic loads, and provide the most efficient method of providing chilled water. Contractor shall advise if Temperature Control Valves are shipped loose to be installed in BOP piping.
k. The packaged control system shall use distributed I/O to reduce installation costs and aid in both the start-up and commissioning the control system. With I/O strategically located throughout the plant, such as at the Chiller Plant, TIC Coils, and secondary field devices can be easily added and implemented in the future. Additional diagnostic and performance data gathering can be achieved also.

2. Performance Monitoring Devices

a. Chilled water temperature transmitters at the supply and discharge of cooling coil manifolds at the gas turbine.
b. T1 ambient dry bulb (DB) temperature and humidity meter (capable of reading in wet bulb (WB) temperature), at the gas turbine filter house.
c. Temperature indicating transmitter at the supply and discharge of the chiller water box, chilled water and condenser refrigerant loops.
d. 0.5 % accuracy mass flow meter (mass flow, not volumetric flow) in chiller skid for chill water loops, and at gas turbine coil assembly. For primary / secondary systems, provide secondary flow measurement also.
e. Ammeter, voltmeter, watt-var meters for low and medium voltages feeders. Metering shall be per each module. For primary / secondary systems, provide secondary power monitoring also.
f. 0-100% Valve Position Feedback at the coil control valves.
g. The above points shall be wired back to the central chiller control system for monitoring and control.
h. Control system shall be capable of providing instantaneous capacity (tons), parasitic electrical load (kW), and efficiency (kW/ton) measurements. Control system shall be capable of trending these values.
i. Differential pressure indicating transmitters shall be furnished to monitor differential pressure across the supply and discharge piping of the chiller water box and chilled water. Process connections for the differential pressure instruments shall be positioned at the 3 o'clock or 9 o'clock position in the horizontal piping within 24" of the chiller discharge flange or connection.

3. Performance Monitoring Devices Supplied by Contractor

a. T2 temperature transmitter, utilizing gas turbine CIT.
b. Gas Turbine MW meter each
c. Net plant output MW
d. The above points shall be wired to the central chiller control system for monitoring and control.

4. Refrigerant Monitor

a. Provide a refrigerant monitor for enclosed skid modules per ASHRAE 15.
b. The refrigerant monitor shall have an infrared sensor using either photo acoustic or photo absorptive sensing method. The minimum refrigerant detection level shall be no more than 1 ppm and its specified error over its measurement range shall be no more than +/- 3 ppm for 1 - 50 ppm range and +/- 10% for 51 - 1,000 ppm range.
c. Alarm shall include a signal to the central control system and a visual warning light outside of the enclosure.

5. Remote Monitoring

a. The system shall be capable of remote monitoring by phone line or Internet connection. The Contractor shall have the capability to monitor and troubleshoot the system remotely.

6. Refrigerant Leak Detection System

a. The system shall be equipped with an automatic refrigerant leak detection system in accordance with any and all applicable regulations including, at a minimum, SCAQMD Rules 1415 & 1415.1.

B. Local Chiller Controls

1. The local chiller control panel shall be a stand-alone Direct Digital Control (DDC) System. A dedicated chiller microprocessor control panel shall be supplied with each chiller compressor by the chiller manufacturer.
2. The local chiller control panel shall provide control, operation and monitoring of all chiller sensors, actuators, relays and switches and shall include controls to safely and efficiently operate the chiller.
3. Safeties - the local chiller control panel shall monitor the following safeties: start and running time between compressor/motor starts, low chilled water temperature, low evaporator refrigerant temperature or pressure, high condenser refrigerant pressure, evaporator, low oil pressure, low oil temperature, high oil temperature, high motor winding temperatures, sensor faults, and proper operation of unit controls.
4. All compressor and motor bearings (including high speed, low speed, and thrust bearings), shall have separate factory installed temperature sensors installed in the bearing or the oil return lines of each bearing. If any temperature reaches or exceeds a set value, the chiller control panel shall shut down the chiller, display the diagnostic, and annunciate a common trouble alarm.
5. The local chiller control panel shall incorporate advanced motor protection to safeguard the motor throughout the starting and running cycles from the adverse effects of:

    a. Phase loss
    b. Phase imbalance
    c. Phase reversal
    d. Under voltage
    e. Motor overload
    f. Motor overload protection incorrectly set
    g. Momentary power loss protection with auto restart consisting of three phase current sensing devices that monitor the status of the current
    h. Starter contactor fault protection
    i. Failure to accelerate

6. Advanced motor protection systems shall be furnished in the associated MCC, for both medium voltage and low voltage motors.
7. The local chiller control panel shall be capable of displaying system data in English or Metric units.
8. The local chiller control panel is to be provided with a start and run time counters.
9. The front of the local chiller control panel shall display the following in clear language, without the use of codes, look-up tables, or gauges:

    a. Entering and leaving evaporator water temperatures
    b. Entering and leaving condenser temperatures
    c. Compressor Motor Winding Temperature of each phase A, B, C.
    d. Saturated evaporator and condenser refrigerant temperatures
    e. Evaporator and condenser refrigerant pressure
    f. Oil Temperature
    g. Oil Tank pressure

h. Oil pump discharge pressure
i. Differential oil pressure
j. Compressor motor starts and running hours
k. Compressor motor current, by phase
l. Compressor motor percent RLA
m. Purge compressor suction temperature
n. Purge pump out rate
o. Purge pump out time last or current cycle
p. Total Purge pump out time
q. Total Purge run time
r. Chilled water set point and set point source
s. Electrical current limit set point and set point source
t. Current chiller operating mode
u. Equipment room refrigerant monitor ppm levels
v. Chiller diagnostics including a time and date of occurrence
w. (Minimum 20 historical diagnostics stored in non-volatile chiller panel memory)
x. Differential pressure across chilled water supply and return
y. Differential pressure across chiller water box supply and return

10. The chiller control panel shall provide evaporator freeze protection and low limit control to avoid low evaporator refrigerant temperature trip-outs during critical periods of chiller operation. The control shall take action in response to the actual value of the evaporator refrigerant temperature. A diagnostic message shall be automatically displayed at the front panel whenever this control is in effect, and if the condition exists for more than 20 minutes, a limit warning alarm relay shall energize.
11. The chiller control panel shall provide individual relay outputs to start/stop the evaporator chilled water pumps. The condenser temperature output can be used to enable the condenser temperature controls.
12. The chiller control panel shall provide a relay output that shall energize whenever the compressor is running.
13. The chiller control panel shall provide an alarm relay output that shall energize whenever a fault is detected by the panel.
14. The chiller control panel shall provide a head relief request Alarm to indicate that the chiller is in condenser limit mode.
15. The chiller control panel shall provide leaving chilled water temperature reset based upon return water temperature or ambient temperature.
16. The chiller control panel shall be capable of supporting a printer. The printer interface shall provide the following printing functions:

    a. Each printed output is stamped with the time and date of printing.
    b. Print on command from the operator interface keypad.
    c. Print based upon each occurrence of a chiller diagnostic.
    d. Print a standard summary report based upon an operator specified timed interval.

17. The chiller control panel shall be capable of providing short cycling protection.

2.7 CIVIL AND STRUCTURAL

A. Refer to Section 481100, Combined Cycle Power Island for general civil and structural requirements.

2.8 ACCESSORIES

A. Insulation

1. Piping, tanks, and equipment shall be insulated if:

Heat loss results in economic loss or negative performance impact of the equipment provided by the Contractor as part of this scope of supply.
Operating temperature exceeds 140˚F or surface temperatures will endanger station personnel.
The equipment and piping must be protected from freezing.

2. Insulation that must be removed for maintenance access shall be provided in modular blankets or sections to facilitate removal for equipment access.
3. Piping and equipment to be insulated for personnel protection shall be insulated up to 8 feet above floors and platforms and 3 feet horizontally of all platforms and walkways.
4. Outdoor insulation shall be weatherproofed and jacketed to prevent degradation due to ambient conditions

B. Heat Tracing

1. All above ground piping containing fluids subject to freezing will be heat traced and insulated. Piping routed in-ground will also be insulated and heat traced down to the frost line.

2.9 FABRICATION

A. Refer to Section 481100, Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

B. The chiller pump room floor shall receive a non-slip coating treatment

2.10 SOURCE QUALITY CONTROL

A. Refer to Section 481100, Combined Cycle Power Island for general source quality control, test, and inspection requirements.

PART 3 - EXECUTION

3.1 COMMISSIONING

A. General

1. The Contractor shall provide onsite commissioning and testing support of the equipment.
2. The Contractor shall allow for training of the General Manager’s personnel appointed to operate the equipment and involved in commissioning.
3. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the

right to remove and take away from site such commissioning and test equipment upon completion.

4. The Contractor shall submit a detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 3 months prior to the commencement of site testing.

B. Commissioning Plan

1. The base scope of the installation and commissioning plan shall provide:

Advance knowledge of project schedules, completion dates, and key event dates.
General definition of manpower and material resources required.
A means of verifying that all critical calibrations, both mechanical and electrical, have been checked.
In addition to the documentation that makes up the base scope the Contractor shall include the services of an Installation and Commissioning Manager to monitor and continuously update the plan during the installation and commissioning period.

C. Installation, Commissioning and Startup (ICS) Manual

1. The ICS Manual shall be an integral part of the Installation and Commissioning plan. Each activity in the ICS manual shall be detailed and documented in the Activities Manual and step-by-step instructions provided for carrying out each activity.
2. Each activity sheet shall identify as a minimum:

The unit on which the activity is to be carried out
Applicable drawings
Engineering standards
Special tools
Torque and alignment specifications
Piping connection information and drawing identification codes
Wiring junction box locations and terminal designations
Switch and control action and set points

3. Log sheets shall be provided where required for recording critical information (alignments, clearances, calibration points achieved etc.) generated during each activity.
4. Each activity sheet shall also provide signature blocks for the Contractor and General Manager to sign off, thereby verifying the activity was completed to both their satisfaction.

3.2 TRAINING

D. Operation and maintenance training shall be provided for up to 10 end user operation and maintenance personnel (not including travel and accommodations) and shall include the following topics:

1. Minor mechanical maintenance
2. Controls and instrumentation
3. Specialist training

E. The training program shall be appropriate for all levels of the end user's staff including Engineers, Supervisors, and Technicians.

F. The training program shall be held at the Contractor's facility and include visit to an operating site with similar equipment.

G. Prior to award of contract, the Contractor shall provide content of the training program for the General Manager's approval.

END OF SECTION 485471

APPENDIX A – Contractor Data Requirements - Refer to Attachment 11 -Drawing Schedule

APPENDIX B – Technical Datasheet by General Manager

	Client Name	Pasadena Water & Power
	Project Name	Glenarm Repowering Project (GT-5 Combined Cycle Installation)
	Project Number	123374
1.0	**Design**	
	Site Conditions	Section 480020, Site Conditions
	Gas Turbine Type	By Gas Turbine Contractor
	Gas Turbine Quantity	1
	GTG Minimum Inlet Air Temperature	By Gas Turbine Contractor
	Total Inlet Air Chilling Load	By Gas Turbine Contractor
	Power (MV/LV/Freq)	4160V/480V/60Hz
2.0	**Air Chilling Coil Design**	By Gas Turbine Contractor
	Maximum Face Velocity	
	Maximum Allowable Air Side Pressure Drop	
	Water Side Pressure Drop	
	Number of Coil Tube Rows	
	Number of Tube Passes	
	Coil Tube O.D	
	Coil Tube Wall Thickness	
	Coil Tube Material	
	Coil Fin Density	
	Coil Entering Water Temperature	
	Coil Leaving Water Temperature	
	Chilled Water Flow Rate	
	Temperature Control	
	Flow Measurement	
	Flow and Bypass Control	
6.0	**Auxiliary Systems**	
	Cooling Tower	By BOP Contractor
	Auxiliary Cooling Water Pumps	By BOP Contractor
	Inlet Air Anti-Icing System and Controls	By Contractor as Required by Gas Turbine Contractor and Site Ambient Conditions

8.4	Length of Each Module	ft	
8.5	Width of Each Module	ft	
8.6	Shipping Weight	lb	
8.7	Refrigerant Type		
8.8	Total Refrigerant Charge	lb	

Notes:

Contractor shall complete datasheets with all missing information.

1. Chiller flow needs revalidation with GTG Coil Design data.
2. The chilled water piping between the chiller package and GTG units will be supplied by the BOP Contractor. For sizing the chiller package the following margins may be assumed in the design:

   Pressure drop in the inter-connecting piping (chilled water supply, coil pressure drops, flow control valves and return water piping) about 150ft of water column.

   Temperature gain in the chilled water supply piping: 0.2 ˚F

   Temperature gain in chilled water return piping: 0.2 ˚F

Chiller Performance Guarantees (with zero tolerance) below are to be filled in by Contractor.

See Section 480020, Site Conditions for defined ambient conditions.

Ambient Conditions	Capacity (Tons)	Total Auxiliary Power (kW)	Electrical Utilization Factor (kW/Ton)	Chilled Water Flow and Temp Difference (gpm)/ΔT ^{0}F

SECTION 485491
COOLING TOWER

PART 1 - GENERAL

1.1 SUMMARY

A. This section details the minimum technical requirements for the design, manufacture, testing, and furnishing of the fiberglass (FRP) structure, wet induced draft counterflow, film fill, field constructed cooling tower. It is not the intent to specify completely herein all details of design and construction of the cooling tower and its' related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict between referenced standards, codes and the documents included in this specification, or an apparent conflict with the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. One complete wet induced draft FRP fire retardant cooling tower including tower hardware, film fill material and supports, drift eliminators, casing, supports and circulating water distribution system and all other equipment and materials necessary to erect a complete operating system.
2. Fan assemblies, two-speed motors, motor vibration switches, gears, coupling, fan stacks, steel mounting structure and shafting
3. One FRP stairway and one hot dip galvanized steel ladder in accordance with OSHA and CALOSHA standards on the ends of the cooling tower.
4. Platforms, handrails, access walkways and stairways for all plant items supplied.
5. FRP cable tray routed off the fan deck and within each cooling tower cell to the motors.
6. Inlet riser sway braces and mounting bracket to laterally support the inlet water risers.
7. Splash type oil lubrication
8. Electric motors for all motor driven equipment
9. Shims, soleplates with leveling screws, keys, restraining blocks and any other non-embedded foundation components
10. Lighting system
11. Piping internal to cooling tower package boundaries
12. Startup, commissioning, and thermal test support
13. Special tools required for maintenance
14. Spare parts for two (2) years of operation

1.3 FURNISHED BY OTHERS

A. The supply by Others shall be limited to the following:

1. Unloading and storage of equipment
2. Field erection of cooling tower support structure and installation of equipment at jobsite
3. Concrete basing with integral pump pit
4. Foundations, foundation bolts, nuts, washers, sleeves and standard shims. Anchor/jacking/pull-down plates, bearing pads, expansion anchors, Nelson studs, headed studs, spacer blocks, support plates and any other embedments required by the Contractor's equipment and identified on Contractor's drawings.
5. Grout
6. Power source and associated MCC starters
7. Lightning protection
8. Field wiring, cable and conduit connecting Contractor supplied components
9. Initial fill of all lubrication and control oils, gases, and water
10. Finish painting of acoustical/weather enclosure
11. Field thermal performance testing

1.4 RELATED SECTIONS

A. Section 260000 - Electrical Mechanical Equipment

B. Section 262050 - Low Voltage Motors

C. Section 480020 - Site Conditions

D. Section 480031- Combined Cycle Power Island Noise Control Performance

E. Section 480032 - Power Island Performance

F. Section 481100 - Combined Cycle Power Island

G. Section 485122.11 – Steam Turbine Bypass Valves

H. Section 485221 - Steam Turbine and TEWAC Generator

I. Section 485432 - Surface Condenser

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. Air-Conditioning, Heating, and Refrigeration Institute (AHRI)
2. American National Standards Institute (ANSI)

    a. S1.4 - Sound Level Meters

b. S1.6 - Preferred Frequencies and Band Numbers for Acoustical Measurements
c. S1.11 - Octave, Half-Octave, and Third Octave Band Filter Set

3. American Society for Mechanical Engineers (ASME)

a. PTC 23 - Atmospheric Water Cooling Equipment

4. Cooling Technology Institute (CTI)

a. ATC-105 - Acceptance Test Code for Water Cooling Towers
b. ATC-107R - Characteristic Curve for use with ATC-105
c. ATC-128 - Code for Measurement of Sound from Water Cooling Towers
d. STD-111 - Gear Speed Reducers
e. STD-131 - Fiberglass Reinforced Plastic Panels for Applications on Industrial Water Cooling Towers
f. STD-136 - PVC Materials Used for Film Fill, Splash Fill, Louvers, and Drift Eliminators
g. STD-137 - Fiberglass Pultruded Structural Products for use in Cooling Towers
h. STD-152 - Structural Design of FRP Components
i. STD-201 - Certification Standard

5. National Fire Protection Association (NFPA)

a. 214 - Standards on Water Cooling Towers
b. 255 - Method of Test of Surface Burning Characteristics of Building Materials
c. 780 - Standards for the Installation of Lightning Protection Systems

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. Reference Section 481100 Combined Cycle Power Island for general design requirements and expected operating profile.

B. Performance Requirements

1. The design ambient wet bulb temperature shall be as specified on the datasheets. The cooling tower shall be designed to operate at full capacity over the range of ambient wet bulb temperatures.
2. The tower design shall ensure adequate performance despite recirculation or interference that may occur due to the proximity of other buildings and/or as a result of wind conditions.
3. The Contractor shall provide equipment performance curves over the entire range of expected operating conditions. Contractor shall include cooling tower performance characteristic curves with tower design point and heat transfer materials in conjunction with KaV/L vs. L/G curve for a counterflow tower.
4. The Contractor shall guarantee that the cooling tower supplied will meet the specified performance conditions when the tower is installed according to plans. If, because of a suspected thermal performance deficiency, the General Manager may choose to conduct an onsite thermal performance test in the presence of the contractor, and under the supervision of a qualified, disinterested third party in accordance with CTI ATC-105 standards during the full year of operation. If the cooling tower fails to perform within the limits of test tolerance, then the Contractor shall make alterations as it deems necessary to overcome indicated deficiency.
5. Contractor shall design and size the cooling tower such that it is capable of simultaneously rejecting the sum total of heat loads, plus a 10% margin, from the following sources:

    a. The steam turbine steam cycle, at 100% turbine load, full steam bypass to the condenser and all operating points in between.
    b. All auxiliary equipment provided by Contractor which requires cooling including but not limited to turbine lubricating oil system, STG TEWAC system and fuel gas compressor lubricating oil heat exchanger and discharge gas heat exchanger.
    c. Mechanical chiller condenser system if used for combustion turbine inlet cooling.

1.8 SUBMITTALS Refer to Attachment 11 – Drawing Schedule

1.9 QUALITY ASSURANCE

A. Refer to Section 481100 Combined Cycle Power Island for general quality assurance requirements.

1.10 PACKAGING, DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping

1. Refer to Section 481100 Combined Cycle Power Island for general packaging and shipping requirements.
2. The system shall be packaged for shipment to allow for outdoor storage as prescribed by Contractor for a period of six months without damage from dust, sun, wind, or rain.

1.11 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.12 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MATERIALS AND WELDING

A. Refer to Section 481100 Combined Cycle Power Island for general material and welding requirements.

2.2 MANUFACTURED UNIT

A. Structural Requirements

1. General

a. Refer to Section 481100 Combined Cycle Power Island for general structural design requirements.
b. All wetted structural members of the cooling tower shall be either FRP or 316 stainless steel. All wetted fasteners and washers shall be 316 stainless steel.
c. The cooling tower shall remain operative after being subjected to the design seismic event without loss of performance or structural integrity.
d. The Contractor shall perform a seismic and wind analysis of the cooling tower using the information provided in Section 480020, Site Conditions. The seismic and wind analysis with complete frame-work loading diagrams shall be submitted for approval by General Manager.

2. Platforms and Stairs

a. Refer to Section 481100 Combined Cycle Power Island for general platform and stairs design requirements.

2.3 EQUIPMENT

A. Cooling Tower

1. The cooling tower shall be a multi-cell counterflow wet mechanical induced draft design employing low-clog film fill. The air path shall be designed to minimize air pressure drop, water drift, and splash.
2. The cooling tower will be located in a concrete basing with an integral pump pit.

3. The cooling tower shall be comprised of multiple cells modularized such that one complete cell can be taken out of service for cleaning or maintenance while the balance of the cells remain in operation. The cooling tower will be required to support the loads associated with the circulating water riser and distribution headers being attached to the structure.
4. The cooling tower shall be designed and will be tested in accordance with the Cooling Technology Institute (CTI) standards.

2.4 COMPONENTS

A. Fill Design and Material

1. The cooling tower shall be designed to utilize film fill type. The low-clog film type shall be fabricated in single sheets for the full depth of the fill pack. The fill material shall be fire retardant plastic, with a minimum thickness of 17 mils. It shall have a maximum temperature limit that is compatible with all operating conditions of the plant, including dry shut down and subject to solar heat gain.
2. Fill shall be supported by girts and joists on centers as required to accommodate operational loads, as well as the specified live load. The support grids shall be installed so as to provide adequate and proper support for the fill material and to prevent any possibility of sagging of the fill occurring during the service life of the cooling tower.

B. Drift Eliminators

1. The cooling tower shall include drift eliminators which hold drift losses to less than 0.0005 percent of the inlet water flow. Contractor shall provide a statement of warranty for the drift efficiency
2. Drift eliminators shall be thermoformed of 17 mil or heavier PVC. They shall be cellular type, triple pass. They shall be factory assembled into easily handled packs that nest together to form a continuous plane of drift eliminators throughout the plan area of each tower cell. They shall be easily removed from inside the tower for cleaning. Eliminators shall be supported by through bolted 2” x 4” (nominal) or larger, girts on no greater than 6’-0” centers. They shall also be designed to be completely self draining and to shed water back to the cold water basin.

C. Fan Deck

1. Material used for decking, sheathing, stairways (e.g. fan decks, hot well covers, hand rails, access stairs, etc.) and other areas normally exposed to the weather shall be made from pultruded fiberglass with a non-skid treatment applied to the deck surface and other walk surfaces with a top surface at least 3/16” thick. The material shall have a flame spread rating of 25 or less per ASTM E-84. The fan deck shall be constructed of rigid fiberglass panels utilizing ribbed stiffeners and supported on maximum spacing of 2 ft centers. The deck shall be designed to prevent sagging, buckling and warping. Foam core decking material will not be accepted.
2. The fan deck shall be designed as part of the tower structure such that it will transmit all live, wind and other loads uniformly to the tower framing. It shall be designed for a minimum live load of 105 psf in addition to any concentrated or live loads from usual tower construction, operation and maintenance provisions. The fan deck shall be capable of

supporting fan components, driving motor, gearing and shafting during overhaul. It shall also provide adequate support for the fan stacks and access to the fan mechanical drive gear and water distribution system of each cell.

3. Fiberglass safety guard-rails of adequate and substantial construction shall be provided around the perimeter of the fan deck and around any area of potential danger to personnel. Handrails, knee rails and toe-boards shall also be provided. All such safety rails shall be bolted to rigid support structures. All necessary internal access ways and ladders shall be provided where required for access to plant and equipment.

D. Corrosion Resistance

1. All wetted surface materials shall be capable of withstanding circulating water pH of 3.0 minimum.
2. All non-metallic cooling tower components and equipment shall be resistant to deterioration from ultra-violet light and water chemistry.
3. Combinations of different materials which may result in electrolytic corrosion shall not be used unless suitably protected and or isolated.

E. Fire Resistance and Tower Wetting

1. Cell partitions, end walls and louvers shall be fire retardant. The fan deck shall have a fire retardant coating. The following tower components shall be composed of non-combustible, or fire resistant materials with a flame spread classification of less than 25, as described in NFPA standard No. 255:

    a. Fill
    b. Drift eliminators
    c. Siding
    d. Structural members

F. Water Distribution System

1. Nozzles shall be threaded to permit easy removal for cleaning of the nozzles and the distribution pipework. Cleanout provisions shall be made at the end of all headers and distribution pipework.
2. The design of the water distribution system shall allow for 90% of the plan area of the cell to receive a water flow within 5% of the average flow. The water flow to no portion of the plan area shall deviate by more than 10% from the average.
3. Joints in the FRP piping shall be located away from support points. The Contractor shall furnish sway bracing for hot water riser (by BOP Contractor). Inlet water risers shall be supported by lateral sway bracing. Bracing shall transmit lateral loads to cooling tower structure and 316L stainless steel. All necessary nuts, bolts and washers for use with the connectors shall be provided and shall be Grade 316 stainless steel. Bracing clamp shall be two piece clamp type with 3" minimum bar width and 1/4” neoprene liner.
4. Water distribution shall be effected by non-clogging nozzles manufactured from corrosion and erosion resistant polypropylene. Contractor shall be responsible for sizing nozzles in accordance with the performance specifications herein. The water distribution shall be even and shall completely cover the whole area of the tower fill material.

G. Axial Fans

1. Fan blades shall be compression molded, fiberglass reinforced polyester with aerofoil profile. All blades shall be uniform in weight, shape and balance and have provision for manually adjusting the pitch angle. The number of blades on each fan impeller shall be selected to ensure that no pulsation of air will occur when the fan is rotating. Each fan shall be statically balanced to a master standard and be randomly interchangeable. Support and attached structures shall be designed to avoid blade passing frequency harmonic excitation. The leading edge of the blades shall incorporate features to provide protection against erosion.
2. Hubs shall be fabricated of hot-dip galvanized steel and ductile cast iron, assembled with 316L stainless steel hardware. Galvanized steel components shall be epoxy coated after galvanizing to a dry film thickness of 12 mils. Hubs shall be statically balanced at the factory. Contractor shall ensure that the operating speed is well clear of any critical speeds associated with the whole assembly or any part thereof.
3. The complete mechanical assembly of each cell shall be supported by a rigid, unitized, torque-tube type support that prevents misalignment between the motor and the gear reducer. Support and any associated structural members shall be epoxy coated mild steel, to which heavy plate platforms for the motor and gear reducer have been welded. The support base for the gear box and motor shall be a machined base. The torque tube shall have structural outriggers to provide structural stability and transmit loads into the tower structure. Provision shall be made in the design of the support for the fitting of demountable lifting gear for maintenance purposes at both the gearbox and drive motor ends. All parts of the fan assembly support shall be effectively protected against the corrosive and erosive environment in which it will be located

H. Fan Motors

1. Two-speed motors shall be located outside the fan cylinders and shall be connected to the speed reducer by tubular, extended, full floating driveshafts. Driveshaft tubes shall be carbon fiber/glass/epoxy composite.
2. Flanges shall be manufactured of 316L stainless steel, attached to the tube by type 316L stainless steel compression rings. Couplings shall be cast 316 stainless, joined to the driveshaft by flexible neoprene bushings and type 316 stainless steel inserts. Connecting hardware shall be 316 stainless steel.
3. Driveshaft assemblies shall be dynamically balanced at the factory at full motor speed.
4. Two type 316 stainless steel driveshaft guards anchored to the mechanical equipment support shall surround the driveshaft for containment in the event of failure. Protective guards shall be provided for the shafts at the end with the electric motor.
5. Cooling tower fan motors and their terminal boxes shall be rated IP55.
6. The maximum power consumption of the tower fan motors shall not exceed the value indicated on the data sheets.
7. Additional fan motor requirements may be found in Section 262050 Low Voltage Motors.

I. Drive Shafts

1. Hollow rotating components shall be either sealed to prevent water ingress or be effectively drained to prevent accumulated water from impairing the balance. All shafts shall be prevented from major displacement by suitable retaining straps situated just clear of the shafts.
2. Belt drives are not acceptable.

J. Gear Drives

1. Gear reduction units shall be double reduction, right-angle type, utilizing helical and/or spiral bevel matched gear sets. Cases shall be epoxy coated, ASTM Class 20, gray cast iron. Bearings shall be tapered roller type. Gears and bearings shall be splash-lubricated in a bath of turbine type mineral oil. Gear reducers shall meet or exceed the requirements of CTI STD-111 and AGMA STD 420.4. Gear boxes shall have a minimum AGMA service factor of 2.0 and be designed for the life of the plant. Bearings shall be designed for a minimum L_{10} life of 100,000 hours when the shaft is subjected to a bending moment of three (3) times the normal torque at the fan. Gear Reducers shall be run-in under load and adjusted at the factory. Interior surfaces shall be coated with a rust-proofing oil prior to shipment.
2. Gear boxes shall have an oil level sight glass, fill line, vent line, drain line, a low level switch and grease fittings connections all located outside the fan stack for convenient maintenance access. Adequate lubrication shall be automatically provided for windmilling. All oil lines and components shall be 316 stainless steel. External oil pumps will not be acceptable. Double oil seals shall be employed throughout to eliminate as far as possible the risk of oil leakage or the ingress of moisture. The lubrication system shall ensure that all gearing is totally immersed when the unit is at standstill to protect against corrosion and shall also ensure that adequate lubrication is provided to all elements requiring lubrication when operating.
3. Each cell shall be equipped with an external stainless steel oil level gauge and gear reducer drain line, terminating at a sight glass and plug located outside the fan cylinder near the motor. Lubricating oil fill and drain pipes shall be extended to a convenient point outside the fan stack and, if required, an appropriate air vent should be provided for use during the addition of oil. Oil level indication, which shall be gradated to show, recommended standing and running oil levels. All low level switches shall be completely weatherproof and of corrosion proof construction, SPDT, in a NEMA 4X or greater housing. Switches shall be conveniently located external to the fan stacks and easily accessible for inspection. Each speed reducer shall be equipped with a magnetic cap for protection against burrs present in the lubricating oil.

K. Vibration Monitoring

1. Individual vibration monitoring transducers (Bently-Nevada) shall be provided for each gearbox assembly and shall consist of analog vibration sensing devices for monitoring and trending vibration, and providing alarm and shutdown signals as required. Each group of four (4) cells shall have one Bently-Nevada 1900/65 series vibration monitoring rack located on the fan deck. Each rack shall transmit the analog vibration data to the plant control system using hard-wired 4-20mA signals. Contractor shall supply definite 4-20mA ranges and alarm and trip set points and indicate which standard or criteria were used in selection of the set point. Transducers and monitors shall be mounted in IP66 enclosures.
2. Individual vibration cut-out switches shall be provided for each fan motor which will effectively and safely disconnect the electrical supply to the drive motor in the event of any abnormal vibration of the mechanical equipment. The switches shall be of the manual reset type, which requires resetting before the drive motor can be restarted following its operation and subsequent to clearing the fault. It shall incorporate means of adjusting the response level to allow for normal slight vibrations, which may occur during starting and stopping of the fans. The switches shall be conveniently located external to the fan stacks

and easily accessible for inspection or resetting. All switches shall be completely weatherproof and of corrosion proof construction, Metrix or equivalent, SPDT, in a NEMA 4X or greater housing, with optional remote electrical reset.

L. Fan Stacks

1. The fan stacks shall consist of factory molded FRP segments joined by vibration proof fittings and be self-supporting. Stiffeners, external supports or cables are not permitted. Reinforcing ribs shall be incorporated in the segment moldings external to the airstream surface to provide adequate design strength and rigidity against live loads and mechanical vibrations. Each fan cylinder segment shall be through-bolted to both the fan deck and a primary fan deck framing member. Anchorage by lag screws into the fan deck alone will not be permitted. Fan cylinder connection and anchorage hardware shall be 316L stainless steel. Each stack must have a removable access through which maintenance can be performed on the inside mechanical equipment. A sight glass shall be provided for each fan stack.
2. The fan stacks shall incorporate entrance flares (velocity recovery) flares with extended approach to the fan. Fan cylinders shall be with eased inlets to promote airflow at blade tips. The smooth operating plane of the fan shall be at a level above the fan deck of at least 15% of the overall fan diameter. Fan tip clearance shall not exceed 0.5% of the fan diameter. Velocity recovery fan cylinders shall have a maximum flare angle of 12 degrees, with a maximum assumed velocity recovery of 75% of the difference in average velocity pressure and have an extended diffuser section to aid the above gas diffusion and reduce recirculation. The minimum exit air velocity shall be 30 ft/s at maximum fan speed.

M. Endwalls

1. The endwalls of the tower as well as the sidewalls above the air inlet elevation shall be cased with 8 oz/ft^2 corrugated FRP panels attached to tower columns with 316L stainless steel screw shank fasteners and self sealing washers. Panels shall be installed with corrugations horizontal and shall be lapped to shed water inward to the tower. Joints shall be lapped and sealed watertight. Casing ends at tower corners shall be covered with 12 oz/ft^2 FRP 90 degree corner rolls. To reduce windage losses at the tower corners, the endwalls shall extend around the corners of the tower to cover the beginning 3 ft of the air inlet opening.

2. The casing wall sheeting shall be lapped so as to shed water within the tower confines and shall be opaque to inhibit the growth of algae. The casing walls shall be completely air-tight and effectively prevent air by-passing the designed air entrance.

N. Partition Walls

1. The tower shall be partitioned such that the fan of each cell can be operated and cycled independently of the remaining cells and shall be designed so that each cell can be isolated from water flow during operation and maintenance. Full width, full height, watertight, corrugated FRP panels shall extend from casing to casing across the tower, and from the top of the lowest basin water level upward to the underneath side of the fan deck floor. Each partition shall be rated for minimum fire separation per NFPA 214, with a half hour

fire rating and shall effectively prevent air leakage between adjacent cells, during operation and maintenance. The partitions shall be constructed from minimum 12oz/ft^2 fire retardant fiberglass corrugated panels. Fiberglass panels shall be firmly fixed to the tower structure with 316 stainless steel drive screws or bolts and washers. Nailing shall not be permitted. Cell dividers shall be provided so that the cells shall be totally independent. All divisions must extend a minimum of 20" below top of curb. The partition walls shall be not less than 2".

O. Windwalls

1. A full-length, full height, watertight, corrugated FRP panel partition shall also extend from endwall to endwall along the approximate centerline of the tower, rising from the basin level girt line to the underneath of the fill. Wind walls shall extend inward at an approximate 45 degree angle from the corner columns of the end cells to meet the longitudinal partition. All divisions must extend a minimum of 20" below top of curb.

P. Piping and Valves

1. All piping shall conform to design, installation, testing and inspection requirements of ASME B31.1. Valves shall be appropriate for the pressures and temperatures of each specific application. Contractor shall provide an adequate pipe anchoring system to allow pipe expansion, contraction and resistance to appropriate seismic and operating loads.
2. Flanges for piping 24 inch and smaller shall be in accordance with ASME B16.5. Flanges for piping larger than 24 inch shall be in accordance ASME B16.47 Series A. All FRP flanges, and flanges for connection to the General Managers non-metallic piping, shall be flat faced.
3. FRP piping shall be of the reinforced thermosetting resin type manufactured by the filament wound process using a thermosetting polyester resin reinforced with fiberglass, generally to ASTM D2310 designation NTDD105 and AWWA Standard C950.
4. Where above ground pipework is FRP material, it shall be suitably supported in accordance with manufacturer's requirements and protected from damage from impact or other accidental causes. Pipe joints shall be made only by suitably qualified and experienced tradesmen to a procedure to be approved by the General Manager.
5. Joining and repair procedures for FRP piping shall be developed by the Contractor and included in the plant maintenance manuals. Special tools for the repair of the piping during the life of the cooling tower shall be supplied by the Contractor.

Q. Access and Safety

1. An HDG steel ladder with safety cage fire escape ladder meeting OSHA requirements shall be provided one end of the cooling tower and a FRP stairway. Contractor shall provide handrails and toe boards on the stairway and fan deck to comply with all applicable regulations. Lighting shall be provided on the stairway, ladder, fan deck, and around the tower by Contractor.
2. Each cell shall have a lift-off access hatch in the fan deck floor and a ladder leading down to a landing at the drift eliminator level. Each landing shall have a lift-off hatch for entry to the top of the fill and water distribution level. There shall be a minimum 3 foot crawl space between the top of fill and drift eliminator for access to water nozzles.
3. Fan cylinders shall have easily removable external hatches of sufficient size to permit removal of all mechanical equipment and components. A removable access catwalk shall be provided.

4. All doors providing access into the cooling tower shall be designed to be easily opened from the inside of the tower and shall open outwards. Bolts, locks, catches etc. on such access doors shall be such that they cannot accidentally become fastened, and the door frame shall be designed to avoid future warpage. A device to compensate for the pressure difference when operating shall be fitted to the door. Partition doors shall be fire rated equal to the partition wall fire resistance rating. All means of access to the tower shall be suitably designed to comply with all applicable regulations and shall be adequately lit and guarded.

R. Noise

1. Noise limits shall conform to the Section 480031, Combined Cycle Power Island Noise Control Performance.

S. Lightning Protection

1. Lightning protection per NFPA 780 shall be provided by the BOP Contractor. Pigtails shall be terminated on NEMA 2 hole ground pads 6" above grade. Under no circumstances shall the lightning protection system be comprised of any bare copper or copper alloys; it shall be comprised of either stainless steel or aluminum.

T. Lighting

1. Contractor shall provide a tower lighting system for the fan deck, stairway, and ladder. Lighting shall have a minimum 100 lumen coverage. Light fixtures shall have IP 65 enclosures.
2. Lighting shall not be attached to cooling tower handrails.

U. Instrumentation

1. Refer to Section 481100, Combined Cycle Power Island for instrument calibration requirements.

2.5 ACCESSORIES

A. Insulation

1. Refer to Section 481100 Combined Cycle Power Island for insulation requirements.

B. Equipment Removal System

1. Contractor shall furnish equipment removal system capable of handling the largest single piece of electrical or mechanical equipment.

2.6 FABRICATION

A. Refer to Section 481100 Combined Cycle Power Island for general fabrication, cleaning, finishing, and painting requirements.

2.7 SOURCE QUALITY CONTROL

A. Refer to Section 481100 Combined Cycle Power Island for general source quality control, test, and inspection requirements.

PART 3 - EXECUTION

3.1 COMMISSIONING

A. General

1. The Contractor shall provide onsite commissioning and testing support of the equipment.
2. The Contractor shall allow for training of the General Manager's personnel appointed to operate the equipment and involved in commissioning.
3. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the right to remove and take away from site such commissioning and test equipment upon completion.
4. The Contractor shall submit a detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 3 months prior to the commencement of site testing.

B. Commissioning Scope

1. The base scope of the installation and commissioning plan shall provide:

a. Advance knowledge of project schedules, completion dates, and key event dates.
b. General definition of manpower and material resources required.
c. A means of verifying that all critical calibrations, both mechanical and electrical, have been checked.
d. In addition to the documentation that makes up the base scope the Contractor shall include the services of an Installation and Commissioning Manager to monitor and continuously update the plan during the installation and commissioning period.

3.2 TRAINING

A. Refer to Section 481100, Combined Cycle Power Island for general personnel training requirements.

B. Operation and maintenance training shall be provided for up to 10 end user operation and maintenance personnel (not including travel and accommodations) and shall include the following topics:

1. Minor mechanical maintenance
2. Controls and instrumentation
3. Water treatment

C. Prior to award of contract, the Contractor shall provide content of the training program for the General Manager's approval.

SECTION 485952
CONDENSATE POLISHER

PART 1 - GENERAL

1.1 SUMMARY Refer to Attachment 1 – Scope of Supply, Attachment 1 Scope of Supply, Mechanical and Fluid.doc

A. This specification details the minimum technical requirements for the design, manufacture, testing, and furnishing of a condensate polisher skid to treat condensate water flows prior to entering a heat recovery steam generator. The scope includes initial charge of resin, piping, valves, and instrumentation. It is not the intent to specify completely herein all details of design and construction of the equipment and its related auxiliary systems. However, the equipment shall conform in all respects to high standards of engineering, design and workmanship and be capable of performing in continuous commercial operation up to the Contractor's guarantee in a manner acceptable to the General Manager.

B. The Contractor shall have single source responsibility for all equipment furnished under this specification. No departure shall be made from this specification and the referenced standards and codes unless specific requirements are waived or amended in writing by the General Manager.

C. In the event of a perceived conflict among referenced standards, codes and the documents included in this specification, or a perceived conflict between the technical requirements of the specification and the Contractor's ability to meet the performance requirements contained herein, the Contractor shall refer the conflict in writing to the General Manager for resolution.

1.2 FURNISHED BY CONTRACTOR

A. The Contractor shall design, fabricate and test the specified equipment, including but not limited to the following:

1. Packed bed Cation Exchangers including initial charge of resin, piping, valves, and instrumentation.
2. Packed bed Anion Exchangers including initial charge of resin, piping, valves, and instrumentation.
3. brine system
4. Mixed Bed Polishers including initial charge of resin, piping, valves, and instrumentation.
5. Control System to automate operations
6. All instrumentation necessary for control
7. Piping and valves
8. Conduit
9. Pipe and conduit supports
10. Wiring, both power and control
11. Loop checks, instrument calibrations
12. Startup and performance testing
13. Operator training

1.3 BY OTHERS

A. The supply by Others shall be limited to the following:

1. Foundations
2. Power
3. Support foundations for system skid
4. Tie-in of piping, electrical power, and control wiring at system interfaces

1.4 RELATED SECTIONS

A. Section 480020, Site Conditions

B. Section 481100, Combined Cycle Power Island

C. Section 261050, Medium Voltage Motors

D. Section 262050, Low Voltage Motors

1.5 CODES AND STANDARDS

A. Refer to 481100 Combined Cycle Power Island for general codes and standards applicable to the project. The following codes and standards apply to the specific equipment supplied under this Section.

1. American Institute of Steel Construction (AISC)
    a. 341 - Seismic Provisions for Steel Construction
    b. 360 - Steel Construction Manual
2. American National Standards Institute (ANSI)
3. American Society of Mechanical Engineers (ASME)
    a. B1.1 - Unified Inch Screw Threads
    b. B16.34 - Valves-Flanged, Threaded, and Welding End
    c. B16.5 - Steel Pipe Flanges and Flanged Fittings
    d. B16.9 - Factory - Made Wrought Steel Butt Welding Fittings
    e. B16.21 - Non-metallic Flat Gaskets for Pipe Flanges
    f. B31.1 - Power Piping
    g. B31.3 - Process Piping
    h. PTC 19 - Instruments and Apparatus
    i. PTC 36 - Measurement of Industrial Sound
4. American Society for Testing and Materials (ASTM)
    a. A105 - Carbon Steel Forgings for Piping Applications
    b. A312 - Specification for Seamless and Welded Austenitic Stainless Steel Pipe
5. Hydraulic Institute (HI)

1.6 DEFINITIONS

A. Balance of Plant (BOP) Contractor: The party employed by the City to oversee construction efforts, install Contractor's work and coordinate Contractor's and Subcontractor's work on the site.

B. City: The City of Pasadena, CA

C. Contractor: The Contractor, or individual, partnership, corporation, joint venture, or other legal entity having a Contract with the City to perform the Work specified directly or by reference in Section 481100, Combined Cycle Power Island Equipment.

D. General Manager: The General Manager of the Water and Power Department, or his/her properly authorized agent, representative, or engineer, acting within the scope of the particular duties and authorities delegated to them.

1.7 SYSTEM DESCRIPTION

A. Design Requirements

1. The System shall be the Contractor's design, modified as required, to comply with this specification. Major equipment shall be of proven design with a minimum of 2 years of successful operation in equal or more severe design and operating conditions as outlined in Technical Datasheet by Contractor.
2. The System shall be designed to provide trouble-free operation during startup, shutdown, and system operating modes.
3. The complete System shall be furnished on a skid mounted assembly. Components on a skid assembly shall be installed properly and completely pre-piped and prewired. Electrical interface connections shall be brought out to junction boxes at the edge of the skid. Contractor/General Manager piping interface connections shall terminate at the skid boundary. Piping shall be supported from skid or equipment.
4. The design of equipment, arrangement of components, and routing of piping and electrical conduit shall consider operation and maintenance accessibility of components. Equipment, piping, and conduit shall be arranged so that when installed, components requiring manipulation, observation, or maintenance will be readily accessible and safe to operating and maintenance personnel.
5. Pneumatic tubing shall be preassembled on skids and run to a common point, and supported adequately with structural steel angles or channels to provide straight runs.

B. Performance Requirements

1. The Contractor shall guarantee that the System will meet the effluent pressure, volumetric flow rate, and quality as specified on the Technical Datasheet by Contractor.

C. Reliability: No single failure of an auxiliary component or system shall result in damage to the System. The Contractor shall provide adequate redundancy to meet this requirement. Contractor shall clearly identify which non redundant components or systems are capable of causing a forced outage of the unit in the event of a failure. Contractor shall provide additives for redundancy for these systems and components.

1.8 ALTERNATIVES Contractor will furnish an alternative technology as described in Attachment 1 – Scope of Supply, Attachment 1 Scope of Supply, Mechanical and Fluid.doc

A. The Contractor may provide Alternate Bid(s). Any Alternate Bids proposed by the Contractor shall provide a clear benefit/advantage to the General Manager. The contractor shall state this benefit/advantage in their proposal. The Contractor shall clearly state the technical differences between the Base Bid and any Alternate Bids. Alternate Bids shall be supported with complete technical, performance, and cost data.

B. The Contractor may request alternative materials, equipment, or configurations for consideration provided compliance to requirements of applicable codes is not compromised.

1.9 SUBMITTALS

A. Refer to Attachment 11 – Drawing Schedule

1.10 QUALITY ASSURANCE

A. Refer to Section 481100, Combined Cycle Power Island for general quality assurance requirements.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping

1. Refer to Section 481100, Combined Cycle Power Island for general packaging and shipping requirements.

1.12 SITE CONDITIONS

A. Refer to Section 480020, Site Conditions.

1.13 WARRANTY

A. Refer to Article 13 in the Contract.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The following Manufacturers are pre-approved to supply equipment specified within this Section. Additional Manufacturers must be submitted to the General Manager for approval before consideration to include in the Contractor's Proposal.

1. Not Used

2.2 MATERIALS AND WELDING

A. Refer to Section 481100, Combined Cycle Power Island for general material and welding requirements.

2.3 EQUIPMENT

A. Condensate Polisher Skid

1. Condensate Polisher Skid shall contain 2x100% process trains with bypass capability. The skid layout shall be designed to facilitate offsite regeneration of the ion exchange resin vessels.
2. The bypass should be used only to continue to supply feedwater in the event of a malfunction of the condensate polishing system.
3. Condensate polishers shall be equipped with recycle systems to be used when placing vessels in service or prior to startup. The recycle flow will compact the bed and prepare it for condensate flow as well as allow monitoring of each bed's effluent quality as a final quality check.

2.4 COMPONENTS

1. Service Vessels

   a. Service vessels should be constructed according to the ASME Section VIII Code for Unfired Pressure Vessels.
   b. The design pressure for the vessels shall be the highest pressure the vessel can be exposed to, generally the condensate pump shutoff head.
   c. Cylindrical vessels shall be supplied with flanged and dished heads, according to the ASME Code. All connections to service vessels should be with flanged nozzles. Use of pad type flanges should be limited to sight ports only.
   d. Carbon steel vessels shall contain an interior lining to prevent corrosion. Contractor shall provide at least 5 year warranties for their standard linings.
   e. Service vessels shall be equipped with at least two sight glasses, one in the top to confirm resin levels and one at the bottom to allow inspection of the underdrains and to ensure that resin removal is complete.

2. Influent Water Distribution

   a. Inlet distributors shall provide uniform water flow across the surface area of the resin bed and thus uniform flow throughout the resin volume. Condensate flows of approximately 50 gpm/ft^2 through the bed must be maintained to prevent jets and eddies that will fluidize the resin.

3. Underdrains

   a. The vessel underdrain design must provide for uniform flow through the resin bed, allow complete removal of exhausted resin, protect against resin leakage, and provide sufficient support to withstand expected weight and hydraulic forces.

4. Sight Glasses

   a. Sight glasses are required to permit observation of the key steps in the condensate polisher operation. Sight glass installation should assure that a smooth surface is maintained inside the service vessel to prevent resin getting trapped in the sight glass housing.
   b. Sight glasses should be easily accessed and located away from interferences by valves, piping, pumps etc.

5. Resin Traps

   a. Resin traps should be designed to prevent gross ingress of resin into the feedwater system in the event of polisher vessel underdrain damage or failure. Generally, they should not be designed to retain resin fines.
   b. Clean resin trap differential pressure at rated flow rate shall be less than 2 psi.
   c. Trap strainer element capable of withstanding a differential pressure equal to system operating pressure to prevent strainer rupture and release of collected resin and corrosion products.
   d. Backwash and drain connections shall be provided for “in situ” strainer element cleaning.
   e. Resin traps shall be designed for easy removal of strainer element for cleaning or replacement.

6. Service Vessel Piping

   a. Polishing influent and effluent piping materials should be carbon steel or alloy steel, consistent with the piping used for the remainder of the condensate system.

2.5 ACCESSORIES

A. Not Used

2.6 CIVIL AND STRUCTURAL

A. Refer to Section 481100, Combined Cycle Power Island for civil and structural requirements

2.7 INSTRUMENTATION AND CONTROLS

A. General

1. It is the intent of the General Manager to integrate the Contractor's equipment into a Contractor-furnished plant control system (PCS). All control devices furnished by the Contractor shall be capable of interfacing with the plant control system and provide it with sufficient data and status information required for system control and performance monitoring. This includes all data from process sensors furnished by the Contractor. Equipment and controls furnished by the Contractor shall allow the plant control system to remotely start and stop all rotating equipment and to allow automatic switch over to any backup units.

2. Instrumentation and controls plan shall be designed such that no single instrument fault will cause a trip of the plant.
3. The Contractor shall permanently install a 1-1/4 inch stainless steel identification tag in a conspicuous location on each instrument and control device. The tag shall bear General Manager's specified “Instrument Tag Number” to be provided later. The Contractor shall use this tag number when reference is made to any tagged device in correspondence, engineering documentation, or any other communication with General Manager.
4. All skid mounted control and instrument wiring shall be provided with cable identification tags on the main cable trunk and individual conductors shall be uniquely identified and tagged at both termination points. Provisions shall be made for wiring of non-skid mounted devices. Special cables or termination kits if required for flame scanners, ignition transformers, etc. shall be provided by the Contractor for installation by the BOP Contractor.
5. The control philosophy shall provide a high level of plant automation. Sufficient operator interface devices are to be provided to enable safe start-up, operation, and shutdown. Roving operators place some auxiliary equipment into operation manually at the equipment location or at a motor control center to establish ready-to-start status.
6. The control system shall provide protective features to enable safe operation. The system shall have built-in logic and circuitry to alarm, annunciate, and trip as a result of abnormal operating conditions. Logic is to be designed to provide interlocks to improve plant availability and guidance to the operator about design limits.
7. Plant systems and equipment are to be monitored and/or controlled through the plant control system. Packaged systems with self-contained controllers are only to have high-level monitoring and starting interfaces to the plant control system.
8. All instrument tubing shall be stainless steel and fittings shall be Swagelok or equivalent.
9. All pneumatic and motor operated on/off valves shall have control room indication of open and closed status via two DPDT position limit switches or proximity switches, unless noted otherwise.
10. Contractors control system shall utilize a control platform that integrates well with the General Managers Plant Control System which will be Rockwell’s RSLogix 5000.

B. Instrumentation & Control Devices – Requirements

1. 3-wire, 100-ohm platinum RTDs shall be used.
2. Should thermocouples be used, appropriate junction devices shall be supplied for use with thermocouple conductors where necessary to avoid cold junction signal distortion.
3. Thermowells shall be a minimum of 3/4 inch diameter drilled solid bar type with taper. Thermowell body shall be long enough to clear General Manager furnished insulation.
4. Electronic transmitters shall be Yokagawa, Endress & Hauser, or SMAR smart transmitters.
5. Control valves and pressure regulators shall be manufactured by Fisher.

PART 3 - EXECUTION

3.1 SPARE PARTS

A. Refer to Section 481100 Combined Cycle Power Island for spare parts requirements.

3.2 COMMISSIONING

A. General

1. The Contractor shall allow for training of the General Manager's personnel appointed to operate the equipment and involved in commissioning.
2. The Contractor shall arrange and supply any test or additional instrumentation required for all commissioning or performance testing, but shall retain ownership of and have the right to remove and take away from site such commissioning and test equipment upon completion.
3. The Contractor shall submit a detailed and comprehensive plan which describes the commissioning and testing of the plant and equipment that is within the scope of supply in accordance with the timetable that is specified by the contract program but not later than 3 months prior to the commencement of site testing.

B. Field Acceptance Tests

1. Refer to Section 481100 Combined Cycle Power Island for general field acceptance test requirements.

CleaverBrooks®

LOW EMISSIONS, COMPACT, QUIET

INSTANTANEOUS ELECTRIC RESISTANCE BOILER

Models: S, CR, WB, HSB & IWH

Steam and Hot Water

12-3375 kW • 208-600V

Electric Boilers

Features

Compact, economical units that deliver maximum output with minimum space requirements. Ideal for new boiler applications or as a replacement unit to upgrade existing installations.

Steam boiler models S, CR & HSB along with hot water boiler model WB take up less floor area and fits through smaller openings than large conventional units. The instantaneous hot water boilers, IWH Model, are also designed with a compact floor plan.

The Electric boiler is one of the many products Cleaver-Brooks offers to meet your boiler room needs. Performance and reliability in a small package.

Why an Electric Boiler?

Cleaver-Brooks Electric Boilers are designed for heavy duty commercial and industrial heating needs. They serve as either a primary or supplementary source of both hot water and steam. These immersion element boilers are quiet, flame-free and compact. Electric boilers completely eliminate the need for stacks and emission control. C-B electric water boilers use resistance elements as a source of heat while keeping water volume as low as possible to allow close control and rapid response.

Advantages

Compact Design

The smaller footprint reduces the overall boiler room space requirement.

No Stack or Fuel Requirements

The unit can be located anywhere in the building and the exterior of the building is not compromised with an unsightly stack, particularly helpful in tall or high rise buildings.

Typical Applications

Universities and Schools

Hospitals and Clinics

Commercial Buildings

Emissions

Electric boilers are 100% local emission free. This is beneficial in meeting the total emissions of a given project site, or in areas where fuel combustion emissions are limited.

Quiet Operation

Elimination of combustion noise and minimal moving parts results in extremely quiet operation.

High Efficiency

The electric boiler will provide nearly 100% efficiency at all operating points.

Ease of Maintenance

The absence of higher maintenance combustion equipment and the use of solid state control devices reduce the complexity and number of moving parts. Electric elements are very accessible and easily replaceable, either individually or in flange mounted groups.

Lower Operating Cost

For areas affected by allocations or interruptions of natural gas and costly oil supplies, electric boilers provide a dependable source of steam or hot water. Electric boilers offer a clean, alternative to fossil fuels allowing users to take advantage of lower energy rates during daily or seasonal off-peak periods.

Quality Construction

ISO 9001:2001 certified manufacturing processes ensure the highest compliance with manufacturing standards.

Each unit is tested and certified in accordance with UL or cUL and a label is affixed attesting to meeting the latest requirements for packaged electric boilers.

Progressive Sequencing Modulation

By individually controlling the heating elements with solid-state digital step controllers only the amount of electrical energy required in response to the system demand is used. In addition virtually a full range of input control is available with optional solid-state analog current controllers that reduce on/off cycling while providing unprecedented load tracking, and thus reduced operating costs.

Standard Features

Boiler:

- ASME Code Vessel
- UL Listed
- Integral Steel Frame
- Incoloy 800 Heating Elements
- Fiberglass Insulation
- ASME Pressure Relief Valves

Trim:

- Proportional Pressure (Temperature on WB & IWH) Control on most sizes
- Manual Reset High Pressure (Temperature on WB & IWH) Control
- Auxiliary Low Water Cut-off (Low Water Cut-Off on WB & IWH)
- Auxiliary Auto High Water Cut-off
- Pilot Light: Control Power On, Low Water, High Pressure (Temperature on WB & IWH)

Electrical Equipment:

- 200,000 AIC Rated Fuses
- Contactors rated at 500,000 Cycles
- Control Circuit Step-Down Transformer
- Customer Connection Terminal Strip
- Primary Lugs Connection Lugs

Model-WB Boiler

Simple to use Interface

SAMPLE SPECIFICATIONS

The following sample specifications are provided by Cleaver-Brooks to assist you in meeting your customer's specific needs and application.

PART 1 GENERAL

1.1 CAPACITIES

A. Boiler Capacity - Hot Water

1. The _____ gallon _____ capacity hot water boiler shall be Cleaver-Brooks Model _____ rated _____ kW at _____ V, _____ ph, 60 Hz, _____ MBtu/hr. Unit shall be suitable to operate under the following conditions: system flow rate _____ gpm; outlet water temperature _____ °F; return water temperature _____ °F; system operating pressure _____ psig.

B. Boiler Capacity - Steam

1. The _____ gallon _____ capacity steam boiler shall be Cleaver-Brooks Model _____ rated _____ kW at _____ V, _____ ph, 60 Hz. Unit shall produce _____ lbs steam/hr (from and at 212 °F) at a nominal pressure of _____ psig.

C. Water Heater Capacity - Instantaneous

D. The horizontal circulation water heater shall be Cleaver-Brooks Model IWH _____ rated _____ kW at _____ V, _____ ph, 60 Hz.

1.2 STORAGE TANK HEATER CAPACITY

The _____ gallon capacity (horizontal or vertical) shall be Cleaver-Brooks Model _____ rated kW at _____ V, _____ ph, 60 Hz, and shall recover _____ gpm at 100 °F rise.

PART 2 PRODUCTS

2.1 BOILER

A. The vessel shall be constructed in accordance with ASME Boiler Code.

B. The vessel shall be designed for _____ psig.

C. The relief valve shall be per ASME Code, set at _____ psig.

D. The vessel shall be insulated with a double wrap of 2-inch fiber blanket insulation having 1-1/2 PCF density.

E. The boiler shall be UL listed, and bear the Underwriters Laboratories' label.

F. The boiler shall be of the packaged type, factory assembled, wired, and tested.

G. The boiler shall be mounted on a full size structural steel base.

H. The boiler enclosure shall be 16-gauge steel.

I. The entire enclosure shall be finished in light blue enamel paint.

J. The overall dimensions of the boiler shall be _____ inches long, _____ inches wide, and _____ inches high.

K. For CR Models, the boiler shall include built-in condensate receiver and feed pump, with make-up valve mounted on common base with boiler, factory wired and piped, and enclosed in boiler casing.

2.2 HEATING ELEMENTS

A. The heating elements shall be individually mounted, rod type, and field replaceable with standard tools.

B. The heating watt density shall not exceed _____ (50 or 75) W/sq-in.

C. The heating elements shall be (copper or Incoloy) sheathed.

2.3 TRIM AND CONTROLS

A. The units shall be complete with the following:

1. Main lugs for supply circuits.
2. Supplemental internal branch circuit fuses, current limiting, rated at 200,000 amps interrupting capacity.
3. Fused 120 V control circuit transformer.
4. Magnetic contactors rated at 500,000 cycles.
5. Integral high temperature limit (hot water boilers).
6. High pressure limit (steam boilers).
7. Low water cutoff (float-type with gauge glass for steam) on all models except IWH which is supplied with a flow switch.
8. Pressure-temperature gauge (hot water boilers).
9. Pressure gauge (steam boilers).
10. Pilot switch.
11. Pilot lights for power on, low water, high temperature or pressure.
12. Relief valve.
13. Drain valve (hot water boilers).
14. Bottom and water column blowdown valves (steam boilers).
15. Feedwater stop and check valves (steam boilers).
16. All models except IWH shall be supplied with modulating step controls to gradually apply the load in _____ steps.
17. All models except IWH shall be supplied with proportioning temperature (hot water units) or pressure (steam units) control to balance power input to match system demand.
18. Temperature control on IWH is one of the following methods (select a. or b. or c. below).
    a. Thermostats - The heating elements shall be staged by control thermostats. (Standard for one and two step heaters).
    b. Sequencer - The heating elements shall be staged by a time delay sequencer, to energize heating elements in _____ stages with an adjustable 1 to 15 second time delay between stages. (Standard for 3 or 4 step heaters.)
    c. Modulating Step Control - (Standard for heaters above 4 steps).

PART 3 EXECUTION

3.1 WARRANTY

A. The Cleaver-Brooks unit shall be warranted against defective workmanship and materials for a period of one year from the date of start- up or 18 months from shipment.

This section contains information on the complete line of Cleaver-Brooks electric boilers with kilowatt output ratings from 12 to 3,375 kW. Electric boilers are typically utilized for applications where stringent environmental regulations and boiler space requirements are critical.

FEATURES AND BENEFITS

In applications where electric power is more economically available than fossil fuels, or where fossil fuel combustion and the handling of combustion by-products are unacceptable, electric boilers offer a viable alternative.

Compact Design

Electric boilers are typically one-quarter to one-half the size of fuel fired boilers with similar BTU per hour output. The smaller footprint reduces the overall boiler room space.

No Stack Requirements

With no products of combustion to contend with, installation costs are reduced by the elimination of stack requirements. This means the unit can be located anywhere in the building and the exterior of the building is not compromised with an unsightly stack, particularly helpful in tall or high rise buildings.

Emissions

Because there is no combustion, electric boilers are 100% emission free. This is beneficial in meeting total emissions of the project site or in areas where fuel combustion emissions are not tolerated.

Quiet Operation

Elimination of combustion noise and minimal moving parts results in extremely quiet operation, virtually no noise emissions. Very beneficial in applications such as hospitals, nursing homes, schools, and the like.

High Efficiency

With minimum radiation losses and not having the losses associated with combustion equipment the electric boiler will provide nearly 100% efficiency at all operating points.

Ease of Maintenance

The absence of high maintenance combustion equipment and the use of solid state control devices reduce the complexity and number of moving parts.

Electric elements are easily accessible and replaceable either individually or in flange mounted groups.

Pressure vessel components are not subjected to thermal stresses induced by high temperature differentials and cycling encountered with fossil fuel combustion.

Quality Construction

ISO 9001:2001 certified manufacturing process ensures the highest degree of manufacturing standards are always followed.

ASME Code construction ensures high quality design, safety, third party inspection, and reliability, and stamped accordingly.

Each unit is tested and certified in accordance with UL or cUL and the Label is affixed attesting to meeting the latest UL requirements for packaged electric boilers.

Progressive Sequencing Modulation

By individually controlling the heating the heating elements with solid state digital step controllers, only the amount of heat required in response to the system demand is achievable. Virtually unlimited input control is available with optional solid state analog current controllers, which reduces on/off cycling, excellent load tracking, and reduced operating costs.

Designed For Heating Applications

Electric boilers are able to withstand virtually any return water temperature. With combustion by-products and high temperature differentials eliminated, condensation and thermal shock do not limit return water temperatures.

Because of the design characteristics, the electric boiler is well suited for applications utilizing indoor/outdoor reset controls, radiant floor heating, snow melt systems, and ground source heat pump systems

For potable water applications, the IWH can be used with the optional epoxy lining or with the optional stainless steel trim.

PRODUCT OFFERING

Information in this section applies to electric resistance steam or hot water boiler sizes ranging from 12 kW through 3375 kW for operation on 208, 240, 380, 480, 575 or 600 volts, thee phase power supplies. Installation is for indoor use only.

The complete package has been tested and certified in accordance with U.L. and is approved, listed, and bears the U.L label (U.S.A. and Canada) for electric resistance boilers. For Canada, each vessel is registered in each Province and the relative CRN number is attached to the boiler.

Dimensions, ratings, and product information may change to meet current market requirements and product improvements. Therefore, use this information as a guide.

Refer to Table B4-1 as a quick reference guide to the boiler models and sizes provided.

Standard Equipment – Steam Boilers

Equipment described below is for the standard steam electric boilers offering:

A. Model CR and S Boiler

1. Each boiler is designed and constructed in accordance with the A.S.M.E. Code; UL listed, and are mounted on an integral steel frame. Fiberglass insulation (2" thickness) is covered with a preformed, sectional steel painted jacket, factory installed.
2. Trim and Controls:
   a. Manual Reset High Pressure Cutoff.
   b. Probe Aux. Low Water Cutoff, MR.
   c. Aux. Auto High Pressure Cutoff.
   d. For S/CR-120 through 161:
      - 1-Step (1) on/off pressure switch.
      - 2-Step (2) on/off pressure switch.
   e. For Models S/CR 162 and greater:
      - Solid state electronic proportional pressure control with progressive step control with adjustable span and inter-stage time delay.
   f. Primary Low Water Cutoff and On/Off Pump Controller.
   g. Bottom and Water Column Blowdown Valves.
   h. Feedwater Stop and Check Valves.

i. A.S.M.E Pressure Relief Valve(s).

j. Steam Pressure Gauge w/test cock.

k. Sight Gauge with drain and guards.

3. Model CR Boilers include an integral Feedwater Tank and Feedwater Pump Assembly piped and wired.

4. Electric Equipment

   a. Main Control Panel. Panel door key lock is standard on all S Models 422 and 480.

   b. Lugs for the primary power supply, top of panel ingress as standard.

   c. Fuses for each contactor, 200,000 Amps interrupting capacity (AIC).

   d. Contactors duty rated @ 500,000 cycles.

   e. Pilot lights for "Control Power On", "High Pressure", "Low Water", and "Steps".

   f. 67 watts per square inch (WSI) or 78 WSI @ 600V Incoloy 800 heating elements.

   g. Control Circuit Step-down Transformer with primary and secondary fuses and secondary control power switch.

   h. Terminal strip for control wiring and external customer connections.

5. Vessel Inspection Openings:

   - S/CR120 to S/CR 162: Element Flange.
   - S/CR200 to S/CR302: 3" Half Coupling.
   - S361 and larger: 12" x 16" Manway.

B. Model HSB Boiler

1. Each boiler is designed and constructed in accordance with the A.S.M.E. Code; UL listed, and are mounted on an integral steel frame. Fiberglass insulation (2" thickness) is covered with a preformed, sectional steel painted jacket, factory installed.

2. Trim and Controls:

   a. Manual Reset High Pressure Cutoff.

   b. Probe Aux. Low Water Cutoff, MR.

   c. Aux. Auto High Pressure Cutoff.

   d. Solid state electronic proportional pressure control with progressive step control with adjustable span and inter-stage time delay.

   e. Primary Low Water Cutoff and On/Off Pump Controller.

   f. Bottom and Water Column Blowdown Valves.

   g. Feedwater Stop and Check Valves.

   h. A.S.M.E Pressure Relief Valve(s).

   i. Steam Pressure Gauge w/test cock.

   j. Sight Gauge with drain and guards.

3. Electric Equipment

   a. Main Control Panel with panel door key lock.

b. Lugs for the primary power supply, top of panel ingress as standard.

c. Fuses for each contactor, 200,000 Amps interrupting capacity (AIC).

d. Contactors duty rated @ 500,000 cycles.

e. Pilot lights for "Control Power On", "High Pressure", "Low Water", and "Steps".

f. 75 watts per square inch (WSI) "Incoloy-800" heating elements.

g. Control Circuit Step-down Transformer with primary and secondary fuses and secondary control power switch.

h. Terminal strip for control wiring and external customer connections.

4. Vessel Inspection Openings:

- HSB-301 to HSB-302: 3" Half Coupling.
- HSB-361 and larger: 12" x 16" Manway.

Standard Equipment – Water Boilers

Equipment described below is for the standard hot water electric boilers offering:

A. Model WB Boiler

1. The Model WB boiler is designed and constructed in accordance with the A.S.M.E. Code; UL listed, and are mounted on an integral steel frame. Fiberglass insulation (2" thickness) is covered with a preformed, sectional steel painted jacket, factory installed.

2. Trim and Controls:

a. Manual Reset High Temperature Cutoff.

b. Probe Low Water Cutoff, auto reset.

c. Aux. Auto High Temperature Cutoff.

d. For WB-120:

- 1-Step (1) on/off temperature switch.
- 2-Step (2) on/off temperature switch.
- 3-Step (1) 3-stage electronic temperature control.
- 4-Step (1) 4-stage electronic temperature control.

e. For Models WB 121 and above:

- Solid state electronic proportional temperature control with progressive step control with adjustable span and inter-stage time delay.

f. Bottom drain valve.

g. A.S.M.E Pressure Relief Valve(s).

h. WB120: Separate Pressure and temperature gauge.

i. WB-121 and above: Separate Pressure Gauge and Digital Temperature Readout.

3. Electric Equipment

a. Main Control Panel. Panel door key lock is standard on WB Models > 930kW.

b. Lugs for the primary power supply, top of panel ingress as standard.

c. Fuses for each contactor, 200,000 Amps interrupting capacity (AIC).

d. Contactors duty rated @ 500,000 cycles.

e. Pilot lights for "Control Power On", "High Temperature", "Low Water", and "Steps".

f. 75 watts per square inch (WSI) "Incoloy-800" heating elements.

g. Control Circuit Step-down Transformer with primary and secondary fuses and secondary control power switch.

h. Terminal strip for control wiring and external customer connections.

4. Vessel Inspection Openings:

WB-120 to WB-200: Element Flange.

WB-201 to WB-243: 3” Half Coupling.

WB-361 and larger: 12" x 16" Manway.

B. Model IWH Heater

1. The Model IWH water heater is designed and constructed in accordance with the A.S.M.E. Code; UL listed, and are mounted on an integral steel frame. Fiberglass insulation (2" thickness) is covered with a preformed, sectional steel painted jacket, factory installed.

2. Trim and Controls:

a. Manual Reset High Temperature Cutoff.

b. Water Flow Switch - shipped loose.

c. Aux. Auto High Temperature Cutoff.

d. Stage Controls for 15 - 240 kW:

1-Step (1) on/off temperature switch.
2-Step (2) on/off temperature switch.
3-Step (1) 3-stage electronic temperature control.
4-Step (1) 4-stage electronic temperature control.

1) For 270 kW and greater:

Solid state electronic proportional temperature control with progressive step control with adjustable span and inter-stage time delay.

e. Bottom drain valve.

f. A.S.M.E Pressure Relief Valve(s).

g. Pressure and Temperature gauges.

3. Electric Equipment

a. Lugs for the primary power supply, top of panel ingress as standard.

b. Fuses for each contactor, 200,000 Amps interrupting capacity (AIC).

c. Contactors duty rated @ 500,000 cycles.

d. Pilot lights for "Control Power On", "High Temperature", "Low Water", and "Steps".

e. 75 watts per square inch (WSI) "Incoloy-800" heating elements.

f. Control Circuit Step-down Transformer with primary and secondary fuses and secondary control power switch.

g. Terminal strip for control wiring and external customer connections.

4. Vessel Inspection Openings:

   Element Flange.

Optional Equipment

For option details, contact the local authorized Cleaver-Brooks representative. In summary, here are the options that can be provided with the boiler:

- Output step enable/disable toggle switches.
- Additional Pilot Lights.
- Alarm relays for remote annunciation.
- Alarm Horn with silence switch.
- Safety Door Interlock.
- Outdoor reset control.
- Time Clock.
- Ammeter.
- Voltmeter.
- Kilowatt hour meter.
- Ground Fault Detection.
- Pneumatic control interface (3-15 or 6 - 30 psig to 0 - 145 ohms.)
- Load limiting module.
- Auxiliary Low Water Cutoff.
- Preheat Switch for elements.
- Manual Disconnect Switches.
- Shunt Trip for disconnect switches.
- Main Power Door Interlock (standard with switchgear below 600 AMPS).
- Blowdown Separators.
- Water Softener.
- Chemical Feed Systems.
- SCR controls
- Local/Remote control
- BMS interface
- Return water baffle
- Conductivity control

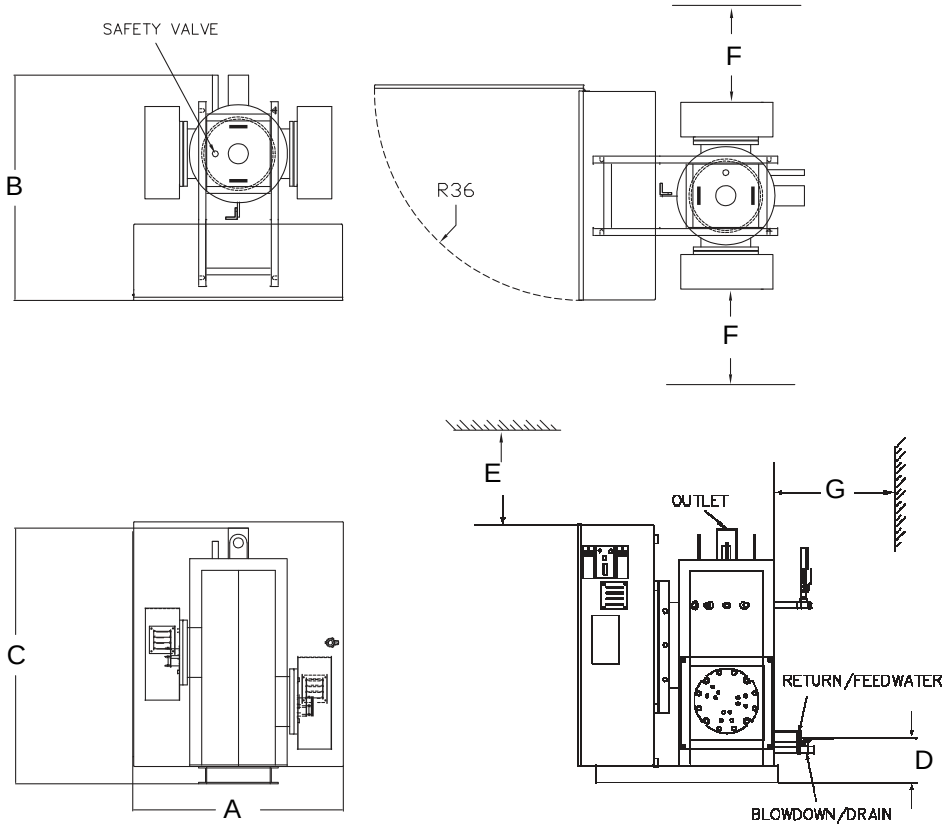
Optional choices also available for nozzles, inspection hand holes, and valves.

Table B4-1. Standard product offering

Product Type	Boiler Model	Output (kW)	Element Density (W/sq in)	Water Content (gallons)	Design Pressure (psig)	Notes
Hot water boilers	WB	12 - 3360	75	16 - 500	160, 200, 250	1
Steam boilers	S	12 - 2250	67 or 78@600V	16 - 595	15, 150, 200, 250	1
	CR	12 - 563	67 or 78@600V	16 - 115	15, 150, 200, 250	1, 2
	HSB	1560 - 3375	75	180 - 790	15, 150, 200, 250	1
Instantaneous Water Heaters	IWH	15 - 360	75	135 - 360*	160	1

Notes: 1. Heating elements are of Incolloy-800 construction
2. Model CR identical to Model S but has integral condensate return tank and pump.

A. 'Water content' not applicable. Flow rate in GPM is listed.



DIMENSIONS AND RATINGS

For layout purposes, the overall dimensions for the Electric Boilers are shown in **Figures B4-1 through B4-5** including the various pipe connections sizes for supply and return water, drain, and steam supply.

Specific ratings of each model are noted in **Tables B4-2 through B4-14**. These tables provide the ampacity at the various supply voltages, element ratings, and contactors employed in the standard models.

Altitude

Because the electric boiler does not require combustion air, installation of the boiler at any elevation is possible without derating or providing special devices for altitude correction normally associated with fuel combustion. Thus the ratings shown are for all elevations.

PERFORMANCE DATA

Efficiency

Electric boilers are void of losses normally associated with fuel fired equipment such as stack loss, combustion loss, excess air loss, etc. Therefore electric boilers are nearly 100% efficient at all operating points. For hot water boilers, the only loss from 100% is the radiation loss from the vessel which is ½%. For steam units, in addition to the radiation loss, blowdown losses should be factored in.

Emissions

Since electric boilers are void of fuel combustion, no emissions occur. Therefore, electric boilers are well suited for installations that must meet stringent emissions requirements.

Noise Level

With no moving parts, the electric boiler is nearly noiseless and thus, is well suited for installations sensitive to noise emissions from mechanical equipment. Installations such as hospitals, nursing homes, schools, research laboratories, and the like are ideal for an electric boiler application.

Regardless of output from minimum to maximum, noise emissions are almost undetectable.

ENGINEERING DATA

Boiler Information – Hot Water

Cleaver-Brooks electric hot water boilers are designed for service in any closed hydronic system and can be used to augment any hot water system. They can be put into operation as a single stand-alone unit with high turndown or in multiple units for larger turndown and capacity.

C-B electric hot water boilers may be utilized in water heating systems with temperatures from 400°F (4.4°C) to 245°F (118.3°C); ideal for ground water source heat pump applications, etc. Because the WB is an electric boiler, low water temperature (below the dewpoint) restrictions do not apply.

Variable temperature differentials can be designed to make use of changing outdoor conditions and thus, the WB is not restrictive to a nominal 200°F (10°C) differential. The boiler is designed to withstand thermal stresses with supply and return temperature differences of 100°F (55°C) and greater. However, when the elements are on, water flow through the boiler must be ensured and a flow switch to prove water flow is established is recommended.

Flow Rates and Pressure Drops

To maintain rated capacity of the boiler, recommended flow rates should not be exceeded as the flow will remove the heat beyond the capacity of the boiler. Table B4-15 can be used to determine the full boiler output relative to system temperature drop and the maximum recommended system pump flow.

The pressure drop through the boiler is < 1 psig.

System Operating Parameters

To prevent water flashing to steam within the boiler or system, hot water boilers must operate with proper over pressure. System over pressure requirements are shown in Table B4 – 16.

While proper overpressure is required, a means to relieve excess pressure at or beyond the design pressure of the boiler must be provided. As boiler water is heated, expansion occurs. And this expansion must be accounted for either with an expansion tank (air filled) or with a bladder type tank. These devices permit the water pressure to expand outside of the boiler and not impact the pressure vessel or pressure relieving device. But, in accordance with Code, each boiler is equipped with an ASME approved safety relieving device should pressure build-up occur.

Table B4-16. Model WB Minimum Over Pressure Requirements

Outlet Water Temperature °F (°C)	Minimum System Pressure PSIG (Bar)
80 - 180 (27 - 82)	12 (0.83)
181 - 185 (83 - 85)	15 (1.03)
186 - 195 (86 - 91)	18 (1.24)

Rule of Thumb Calculations

The following formula can be used to size a hot water boiler:

kW = gph (gallons per hour) x delta T (as expressed in °F) divided by 410

Or

kW = 1 lph (liter per hour) x delta T (as expressed in °C) divided by 862. Where:

- kW is the boiler output rating.
- lph (liters per hour) or gph (gallons per hour) is the hot water flow rate.
- "delta T" is the temperature rise of water.

As an example:

kW= gph x delta T/410

kW = 5000 x 20/410

kW = 100000/410

kW = 244

Boiler Information – Steam

Models CR, S, and HSB are designed for steam service and are built in accordance with the ASME Code for either low pressure steam applications (less than 15 psig operation) or for high pressure steam applications (above 15 psig).

For approximate conversion of pounds of steam to kW, the following can be used:

10 kW = 34 lbs. steam/hr = 1.02 boiler horsepower from and at 212° F.

It is important to know what the operating pressure will be and the feedwater makeup temperature, to properly size the steam boiler. From Table B4-17, one can obtain the pound of steam value for the operating pressure and corresponding feedwater makeup temperature. Based on this, the proper assumption can be made as to the required kW size of the electric boiler.

For example: Steam load required of 2000 pounds per hour of steam at an operating pressure of 100 psig and feedwater temperature of 170 degrees F. Referring to Table B4-17, we find the value of 0.3077 kW per pound of steam. We multiply the required pounds of steam by this value (2000 x 0.3077) and obtain 615. The required boiler would be 615 kW or the Model S-301-620, 150# design.

Table B4-17. kW per pound of steam

Feedwater Temperature (°F)	Boiler Operating Pressure (PSIG)				
	0	15	50	100	150
50	0.3318	0.3359	0.3401	0.3429	0.3441
70	0.3259	0.3300	0.3343	0.3370	0.3382
100	0.3171	0.3212	0.3255	0.3283	0.3294
120	0.3112	0.3154	0.3196	0.3224	0.3236
150	0.3025	0.3066	0.3108	0.3136	0.3148
170	0.2966	0.3001	0.3050	0.3077	0.3089
200	0.2878	0.2919	0.2962	0.2978	0.3001
212	0.2857	0.2898	0.2941	0.2957	0.2980
227	0.2836	0.2877	0.2920	0.2936	0.2967

Water Treatment

Even though hot water systems are “closed”, some amount of make-up water (up to 10%) will be introduced, usually due to pump seal leaks or other minimal leaks from valves etc., that go unnoticed. Therefore, proper water chemistry of a hot water boiler is necessary for good operation and longevity, particularly to ensure that free oxygen is removed to prevent waterside corrosion.

For steam boilers, proper blowdown (surface and bottom) is a required maintenance procedure. This water loss and associated steam use or loss must be made up. Any make-up water should be properly treated prior to introduction into the boiler via water softener, chemical feed, etc. Proper water chemistry in a steam boiler is mandatory for effective operation and longevity.

See **Table B4-18** for water quality requirements.

Table B4-18. Electric Boilers Required Water Quality Parameters

Parameter	Hot Water Boilers Water Limit	Steam Boilers Water Limit
pH	8.3 - 9.5	8.3 - 10.5
Iron	0.1 ppm	0.1 ppm
Alkalinity	< 300 ppm	< 600 ppm
Chlorides	30 mg/liter	30 mg/liter
Oxygen	0.1 mg/liter	0.1 mg/liter
Specific Conductivity	3500 umho/cm	4500 umho/cm
Total Hardness	< 3 ppm	< 3 ppm

Boiler Room Information

The boiler must be installed on a level non-combustible surface. If the surface is not level, piers or a raised pad (slightly larger than the length and width of the boiler base dimensions) will make boiler leveling possible. Installing the boiler on a raised pad or piers will make boiler drain connections more accessible and will keep water from splashing onto the boiler when the boiler room floor is washed. NOTE: The pad or piers must be of sufficient load bearing strength to safely support the operating weight of the boiler and any additional equipment installed with it. Approximate operating weights are shown in Dimensions and Ratings.

Clearances

The boiler must be installed so that all components remain accessible, especially be free of side mounted piping so the element flanges may be opened. Refer to Dimension Sheets **Figure B4 – 1 through B4 - 5**.

Hot Water Piping

Primary/Secondary Pumps are not necessary with the electric hot water boilers, although they can be used. As its design is such that thermal shock is not a concern, some flow is required whenever the boiler elements are on. Therefore, whether primary/secondary or system pump, an interlock such as a flow switch should be employed to ensure that water flow is established before the boiler elements are allowed on.

Electrical

Voltage requirements for the electric boilers are as noted in the ratings sheets including the relative ampacity. Switchgear above 600 amps will not be furnished by Cleaver-Brooks due to the overall size of the equipment and NEC Code requirement for switchgear wiring. The larger switchgear wiring requirements exceed the UL certification of the package boiler.

NOTES

ELECTRIC BOILER SPECIFICATIONS

CAPACITIES B37-40

HEATING ELEMENTS B37-40
TRIM AND CONTROLS B37-41
WARRANTY B37-41

SAMPLE SPECIFICATIONS

The following sample specifications are provided by Cleaver-Brooks to assist you in meeting your customer's specific needs and application.

PART 1 GENERAL

1.1 CAPACITIES

A. Boiler Capacity - Hot Water

1. The _____ gallon _____ capacity hot water boiler shall be Cleaver-Brooks Model _____ rated _____ kW at _____ V, _____ ph, 60 Hz, _____ MBtu/hr. Unit shall be suitable to operate under the following conditions: system flow rate _____ gpm; outlet water temperature _____ °F; return water temperature _____ °F; system operating pressure _____ psig.

B. Boiler Capacity - Steam

1. The _____ gallon _____ capacity steam boiler shall be Cleaver-Brooks Model _____ rated _____ kW at _____ V, _____ ph, 60 Hz. Unit shall produce _____ lbs steam/hr (from and at 212 °F) at a nominal pressure of _____ psig.

C. Water Heater Capacity - Instantaneous

D. The horizontal circulation water heater shall be Cleaver-Brooks Model IWH _____ rated _____ kW at _____ V, _____ ph, 60 Hz.

1.2 STORAGE TANK HEATER CAPACITY

The _____ gallon capacity (horizontal or vertical) shall be Cleaver-Brooks Model _____ rated kW at _____ V, _____ ph, 60 Hz, and shall recover _____ gpm at 100 °F rise.

PART 2 PRODUCTS

2.1 BOILER

A. The vessel shall be constructed in accordance with ASME Boiler Code.

B. The vessel shall be designed for _____ psig.

C. The relief valve shall be per ASME Code, set at _____ psig.

D. The vessel shall be insulated with a double wrap of 2-inch fiber blanket insulation having 1-1/2 PCF density.

E. The boiler shall be UL listed, and bear the Underwriters Laboratories' label.

F. The boiler shall be of the packaged type, factory assembled, wired, and tested.

G. The boiler shall be mounted on a full size structural steel base.

H. The boiler enclosure shall be 16-gauge steel.

I. The entire enclosure shall be finished in light blue enamel paint.

J. The overall dimensions of the boiler shall be _____ inches long, _____ inches wide, and _____ inches high.

K. For CR Models, the boiler shall include built-in condensate receiver and feed pump, with make-up valve mounted on common base with boiler, factory wired and piped, and enclosed in boiler casing.

2.2 HEATING ELEMENTS

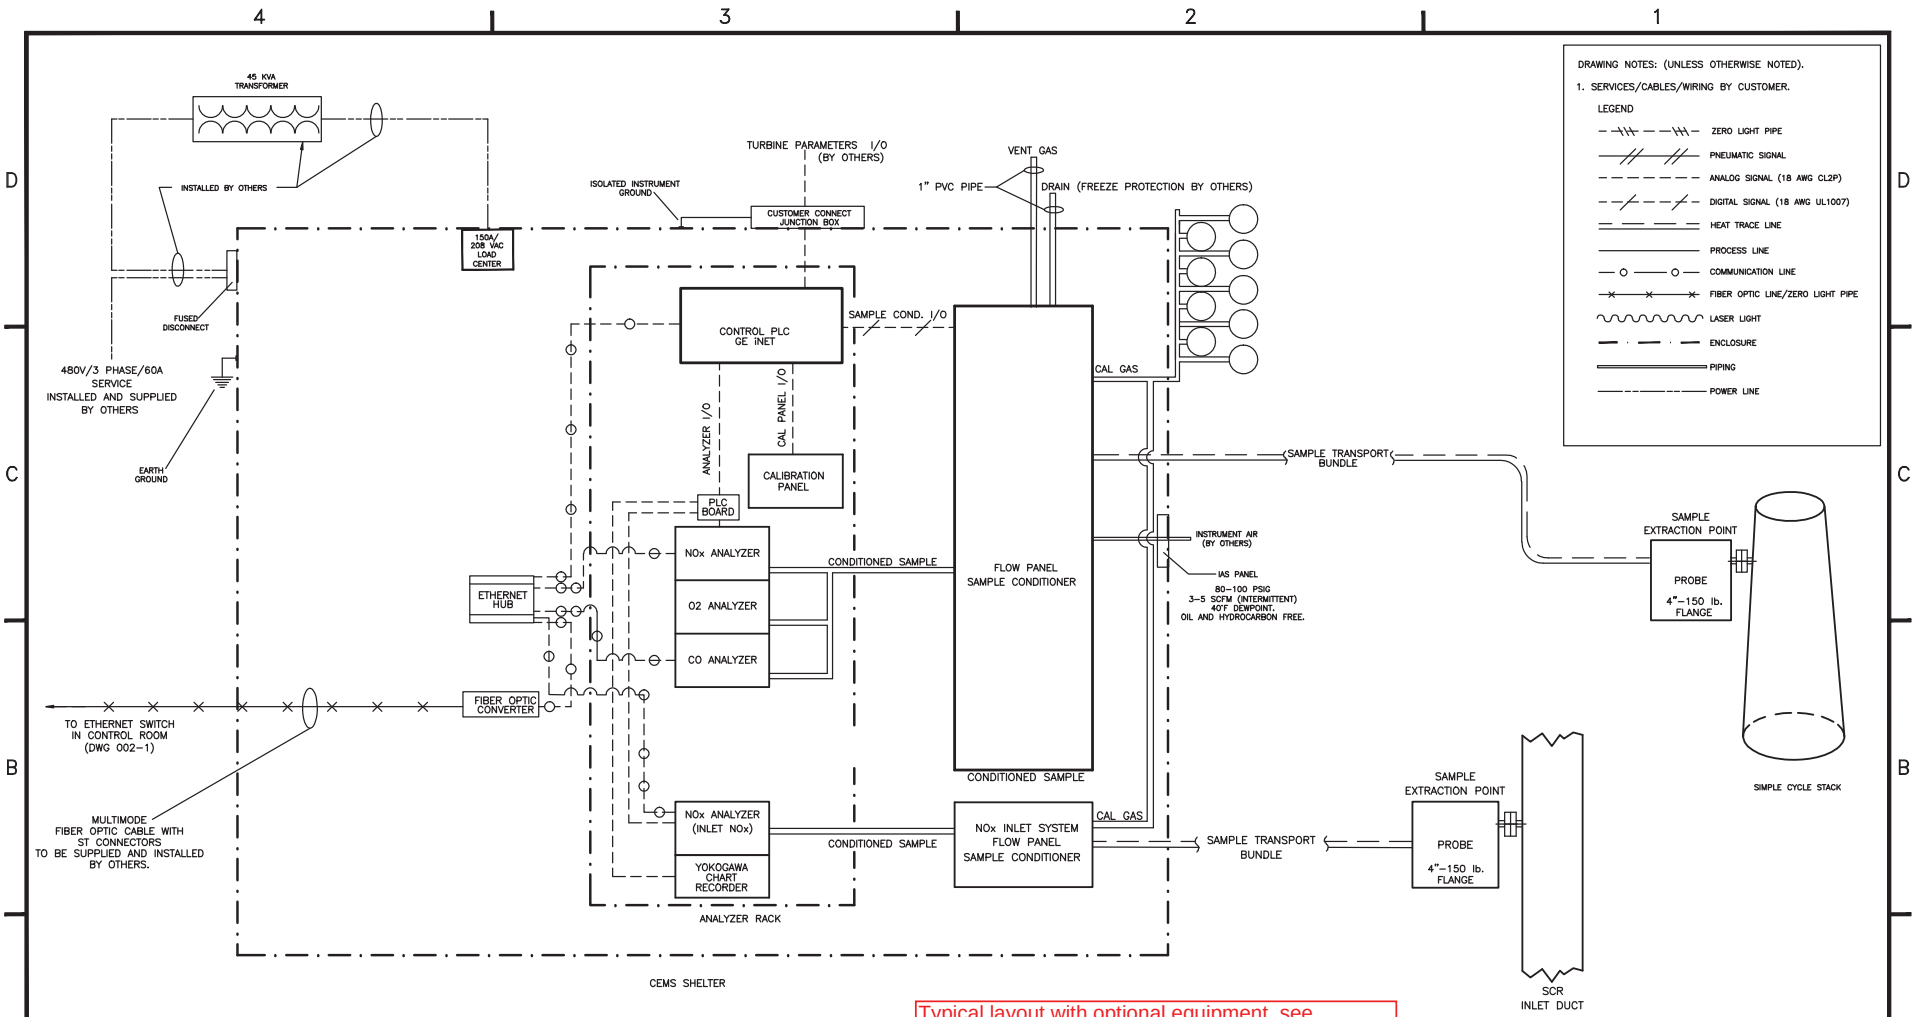
A. The heating elements shall be individually mounted, rod type, and field replaceable with standard tools.

B. The heating watt density shall not exceed _____ (50 or 75) W/sq-in.

C. The heating elements shall be (copper or Incoloy) sheathed.

2.3 TRIM AND CONTROLS

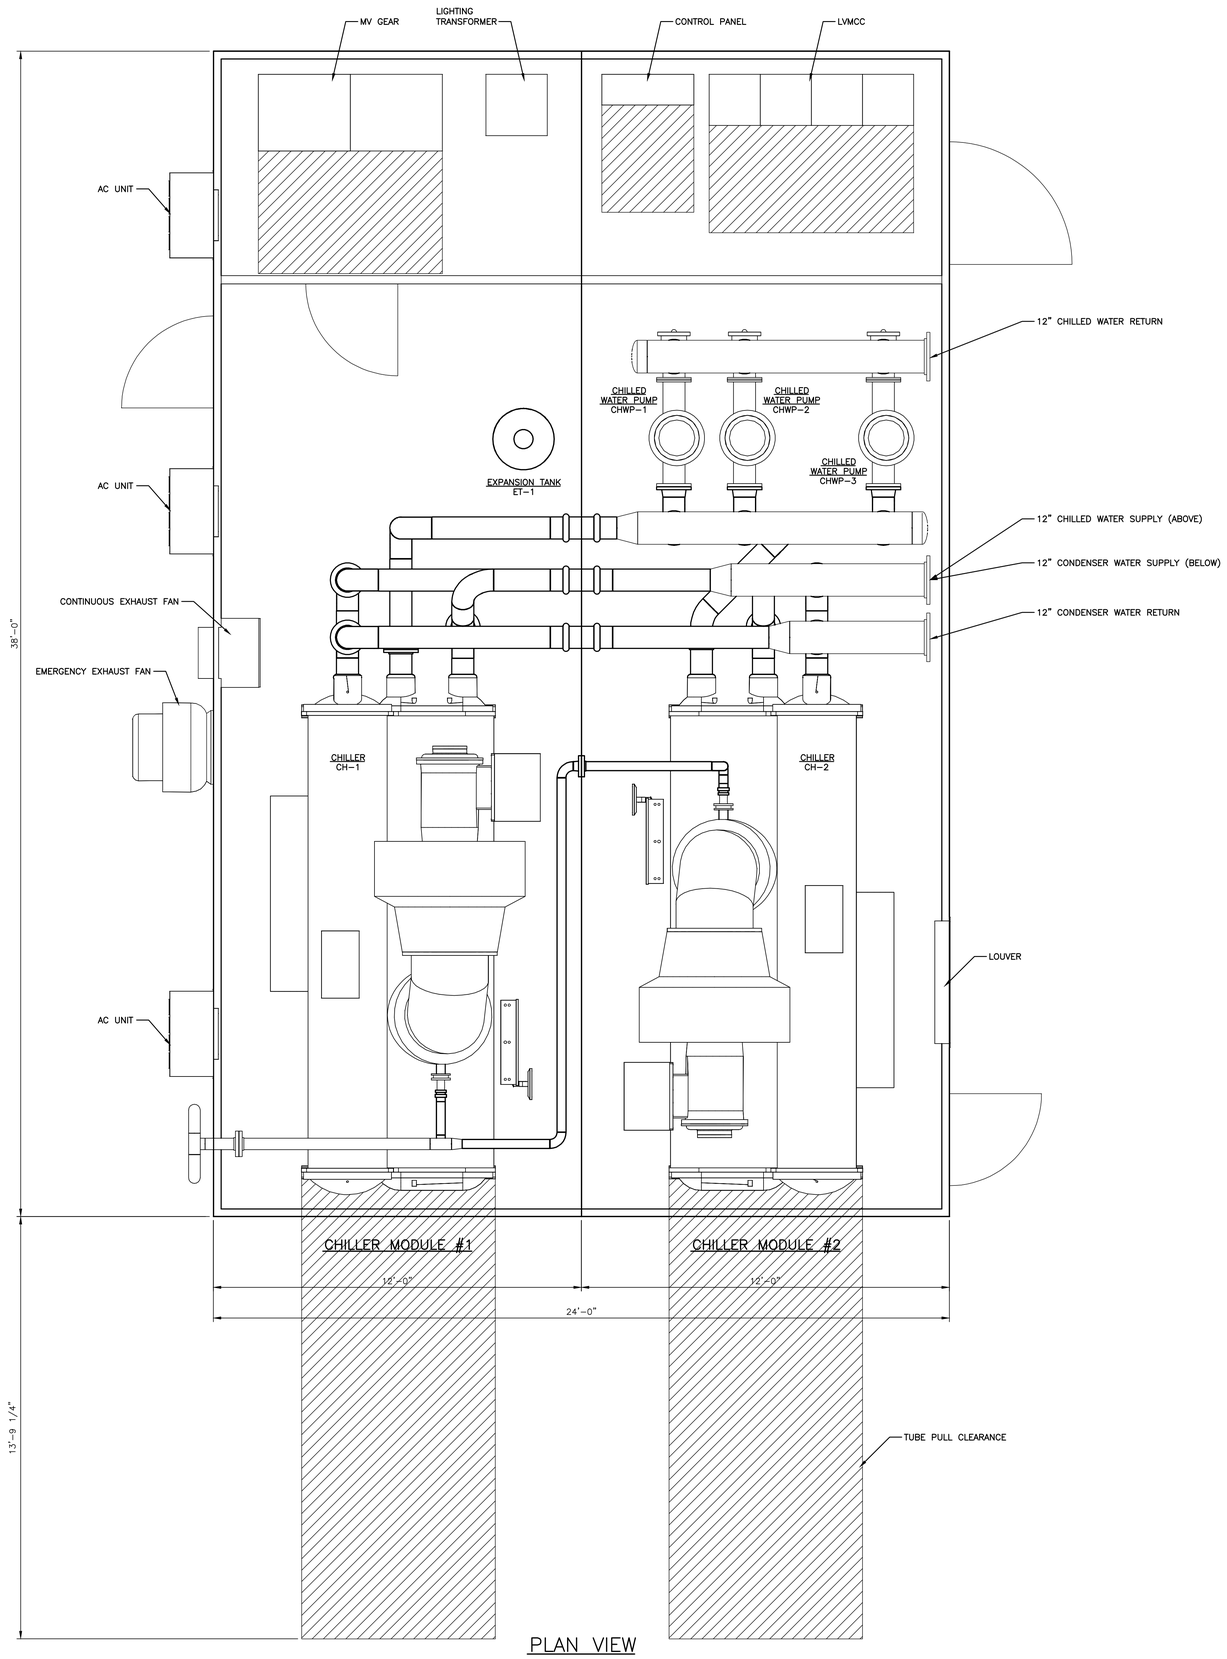
A. The units shall be complete with the following:



1. Main lugs for supply circuits.
2. Supplemental internal branch circuit fuses, current limiting, rated at 200,000 amps interrupting capacity.
3. Fused 120 V control circuit transformer.
4. Magnetic contactors rated at 500,000 cycles.
5. Integral high temperature limit (hot water boilers).
6. High pressure limit (steam boilers).
7. Low water cutoff (float-type with gauge glass for steam) on all models except IWH which is supplied with a flow switch.
8. Pressure-temperature gauge (hot water boilers).
9. Pressure gauge (steam boilers).
10. Pilot switch.
11. Pilot lights for power on, low water, high temperature or pressure.
12. Relief valve.
13. Drain valve (hot water boilers).
14. Bottom and water column blowdown valves (steam boilers).
15. Feedwater stop and check valves (steam boilers).
16. All models except IWH shall be supplied with modulating step controls to gradually apply the load in _____ steps.
17. All models except IWH shall be supplied with proportioning temperature (hot water units) or pressure (steam units) control to balance power input to match system demand.
18. Temperature control on IWH is one of the following methods (select a. or b. or c. below).
    a. Thermostats - The heating elements shall be staged by control thermostats. (Standard for one and two step heaters).
    b. Sequencer - The heating elements shall be staged by a time delay sequencer, to energize heating elements in _____ stages with an adjustable 1 to 15 second time delay between stages. (Standard for 3 or 4 step heaters.)
    c. Modulating Step Control - (Standard for heaters above 4 steps).

PART 3 EXECUTION

3.1 WARRANTY



A. The Cleaver-Brooks unit shall be warranted against defective workmanship and materials for a period of one year from the date of start- up or 18 months from shipment.

Process Specification
Fuel Gases For Combustion In AeroDerivative Gas Turbines

These instructions do not purport to cover all details or variations in equipment or to provide for every possible contingency to be met in connection with installation, operation or maintenance. Should further information be desired or should particular problems arise which are not covered sufficiently for the purchaser's purposes the matter should be referred to the GE Company.

Table 2a. Fuel Gas Composition Limits for DLE Configuration 2
Table 2b. Fuel Gas Composition Limits for SAC Configuration 3
Table 3. Test methods for gaseous fuels 4

1 GENERAL

GE AeroDerivative gas turbines have the ability to burn a wide range of gaseous fuels as shown in Table 1. These gases present a broad spectrum of properties due to both active and inert components. This specification is designed to define guidelines that must be followed in order to burn these fuels in an efficient, trouble-free manner, while protecting the gas turbine and supporting hardware.

Table 1. Fuel Classification

Fuel	**LHV Btu/scf**	**Major Components**
Pipeline Natural Gas and Liquefied Natural Gas	800 - 1200	Methane
Liquefied Petroleum Gas	2300 – 3200	Propane, Butane
Gasification Gases - Air Blown - Oxygen Blown	 100 - 150 200 - 400	 Carbon Monoxide, Hydrogen, Nitrogen, Water Vapor Carbon Monoxide, Hydrogen, Water Vapor
Process Gases	300 - 3000	Methane, Hydrogen, Carbon Monoxide, Ethane, Ethene, Propane, Propene, Carbon Dioxide, Nitrogen

Table 2a identifies the fuel composition limits for aeroderivative gas turbines with Dry Low Emission (DLE) combustion systems and Table 2b identifies the fuel composition limits for aeroderivative gas turbines with Standard (Single Annular Combustor (SAC)) combustion systems.

Table 2a. Fuel Gas Composition Limits for DLE Configuration.

Parameter	**Requirement – DLE Configuration**	
	Minimum	Maximum
Modified Wobbe Index (1)	40 (2)	60
Methane (CH4)	50% vol	100% vol
Ethane (C2+ paraffins)		
LM1600	0	35% vol
LM2500 / LM2000	0	35% vol
LM2500+G4	0	30% vol
LM6000 / LMS100	0	24% vol
Hydrogen (H2)	0	5% Vol (2)
Diolefins (i.e. Butadiene, propadiene)	0	None allowed
Other combustibles (3)	0	Consult GE

Notes:
1. MWI at max limits C2+.
2. Other levels may be possible. Consult GE.
3. Other combustibles - CO, olefin hydrocarbons. etc.

Table 2b. Fuel Gas Composition Limits for SAC Configuration.

Parameter	**Requirement – SAC Configuration**	
	Minimum	Maximum
Modified Wobbe Index (1)		
LMS100 Low MWI Nozzles	35	44
LMS100 Standard MWI Nozzles	45	60
All Other LM	40	60
Hydrogen + ½ CO (H2 + ½ CO) (2)		
LM2500 / LM2000	0	85% Vol
LM2500+/+G4/LM1600/LM5000	0	75% Vol
LM6000 / LMS100	0	35% Vol
Diolefins (i.e. Butadiene, propadiene)	0	See Note 3
Olefins	0	15% Vol (4)
Other combustibles (5)	0	Consult GE

Notes:
1. Expanded values may be possible with fuel nozzle modifications. Consult GE
2. High hydrogen and carbon monoxide content fuels have large rich to lean flammability limits. These types of fuels often require inert gas purging of the gas turbine gas fuel system upon unit shutdown or a transfer to a more conventional fuel. When process gas fuels have extreme flammability limits such that the fuel will auto ignite at turbine exhaust conditions, a more "conventional" start–up fuel, such as methane, is required.
3. The presence of even trace amounts of butadiene in the gas fuel may cause fuel system fouling. Additional fuel system maintenance may be required when using fuels containing butadiene.
4. Olefins in the gas fuel at moderate levels (<15%) are not expected to present problems as long as the fuel temperature is kept below 176°F (80°C). With a higher level of olefins or with a higher gas fuel temperature, fuel system fouling may be an issue
5. Other combustibles - CO, hydrocarbons. etc.

Notes for Table 1, 2a, and 2b:

1. When considering the use of alternate fuels, provide details of the fuel constituents, fuel pressure, fuel temperature, and expected engine usage conditions and operating characteristics to GE for evaluation and recommendations.

2. Values and limits apply at the inlet of the gas fuel control module.

3. Heating value ranges shown are provided as guidelines. Specific fuel analysis must be furnished to GE for evaluation. The standard configured single annular combustor (SAC) gas turbines require a fuel with a LHV no less than of 6500 BTU/pound. The Dry Low Emissions (DLE) combustion system requires a minimum LHV of 18000 BTU/pound. (Reference Section 3.1)

4. The fuel gas supply shall be 100% free of liquids. Admission of liquids can result in combustion and/or hot gas path component damage. (Reference Section 3.3)

5. Modified Wobbe Number Index (MWI), is described in Section 3.2

Table 3 identifies the acceptable test methods to be used in determining gas fuel properties.

TABLE 3
TEST METHODS FOR GASEOUS FUELS

PROPERTY	ACCEPTABLE METHODS
Gas Composition	ASTM D1945 - Standard method for constituents of gases by gas chromatography, or ISO 6974 - Natural gas -- Determination of composition from C1 to C8 with defined uncertainty by gas chromatography ISO 6975 - Natural gas -- Determination of hydrocarbons from butane (C4) to hexadecane (C16) -- Gas chromatographic method
Heating Value Specific Gravity Compressibility Factor	ASTM D3588 - Procedure for calculating calorific value and specific gravity of gaseous fuels, or ISO 6976 - Natural gas -- Calculation of calorific values, density, relative density and Wobbe index from composition GPA 2172 - Calculation of Gross Heating Value, Relative Density and Compressibility Factor for Natural Gas Mixtures From Compositional Analysis
Dew Point (see note 1)	ASTM D1142 - Water vapor content of gaseous fuels by measurement of dew point temperature
Sulfur	ASTM D1072 - Total Sulfur in Fuel Gases by Combustion and Barium Chloride Titration, or ASTM D3246 - Sulfur in Petroleum Gas by Oxidative Microcoulometry (see note 2) ASTM D5504 - Sulfur Compounds in Natural Gas and Gaseous Fuels by Gas Chromatography and Chemiluminescence ASTM D6667 - Determination of Total Volatile Sulfur in Gaseous Hydrocarbons and Liquefied Petroleum Gases by Ultraviolet Fluorescence ASTM D6968 - Simultaneous Measurement of Sulfur Compounds and Minor Hydrocarbons in Natural Gas and Gaseous Fuels by Gas Chromatography and Atomic Emission Detection ISO 4260 - Petroleum Products and Hydrocarbons - Determination of Sulfur Content - Wickbold Combustion Method ISO 6326 - Natural gas -- Determination of sulfur compounds

	ISO 19739 - Natural gas -- Determination of sulfur compounds using gas chromatography IP 243 - Petroleum Products and Hydrocarbons - Determination of Sulfur Content - Wickbold Combustion Method
Chemical Composition	ASTM D2650 - Chemical composition of gases by mass spectrography
ASTM – ASTM International ISO - International Organization for Standardization GPA - Gas Processors Association IP – Institute of Petroleum UK	

Notes:

1. Hydrocarbon and water dew points shall be determined by direct dew point measurement (Chilled Mirror Device). If dew point cannot be measured, an extended gas analysis, which identifies hydrocarbon components from C1 through C14, shall be performed. This analysis must be accurate within 10ppmv. A standard gas analysis to C6+ is normally not acceptable for dew point calculation unless it is known that heavier hydrocarbons are not present, as is most often the case with liquefied natural gases.

2. This test method will *not* detect the presence of condensable sulfur vapor. Specialized filtration equipment is required to measure sulfur at concentrations present in vapor form. Contact GE for more information.

2 FUEL GAS CLASSIFICATION

2.1 Natural Gas, Liquefied Natural Gas (LNG), Medium BTU Natural Gas, and Liquefied Petroleum Gas (LPG)

Natural gases are predominantly methane with much smaller quantities of the slightly heavier hydrocarbons such as ethane, propane and butane. Liquefied petroleum gas is propane and/or butane with traces of heavier hydrocarbons.

2.1.1 Pipeline Natural Gas

Natural gases normally fall within the calorific heating value range of 800 to 1200 BTU/SCF (LHV). Actual calorific heating values are dependent on the percentages of hydrocarbons and inert gases contained in the gas. Natural gases are found in and extracted from underground reservoirs. These “raw gases” may contain varying degrees of nitrogen, carbon dioxide, hydrogen sulfide, and contaminants such as salt water, sand and dirt. Processing by the gas supplier normally reduces and/or removes these constituents and contaminants prior to distribution. A gas analysis must be performed to ensure that the fuel supply to the gas turbine meets the requirements of this specification.

2.1.2 Liquefied Natural Gas

Liquefied natural gas is produced by drying, compressing, cooling and expanding natural gas to approximately -260° F at 14.7 psia. The product is transported as a liquid and delivered as a gas after pressurizing and heating to ambient temperature. The composition is free of inerts and moisture and can be treated as a high quality natural gas. LNG can pick up moisture that is present in the pipeline but it is not a source of the moisture.

2.1.3 Medium BTU Natural Gas

Natural gases are found in and extracted from underground reservoirs. These "raw gases" may contain varying degrees of nitrogen, carbon dioxide, hydrogen sulfide, and contain contaminants such as salt water, sand and dirt. The heating values of medium BTU natural gas normally fall between 400 and 800 BTU/SCF (LHV) Processing by the gas supplier normally reduces and/or removes these constituents and contaminants prior to use in the gas turbine. A gas analysis must be performed to ensure that the fuel supply to the gas turbine meets the requirements of this specification.

2.1.4 Liquefied Petroleum Gases

The heating values of Liquefied Petroleum Gases (LPGs) normally fall between 2300 and 3200 Btu/SCF (LHV). Based on their high commercial value, these fuels are normally utilized as a back–up fuel to the primary gas fuel for gas turbines. Since LPGs are normally stored in a liquid state, it is critical that the vaporization process and gas supply system maintains the fuel at a temperature above the minimum required superheat value. Fuel heating and heat tracing is required to ensure this.

2.2 Gasification Fuels

Other gases that may be utilized as gas turbine fuel are those formed by the gasification of coal, petroleum coke or heavy liquids. In general, the heating values of gasification fuel are substantially lower than other fuel gases. These lower heating value fuels require that the fuel nozzle gas flow passages be larger than those utilized for fuels of higher heating values. Gasification fuels are produced by either an Oxygen Blown or Air Blown gasification process.

2.2.1 Oxygen Blown Gasification

The heating values of gases produced by oxygen blown gasification fall in the range of 200 to 400 Btu/SCF (7876-15752 kJ/NM^3). The Hydrogen (H_2) content of these fuels is normally above 30% by volume and have H_2/CO mole ratio between 0.5 to 0.8. Oxygen blown gasification fuels are often mixed with steam for thermal NOx control, cycle efficiency improvement and/or power augmentation. When utilized, the steam is injected into the combustor by an independent passage. Due to high hydrogen content of these fuels, oxygen blown gasification fuels are normally not suitable for Dry Low Emissions (DLE) applications**.**

2.2.2 Air Blown Gasification

Gases produced by air blown gasification normally have heating values between 150 and 200 BTU/ SCF (5907 - 7876 kJ/NM^3) LHV. The Hydrogen (H_2) content of these fuels can range from 8% to 20% by volume and have a H_2/CO mole ratio 0.3 to 3:1. The use and treatment of these fuels are similar to that identified for oxygen blown gasification.

For Gasification fuels a significant part of the total turbine flow comes from the fuel. In addition, for oxygen blown fuels there is a diluent addition for NOx control. Careful integration of the gas turbine with the gasification plant is required to assure an operable system. Due to the low volumetric heating value of both oxygen an air blown gases, special fuel system and fuel nozzles are required.

2.3 Process Gases

Many chemical processes generate surplus gases that may be utilized as fuel for gas turbines. (i.e. tail or refinery gases). These gases often consisting of methane, hydrogen, carbon monoxide, and carbon dioxide that are normally byproducts of petrochemical processes. Due to the hydrogen and carbon monoxide content, these fuels have large rich to lean flammability limits. These types of fuels often require inert gas purging of the gas turbine gas fuel system upon unit shutdown or a transfer to a more conventional fuel. When process gas fuels have extreme flammability limits such that the fuel will auto ignite at turbine exhaust conditions, a more "conventional" start–up fuel, such as methane, is required.

Additional process gases utilized as gas turbine fuels are those that are byproducts of steel production. These are:

2.3.1 Blast Furnace Gases (BFGs)

Blast Furnace Gases (BFGs), alone, have heating values below minimal allowable limits. These gases must be blended with other fuel to raise the heating value to above the required limit. Coke Oven and/or Natural Gases or hydrocarbons such as propane or butane can be utilized to accomplish this.

2.3.2 Coke Oven Gases

Coke oven gases are high in H_2 and CH_4 and may be used as fuel for single annular combustion (SAC) systems, but are not suitable for Dry Low Emissions (DLE) combustion applications. These fuels often contain trace amounts of heavy hydrocarbons, which when burned could lead to carbon buildup on the fuel nozzles. The heavy hydrocarbons must be "scrubbed" or removed from the fuel prior to delivery to the gas turbine or maintained in the gaseous state.

2.3.3 Flare Gases

Flare gases are produced by a number of associated gas activities including oil wells or oil rigs, refineries, chemical plants and landfills. Associated gases from oil production and refineries is normally flared, but can also be a good fuel source for power production. These associated gases can be high in methane and C2+ gases and must be evalauated on a case by case basis by GE. Refinery gases are also known to contain butadienes which must be removed prior to use. Gases produced from chemical plants are usually the result of a chemical reaction and will vary in heating value depending on the composition and process. In landfills, gas which results from the decomposition of materials buried in the landfill can also be a source fuel for power production. These types of gases are usually in the low to medium heating value range (300-450 btu/scf) and normally contain siloxanes.

3. FUEL PROPERTIES

3.1 Heating Value

A fuel's heat of combustion, or heating value, is the amount of energy, expressed in BTU (British Thermal Unit), generated by the complete combustion, or oxidation, of a unit weight of fuel. The amount of heat generated by complete combustion is a constant for a given combination of combustible elements and compounds.

For most gaseous fuels, the heating value is determined by using a constant pressure, continuous type calorimeter. This is the industry standard. In these units, combustible substances are burned with oxygen under essentially constant pressure conditions. In all fuels that contain hydrogen, water vapor is a product of combustion, which impacts the heating value. In a bomb calorimeter, the products of combustion are cooled to the initial temperature and all of the water vapor formed during combustion is condensed. The result is the HHV, or higher heating value, which includes the heat of vaporization of water. The LHV, or lower heating value, assumes all products of combustion including water remain in the gaseous state, and the water heat of vaporization is not available. It is a common practice in the gas turbine industry to utilize the LHV when calculating the overall cycle thermal efficiency.

3.2 Modified Wobbe Index Range

While gas turbines can operate with gases having a very wide range of heating values, the amount of variation that a single specific fuel system can accommodate is much less. Variation in heating value as it affects gas turbine operation is expressed in a term identified as modified Wobbe Index (Natural Gas, E. N. Tiratsoo, Scientific Press Ltd., Beaconsfield, England, 1972). This term is a measurement of volumetric energy and is calculated using the Lower Heating Value (LHV) of the fuel, specific gravity of the fuel with respect to air at ISO conditions, and the fuel temperature, as delivered to the gas turbine. The mathematical definition is as follows:

Modified Wobbe Index $= LHV/(SG_{gas} \times T_{gas})^{1/2}$

This is equivalent to:

Modified Wobbe Index $= LHV/[(MW_{gas}/28.96) \times T_{gas}]^{1/2}$

Where:

- LHV = Lower Heating Value of the Gas Fuel (Btu/scf)
- SG_{gas} = Specific Gravity of the Gas Fuel relative to Air
- MW_{gas} = Molecular Weight of the Gas Fuel
- T_{gas} = Absolute Temperature of the Gas Fuel (Rankine)
- 28.96 = Molecular Weight of Dry Air

The allowable modified Wobbe Index range between 40 and 60 is established to ensure that required fuel nozzle pressure ratios be maintained during all combustion/turbine modes of operation for standard fuel system configurations. An accurate analysis of all gas fuels, along with fuel gas temperature profiles shall be submitted to GE for proper evaluation.

3.3 Superheat Requirement

The superheat requirement is established to ensure that the fuel gas supplied to the gas turbine is 100% free of liquids. Dependent on its constituents, gas entrained liquids could cause degradation of gas fuel nozzles, and for DLE applications, premixed flame flashbacks or re-ignitions. A minimum of 50°F (28°C) of superheat is required and is specified to provide enough margin to compensate for temperature reduction due to pressure drop across the gas fuel control valves. A minimum of 20°F (11°C) of superheat is required at the gas turbine fuel manifold inlet connection.

3.4 Gas Constituent Limits

Gas constituents are not specifically limited except to the extent described above. These limitations are set forth to assure stable combustion through all gas turbine loads and modes of operation. Limitations are more stringent for DLE combustion systems where “premixed” combustion is utilized. A detailed gas analysis shall be furnished to GE for proper evaluation.

3.5 Gas Fuel Supply Pressure

Gas fuel supply pressure requirements are dependent on the gas turbine model and combustion design, the fuel gas analysis and unit specific site conditions. Minimum and maximum supply pressure requirements can be determined by GE for specific applications.

4. CONTAMINANTS

Dependent on the type of fuel gas, the geographical location and the forwarding means there is the potential for the “raw” gas supply to contain one or more of the following contaminants:

1. Tar, lamp black, coke
2. Water, salt water
3. Sand, clay
4. Rust
5. Iron sulfide
6. Scrubber oil or liquid
7. Compressor Lube oil
8. Naphthalene
9. Gas Hydrates
10. Siloxanes

It is critical that the fuel gas is properly conditioned prior to being utilized as gas turbine fuel. This conditioning can be performed by a variety of methods. These include but are not limited to media filtration, inertial separation, coalescing and fuel heating. Trace metal, particulate and liquid contamination limits are given below. These limits are given in parts per million by weight (ppmw) corrected to the actual heating value of the fuel. It is critical that fuel gas conditioning equipment be designed and sized so that these limits are not exceeded.

4.1 Particulate

Contamination limits for particulates are established to prevent fouling and excessive erosion of hot gas path parts, erosion and plugging of combustion fuel nozzles and erosion of the gas fuel system control valves. The utilization of gas filtration or inertial separation is required. The filtration level should be a beta ratio of 200 minimum (efficiency of 99.5%) at 5μ or less. The total particulate should not exceed 30 ppm by weight. GE requires the use of stainless steel piping downstream of this last level of filtration.

4.2 Liquids

No liquids are allowed in the gas turbine fuel gas supply. Liquids contained in the fuel can result in nuisance and/or hardware damaging conditions. These include rapid excursions in firing temperature and gas turbine load, primary zone re-ignition and flashback of premixed flames, and when liquids carry over past the combustion system, melting of hot gas path components. When liquids are identified in the gas supply, separation and heating is employed to achieve the required superheat level.

Gas at the wellhead is typically produced in a wet saturated condition and is treated to remove water and heavy hydrocarbon liquids. Depending on the degree of treatment and the supply pressure, the gas may be delivered in a dry condition. After pressure reduction it is possible for condensates to form as the gas cools during expansion. The condensates may be either water or hydrocarbons or both. Carry over of lubricating oil from compressor stations is another source of liquids.

4.3 Sulfur

Sulfur can sometimes be found in natural gas in the compounds “H2S” and/or “COS”. It is produced with the natural gas. Typically the gas supplier will limit H2S to a concentration of less than approximately 20 ppmv by removing sulfur in a treatment system. Sulfur may also be present in very low concentrations (< 100 ppbv) in the form of elemental sulfur vapor.

There is no specific limit on natural gas fuel sulfur content if the engine is used in an application where both the fuel and environment are free of alkali metals, including sulfur compounds. There are several concerns relative to the levels of sulfur contained in the fuel gas supply. Many of these are not directly related to the gas turbine but to associated equipment and emissions requirements.

These concerns include but are not limited to:

4.3.1 Hot Gas Path Corrosion

Typically, use of sulfur bearing fuels will not be limited by concerns for corrosion in the turbine hot gas path unless alkali metals are present. Sodium, potassium and other alkali metals are not normally found in natural gas fuels, but are typically found to be introduced in the compressor inlet air in marine environments, as well as in certain adverse industrial environments. The total amount of sulfur and alkali metals from all sources shall be limited to form the equivalent of 0.6 ppm of alkali metal sulfates in the fuel. Unless sulfur levels are extremely low, alkali levels are usually limiting in determining hot corrosion of hot gas path materials. For low Btu gases, the fuel contribution of alkali metals at the turbine inlet is increased over that for natural gas and the alkali limit in the fuel is therefore decreased. The total amount of alkali metals [(a)] in gas fuels used with engines having marinized (corrosion-resistant) coatings on the high pressure turbine blading shall not exceed 0.2 ppm [(b)].

(a) Sodium, potassium, and lithium. Experience has shown that sodium is by far the preponderant alkali metal, if any, found in gaseous fuels.

(b) This limit assumes zero alkali metals in the inlet air or injected water or steam. When actual levels are above zero, the maximum allowable sodium content of the fuel must be reduced in accordance with the following relationship:

ppm sodium inlet air x Air/Fuel Ratio	=
ppm sodium in water or steam x $\frac{\text{Water or Steam}}{\text{Fuel}}$ ratio	=
ppm sodium in fuel	=
Total fuel equivalence for sodium from all sources not to exceed	0.2 ppm

4.3.2 HRSG Corrosion

If heat recovery equipment is used, the concentration of sulfur in the fuel gas must be known so that the appropriate design for the equipment can be specified. Severe corrosion from condensed sulfuric acid results if a heat recovery steam generator (HRSG) has metal temperatures below the sulfuric acid dew point. Contact the HSRG supplier for additional information.

4.3.3 Selective Catalytic Reduction (SCR) Deposition

Units utilizing ammonia injection downstream of the gas turbine for NOx control can experience the formation of deposits containing ammonium sulfate and bisulfate on low temperature evaporator and economizer tubes. Such deposits are quite acidic and therefore corrosive. These deposits, and the corrosion that they cause, may also decrease HRSG performance and increase backpressure on the gas turbine. Deposition rates of ammonium sulfate and bisulfate are determined by the sulfur content of the fuel, ammonia content in the exhaust gas, tube temperature and boiler design. Fuels having sulfur levels above those used as odorants for natural gas should be reported to GE . In addition, the presence of minute quantities of chlorides in the inlet air may result in cracking of AISI 300 series stainless steels in the hot gas path. Contact the SCR supplier for additional information.

4.3.4 Exhaust Emissions

Sulfur burns mostly to sulfur dioxide, but 5% to 10% oxidizes to sulfur trioxide. The latter can result in sulfate formation, and may be counted as particulate matter in some jurisdictions. The remainder will be discharged as sulfur dioxide. To limit the discharge of acid gas, some localities may restrict the allowable concentration of sulfur in the fuel.

4.3.5 Elemental Sulfur Deposition

Solid elemental sulfur deposits can occur in gas fuel systems downstream of pressure reducing stations or gas control valves under certain conditions. Power reduction has been observed for DLE applications due to elemental sulfur. These conditions may be present if the gas fuel contains elemental sulfur vapor, even when the concentration of the vapor is a few parts per billion by weight. Concentrations of this magnitude cannot be measured by commercially available instrumentation and deposition cannot therefore be anticipated based on a standard gas analysis. Should deposition take place, fuel heating will be required to maintain the sulfur in vapor phase and avoid deposition. A gas temperature of 130°F (54°C) or higher may be required at the inlet to the gas control valves to avoid deposition, depending on the sulfur vapor concentration. The sulfur vapor concentration can be measured by specialized filtering equipment. If required, GE can provide further information on this subject.

4.4 Siloxanes

Siloxanes are sometimes found in non-traditional gas fuels such as obtained from landfills. Siloxanes should be removed with current technology so that the content is as low as possible, but not to exceed 50 ppb by weight in the fuel gas. If the application includes wet NOx controls, the silica limit for the water or steam is reduced to 50 ppb by weight. Gas sampling and analysis is required and should include either an impinger or sorbent collection method and have a laboratory with Gas chromatography coupled with Mass Spectrometer (GC-MS) capability to analyze the samples collected.

APPENDIX 1 – DEFINITIONS

Dew Point

This is the temperature at which the first liquid droplet will form as the gas temperature is reduced. Common liquids found in gas fuel are hydrocarbons, water and glycol. Each has a separate and measurable dew point. The dew point varies considerably with pressure and both temperature and pressure must be stated to properly define the gas property. Typically, the hydrocarbon dew point will peak in the 300 to 600 psia (2068 to 4137 kPa) range.

Dry Saturated Conditions

The gas temperature is at, but not below or above, the dew point temperature. No free liquids are present

Gas Hydrates

Gas hydrates are semi–solid materials that can cause deposits that plug instrumentation lines, control valves and filters. They are formed when free water combines with one or more of the C1 through C4 hydrocarbons. Typically the formation will take place downstream of a pressure reducing station where the temperature drop is sufficient to cause moisture condensation in a region of high turbulence. Because hydrates can cause major problems in the gas distribution network, the moisture content is usually controlled upstream at a dehydration process station.

Gas Hydrate Formation Line

This is similar to the dew point line except the temperature variation with pressure is much less. The hydrate line is always below or at the moisture dew point line as free water must exist in order for hydrates to form. Maintaining 50°F of superheat above the moisture dew point will eliminate hydrate formation problems.

Glycol

Glycol is not a natural constituent of natural gas but is introduced during the dehydration process. Various forms of glycol are used, diethylene and triethylene glycol being two most common. In some cases glycol is injected into the pipeline as a preservative. In most cases, glycol may only be a problem during commissioning of a new pipeline or if an upset has taken place at an upstream dehydration station.

Odorant

Odorants are injected into natural and LP gas to make leaks readily detectable. The odorant commonly used for natural gas is tertiary butyl mercaptan, while ethyl mercaptan is used for LP gas.

Superheat

This is defined as the difference between the gas temperature minus the liquid dew point. The difference is always positive or zero. A negative value implies that the value is being measured at two differing states of pressure and temperature and is not valid. A measured gas temperature below the theoretical dew point means that the gas is in a wet saturated state with free liquids present.

Saturation Line

This is the same as the dew point line.

Wet Saturated Conditions

A point where a mixture consists of both vapor and liquids.

Requirements for Water and Steam Purity for Injection in Aero Derivative Gas Turbines

1.1 Scope

This document establishes the purity requirements for water for NOx suppression and *SPRINT*® injection into gas turbine engines and for Steam for injected into the gas turbine whether for NOx suppression or power augmentation.

1.2 Definitions

For the purpose of this specification, the following definitions shall apply:

NOx Suppression Water - Water introduced into the engine combustor for the purpose of suppressing the oxides of nitrogen (NOx) in the engine exhaust gases. This does not include any boiler feed or make up water for steam generation.

SPRINT® Water – Water introduced into the engine inlet or into the high pressure compressor inlet for purpose of power enhancement.

Steam – Steam that is injected into the combustor for NOx suppression or injected into the compressor rear frame or LP Turbine for power augmentation on certain LM models.

2. Applicable Documents

2.1 American Society of Testing and Materials

Available from ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959 USA. (http://www.astm.org)

ASTM D1066	Standard Practice for Sampling Steam
ASTM D3370	Standard Practices for Sampling Water from closed Conduits
ASTM D4327	Anions in Water by Chemically Suppressed Ion Chromatography
ASTM D5391	Electrical Conductivity and Resistively of a Flowing High-Purity Sample
ASTM D5464	Standard Test Method for pH of Water with Low Conductivity
ASTM D5542	Trace Anions in High-Purity Water by Ion Chromatography
ASTM D5907	Standard Test Method for Filterable and Non-Filterable Matter in Water

2.2 Environmental Protection Agency (EPA) Test Methods

EPA 150.1	pH Electrometric
EPA 200.7	Metals & Trace Elements
EPA 300.0	Determination of Inorganic Anions By Ion Chromatography

3.0 Water Requirements

3.1 Water Sampling Requirements

The sampling shall be in accordance with ASTM D3370. A minimum of one (1) gallon or four (4) liters shall be supplied.

3.2 Water Purity Requirements

The water shall meet the following requirements when tested in accordance with the designated test method:

	Limit	Test Method
Total Suspended Solids and Total Dissolved Solids, mg/L, max	5 5	ASTM D5907(1), EPA 160.1(1), EPA 160.2(1)
pH(2)	6.0 - 8.0	ASTM D5464 or EPA 150.1
Conductivity(2), μS/cm at 25°C	< 1.0	ASTM D5391(3)
Sodium + potassium, ppm, max	See 3.3	EPA 200.7
Silica (SiO_2), mg/L, max.	0.1(4)	EPA 200.7
Chlorides, mg/L, max	0.5	ASTM D5542, ASTM D4327, or EPA 300.0
Sulfates, mg/L, max	0.5	ASTM D5542, ASTM D4327 or EPA 300.0

(1) Use twice the recommended volume of sample
(2) pH and Conductivity shall be measured when water is free of carbon dioxide
(3) Flowing Sample Method B.
(4) If gas fuel utilized contains Siloxanes, limit is 0.05 mg/l (Ref MID-TD-0000-1)

3.3 Sodium & Potassium Limits in Water or Steam

The maximum amount of NA + K allowed in the water or steam injected into the engine depends upon the total NA + K contamination from all sources; i.e., from the fuel, air, water and steam. The maximum Na + K allowed is determined from the equation:

(ppmFuel) + (ppmAir)*A/F + (ppmWater)*W/F + (ppmSteam)*S/F = 0.2 ppm

Where:

ppmFuel	=	Parts per million Na + K in fuel
ppmAir	=	Parts per million Na + K in Air
ppmWater	=	Parts per million Na + K in water
ppmSteam	=	Parts per million Na + K in steam
A/F	=	Air/Fuel Ratio (Wt. Basis)
W/F	=	Water/Fuel Ratio (Wt. Basis)
S/F	=	Steam/Fuel Ratio (Wt. Basis)

3.4 Water Filtration Requirements

Filtration is most commonly expressed by filter beta ratio (β) at a specified particle diameter. The standard of beta ratio at a particle size is β = (total number particle at diameter or greater into filter) / particles at diameter or greater through filter). Thus, for a given particle size, efficiency in terms of beta ratio is [$\varepsilon = (1 - 1/ \beta) \times 100\%$]. The filtration level shall be a beta ratio of 200 minimum (efficiency of 99.5%) at 20μ or less.

4.0 Steam Requirements

4.1 Steam Purity

The Steam shall meet the following requirements when tested in accordance with the designated test method:

- **Sodium + Potassium (Na +K)** – See paragraph 3.3
- **Total Conductivity (Cation + Anion)**

  Normal: <1.5 μS/cm (95% of operation time)
  Abnormal: < 2.0 μS/cm (5% of operating time)

- **Total Solids**

  The maximum total solids depends on the steam/fuel weight ratios at which the gas turbine is to operate in the specific application. The value is determined form Figure 1. Contaminant size shall not exceed 250 microns. With the exception of silica, there is no differentiation between types of solids as long as other limitations of this section are met.

  Interpretation of Figure 1 should be made as follows:

  a. Calculate maximum steam-to-fuel ratio by dividing total (CDP & fuel nozzle) high pressure steam flow by fuel flow (WF36) for site operating conditions. Where steam flow may vary widely, operating condition with highest steam-to-fuel ratio should be used.

  b. From curve, determine maximum solids permissible and apply this limit to steam supplied to gas turbine.

  Silica in the steam is limited to 20 ppb.

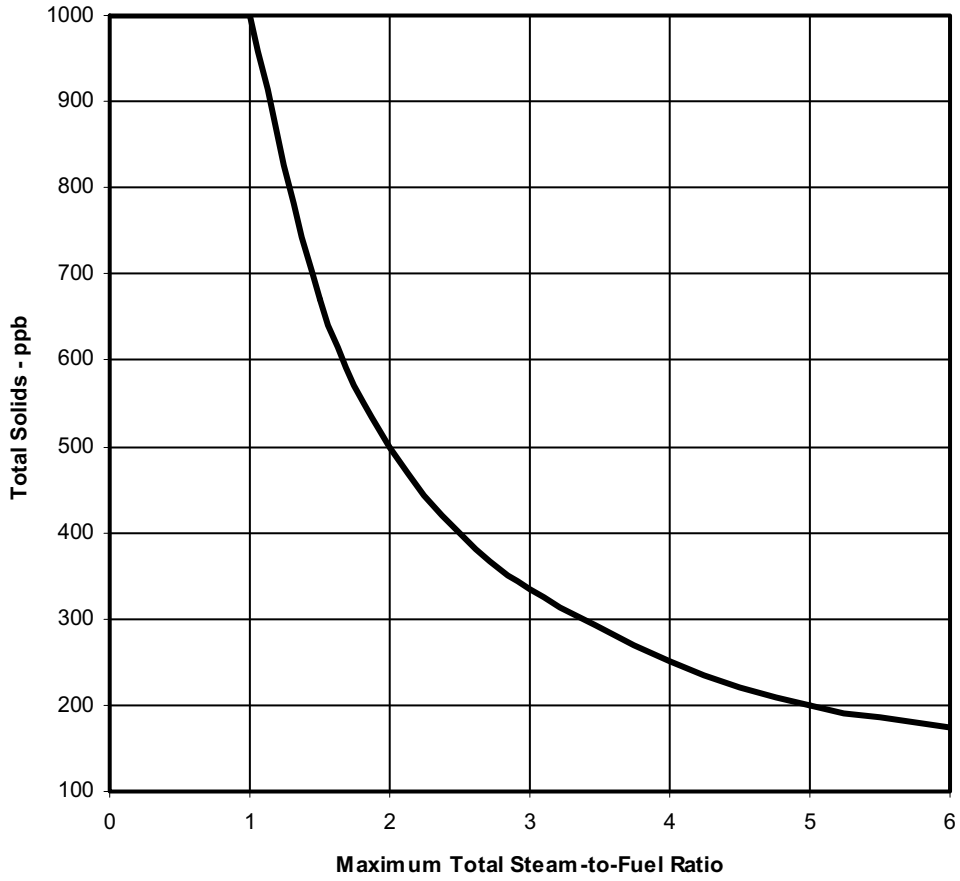

Figure 1. Steam Contamination Maximum Solids

4.2 Steam Sampling

Steam samples should be taken in accordance with ASTM D1066.

Compressor Cleaning Water Purity Requirements for GE Aircraft Derivative Gas Turbines

1.1 Scope

This specification establishes the requirements for purified water for use in cleaning the compressor of gas turbine engines where the intent is to restore performance by removing the build up of deposits on compressor components. The water quality defined in this specification applies to water used in both on–line compressor cleaning and crank–soak compressor cleaning.

1.2 Definitions

For the purpose of this specification, the following definitions shall apply:

On–line Compressor Cleaning - A method of removing the build up of deposits on compressor components while the engine is operating. On–line cleaning as accomplished by spraying cleaning solution into the inlet of the engine while the engine is operating.

Crank–Soak Compressor Cleaning - A method of removing the buildup of deposits on compressor components while the engine is motored by the starter. Crank–soak cleaning is accomplished by spraying cleaning solution into the inlet of the engine while the engine is operating unfired at crank speed.

Liquid Detergent - A concentrated solution of water soluble surface active agents and emulsifiable solvents.

Cleaning Solution - A solution of emulsion of liquid detergent and water or a water and antifreeze mixture for direct engine application. The recommended dilution of liquid detergent and water shall be specified by the liquid detergent manufacturer.

2.0 Applicable Documents

The following documents shall form a part of this specification to the extent specified herein. Unless a specific issue is specified, the latest revision shall apply.

2.1 American Society of Testing and Materials

Available from ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959 USA. (http://www.astm.org)

ASTM D1293 Tests for pH of Water

ASTM D3370 Practices for Sampling Water

ASTM D4191 Tests for Sodium in Water by atomic Absorbtion Spectography

ASTM D4192 Tests for Potassium in Water by Atomic Absorbtion Spectography

ASTM D5907 Tests for Filterable and Non-Filterable Matter in Water

2.2 Environmental Protection Agency (EPA) Test Methods

EPA 160.3 Residue, Non-Filterable and Total Suspended Solids

EPA 150.1 pH Electrometric

EPA 200.7 Metals & Trace Elements

3.0 Requirements

3.1 Sampling Requirements

The sampling shall be in accordance with ASTM D3370. A minimum sample of one (1) gallon or four (4) liters shall be supplied.

3.2 Chemical Requirements

The water shall meet the following requirements when tested in accordance with the designated test method.

3.3 Filtration Requirements

Filtration is most commonly expressed by filter beta ratio (β) at a specified particle diameter. The standard of beta ratio at a particle size is β = (total number particle at diameter or greater into filter) / particles at diameter or greater through filter). Thus, for a given particle size, efficiency in terms of beta ratio is [ε = (1 – 1/ β) x 100%]. The filtration level shall be a beta ratio of 200 minimum (efficiency of 99.5%) at 100μ or less.

	Limit	Test Method
Total matter, ppm, max	100	ASTM D5907 or EPA 160.3
pH	6.5 - 8.5(1)	ASTM D1293 or EPA 150.1
Sodium + potassium, ppm max	25	ASTM D4191 & ASTM D4192 or EPA 200.7

Note (1): pH of 6.5 – 8.5 is desired, 6.0 – 8.5 is permitted.

Liquid Detergent for Compressor Cleaning for GE Aircraft Derivative Gas Turbines

This specification establishes the requirements for liquid detergent products used to prepare cleaning solutions for cleaning the compressors of gas turbine engines, where the intent is to restore performance by removing the build–up of deposits on compressor components. Such deposits include salt, soils or oils that may be ingested from the atmosphere.

The cleaning process shall be carried out by spraying the cleaning solution into the bellmouth of the engine while the engine is running at power (on–line cleaning) or while the engine is being cranked (crank soak cleaning).

For the purposes of this specification, the following definitions shall apply:

Liquid Detergent - A concentrated solution of water soluble surface active agents and emulsifiable solvents.

Cleaning Solution - A solution or emulsion of liquid detergent in water or a water and antifreeze mixture for direct engine application. The recommended dilution of liquid detergent and water shall be determined by the liquid detergent manufacturer.

1. Applicable Documents

The following documents shall form a part of this specification to the extent specified herein. Unless a specific issue is specified, the latest revision shall apply.

ASTM D88 Standard Test Method For Saybolt Viscosity

ASTM D445 Standard Test Method for Kinematic Viscosity of Transparent and Opaque Liquids

ISO 3104 Determination of Kinematic viscosity and calculation of dynamic viscosity

ARP 1795 Stress–Corrosion of Titanium Alloys, Effect of Cleaning Agents on Aircraft Engine Materials

AMS 1424 Deicing/Anti-icing Fluid, Aircraft (Newtonian-SAE Type 1)

2. Detergent Properties

2.1 Composition

The chemical composition of the detergent is not limited, other than as specified herein.

2.2 Biodegradability

Use of the liquid detergent/cleaning solution shall conform to local regulations for water pollution. Use of biodegradable ingredients is recommended.

2.3 Toxicity

Use of the liquid detergent/cleaning solution shall conform to local regulations for industrial hygiene and air pollution. Use of nontoxic ingredients is recommended.

2.4 Health and Safety Information

The liquid detergent manufacturer shall make available health and safety information for the liquid detergent as required by applicable local, state and federal regulations.

2.5 Solids

The liquid detergent shall contain no particles larger than 20 micron.

2.6 Physical and Chemical Properties

The liquid detergent shall meet the test requirements.

3. Test Requirements

3.1 Liquid Detergent

3.1.1 Residue or Ash Content

Residue or ash content shall not exceed 0.01 percent when tested in accordance with paragraph 4.1.

3.1.2 Low Temperature Stability

The liquid detergent shall show no evidence of separation of component parts when maintained at 40°F ± 3 (5°C ± 2). It is highly desirable although not mandatory that the fluid shall remain liquid below 32°F (0°C).

3.1.3 Cold Weather Solution Compatibility

The liquid detergent shall show no separation, layering or precipitation when mixed to the liquid detergent manufacturer's recommended dilution in one or more of the following antifreeze solutions after 2 hours at 10°F ± 3 (-12°C ± 2):

- Isopropyl Alcohol
- Monopropylene glycol (PG)
- Acetone

See paragraph 6.1 for more information regarding liquid detergent and antifreeze mixtures.

3.1.4 Hard Water Compatibility

The liquid detergent shall show no separation or layering when mixed with synthetic hard water prepared in accordance with paragraph 4.2.

3.1.5 Acid and Alkali Acceptance

The liquid detergent shall show no separation, layering or precipitation when tested in acidic or alkali media in accordance with paragraph 4.3.

3.1.6 Salt Water Tolerance

The liquid detergent shall show no separation or gelling when mixed with 3.5 percent salt water in accordance with paragraph 4.4.

3.1.7 Viscosity

The liquid detergent shall have a viscosity of 50 to 200 SUS at 77°F (25°C) when tested in accordance with ASTM D88, or 7.4 to 43.3 cSt when measured per ASTM 445 or ISO 3104.

3.1.8 pH

The pH of the liquid detergent as received shall be from 6.5 to 8.5 when measured with a suitable pH meter employing a glass electrode.

3.2 Cleaning Solution

3.2.1 Corrosive Elements

Maximum levels of elements in the cleaning solution which may promote various types of corrosion, shall be no greater than as shown in Table 1, when analyzed by methods in paragraph 4.5.

Table 1. Maximum Corrosives Limit

Total alkali metals (sodium + potassium + lithium, etc.)	25 ppm max.
Magnesium + calcium	5 ppm max.
Vanadium	0.1 ppm max.
Lead	0.1 ppm max.
Tin + Copper	10 ppm max.
Sulfur	50 ppm max.
Chlorine	40 ppm max.

3.2.2 pH

The pH of the cleaning solution shall be from 6.5 to 8.5 when measured with a suitable pH meter employing a glass electrode.

4. Test Methods

4.1 Residue or Ash Content

Weigh 10 ± 0.1 gram sample of liquid detergent in a weighed 30 ml porcelain crucible. Heat gently to volatilize any water or solvents. (Crucible may be placed in air oven at 105°C ± 2 for 24 hours, followed by 240°C ± 2 for 24 hours to insure all volatile matter is evaporated.) Finally, ignite contents over Bunsen Burner, first at low temperature under good oxidizing conditions until all ignitable material is consumed, then place a crucible in a muffle furnace at 1040 to 1100°C for 2 hours. Cool in desiccator, and weigh.

Percent residue or ash = (100 x A)/W

Where: A = grams of residue
W = grams of sample

4.2 Hard Water Compatibility

4.2.1 Preparation of Synthetic Hard Water

A hard water solution is prepared by dissolving the following in one liter of just boiled and cooled distilled water:

a. 0.20±0.005 gram Calcium Acetate, reagent grade $Ca(C_2H_3O_2)_2 \bullet H_2O$

b. 0.15±0.005 gram Magnesium Sulfate, reagent grade $MgSO_4 \bullet 7 H_2O$

4.2.2 Hard Water Test

5 ml of liquid detergent shall be added to a clean 50 ml cylinder. 45 ml of synthetic hard water shall be added and mixed well. The solution shall be examined for compatibility after 16 hours at 77°F ± 5 (25°C ± 3).

4.3 Acid and Alkali Acceptance

The liquid detergent shall be mixed with distilled water in accordance with the liquid detergent manufacturer's recommended dilution. To 50 ml of the solution, add 1 ml of 75 percent phosphoric acid. To another 50 ml of the solution, add 5 ml of 75 percent phosphoric acid. To another 50 ml of the solution, add 1 ml of 50 percent potassium hydroxide. Let all three mixtures stand for one hour at 77°F ± 5 (25°C ± 3), and then examine for acid or alkali acceptance.

4.4 Salt Water Tolerance

Prepare a 3.5 percent by weight solution of sodium chloride in distilled water. Add 15 ml of salt solution to 35 ml of liquid detergent and let stand for 1 hour at 77°F ± 5 (25°C ± 3). Examine for salt water tolerance.

4.5 Elemental Content

Elemental content shall be determined using the following methods:

Element	Method
Sulfur, Phosphorous	Inductivity Coupled Plasma Spectroscopy - Atomic Emission Spectroscopy (ICP-AES)
Chlorine	Microcoulometric filtration
Sodium, Potassium	Atomic Absorption (AA)
Other metals	ICP-AES or AA

5. Material Compatibility

5.1 Compatibility with Engine Materials

Use of the detergent gas turbine cleaner shall not have adverse effects on engine system materials such as titanium stress corrosion, hot corrosion of turbine components or damage to lubrication system components.

5.2 Titanium Stress Corrosion

A titanium stress corrosion test in accordance with ARP 1795 or equivalent may be run on the liquid detergent at the discretion of GE.

6.1 Cold Weather Usage

In cold weather, liquid detergent must be added to antifreeze mixture rather than to water alone. At present, the only acceptable antifreeze solutions are:

- Isopropyl Alcohol
- Monopropylene glycol (PG)
- Acetone

Monopropylene glycol (PG) must be per AMS 1424 and may be used down to 20°F (-7°C)

Antifreeze mixtures are shown in Table 2. The liquid detergent manufacturer must specify which, if any, of the antifreezes specified above is not compatible with the liquid detergent.

The use of non-isopropyl alcohol, ethylene glycol or additives containing chlorine, sodium or potassium are not permitted since they may attack the titanium and other metals in the gas turbine.

It is extremely important that the liquid detergent and antifreeze solution be a homogeneous mixture when sprayed into the bellmouth of the gas turbine. If after 2 hours the liquid detergent and antifreeze solution separates, (see paragraph 3.1.3) agitation of the mixture in the wash water tank is permissible. However, the liquid detergent manufacturer shall specify that agitation is required.

Table 2. Water Wash Antifreeze Mixtures.

Lubricating Oil Specification for GE Aircraft Derivative Gas Turbines

This document provides the requirements and application guidelines for selection of lubricating oils which can be satisfactorily utilized in GE Marine and Industrial Aeroderivative Applications. It is recommended that the lubricating oil selected be reviewed with GE prior to its use.

1.0 Oil Specifications

Oils conforming to the US Department of Defense (DoD) Specifications shown in paragraph 2.1 are acceptable for use in GE Aircraft Derivative gas turbines, provided they are listed on the Qualified Product List (QPL) for the specific Specification.

1.1 Commercial Specifications

Commercially available synthetic based lubricating oils, per the Supplier's Specification, are acceptable for use in GE Aircraft Derivative gas turbines, provided they are listed in Section 4 of this document. Such oils largely conform to the primary requirements of the oils in Section 1.0, but certain variations have been approved. Such oils have been qualified by the Supplier to meet the requirements of this document.

2.0 Applicable Documents

The following documents shall form a part of this document to the extent specified herein. Unless a particular issue is specified, the latest revision shall apply.

2.1 US DoD Specifications

MIL-PRF-23699 Lubricating Oil, Aircraft Turbine Engines, Synthetic Base, Class STD

MIL-L-7808 Lubricating Oil, Aircraft Turbine Engines, Synthetic Base, Type 1

2.2 American Society of Testing and Materials.

The following documents are available from ASTM International, 100 Barr Harbor Drive PO Box C700, West Conshohocken, PA 19428-2959:

ASTM D2532 Low Temperature Viscosity

ASTM D97 Pour Point

ASTM D445 Kinetic Viscosity

ISO 3104 Determination of Kinematic viscosity and calculation of dynamic viscosity

3.0 Requirements

The lubricating oil shall conform to the requirements of MIL-PRF-23699, Class STD however, exceptions to the following requirements will be considered:

- Low temperature Viscosity when tested per ASTM D2532.
- Pour Point when tested per ASTM D97.
- Viscosity at 40°C and 100°C when tested per ASTM D445 or ISO 3104
- Base Stock Composition

The specific variations to MIL-PRF-23699, Class STD shall be provided by the oil supplier, along with performance difference impacts, for review by GE.

3.1 Material Compatibility

The lubricating oil shall be compatible with the same elastomer seal and metallic materials as the MIL-PRF-23699, Class STD compliant lubricating oils are.

The lubricating oil shall be mixable with MIL-PRF-23699, Class STD or MIL-L-7808 compliant oil in a ratio of up to 5% of either oil, without adversely affecting the property integrity of the majority, or operating, oil. Mixing of oils is not intended, but will result due to engine location changes.

4.0 Qualification

Lubricating oil shall be considered qualified and acceptable for use in GE Aircraft Derivative gas turbines demonstrating conformance to the requirements and after being listed in paragraph 4.4. The qualification program shall be carried out by the oil supplier in conjunction with a sponsoring gas turbine owner/operator. GE's participation will be limited to technical consultation, review and final approval only.

4.1 Performance Tests

The oil supplier shall conduct tests in accordance with the requirements of MIL-PRF-23699, Class STD and compare the results with the requirements stated therein. All results, and specifically the variations to MIL-PRF-23699, Class STD requirements, shall be reviewed with GE prior to initiation of Service Evaluation Testing. Specifically, the material presented for review shall include, as minimum, the following:

- Physical/Chemical Properties and variations to MIL-PRF-23699, Class STD
- Expected impact to operating systems due to Property variations
- Material Compatibility Lists & Test results
- Oil Coking Test Results

4.2 Service Evaluation Tests

The oil shall undergo service evaluation testing in a LM Series gas turbine application(s). The sponsoring operator will accept total responsibility for all results related to operating with the candidate lubricating oil. The service evaluation engine shall have a known hardware condition baseline, based on depot inspection or new delivery, immediately prior to the service evaluation test.

Service evaluation testing shall be conducted on a minimum of three LM series gas turbines, each accumulating at least 8,000 operating hours, at a baseload operating site, prior to inspection. During operation, periodic oil samples shall be tested and trended for physical and chemical property changes. Inspection shall be performed at an authorized depot, and shall be in accordance with the applicable repair manual.

Inspection shall be focused on the oil wetted parts, including the bearings, gears, elastomer seals, sump oil seals, actuators, and lube/hydraulic pumps. GE will be permitted to witness any of the inspections, at the discretion of GE.

4.3 Qualification Report

The oil supplier, and/or operator, shall prepare and submit a Final Qualification Report to GE. The report shall include, as a minimum, the following:

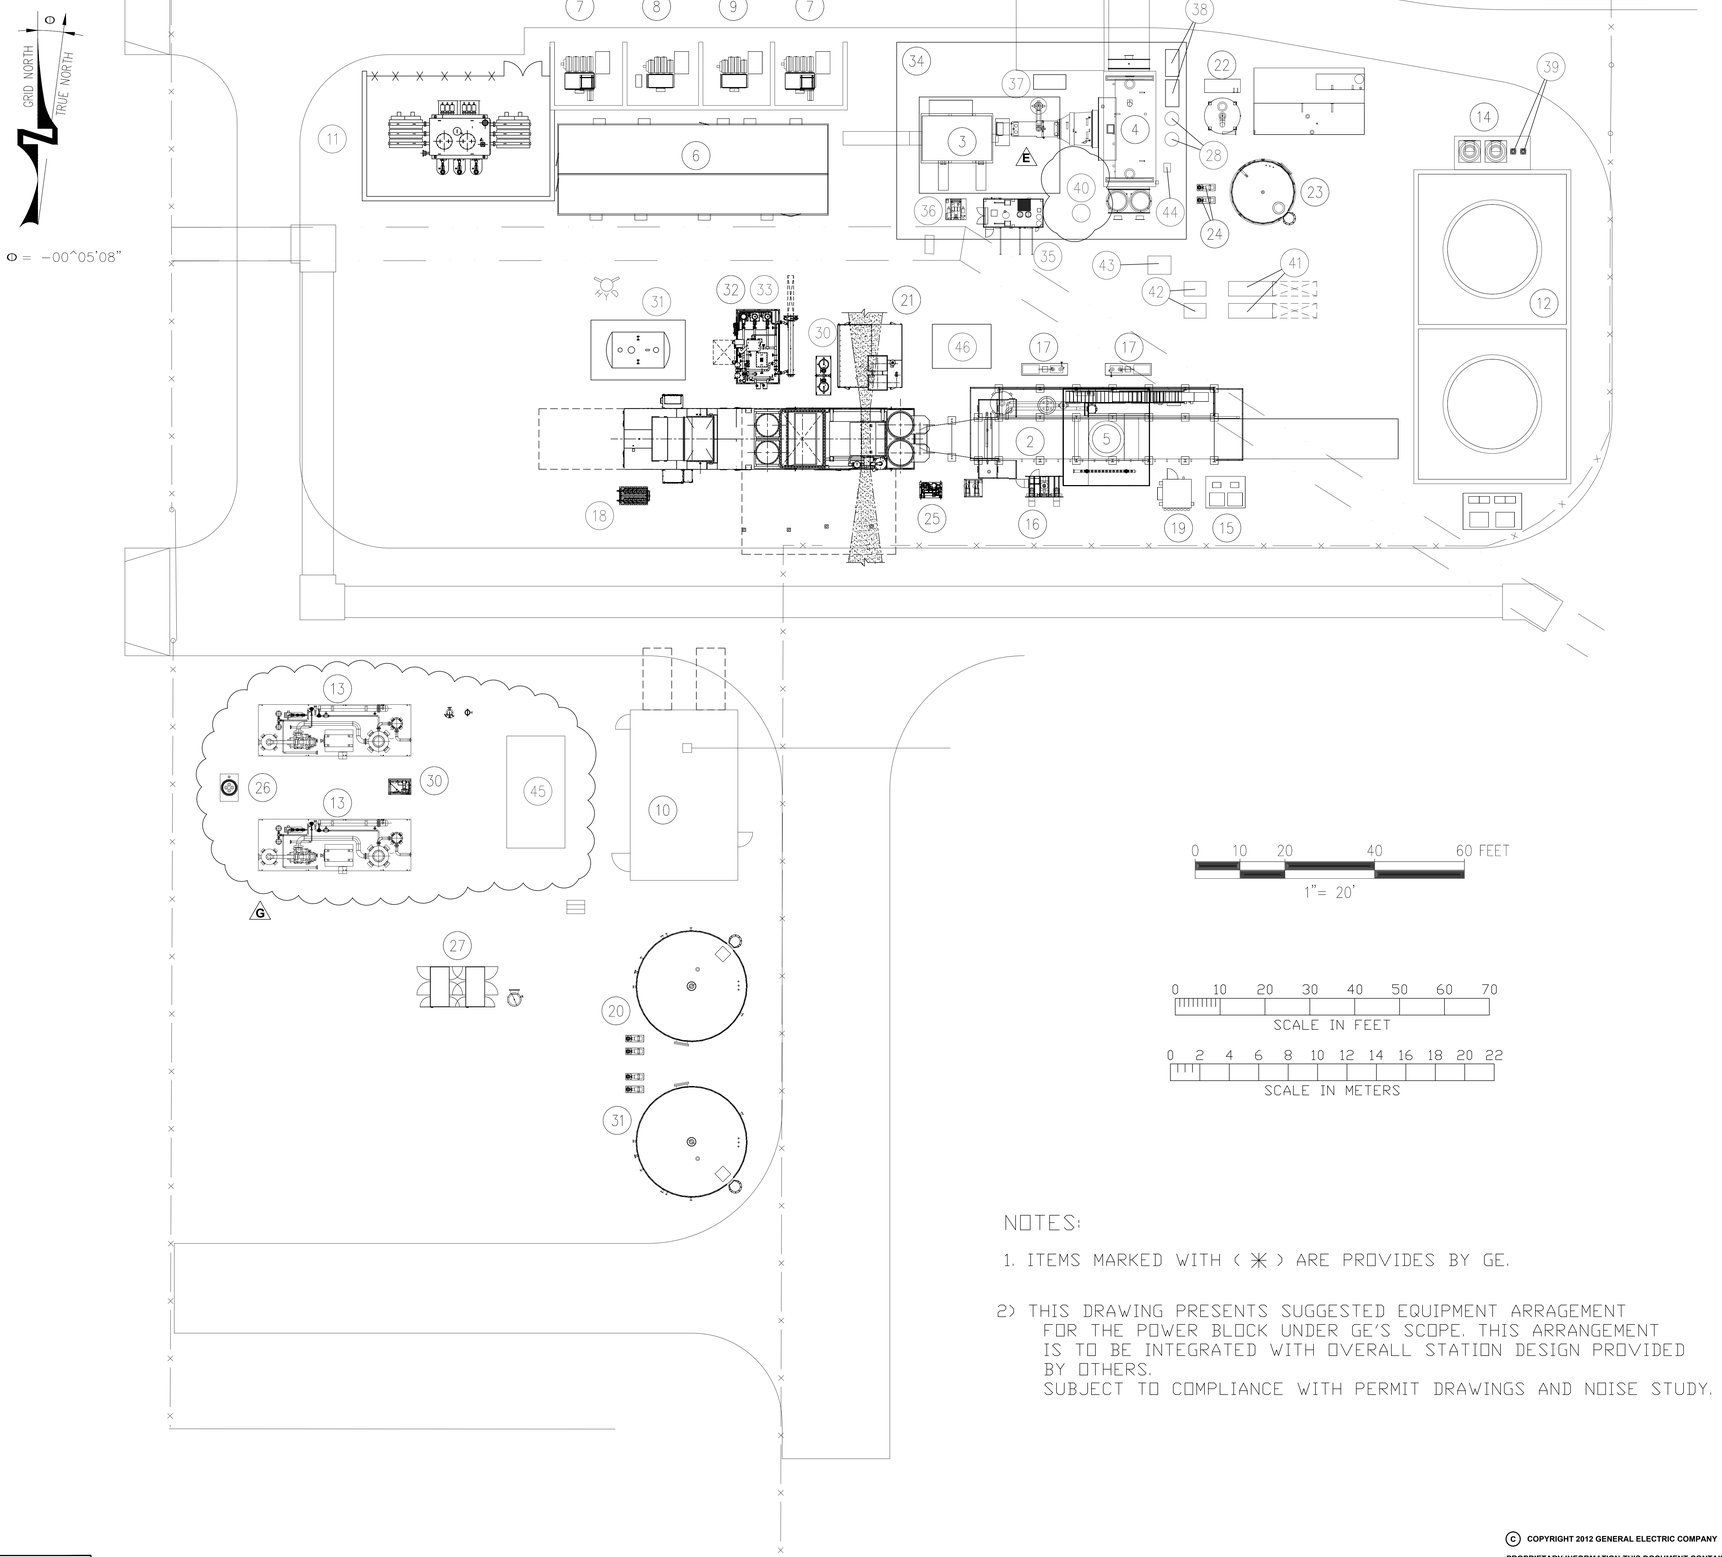
- Oil Brand Description including the complete formulation
- Certified physical, chemical and performance test results
- Material Safety Data Sheets
- Service evaluation test history including all significant operational and maintenance events
- Service evaluation oil sample trending results
- Final depot engine inspection results

Upon final review and approval of the Final Qualification Report by GE, the candidate oil will be included on the approved oils list.

Formulation changes affecting any approved performance characteristics must be reviewed with GE for impact on qualification results.

4.4 Approved Lubricating Oils

Approved lubricating oils listed on QPL-23699 Class STD, and QPL-7808, (Qualified Products List). Oils listed for MIL-PRF-23699, Class HTS are specifically not approved for aero derivative gas turbines.



In addition, the following lubricating oils are approved for use in GE Aero Derivative gas turbines and gas generators:

1. None at this time.

SHEET 4 OF 4

NOTES:

1. THIS DRAWING IS ONLY AN INTERCONNECT PLAN THAT REFERENCES AND IDENTIFIES RACEWAY RUNS.
2. RACEWAY RUNS SHOWN TO PANELS AND CONTROLS ARE GENERAL AND DO NOT INDICATE ACTUAL ENTRY POINTS.
3. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
4. * ASTERISK INDICATES FURNISHED BY OTHERS. ITEMS SHOWN AS "BY OTHERS" MAY VARY BUT ARE SHOWN TO ATTEMPT CLARITY OF PERSPECTIVE ON THIS DRAWING.
5. ALL CABLES, CABLE GLANDS & RACEWAYS ARE FURNISHED BY OTHERS, UNLESS OTHERWISE INDICATED. ALL CABLES AND CABLE GLANDS SHALL MEET THE IP/NEMA RATING OF THE TERMINATION BOX AND PANELS. A RACEWAY IS AN ENCLOSED CHANNEL DESIGNED TO HOLD CABLES, WIRES, BUS–BARS. RACEWAY SHOULD BE METALLIC OR NON METALLIC MATERIAL AND CAN BE CONDUIT, CABLE TRAY, FLEXIBLE CONDUIT, UNDER GROUND DUCT. RACEWAYS THAT ARE METALLIC SHOULD BE BONDED THROUGH THEIR PERIMETER AND GROUNDED AT BOTH ENDS, AS A MINIMUM
6. CUSTOMER IS ADVISED TO PULL A MINIMUM OF 10% EXTRA WIRING FOR SPARES. ALL SPARE CONDUCTORS MUST BE GROUNDED ON BOTH ENDS. GROUND BARS TO BE ON CUSTOMER SCOPE OF SUPPLY AS REQUIRED
7. CABLES WITH THE SAME RACEWAY NUMBER AND SAME VOLTAGE MAY BE RUN IN MULTI CONDUCTOR CABLE. CABLE SHOULD HAVE OVERALL OUTER SHIELD AND SHIELD FOR EACH PAIR, TRIAD, QUAD AS APPLICABLE.
8. ALL CABLES WITH DIFFERENT VOLTAGE CAN NOT COEXIST IN THE SAME RACEWAY NUMBER.
9. ALL FIRE SYSTEM CABLES SHALL BE SEGREGATED FROM ALL OTHER CABLES, WHICH IS IN ACCORDANCE WITH NFPA 70 (NEC) AND LOCAL JURISDICTION CODES.
10. ALL COMMUNICATION CABLES SHALL BE SEGREGATED FROM ALL OTHER CABLES AND NOT COMBINED WITH NON–COMMUNICATION CABLE RACEWAYS.
11. FOR INSTRUMENTATION CABLES THAT ARE INCORPORATED IN MULTICONDUCTOR CABLES, INDIVIDUAL SHIELDS MUST BE INCORPORATED AS INDICATED FOR EACH INDIVIDUAL PAIR, TRIAD, ETC. CABLES WITH SHIELDS SHALL HAVE THEIR SHIELD DRESSED OUT NO MORE THAN 1 IN. [25 mm].
12. CUSTOMER TO ENSURE PROPER CABLE INSTALLATION AND SEPARATION BY SERVICE LEVEL IN ACCORDANCE TO THE FOLLOWING INDUSTRY STANDARDS OR EQUIVALENT:
    IEEE 422: IEEE GUIDE FOR THE DESIGN AND INSTALLATION OF CABLE SYSTEMS IN POWER GENERATING SYSTEMS.
    NFPA 70 (NEC): ARTICLE 300–310 CONDUCTORS OF DIFFERENT SYSTEMS.
    IEC 61000–5–2: EMC – INSTALLATION AND MITIGATION GUIDELINES, EARTHING AND CABLING.

    INSTRUMENTATION & CONTROL (24 VDC OR LESS) AND COMMUNICATION CABLES SHALL BE SEGREGATED FROM POWER CABLES
    IN ACCORDANCE TO THE FOLLOWING AIR GAP REQUIREMENT, AS A MINIMUM (BASED ON 100 M RUNS):

    75 TO 130 V: ENSURE 30 IN. [0.75 M] AIR GAP, LOW VOLTAGE.
    150 TO 230 V: ENSURE 60 IN. [1.5 M] AIR GAP, LOW VOLTAGE.
    380 TO 480 V: ENSURE 90 IN. [2.25 M] AIR GAP, LOW VOLTAGE.
    600 TO 15 KV: ENSURE 120 IN. [3 M] AIR GAP, MEDIUM VOLTAGE.

    IF SEGREGATION AIR GAP IS NOT POSSIBLE, METAL BARRIERS WITH GROUNDS TO BE ADDED BETWEEN CABLE RUNS. ALL CABLES SHOULD NOT BE BENT TO A RADIUS LESS THAN 8 TIMES THE OVERALL DIAMETER FOR NON–SHIELDED CABLES OR 12 TIMES THE OVERALL DIAMETER FOR SHIELDED CABLES.
    ALL CABLES SHALL BE RATED FOR ALL OF THE ENVIRONMENTAL CONDITIONS WHERE THEY ARE TO BE INSTALLED.
    WHEN METALLIC SHEATH ARMOR CABLES ARE USED, BOTH ENDS OF THE OUTER ARMOR SHOULD BE GROUNDED TO PE.

NOTES:

1. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
2. THE WIRE SIZE SHOWN IS ESTIMATED MINIMUM SIZE BASED ON COPPER CONDUCTORS TYPE THW OR RHW INSULATION, OR EQUIVALENT, AND A LENGTH OF 100 FT [30.48 M]. ALL WIRE SHALL BE TWISTED STRANDED TYPE, SHIELDED (AS APPLICABLE), IN ACCORDANCE WITH THIS SCHEDULE.
3. THE CUSTOMER IS ADVISED TO MAKE ALLOWANCES FOR CABLE LENGTHS GREATER THAN THE 100 FT [30.48 M] SO AS TO LIMIT THE VOLTAGE DROPS TO 3% MAXIMUM. UNLESS OTHERWISE INDICATED.
4. CUSTOMER IS ADVISED TO PULL A MINIMUM OF 10% EXTRA WIRING FOR SPARES. ALL SPARE CONDUCTORS MUST BE GROUNDED ON BOTH ENDS. GROUND BARS TO BE ON CUSTOMER SCOPE OF SUPPLY AS REQUIRED.
5. NOT USED.
6. CABLES WITH THE SAME RACEWAY NUMBER AND SAME VOLTS MAY BE RUN IN SAME MULTICONDUCTOR CABLE. MULTICONDUCTOR SHOULD HAVE OVERALL OUTER SHIELD AND SHIELD FOR EACH PAIR, TRIAD, QUAD, AS APPLICABLE.
7. ALL CABLES SHALL HAVE 600V INSULATION TO COEXIST IN THE SAME RACEWAY NUMBER AC AND DC CABLE SHALL BE SEGREGATED ACCORDING TO THIS DRAWINGS.
8. ALL FIRE SYSTEM CABLES SHALL BE SEGREGATED FROM ALL OTHER CABLES IN ACCORDANCE WITH NFPA 70 (NEC) AND LOCAL JURISDICTION CODES.
9. ALL COMMUNICATION CABLES SHALL BE SEGREGATED FROM ALL OTHER CABLES AND NOT COMBINED WITH NON–COMMUNICATION CABLE RACEWAYS.
10. FOR INSTRUMENTATION CABLES THAT ARE INCORPORATED IN MULTICONDUCTOR CABLES, INDIVIDUAL SHIELDS MUST BE INCORPORATED AS INDICATED FOR EACH INDIVIDUAL PAIR, TRIAD, ETC. CABLES WITH SHIELDS SHALL HAVE THEIR SHIELD DRESSED OUT NO MORE THAN 1 IN. [25 mm].
11. CUSTOMER TO ENSURE PROPER CABLE INSTALLATION AND SEPARATION BY SERVICE LEVEL IN ACCORDANCE TO THE FOLLOWING INDUSTRY STANDARDS OR EQUIVALENT:

    IEEE 422: IEEE GUIDE FOR THE DESIGN AND INSTALLATION OF CABLE SYSTEMS IN POWER GENERATING SYSTEMS.
    NFPA 70 (NEC): ARTICLE 300–310 CONDUCTORS OF DIFFERENT SYSTEMS.
    IEC 61000–5–2: EMC–INSTALLATION AND MITIGATION GUIDELINES, EARTHING AND CABLING.

    INSTRUMENTATION & CONTROL (24 VDC OR LESS) AND COMMUNICATION CABLES SHALL BE SEGREGATED FROM POWER CABLES IN ACCORDANCE TO THE FOLLOWING AIR GAP REQUIREMENT, AS A MINIMUM (BASED ON 100 M RUNS):
    75 TO 130 V: ENSURE 30 IN. [0.75 M] AIR GAP, LOW VOLTAGE.
    150 TO 230 V: ENSURE 60 IN. [1.5 M] AIR GAP, LOW VOLTAGE.
    380 TO 480 V: ENSURE 90 IN. [2.25 M] AIR GAP, LOW VOLTAGE.
    600 TO 15 KV: ENSURE 120 IN. [3 M] AIR GAP, MEDIUM VOLTAGE.

    IF SEGREGATION AIR GAP IS NOT POSSIBLE, METAL BARRIERS WITH GROUNDS TO BE ADDED BETWEEN CABLE RUNS. ALL CABLES SHOULD NOT BE BENT TO A RADIUS LESS THAN 8 TIMES THE OVERALL DIAMETER FOR NON–SHIELDED CABLES OR 12 TIMES THE OVERALL DIAMETER FOR SHIELDED CABLES. ALL CABLES SHALL BE RATED FOR ALL OF THE ENVIRONMENTAL CONDITIONS WHERE THEY ARE TO BE INSTALLED. WHEN METALLIC SHEATH ARMOR CABLES ARE USED, BOTH ENDS OF THE OUTER ARMOR SHOULD BE GROUNDED TO PE.
12. USE CORNING OPTICAL FIBER CABLE NO. 006KSF–T4130D20 OR EQUAL W/INTEGRAL STAINLESS STEEL SC TYPE CONNECTOR ON BOTH ENDS OF THE CABLE, WHERE INDICATED.
13. MAINTAINED SWITCH CONTACT, WHERE INDICATED.
14. MOMENTARY SWITCH CONTACT, WHERE INDICATED.
15. ACTIVE ONLY WHEN SELECTED BY LOCAL/REMOTE SWITCH ON THE LOCAL CONTROL PANEL (TCP), WHERE INDICATED.
16. IF SIGNAL IS NOT REQUIRED, ADD JUMPER BETWEEN ITS TERMINAL POINTS, WHERE INDICATED.
17. OPEN CONTACT = CONDITION SHOWN, WHERE INDICATED.
18. ALL WIRES TO BE LABELED AT EACH TERMINATION WITH A SLEEVE TYPE WIRE MARKERS.
19. BREAKDOWN OF BLOCK IDENTIFICATION:
    CABLE ID./RACEWAY NO.
    AC03/617
    12 AWG/4
    WIRE SIZE/NO. OF CONDUCTORS
20. ALL CABLES, CABLE GLANDS & RACEWAYS ARE FURNISHED BY OTHERS, UNLESS OTHERWISE INDICATED. ALL CABLES AND CABLE GLANDS SHALL MEET THE IP/NEMA RATING OF THE TERMINATION BOX AND PANELS. A RACEWAY IS AN ENCLOSED CHANNEL DESIGNED TO HOLD CABLES, WIRES, BUS–BARS. RACEWAY SHOULD BE METALLIC OR NON METALLIC MATERIAL AND CAN BE CONDUIT, CABLE TRAY, FLEXIBLE CONDUIT, UNDER GROUND DUCT. RACEWAYS THAT ARE METALLIC SHOULD BE BONDED THROUGH THEIR PERIMETER AND GROUNDED AT BOTH ENDS, AS A MINIMUM.
21. TWISTED PAIR SHIELDED CABLE TO BE 22 AWG, TINNED COPPER, 8.8 PF/FT [28.86 PF/M], STRANDED, 150V, 150 OHMS IMPEDANCE, BELDEN NO. 89182 OR EQUAL, WHERE INDICATED.
22. USE CAT5e SHIELDED ETHERNET CABLE W/RJ45 CONNECTORS, WHERE INDICATED.
23. USE GREEN/YELLOW CABLE, WHERE INDICATED.
24. TERMINATION SUFFIXED WITH A "G" INDICATES HALF GREEN/HALF YELLOW GROUND TERMINAL.
25. ALL UNUSED INDIVIDUAL WIRE ENDS (INCLUDING THOSE IN SHIELDED CABLES) TO BE FOLDED BACK AND TAPED.
26. ALL SHIELDING WILL HAVE A MAXIMUM EXPOSED SHIELD LENGTH OF 2 IN [51 mm] AT TERMINAL END.
27. FOR 60 HZ NEC/CSA APPLICATIONS, AC WIRING COLORS SHALL BE PER NEC ARTICLE 200. STANDARD WIRING COLORS ARE RED, BLACK, BROWN FOR POWER PHASES AND WHITE FOR NEUTRAL. PE GROUND WIRING COLOR IS GREEN/YELLOW STRIPE, OR GREEN.
28. FOR 50 HZ IEC APPLICATIONS, AC WIRING COLORS SHALL BE PER IEC ARTICLE 60446. STANDARD WIRING COLORS ARE BLACK, BROWN, GRAY FOR POWER PHASES AND BLUE FOR NEUTRAL. PE GROUND WIRING COLOR IS GREEN/YELLOW STRIPE.
29. IF DISTANCE BETWEEN REMOTE HMI AND TCP IS LESS THAN 300 FT [91.4 M], USE CAT5e SHIELDED ETHERNET CABLE W/RJ45 CONNECTORS, WHERE INDICATED. IF DISTANCE BETWEEN REMOTE HMI AND TCP IS GREATER THAN 300 FT [91.4 M], USE FIBER OPTIC CABLE WITH FIBER OPTIC TO ETHERNET MEDIA CONVERTER AT EACH END, WHERE INDICATED.
30. CABLE TO BE SIZED BY CUSTOMER, WHERE INDICATED.
31. ALL CABLE GLANDS AND CABLE SUPPORT SYSTEMS ARE WITHIN CUSTOMER SCOPE OF SUPPLY AND NOT SUPPLIED BY GE.
32. SYSTEM SUPPLIED BY GEPPLP, INSTALLATION AND LOCATION IS UNDER THE CUSTOMER SCOPE AND MUST COMPLY WITH THE INSTALLATION INSTRUCTIONS STATED IN THE USER'S GUIDE. THE MAXIMUM LENGTH OF THE CABLE FROM ANTENNA TO HMI IS 300 FT [91.44 M] PER GEPPLP DESIGN.
33. SYSTEM SUPPLIED BY CUSTOMER, GEPPLP RECOMMEND TO USE GE PART #398A4893P0001 (SUPPLY BY MEINBERG).
34. INSTALLATION AND LOCATION IS UNDER CUSTOMER SCOPE AND MUST COMPLY WITH THE INSTALLATION INSTRUCTIONS STATED IN THE USER'S GUIDE. THE MAXIMUM LENGTH OF THE CABLE FROM ANTENNA TO HMI IS 300 FT [91.44 M] PER GEPPLP DESIGN.
35. ENET8 IS SUPPLIED BY GE WHEN REMOTE HMI OPTION IS PURCHASED ETHERNET SWITCH IS AN ALLIED TELESYN INTERNATION AT–8026FC MODEL.
36. WOBBE METER CAN SUPPORT UP TO 3 GAS TURBINE GENERATOR SETS, FOR CAT5e ETHERNET CABLE INSTALLATION THE WOBBE METER CAN DIRECT CONNECT TO EACH UNIT FEATURING ONBOARD ETHERNET SWITCH(ENET7), PORT 3 IS FOR UNIT 1, PORT 4 IS FOR UNIT 2, AND PORT 5 IS FOR UNIT 3.
37. WOBBE METER CAN SUPPORT UP TO 3 GAS TURBINE GENERATOR SETS, FOR FIBER OPTIC CABLE INSTALLATION THE WOBBE METER CAN DIRECT CONNECT TO ONE UNIT FEATURING ONBOARD ETHERNET SWITCH WITH FIBER OPTIC PORT. THE FIBER PORT SHALL INTERFACE WITH ENET1 FIBER OPTIC PORT, IF MULTIPLE UNIT INSTALLATION IS REQUIRED ENET1 AND ENET2 AS APPLICABLE SHALL BE LINKED TO ENET1 AND ENET2 AS APPLICABLE OF ADDITIONAL UNITS UP TO 3.
38. ALL CABLES WITH DIFFERENT VOLTS CAN NOT COEXIST IN THE SAME RACEWAY NUMBER.

GE PACKAGED POWER, L.P.

© Copyright 2013
GE Packaged Power, L.P.
All rights reserved.
This drawing is the proprietary information of GE Packaged Power, L.P. and is loaned in strict confidence with the understanding that will not be reproduced nor used for any purpose except that for which it is loaned. It shall be immediately returned on demand and is subject to all other terms and conditions of any written agreement or purchase order that incorporates or relates to this drawing.

NOTES:

1. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)-(STANDARD DRAWING NUMBER), AND REFERENCED AS X-(STANDARD DRAWING NUMBER), WHERE X=ORDER NUMBER.
2. THE WIRE SIZE SHOWN IS ESTIMATED MINIMUM SIZE BASED ON COPPER CONDUCTORS TYPE THW OR RHW INSULATION, OR EQUIVALENT, AND A LENGTH OF 100 ft [30.48 m]. ALL WIRE SHALL BE TWISTED STRANDED TYPE, SHIELDED (AS APPLICABLE), IN ACCORDANCE WITH THIS SCHEDULE.
3. THE CUSTOMER IS ADVISED TO MAKE ALLOWANCES TO LIMIT THE VOLTAGE DROPS TO 3% MAXIMUM, UNLESS OTHERWISE INDICATED.
4. CUSTOMER IS ADVISED TO PULL A MINIMUM OF 10% EXTRA WIRING FOR SPARES. ALL SPARE CONDUCTORS MUST BE GROUNDED ON BOTH ENDS. GROUND BARS TO BE ON CUSTOMER SCOPE OF SUPPLY AS REQUIRED
5. ALL CABLES, CABLE GLANDS & RACEWAYS ARE FURNISHED BY OTHERS, UNLESS OTHERWISE INDICATED.
   ALL CABLES AND CABLE GLANDS SHALL MEET THE IP/NEMA RATING OF THE TERMINATION BOX AND PANELS.
   A RACEWAY IS AN ENCLOSED CHANNEL DESIGNED TO HOLD CABLES, WIRES, BUS BARS.
   RACEWAYS SHOULD BE METALLIC OR NON-METALLIC MATERIAL AND CAN BE CONDUIT, CABLE TRAY, FLEXIBLE CONDUIT, UNDER GROUND DUCT.
   RACEWAYS THAT ARE METALLIC SHOULD BE BONDED THROUGH THEIR PERIMETER AND GROUNDED AT BOTH ENDS, AS A MINIMUM.
6. CUSTOMER TO ENSURE PROPER CABLE INSTALLATION AND SEPARATION BY SERVICE LEVEL IN ACCORDANCE TO THE FOLLOWING INDUSTRY STANDARDS OR EQUIVALENT:

   IEEE 422: IEEE GUIDE FOR THE DESIGN AND INSTALLATION OF CABLE SYSTEMS IN POWER GENERATING SYSTEMS.
   NFPA 70 (NEC): ARTICLE 300-310 CONDUCTORS OF DIFFERENT SYSTEMS.
   IEC 61000-5-2: EMC - INSTALLATION AND MITIGATION GUIDELINES, EARTHING AND CABLING.

   INSTRUMENTATION & CONTROL (24 VDC OR LESS) AND COMMUNICATION CABLES SHALL BE SEGREGATED FROM POWER CABLES IN ACCORDANCE TO THE FOLLOWING AIR GAP REQUIREMENT, AS A MINIMUM (BASED ON 100 M RUNS):
   75 TO 130 V: ENSURE 30 IN. [0.75 M] AIR GAP, LOW VOLTAGE.
   150 TO 230 V: ENSURE 60 IN. [1.5 M] AIR GAP, LOW VOLTAGE.
   380 TO 480 V: ENSURE 90 IN. [2.25 M] AIR GAP, LOW VOLTAGE.
   600 TO 15 KV: ENSURE 120 IN. [3 M] AIR GAP, MEDIUM VOLTAGE.

   IF SEGREGATION AIR GAP IS NOT POSSIBLE, METAL BARRIERS WITH GROUNDS TO BE ADDED BETWEEN CABLE RUNS.
   ALL CABLES SHOULD NOT BE BENT TO A RADIUS LESS THAN 8 TIMES THE OVERALL DIAMETER FOR NON-SHIELDED CABLES OR 12 TIMES THE OVERALL DIAMETER FOR SHIELDED CABLES.
   ALL CABLES SHALL BE RATED FOR ALL OF THE ENVIRONMENTAL CONDITIONS WHERE THEY ARE TO BE INSTALLED.
   WHEN METALLIC SHEATH ARMOR CABLES ARE USED, BOTH ENDS OF THE OUTER ARMOR SHOULD BE GROUNDED TO PE.
7. CABLES WITH THE SAME RACEWAY NUMBER AND SAME VOLTS MAY BE RUN IN MULTICONDUCTOR CABLE.
   MULTICONDUCTOR CABLES SHOULD HAVE OVERALL OUTER SHIELD AND SHIELD FOR EACH PAIR, TRIAD, QUAD, AS APPLICABLE.
8. ALL CABLES WITH DIFFERENT VOLTS CANNOT COEXIST IN THE SAME RACEWAY NUMBER.
9. ALL FIRE SYSTEM CABLES SHALL BE SEGREGATED FROM ALL OTHER CABLES IN ACCORDANCE WITH NFPA 70 (NEC) AND LOCAL JURISDICTION CODES.
10. ALL COMMUNICATION CABLES SHALL BE SEGREGATED FROM ALL OTHER CABLES AND NOT COMBINED WITH NON-COMMUNICATION CABLE RACEWAYS.
11. FOR INSTRUMENTATION CABLES THAT ARE INCORPORATED IN MULTICONDUCTOR CABLES, INDIVIDUAL SHIELDS MUST BE INCORPORATED AS INDICATED FOR EACH INDIVIDUAL PAIR, TRIAD, ETC.
    CABLES WITH SHIELDS SHALL HAVE THEIR SHIELD DRESSED OUT NO MORE THAN 1 IN. [25 mm].

12. NOT USED
13. USE CORNING OPTICAL FIBER CABLE NO. 006KSF-T4130D20 OR EQUAL W/INTEGRAL STAINLESS STEEL SC TYPE CONNECTOR ON BOTH ENDS OF THE CABLE, WHERE INDICATED.
14. TWISTED PAIR SHIELDED CABLE TO BE 22 AWG, TINNED COPPER, 8.8 pF/ft [28.86 pF/m], STRANDED, 150 V, 150 OHMS IMPEDANCE, BELDEN NO. 89182 OR EQUAL, WHERE INDICATED.
15. FOR 60 Hz NEC/CSA APPLICATIONS, AC WIRING COLORS SHALL BE PER NEC ARTICLE 200.
    STANDARD WIRING COLORS ARE RED, BLACK, BROWN FOR POWER PHASES AND WHITE FOR NEUTRAL.
    PE GROUND WIRING COLOR IS GREEN/YELLOW STRIPE, OR GREEN.
16. NOT USED
17. USE CAT5e SHIELDED ETHERNET CABLE W/RJ45 CONNECTORS, WHERE INDICATED.
18. CUSTOMER TO SUPPLY COAXIAL CABLE RG58/CU - 50 OHM WITH SMA AND BNC CONNECTORS AND MOLDED STRAIN RELIEF BOOTS WITH 300 FT [100 M] MAXIMUM LENGTH OR EQUAL.
19. MEDIUM VOLTAGE CABLES SHOULD BE SHIELDED. MEDIUM VOLTAGE CABLES SHOULD HAVE THEIR SHIELD CONNECTED AT ONE END ONLY TO PREVENT CABLE LOCAL HEATING.
    MEDIUM VOLTAGE CABLES OPERATING AT DIFFERENT VOLTAGE LEVELS SHOULD NOT OCCUPY THE SAME RACEWAY.

SHEET 1 OF 1

NOTES:

1. APPLICABLE STANDARD/SPECIFICATION:
   ASME Y14.5M-1994, DIMENSIONING AND TOLERANCING.
2. REMOVE ALL BURRS AND SHARP EDGES.
3. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
4. SURFACE PREPARATION / FINISHING SHALL BE IN ACCORDANCE WITH THE LATEST REVISION OF GE SPECIFICATION: A-95953.
5. DRILLING AND WELDING SHALL BE DONE PRIOR TO SURFACE PREPARATION / FINISHING.
6. CONSTRUCTION:
   CUBICLE - FABRICATED FROM 11 GAUGE STEEL SHEET, PICKLED AND OILED WITH ANGLE FRAMEWORK.
   BUSDUCT - FABRICATED FROM 1/8" ALUMINUM SHEET.
7. INGRESS PROTECTION TO IP54.
8. APPROXIMATE WEIGHT OF CUBICLE : 3100 lbs [1406 kg]
9. COPPER BUS BAR SHALL BE SILVER PLATED PER ASTM B700 AT ELECTRICAL JOINTS.
10. ALL MAIN BUSBAR JOINTS ARE TO BE FASTENED USING 316 STAINLESS STEEL HARDWARE.
11. ALL LIVE COPPER WORK TO BE FULLY INSULATED USING HEATSHRINK SLEEVING, ALONG WITH FILLER PLASTIC AND POLYISOBUTYLENE SELF-AMALGAMATING TAPE FOR BOLTED JOINTS (CONNECTIONS TO GENERATOR TERMINALS TO BE INSULATED DURING MOUNTING).
12. CIRCUIT REFERENCE LABELS TO BE FITTED ADJACENT TO EACH COMPONENT.
13. LANGUAGE OF LABEL IN SPEC 289273.
14. TORQUE FLEX LINK BOLTS TO 35 ft*lb (34Nm). USE NIKAL ANTI-SEIZE (GE PART #393A3967P0001) ON BOLTS BEFORE INSTALLING.
15. SERVICE: TO BE 10.5/11.0/11.5/13.8 kV, 3 PHASE, 3 WIRE, 50/60 Hz AS APPLICABLE.
16. BUSSING: MAIN BUS TO BE 5200 A COPPER (2) 1/2" X 6" [13 X 152] BRACED FOR 75kA ASYM. AT 221 °F [105 °C] TOTAL TEMPERATURE. BUS TO BE FULLY INSULATED. BUS CONNECTIONS TO BE SILVER PLATED. HARDWARE TO BE STAINLESS STEEL. GROUND BUS TO BE FULL LENGTH 1/4" X 2" [6 X 51] COPPER.
17. THERMOSTAT SHOULD BE SET TO SWITCH HEATERS OFF AT 55 °F [12.7 °C].
18. CUSTOMER CABLE CONNECTIONS AT BUS BAR TO BE COVERED WITH DUCT SEAL COMPOUND (GE PART # 393A3635P0001 OR EQUAL) AND APPLY HIGH VOLTAGE TAPE (GE PART # HVBT -4-R OR EQUAL).
19. ADDITIONAL HOLES FOR TOP COVER SUPPLIED BY CUSTOMER.
20. REFER TO X-969225 FOR LIFTING DETAILS.

9. COPPER BUS BAR SHALL BE SILVER PLATED PER ASTM B700 AT ELECTRICAL JOINTS.
10. ALL MAIN BUSBAR JOINTS ARE TO BE FASTENED USING 316 STAINLESS STEEL HARDWARE.
11. ALL LIVE COPPER WORK TO BE FULLY INSULATED USING HEATSHRINK SLEEVING, ALONG WITH FILLER PLASTIC AND POLYISOBUTYLENE SELF–AMALGAMATING TAPE FOR BOLTED JOINTS (CONNECTIONS TO GENERATOR TERMINALS TO BE INSULATED DURING MOUNTING).
12. CIRCUIT REFERENCE LABELS TO BE FITTED ADJACENT TO EACH COMPONENT.
13. LANGUAGE OF LABEL IN SPEC 256272.
14. TORQUE FLEX LINK BOLTS TO 35 ft•lb (34Nm). USE NIKAL ANTI–SEIZE (GE PART #383A3867P0001) ON BOLTS BEFORE INSTALLING.
15. SERVICE: TO BE 10.5/11.0/11.5/13.8 kV, 3 PHASE, 3 WIRE, 50/60 Hz AS APPLICABLE.
16. BUSWING: MAIN BUS TO BE 5200 A COPPER [2] 1/2" X 6" [13 X 152] BRACED FOR 78kA ASYM. AT 221 °F [105 °C] TOTAL TEMPERATURE. BUS TO BE FULLY INSULATED. BUS CONNECTIONS TO BE SILVER PLATED. HARDWARE TO BE STAINLESS STEEL. GROUND BUS TO BE FULL LENGTH 1/4" X 2" [6 X 51] COPPER.
17. THERMOSTAT SHOULD BE SET TO SWITCH HEATERS OFF AT 85 °F [12.7 °C].
18. CUSTOMER CABLE CONNECTIONS AT BUS BAR TO BE COVERED WITH DUCT SEAL COMPOUND (GE PART # 383A3635P0001 OR EQUAL) AND APPLY HIGH VOLTAGE TAPE (GE PART # HVBT –4–R OR EQUAL)
19. ADDITIONAL HOLES FOR TOP COVER SUPPLIED BY CUSTOMER.
20. REFER TO X–969225 FOR LIFTING DETAILS.

LABELS	
REF.	INSCRIPTION
A	LINE CUBICLE
B	L.V. TERMINAL BOX
C	FRAME EARTH
D	DANGER – HIGH VOLTAGE
E	WARNING – LIVE TERMINALS NOTE: HEATER SUPPLY IS FROM A SEPARATE SOURCE. ISOLATE BEFORE REMOVING COVER
F	SERIAL NUMBER ******-***

NOTE! LABELS ARE TO BE IN CUSTOMER LANGUAGE

SHEET 23 OF 23

PLAN VIEW

NOTES:

1. TOLERANCE ON FLANGE CONNECTIONS ±1/8" [3]
   TOLERANCE ON ELECTRICAL CONNECTIONS ±1/8" [3]
   TOLERANCE ON BOLT HOLES ±1/16" [2] TRUE POSITION
2. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
3. ADDITIONAL EXTERIOR LIGHTING TO BE SUPPLIED BY CUSTOMER.
4. MAXIMUM LOAD ON EACH ENGINE REMOVAL FOOT PAD IS 10,000 LBS [4536 kg], (20,000 LBS [9072 kg] TOTAL ENGINE REMOVAL LOAD). MAXIMUM LOAD ON EACH GEARBOX REMOVAL PAD IS 28,000 LBS [12700 kg]
5. AUXILIARY SKID, SPRINT SKID & FIRE PROTECTION SKID FOUNDATIONS MUST BE AT THE SAME ELEVATION AS THE MAIN SKID FOUNDATION. MLO SKID FOUNDATION MUST BE 1'-6 1/2" [471] LOWER.
6. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)-(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X-(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
7. TOLERANCES:
   LINEAR DIMENSION: ±1/8" [3]
   ANGULAR: ±0.5°
8. PIPING AND/OR TUBING MATERIAL SPECIFICATION LISTED IN CONNECTION LEGEND SHALL BE USED BY CUSTOMER AS A RECOMMENDATION IN DESIGN OF THEIR PLANT INTERCONNECT PIPING SYSTEM.

SAFETY NOTE: CAUTION

1. GEPPLP SHALL NOT BE LIABLE FOR DAMAGE CAUSED BY EXCESSIVE FLANGE LOADS OR INADEQUATE EXPANSION JOINT DESIGN. FAILURE TO PROVIDE FOR ADEQUATE THERMAL EXPANSION OR EXCEEDING ALLOWABLE FLANGE LOADS MAY RESULT IN DAMAGE TO OR DESTRUCTION OF FASTENERS AND ENGINE/EXHAUST SYSTEM RELATED HARDWARE RESULTING IN EXHAUST LEAKS AND ACCELERATED WEAR ON THE EXHAUST DIFFUSER ASSEMBLY. IT IS THE CUSTOMER'S RESPONSIBILITY TO ALLOW A CONSERVATIVE AMOUNT OF EXPANSION CAPABILITY TO ACCOMMODATE INSTALLATION ERRORS AND TOLERANCE STACK-UPS FOR THE COMPLETE EXHAUST SYSTEM.
2. IN THE REMOTE CHANCE OF A HP ROTOR FAILURE THE ENGINE CASING MAY NOT CONTAIN THE ENTIRE FAILURE. IT IS HIGHLY RECOMMENDED THAT NO PERMANENTLY MANNED SPACES BE LOCATED IN THE PLANE OF THE HP TURBINE. IT IS ALSO HIGHLY RECOMMENDED THAT ALL POTENTIALLY HAZARDOUS LINES (i.e. FUEL) OR EQUIPMENT (i.e. SHUTOFF VALVES, CONTROL VALVES) ALSO BE LOCATED OUTSIDE THE PLANE OF THE HP TURBINE.

LEGEND

INDICATES CUSTOMER CONNECTION.

NOTES:

1. MAXIMUM LOAD ON EXHAUST FLANGE TO BE 500 LBS [227 kg] VERTICAL AND 50 LBS [23 kg] AXIAL. TRANSITION FROM EXHAUST COLLECTOR TO OUTLET FLANGE IS SOLID. FOR EXPECTED THERMAL GROWTH, SEE EXHAUST OUTLET LOCATION DIMENSIONS.
2. ALL MAIN UNIT FLANGED CUSTOMER CONNECTIONS ARE LOCATED 6'-8 1/2" [2045] FROM CENTERLINE OF UNIT, EXCEPT:
   14: ALIGNED WITH CENTERLINE
   149: 7'-0 1/4" [2140] FROM CENTERLINE
   228: 6'-10 3/8" [2092] FROM CENTERLINE
   229: 6'-10 3/8" [2092] FROM CENTERLINE
3. ALL MAIN UNIT NPT COUPLINGS EXTEND 6'-5 1/8" [1959] FROM CENTERLINE OF UNIT, EXCEPT CONNECTION 14, 161, 183 AND 184.
4. FOR CONNECTION DESCRIPTIONS, SEE SHEET 13.
5. REFERENCE OTHER APPLICABLE GENERAL ARRANGEMENTS FOR LOCATIONS AND DESCRIPTIONS OF ADDITIONAL CONNECTIONS. THOSE CONNECTIONS NOT LISTED ARE NOT USED ON THIS PROJECT.
6. AN ASTERISK (*) INDICATES CONNECTION HARDWARE BY GEPPLP.
7. "HOT" INTERFACE MATING FLANGE SHOULD BE EXTERNALLY INSULATED AND 321 SS.
8. HARDWARE CONNECTION 13 IS SUPPLIED BY EXHAUST STACK / EXPANSION JOINT SUPPLIER.
9. CONNECTIONS 10, 11, 24 AND 297 ARE SCHEDULE 40 304 SS PIPE RECESSED 1/2" [13] FROM EDGE OF SKID. CUSTOMER TO WELD PIPING AT INSTALLATION.

INSTALLATION FOOTPRINT

LEGEND:

● ANCHOR BOLT

NOTES:

1. FOR VERTICAL P LOADS '+' IS A COMPRESSION AND '–' IS A UPLIFT. VT IS TRANSVERSE SHEAR AND VL IS LONGITUDINAL SHEAR.
2. EACH VALUE IN THE LOAD TABLE REPRESENTS A LOAD AT EACH ANCHOR LOCATION.
3. LIVE LOAD REPRESENTS A UNIFORM LOAD OF 60 PSF APPLIED AT EXPOSED SECTION ON THE ROOF OF GLO TANK.
4. SEISMIC LOADS ARE DUE TO 0.6g STATIC ACCELERATION APPLIED IN THE TRANSVERSE OR LONGITUDINAL DIRECTION AS PER EQUIVALENT LATERAL PROCEDURE FOR SEISMIC DESIGN OF BUILDINGS. THESE LOADS ARE AS PER IBC 2009/CBC 2010 CODE SECTION 1613 THAT REFERENCES ASCE 7-05.

SITE CLASS	D
OCCUPANCY CATEGORY	III
SEISMIC DESIGN CATEGORY – TABLE 1613.5.6	E
I_E – OCCUPANCY IMPORTANCE FACTOR, CATEGORY III, ASCE 7-05, TABLE 11.5.1	1.25
R – RESPONSE MODIFICATION FACTOR, ASCE 7-05, TABLE 15.4-2	3.00
S_{DS} – SPECTRAL RESPONSE ACCEL. AT 0.2 SEC – G	1.44
S_{D1} – SPECTRAL RESPONSE ACCEL. AT 1 SEC – G	0.75
G – LEVELS FOR BASE ACCELERATIONS FOR DESIGN	0.60

SEISMIC LOAD MAY BE POSITIVE OR NEGATIVE.

CUSTOMER SHOULD INCLUDE THE VERTICAL SEISMIC LOAD EFFECT $Ev=+/-\ 0.2 S_{DS} D$ IN THE FOUNDATION LOADS AS PER ASCE 7-05 SECTION 12.4.

LEGEND:

- ● ANCHOR BOLT
- P VERTICAL LOAD
- V_T TRANSVERSE SHEAR
- V_L LONGITUDINAL SHEAR

NOTES:

1. BOLT HOLE TOLERANCE: ± 1/8" [3], TRUE POSITION.
2. LEVELING AND GROUTING TO BE PERFORMED PER GUIDELINES OF INSTALLATION MANUAL.
3. ALL ANCHORING HARDWARE AND EMBEDDED STEEL TO BE SUPPLIED BY CUSTOMER AND SHALL BE ASTM F1554 Gr. 105 ANCHOR BOLT WITH A MIN. YIELD STRENGTH OF 105,000 PSI.
4. W14 X 61# BEAMS ILLUSTRATED AT ANCHOR POINT 10 DO NOT EXTEND TO BOTTOM OF SKID. ALL OTHER BEAMS SHOWN ARE W30 X 132#.
5. W30 X 132# BEAMS ILLUSTRATED AT ANCHOR POINTS 5 AND 6 ARE JOINED BY PLATE AT BOTTOM FLANGES. GROUTING BENEATH PLATE AND BEAMS IS REQUIRED. SEE SHEET 2.
6. FLAT PLATES ILLUSTRATED AT ANCHOR POINTS 2, 3 AND 4 EXTEND TO THE BOTTOM OF SKID. GROUTING OF THESE PLATES IS REQUIRED. SEE SHEET 2.
7. SHEAR LUGS ARE SHIPPED LOOSE FOR FIELD INSTALLATION. HOLES FOR SHEAR LUGS NOT SHOWN FOR CLARITY.
8. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
9. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
10. TOLERANCES: LINEAR DIMENSION: ± 1/8" [3 mm] ANGULAR: ±0.5°
11. LIFTING PINS ARE NOT SHOWN ON PLAN VIEW FOR CLARITY.
12. FOR GROUT INFORMATION AND SHIM LOCATIONS, REFER TO GEPPLP LM6000 60HZ INSTALLATION MANUAL.
13. BOLT TORQUE CAN BE VERIFIED BY ENSURING THAT THE PROTRUSIONS ON THE LOAD INDICATING WASHERS HAVE BEEN COMPRESSED. SUFFICIENT TORQUE WILL COMPRESS THE PROTRUSIONS TO THE EXTENT THAT A MAXIMUM GAP OF 0.005" [0.127 mm] EXISTS BETWEEN THE PROTRUSIONS. NOTE THAT THE MAXIMUM GAP MAY BE INCREASED TO 0.015" [0.381 mm] IF THE LOAD INDICATING WASHER IS USED UNDER THE UNTURNED ELEMENT.
14. DATUM DIMENSIONS ARE FROM GENERATOR END OF SKID.
15. CUSTOMER SUPPLIED GENERATOR AND GEARBOX ANCHOR BOLTS TO BE EMBEDDED INTO FOUNDATION. SEE SHEETS 7 & 8.

SCALE NONE

SHEET 9 OF 12

NOTES:

1. FOR P LOADS '+' IS A COMPRESSION AND '–' IS A UPLIFT. VT IS TRANSVERSE SHEAR AND VL IS LONGITUDINAL SHEAR.
2. EACH VALUE IN THE LOAD TABLE REPRESENT A LOAD AT EACH ANCHOR LOCATION.
3. ROOF LIVE LOAD IS APPLIED AS PER IBC 2009 TABLE 1607.1, REPRESENTS A UNIFORM LOAD OF 60 PSF ON PACKAGE AND AIR FILTER AND 100 PSF ON WALKWAYS APPLIED AT EXPOSED SECTION OF THE MAIN UNIT AND ON THE AIR FILTER ROOF.
4. SEISMIC LOADS ARE DUE TO 0.6g STATIC ACCELERATION APPLIED IN THE LONGITUDINAL AND TRANSVERSE DIRECTION AS PER EQUIVALENT LATERAL FORCE PROCEDURE FOR SEISMIC DESIGN OF BUILDINGS. THESE LOADS ARE AS PER IBC 2009 CODE SECTION 1613 THAT REFERENCES ASCE 7–05.

SITE CLASS	D
OCCUPANCY CATEGORY, TABLE 1604.5	III
SEISMIC DESIGN CATEGORY – SECTION 1613.5.6	E
I_E – OCCUPANCY IMPORTANCE FACTOR, CATEGORY III, ASCE 7–05, TABLE 11.5.1	1.25
R – RESPONSE MODIFICATION FACTOR, ASCE 7–05, TABLE 15.4–1	2.50
SDS – SPECTRAL RESPONSE ACCEL.AT 0.2 SEC – G	1.20
SD1 – SPECTRAL RESPONSE ACCEL.AT 1 SEC – G	0.70
G–LEVELS FOR BASE ACCELERATIONS FOR DESIGN PER IBC 2009	0.60

SEISMIC LOAD MAY BE POSITIVE OR NEGATIVE
CUSTOMER SHOULD INCLUDE THE VERTICAL SEISMIC LOAD EFFECT Ev = +/–0.2SDS D = 0.24 D IN THE FOUNDATION LOADS AS PER ASCE 7–05 SECTION 12.4.

5. WIND LOAD ARE PER ASCE 7–05 CODE, 150 MPH FOR LOW RISE BUILDING, H <60 FT

WIND PRESSURE (PSF), EQ 6–18	p = qh (GCpf – GCpi)	75.533(GCpf–GCpi)
EXTERNAL PRESSURE COEF., FIGURE 6–10	GCpf	
INTERNAL PRESSURE COEF., FIGURE 6–5	GCpi	+/–0.18
VELOCITY PRESSURE (psf) , Eq 6–15	qh = 0.00256 Kz Kzt Kd V2 I	75.53
VELOCITY PRESSURE EXPOSURE COEF. – TABLE 6–3	Kz	0.98
TOPOGRAPHIC FACTOR, Eq. 6–3	Kzt = (1 + K1 K2 K3)2	1.369
FIGURE 6–4	K1	0.17
FIGURE 6–4	K2	1
FIGURE 6–4	K3	1
WIND DIRECTIONALLITY FACTOR, TABLE 6–4	Kd	0.85
WIND VELOCITY (MPH)	V	150
IMPORTANCE FACTOR, TABLE 6–1	I	1.15
EXPOSURE CATEGORY	C	C

6. OPERATING LOADS REPRESENT THE FOLLOWING:
   A. AXIAL THRUST – DUE TO THE MOMENTUM CHANGE THROUGH THE TURBINE.
   B. PRESSURE DIFFERENCE – DUE TO THE PRESSURE DIFFERENCE BETWEEN THE INLET AND THE EXHAUST.
   C. NORMAL OPERATION TORQUE – DUE TO THE OVERTURNING TORQUE PRODUCED BY THE FLUID COUPLING.
   D. THERMAL EXPANSION – DUE TO THE MECHANICAL RESISTANCE TO THE THERMAL GROWTH OF THE TURBINE.
7. GENERATOR FAULT TORQUE IS DECOUPLED INTO UPWARD AND DOWNWARD COMPONENTS. GENERATOR FAULT CAN BE CONSIDERED AS EMERGENCY LOAD CASE.
8. GENERATOR FAULT AND ENGINE SEIZURE CAN BE CONSIDERED AS EMERGENCY LOAD CASE.
9. THE PEAK VIBRATION VELOCITY AT ANY POINT OF THE FOUNDATION SHOULD BE LESS THAN 0.06 IN/SEC AT THE RATED TURBINE SPEED OF 3600 RPM.
10. FOUNDATION SHALL NOT EXCEED +/– 1/8" FLATNESS AND +/– 1/4" SLOPE. FOUNDATION SHALL NOT BOW MORE THAN 1/8" AT ANY LOCATION ON THE SKID.
11. ONE END OF THE FOUNDATION MUST NOT BE 1/4" HIGHER OR LOWER THAN THE OTHER END OF THE SKID.

SHEET 11 OF 12

NOTES:

1. P IS VERTICAL LOAD (TENSION/COMPRESSION), VT IS TRANSVERSE SHEAR AND VL IS LONGITUDINAL SHEAR.
2. SHORT TERM LOAD CASES ARE THE RESULT OF THE FOLLOWING BLADE-OUT CONDITIONS AT THE INDICATED ROTOR POSITION.
   A. TWO STAGE 0 LOW PRESSURE COMPRESSOR AIRFOILS: 27840 gm-in (982.03 OZ.-in), SPEED RANGE 0-4300 RPM FOR 50 Hz UNIT AND 60 Hz UNIT.
   B. TWO STAGE 1 HIGH PRESSURE COMPRESSOR AIRFOILS: 2752 gm-in (97.07 OZ-in), SPEED RANGE 0-10800 RPM.
   C. THREE STAGE 2 HIGH PRESSURE TURBINE AIRFOILS: 4911 gm-in (173.23 OZ-in), SPEED RANGE 0-10800 RPM.
   D. TWO STAGE 5 LOW PRESSURE TURBINE AIRFOILS: 41158 gm-in (1451.81 OZ-in), SPEED RANGE 0-4300 RPM FOR 50 Hz UNIT AND 60 Hz UNIT.
3. SHORT TERM IS DEFINED AS FIVE SECONDS FOR TURBINE LOAD DECAY DURING COASTDOWN.
4. THE CONTINUOUS UNBALANCE LOAD CASES ARE THE RESULT OF THE ALLOWABLE ROTOR UNBALANCE AT THE INDICATED ROTOR POSITION.
   A. TWO STAGE 0 LOW PRESSURE COMPRESSOR AIRFOILS: 300 gm-in (10.58 OZ-in), DESIGN SPEED 3911 RPM FOR 50 Hz UNIT AND 3905 RPM FOR 60 Hz UNIT.
   B. TWO STAGE 1 HIGH PRESSURE COMPRESSOR AIRFOILS: 100 gm-in (3.53 OZ-in), DESIGN SPEED 10600 RPM.
   C. THREE STAGE 2 HIGH PRESSURE TURBINE AIRFOILS: 150 gm-in (5.29 OZ-in), DESIGN SPEED 10600 RPM.
   D. TWO STAGE 5 LOW PRESSURE TURBINE AIRFOILS: 200 gm-in (7.05 OZ-in), DESIGN SPEED 3911 RPM FOR 50 Hz UNIT AND 3905 RPM FOR 60 Hz UNIT.
   E. GENERATOR, BRUSH 7-290ER, CONTINUOUS UNBALANCE LOAD OF 987 gm-in (34.82 OZ-in) AT MIDDLE OF ROTOR PER BRUSH SPECIFICATION.
   F. GEAR BOX, LUFKIN, CONTINUOUS UNBALANCE LOAD OF 152 gm-in (5.36 OZ-in) AT MIDDLE OF SHAFT AS PER LUFKIN SPECIFICATION.
5. THE LOADS IN THE DYNAMIC FOUNDATION LOAD TABLE ARE THE MAXIMUM (0 TO PEAK) LOADS OF EACH ANCHOR BOLT IN THE OPERATING RANGE THESE LOADS MAY OCCUR AT DIFFERENT FREQUENCIES OR PHASES, AND THEREFORE, IT MAY BE TOO CONSERVATIVE TO TREAT LOADS AS STATIC LOAD CASES.
6. DYNAMIC LOADS SHORT TERM: FROM MAX TO ZERO IN 5 SEC. THESE LOAD CASES ARE ASSUMED NOT TO ACT SIMULTANEOUSLY.

7. THE PEAK TO PEAK VIBRATION VELOCITY AT ANY POINT OF THE FOUNDATION SHOULD BE LESS THAN 0.06 In/SEC AT THE RATED TURBINE SPEED OF 3605 RPM FOR 60 Hz UNIT AND 3911 RPM FOR 50 Hz UNIT.

SHEET 12 OF 12

NOTES:

1. LIFTING EQUIPMENT IS SENT TO JOB SITE TO OFF–LOAD MAJOR ITEMS. EQUIPMENT IS TO BE CONSIDERED ON LOAN BY GEPPLP AND IS TO BE RETURNED IN GOOD WORKING ORDER.
2. ALL CABLE SLINGS TO HAVE GEPPLP DRAWING NUMBER REFERENCES WITH RESPECTIVE WEIGHT CAPACITIES AND LENGTHS PERMANENTLY STAMPED AT BOTH ENDS.
3. HOOK LOAD INCLUDES LIFT HARDWARE WEIGHT WHICH IS 3 KIPS FOR MAIN UNIT LIFTS AND 1 KIP FOR ALL OTHER LIFTS.
4. CABLE SLING DESIGNATED IWRC/EIPS IS AN ABBREVIATION FOR INDEPENDENT WIRE ROPE CORE/EXTRA IMPROVED PLOW STEEL.
5. APPROVED EQUAL MUST INCLUDE A MINIMUM RATED OR WORKING LOAD OF 6 TIMES THE MINIMUM ULTIMATE LOAD OR BREAKING STRENGTH. S.W.L. = SAFE WORKING LOAD.
6. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
7. TURBINE ROOM LIFT IS MADE WITH LM6000 ENGINE.
8. GENERATOR LIFT RIGGING ACCOUNTS FOR APPROXIMATELY 2 KIPS.
9. DO NOT LIFT GENERATOR ROOM ON SHEETS 2 AND 3 (LIFT ARRANGEMENT WITHOUT GENERATOR) WITH GENERATOR INSIDE.
10. MUST USE SWIVEL HOIST RINGS – NO SUBSTITUTIONS.
11. THIS DRAWING UTILIZES BILLS OF MATERIAL (BOMS) WHICH CONSIST OF (DRAWING NUMBER) (ITEM TYPE) (ITEM DESIGNATOR) AND IDENTIFIED AS XXXXXXYZZZZ WHERE XXXXXX = DRAWING NUMBER, Y = G (GROUP) OR P (PART) OR L (LIST), AND ZZZZ = ITEM DESIGNATOR (I.E. 0001).

LEGEND:

INDICATES CUSTOMER CONNECTION AS SHOWN ON GENERAL ARRANGEMENT DRAWING.

NOTES:

1. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)-(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X-(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
2. AN ASTERISK (*) INDICATES INTERFACE CONNECTION HARDWARE BY GEPPLP.
3. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
4. INTERCONNECT HOSES ARE FURNISHED BY GEPPLP.
5. THE HYDRAULIC PUMP (ITEM 11) INCLUDES VALVES AND THE FOLLOWING COMPONENTS NOT SHOWN:
   A. CHARGE PUMP RELIEF VALVE - SET 350 PSIG [2413 kPaG]
   B. HIGH PRESSURE RELIEF VALVE - SET 5700 PSIG [39300 kPaG]
   C. LOW PRESSURE RELIEF VALVE - SET 2000 PSIG [13790 kPaG]
   D. PRESSURE COMPENSATOR - SET 5200 PSIG [35853 kPaG]
6. FILTERS COME WITH VISUAL INDICATORS. CHANGE FILTER ELEMENTS ON A REGULAR BASIS AND REPLACE THEM AT LEAST ONCE A YEAR REGARDLESS OF INDICATOR READING, SOONER IF CONDITIONS WARRANT.

SCALE NONE
SHEET 3 OF 3

LEGEND:

INDICATES CUSTOMER CONNECTION AS SHOWN ON GENERAL ARRANGEMENT DRAWING.

DM = DECELERATION TO MINIMUM LOAD
ES = EMERGENCY SHUTDOWN MOTORING
ESN = EMERGENCY SHUTDOWN NO MOTORING
NSD = NORMAL SHUTDOWN

NOTES:

1. DAMPERS CLOSE AUTOMATICALLY WITH CO2 DISCHARGE. 85 PSI [586 kPa] PRESSURIZED AIR IS REQUIRED TO RESET THE DAMPERS.
2. ADDITIONAL CUSTOMER DRAIN CONNECTION [62] SHOWN IN GENERAL ARRANGEMENT 969204.
3. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
4. GENERATOR VENT FANS ARE RATED AT 45,000 SCFM [1274 SCMM] EACH. NORMAL OPERATION REQUIRES 1 FAN RUNNING WITH 1 FAN ON STANDBY.
5. TURBINE ROOM VENT FANS ARE RATED AT 60,000 SCFM [1699 SCMM] EACH. NORMAL OPERATION REQUIRES 1 FAN RUNNING WITH 1 FAN ON STANDBY.
6. FILTER CONFIGURATION IS SHOWN SCHEMATICALLY. ACTUAL CONFIGURATION WILL DIFFER.
7. FOR AIR FILTER CUSTOMER CONNECTIONS SEE GENERAL ARRANGEMENT, AIR FILTER FOR FURTHER DETAILS.
8. TYPICAL OFF-LINE WATER WASH WILL HAVE APPROXIMATELY 100 GALLONS [378 L] OF SOLUTION DRAINING FROM CONNECTION [149] FOR TYPICAL SINGLE WASH-DOUBLE RINSE CYCLE, ACTUAL VOLUME WILL DEPEND ON CUSTOMER USAGE.
9. FIRE PROTECTION DAMPER TRIPPED BY RELEASE OF CO2. REFER TO F & ID FIRE PROTECTION SYSTEM.
10. CONNECTION [347] 1 1/2" NPT CONDENSATE DRAIN, AIR FILTER INLET PLENUM ITEM 127 TO BE INSTALLED TO PROVIDE AT LEAST 20" [508 mm] OF HEAD.
11. APPROXIMATE COMBUSTION AIR FLOW RATE AT HIGH SPEED CRANK IS 8010 SCFM.
12. THE COIL SOLUTION SHOULD HAVE AN INHIBITOR TO PREVENT CORROSION OF COPPER TUBED COILS. COILS MOP = TBD PSIG [TBD kPaG].
13. THE TOTAL QUANTITY OF WATER IN THE COILS, SUPPLY & RETURN HEADERS IS TBD GALLONS [TBD L]. THIS INCLUDES BOTH SIDES A & B.
14. IF FREEZING TEMPERATURES ARE ANTICIPATED (UNLESS PROPER GLYCOL SOLUTION IS USED) THE WATER COIL SYSTEM MUST BE FULLY DRAINED.
15. IF UNEVEN TEMPERATURE DISTRIBUTION ACROSS THE COIL FACE IS NOTED, VENT TRAPPED AIR FROM COILS. 1/2" NPT PETCOCKS ARE PROVIDED BY COIL MANUFACTURER.
16. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)-(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X-(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
17. MONITOR POINT ONLY WHEN OFFLINE AND FANS OFF.
18. INTENTIONALLY LEFT BLANK.

SHEET 2 OF 7

COIL SECTION
(SEE NOTE 17)

NOTES: (CONTINUED FROM SHEET 1)

19. COIL SYSTEM (EXPECTED PERFORMANCE, NOT GUARANTEED)

	HEAT	CHILL
– WATER SUPPLY FLOW RATE (GPM)	TBD	TBD
– ENTERING DRY BULB TEMPERATURE (°F)	TBD	TBD
– ENTERING WET BULB TEMPERATURE (°F)	–	TBD
– LEAVING DRY BULB TEMPERATURE (°F)	TBD	TBD
– LEAVING WET BULB TEMPERATURE (°F)	–	TBD
– ENTERING WATER TEMPERATURE (°F)	TBD	TBD
– LEAVING WATER TEMPERATURE (°F)	TBD	TBD
– CAPACITY	TBD MBTU	TBD TONS
– WATER/GLYCOL SOLUTION (%)	TBD/TBD	TBD/TBD
– COIL & HEADER PRESSURE DROP (FEET)	TBD	TBD

HEATING DATA IS FOR CONDITIONING OF BOTH COMBUSTION AND VENTILATION AIR. CHILLING DATA IS FOR CONDITIONING OF COMBUSTION AIR ONLY.

20. THE COIL SOLUTION SHOULD HAVE AN INHIBITOR TO PREVENT CORROSION OF COPPER TUBED COILS. COIL MOP = 689 kPaG [100 PSIG].
21. THE TOTAL QUANTITY OF WATER IN THE COILS, SUPPLY & RETURN HEADERS IS 720 GALLONS [2725 L]. THIS INCLUDES BOTH SIDES A & B.
22. IF FREEZING TEMPERATURES ARE ANTICIPATED (UNLESS PROPER GLYCOL SOLUTION IS USED) THE WATER COIL SYSTEM MUST BE FULLY DRAINED.
23. IF UNEVEN TEMPERATURE DISTRIBUTION ACROSS THE COIL FACE IS NOTED, VENT TRAPPED AIR FROM COILS. 1/2" NPT PETCOCKS ARE PROVIDED BY GEPPLP.
24. STANDARD CONDITION REF. AT 21 °C [70 °F] AND AT 101 kPaA [14.7 PSIA].
25. DO NOT OPERATE ANTI–ICING COILS WHEN UNIT IS NOT IN OPERATION.

LEGEND:

INDICATES CUSTOMER CONNECTION AS SHOWN ON GENERAL ARRANGEMENT DRAWING.

INDICATES G.E. ENGINE CONNECTION AS DESIGNATED BY G.E. DRAWINGS.

ESN = EMERGENCY STOP NO MOTORING
DM = DECEL TO MINIMUM LOAD

NOTES:

1. VALVE LOCKS TO BE SUPPLIED BY OTHERS UNLESS OTHERWISE NOTED.
2. PERCENTAGE (%) VOLUMES ARE REFERENCE FROM TANK CAPACITY 250 GALLONS [946 L].
   TANK LEVEL FOR NORMAL OPERATION IS IN THE RANGE OF 39-90% (95-219 GALLONS [360-829 L]).
3. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
4. CUSTOMER TO SUPPLY DRAIN VALVE AT CONNECTION 6, CLOSED WHEN RUNNING, OPEN DURING SHUTDOWN.
5. CONNECTION 229 IS SEAL/SUMP OIL DRAIN, WHICH IS TO BE OPEN AT ALL TIMES. NO TRAPS SHOULD BE INSTALLED. THERE SHOULD BE NO FLOW UNDER NORMAL CONDITIONS AND 0.5 USGPM [1.9 L/min] OF OIL PER SUMP AT SEAL FAILURE. ENGINE CONNECTION D1 AT FAILURE WILL FLOW .09 lb/sec [0.04 kg/s] AIR AND 1.6 USGPM [6 L/min] OF OIL PER SUMP.
6. FROM PURGE AIR/INSTRUMENT AIR SUPPLY:
   OPERATIONAL MODE
   PRESSURE RANGE = 85-120 PSIG [586-827 kPaG]
   CONSTANT PRESSURE REQUIRED FOR VALVE OPERATION.
   TEMPERATURE, MAX = 100 °F [38 °C]
   SHUTDOWN MODE - ZERO RPM
   PRESSURE RANGE = 85-120 PSIG [586-827 kPaG]
   FLOW RATE = 60 SCFM [1.7 SCMM]
   TEMPERATURE, MAX = 100 °F [38 °C]
   TIME DURATION = 1 1/2 HOURS
   AFTER GAS GENERATOR SHUTDOWN OR UNTIL GAS GENERATOR IS RESTARTED, WHICHEVER OCCURS FIRST.
7. COOLING WATER 120 GPM [454 L/min] AT 95 °F [35 °C] MAXIMUM INLET TEMPERATURE AND MAX WOP = 100 PSIG [689 kPaG].
   8 PSID [55 kPaD] MAXIMUM DROP WATER SIDE.
   HEAT LOAD = 12,565 BTU/MIN [13257 KJ/min]
8. AN ASTERISK (*) INDICATES CONNECTION HARDWARE BY GEPPLP.
9. CUSTOMER DRAWING NUMBERS CONSIST OF:
   (ORDER NUMBER)-(STANDARD DRAWING NUMBER),
   AND ARE REFERENCED AS X-(STANDARD DRAWING NUMBER),
   WHERE X = ORDER NUMBER.

CUSTOMER INTERFACE INFORMATION

7

CONNECTION DESCRIPTION: EXHAUST DRAIN SIZE: 1"–150# RF FLANGED		
PRESSURE	FLOW	TEMPERATURE
**	**	**
0	0	0
**	**	**

** UP TO 20 GALLONS [76 L] OF WASH SOLUTION/WATER FOR TYPICAL SINGLE WASH – DOUBLE RINSE CYCLE. ACTUAL VOLUME WILL DEPEND ON CUSTOMER USAGE.
GAS OPERATION:
DURING SHUTDOWN–MAXIMUM AIR/NATURAL GAS MIXTURE: FLOW 0.93 PPS, PRESSURE 150 PSIG, TEMPERATURE 380 F DURATION 1 SEC.
UNDER AN UNDETECTED LEAK (FCV–2005) FLOW UP TO 0.26 PPS AT ATMOSPHERIC PRESSURE, TEMPERATURE 380 F.
(SEE NOTE 13)

3 11

CONNECTION DESCRIPTION: GAS FUEL VENT SIZE: 1" SCH 40 WELDED PIPE			
	PRESSURE PSIG [MPaG]	FLOW PPS[Kg/s]	TEMPERATURE °F [°C]
**	73[0.5]	0.79[0.36]	250[121]
***	0	0	70[21]
****	ATM	0.13[0.06]	NOTE 10

** MAX CONDITION WHEN ITEM 9 OPEN DURING SHUTDOWN, DURATION 35 SEC AT THIS PRESSURE & FLOW.
*** NORMAL OPERATION
**** IN CASE IF THERE WAS AN UNDETECTED LEAK (SEE NOTE 13)

3 391

CONNECTION DESCRIPTION: EXTERNAL GAS FUEL VENT SIZE: 2" SCH 40S BUTTWELDED			
	PRESSURE PSIG [MPaG]	FLOW PPS[Kg/s]	TEMPERATURE °F [°C]
**	390[2.69]	29.44[13.38]	250[121]
***	0	0	70[21]
****	ATM	0.26[0.12]	NOTE 10

** MAX CONDITION WHEN SOV–2061 OPEN DURING SHUTDOWN, DURATION 0.6 SEC AT THIS PRESSURE & FLOW.
*** NORMAL OPERATION
**** IN CASE IF THERE WAS AN UNDETECTED LEAK (SEE NOTE 13)

LEGEND:

- ☐ INDICATES CUSTOMER CONNECTION AS SHOWN ON GENERAL ARRANGEMENT DRAWING.
- ⬡ INDICATES G.E. ENGINE CONNECTION AS DESIGNATED BY G.E. DRAWINGS.

ES = EMERGENCY STOP
DM = DECELERATE TO MINIMUM LOAD
SI = STEP TO IDLE
NSD = NORMAL SHUTDOWN
LC = LOCK CLOSE
* = CONNECTION HARDWARE BY GEPPLP

NOTES:

1. INSTRUMENT AIR REQUIREMENTS ARE TO MEET ISA–S7.0.01 AND THE FOLLOWING GE RECOMMENDATIONS:
   – FILTERED TO MINIMUM 10 MICRONS
   – DEW POINT AT LEAST 18 °F [10.0 °C] BELOW THE MINIMUM LOCAL RECORDED AMBIENT TEMPERATURE AT THE PLANT SITE
   – TOTAL OIL OR HYDROCARBON CONTENT SHALL BE AS CLOSE TO ZERO AS POSSIBLE, BUT UNDER NO CIRCUMSTANCES SHALL IT EXCEED ONE (1) PPM UNDER NORMAL CONDITIONS (68 °F [20 °C] AND 14.7 PSIA [1 ATM])
   – FREE OF AIRBORNE SOLVENTS (E.G. AEROSOLS, PAINTS)
   – PRESSURED 80–120 PSIG [552–827 kPaG]
2. VALVE LOCKS TO BE SUPPLIED BY OTHERS UNLESS OTHERWISE NOTED.
3. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
4. FUEL AND WATER MUST MEET G.E. QUALITY REQUIREMENTS PER G.E. AIRCRAFT DERIVATIVE TURBINES:
   NATURAL GAS: MID–TD–0000–1, SHORT TERM PRESSURE PULSATIONS NOT TO EXCEED 2% PEAK TO PEAK
   NOX WATER: MID–TD–0000–3
5. INTENTIONALLY LEFT BLANK
6. FOR EXTENDED NON–USE WITH ANTICIPATED FREEZE CONDITIONS, WATER INJECTION SYSTEM MUST BE DRAINED.
7. EXHAUST DRAIN FROM CONNECTION 7: SEE CONNECTION 7 TABLE.
8. VALVE IS OPENED FOR MAINTENANCE ONLY.
9. INTENTIONALLY LEFT BLANK
10. MINIMUM GAS SUPPLY TEMP SHALL BE 50 °F [27.8 °C] GREATER THAN THE SATURATED VAPOR TEMP AT THE SUPPLY PRESSURE.
11. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
12. ITEM 14 SHOULD BE LOCATED WITHIN 15 FEET FROM THE GAS TURBINE PACKAGE CONNECTION #10.
13. ALL CUSTOMER INTERFACE PIPING CONNECTIONS MATERIAL SHALL BE THE FOLLOWING AFTER THE MAIN FILTER.
   – 304 SS FOR GAS FUEL
   – 304 SS FOR LIQUID FUEL
   – 316 SS FOR WATER INJECTION
   – 304 SS FOR DRAIN & VENT SYSTEM
14. ITEM 1 IS SHIPPED LOOSE FOR INSTALLATION OUTSIDE OF MAIN UNIT AND SHOULD BE LOCATED WITHIN 20 FT [6.1 M] FROM CONNECTION 10.

SAFETY NOTES:

1 FLOWS AND PRESSURES ARE MACHINE DESIGN PARAMETERS AND ARE NOT GUARANTEE POINTS.

2 THIS VALVE MUST REMAIN OPEN EXCEPT FOR MAINTENANCE. SHALL BE WELDED LOCATED AT LEAST 3 METERS AWAY MAXIMUM BACK PRESSURE SHALL NOT EXCEED 1 PSIG [7 kPaG].

3 CUSTOMER SUPPLIED FLAME ARRESTOR MAY BE REQUIRED IF COMBUSTIBLE MIXTURE EXISTS IN CUSTOMER VENT. ALL GAS VENTS MUST BE ROUTED SEPERATELY– NO MANIFOLDING.

4 LINE NEEDS TO BE HEAT TRACED AND INSULATED TO PROTECT WATER FROM FREEZING.

NOTES: (CONTINUED)

3. OFF-LINE WATER WASH MAY NOT BE INITIATED UNTIL SURFACE TEMPERATURES OF GAS TURBINE ARE LESS THAN 200 °F [93 °C].
4. DRAIN TANK AFTER OFF-LINE WASH, CLEAN TO AVOID FLUID FREEZING AS NECESSARY. VALVE POSITIONS SHOWN ARE FOR STORAGE/NON-WATER WASH OPERATION. CONSULT O & M MANUAL FOR WATER WASH VALVE POSITIONING.
5. CUSTOMER IS RESPONSIBLE FOR ADDITION OF ANTI-FREEZE FOR ENGINE PROTECTION DURING COLD WEATHER WASHING.
6. AN ASTERISK (*) INDICATES CONNECTION HARDWARE BY GEPPLP.
7. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)-(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X-(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
8. VALVE LOCKS TO BE SUPPLIED BY OTHERS UNLESS OTHERWISE NOTED.
9. INSTRUMENT AIR TO BE PER ISA S7.3.
10. INSTRUMENT AIR IS BROKEN DOWN INTO THE FOLLOWING:
    F&ID TURBINE LUBE OIL
    FROM PURGE AIR/INSTRUMENT AIR SUPPLY:
    OPERATIONAL MODE
    PRESSURE RANGE = 85-120 PSIG [586-827 kPaG]
    CONSTANT PRESSURE REQUIRED FOR VALVE OPERATION.
    TEMPERATURE, MAX = 100 °F [38 °C]
    SHUTDOWN MODE - ZERO RPM
    PRESSURE RANGE = 85-120 PSIG [586-827 kPaG]
    FLOW RATE = 60 SCFM [1.75 SCMM]
    TEMPERATURE, MAX = 100 °F [38 °C]
    TIME DURATION = 1 1/2 HOURS
    AFTER GAS GENERATOR SHUTDOWN OR UNTIL GAS GENERATOR IS RESTARTED, WHICHEVER OCCURS FIRST.
    F&ID WATER WASH SYSTEM
    FROM PURGE AIR/INSTRUMENT AIR SUPPLY:
    10 SCFM [0.28 SCMM]
    80-120 PSIG [552-827 kPaG]
    1 MINUTE
11. NUMBERS IN { } BRACES ARE GEPPLP ASSIGNED PART NUMBERS.

LEGEND:

INDICATES CUSTOMER CONNECTION AS SHOWN ON GENERAL ARRANGEMENT DRAWING.

NOTES:

1. SPRINT SKID SHALL BE LOCATED AT A DISTANCE FROM THE WATER SOURCE SUCH THAT A SUPPLY PRESSURE OF 5 PSIG [34 kPaG] MINIMUM IS MAINTAINED AT PUMP SUCTION FLANGE FOR ALL TANK LEVELS AND FLOW RATES.
2. CUSTOMER DRAWING NUMBERS CONSIST OF: (ORDER NUMBER)–(STANDARD DRAWING NUMBER), AND ARE REFERENCED AS X–(STANDARD DRAWING NUMBER), WHERE X = ORDER NUMBER.
3. DIMENSIONS AND VALUES IN [ ] ARE SI UNITS AND ARE GIVEN FOR REFERENCE ONLY. EQUIPMENT SHALL BE DESIGNED AND MANUFACTURED USING U.S. CUSTOMARY UNITS.
4. WATER MUST MEET G.E. QUALITY REQUIREMENTS PER G.E. AIRCRAFT DERIVATIVE TURBINES: MID–TD–0000–3.
5. THE LINE SHALL BE PIPED DIRECTLY FROM SUPPLY TANK.
6. RECOMMENDED SKID LOCATION TO BE WITHIN 30 EQUIVALENT PIPE FEET [9 EQUIVALENT PIPE METERS] OF MAIN UNIT CONNECTION POINT TO MINIMIZE PRESSURE LOSS.

SAFETY NOTE:

1 LINE NEEDS TO BE HEAT TRACED AND INSULATED TO PROTECT WATER FROM FREEZING.

REFERENCE DRAWINGS:
